How to use the MICROPAEDIA

The 12 volumes of the MICROPAEDIA contain tens of thousands of shorter articles on specific persons, places, things, and ideas, arranged in alphabetical order. The MICROPAEDIA can be used as an information resource on its own; and it can function as support for the longer articles in the MACROPAEDIA (to which it refers whenever appropriate). The MICROPAEDIA in turn is supported by references in the INDEX and by the lists of suggested readings in the PROPAEDIA. Finally, the MICROPAEDIA is the portion of the *Encyclopædia Britannica* best suited for the reader who wishes to browse among the countless subjects in all fields of human learning and history in all times and places.

Alphabetization

Entry titles are alphabetized according to the English alphabet, A to Z. All diacritical marks (such as in ö, ð, or ñ) and foreign letters without parallels in English (such as ayin ['] and hamza [']) are ignored in the alphabetization. Apostrophes likewise are ignored. Titles beginning with numbers, such as **1812, War of**, are alphabetized as if the numbers were written out (**Eighteen-twelve, War of**).

Alphabetization proceeds according to the "word-by-word" principle. Thus, **Mount Vernon** precedes **mountain**; any **John** entry precedes **John Henry**, which in turn precedes **Johne's disease**. Any character or string of characters preceding a space, hyphen, or dash is treated as a word and alphabetized accordingly. Thus, **De Broglie** precedes **debenture**, and **jack-o'-lantern** precedes **jackal**. Titles with identical spellings are arranged in the following order: (1) persons, (2) places, (3) things.

For many rulers and titled nobility, chronological order, as well as alphabetical order, governs placement. Rulers of the same given name (e.g., William) may be grouped together, separate from other entries, and indicated by the symbol •. They may be subgrouped alphabetically by country and, within each country, arranged chronologically (**William I, William II**, etc.). Nobility or peers of the same titled name (e.g., **Essex, EARLS OF**) are similarly grouped together, separate from other entries; they are indicated by the symbol • and arranged chronologically.

Places with identical names are arranged in the alphabetical order of the countries where they are located. Identical place-names in the same country are alphabetized according to the alphabetical order of the state, province, or other political subdivision where they are found.

Entry arrangement

The titles of entries are arranged according to the forms commonly found in indexes and dictionaries, with some special conventions.

Entry titles for certain physical features, institutions, structures, events, and concepts are ordinarily inverted to place the substantive word first. Thus, the Bay of Bengal is entered as **Bengal, Bay of**; the Bank of England as **England, Bank of**; the Tower of London as **London, Tower of**; the Siege of Vienna as **Vienna, Siege of**; and the balance of power as **power, balance of**. If the name of a physical feature, institution, structure, event, or concept has two or more descriptors, it is entered under the descriptor appearing first. Thus, the Episcopal Church in Scotland is entered as **Episcopal Church in Scotland** (not **Scotland, Episcopal Church in**); the Leaning Tower of Pisa as **Leaning Tower of Pisa**; and the kinetic theory of gases as **kinetic theory of gases**.

The entries for most Western persons are arranged so that one can read a name in correct order by beginning after the first comma, proceeding to the end of the boldface type, returning to the beginning word or words, and proceeding forward to the first comma. Thus, the entry **March, Patrick Dunbar, 2nd Earl of**, is read "Patrick Dunbar, 2nd Earl of March"; the entry **Orléans, Louis, duc d'**, is read "Louis, duc d'Orléans." Names of Far Eastern origin are given in Oriental order, with the surname preceding the personal name (e.g., **Tōjō Hideki, Deng Xiaoping, Nguyen Cao Ky**).

Cross-references

Some cross-reference entries appear in the MICROPAEDIA for the purpose of leading a reader from names that are familiar to alternate names that may not be. Cross-references also appear frequently within or at the ends of standard entries, where they are identified by *see, see also, see under, q.v. (quod vide, "which see"), or qq.v. (quae vide, "which see," plural)*.

Certain entries serve both as relatively brief essays on general subjects and as cross-references to the same subjects treated at greater length and in greater depth in the MACROPAEDIA. Such an entry (e.g., **igneous rock**) begins with a definition of the subject and then provides the following cross-reference: "A brief treatment of igneous rocks follows. For full treatment, *see* MACROPAEDIA: Minerals and Rocks.

Entries on certain broad subjects (e.g., **music**) direct the reader to several relevant articles in the MACROPAEDIA and also to the PROPAEDIA for listings of related articles in the MICROPAEDIA.

Abbreviations

Abbreviations used in the MICROPAEDIA are given in a list that appears at the end of every MICROPAEDIA volume.

Territorial boundaries

In articles and maps indicating disputed geopolitical boundaries and territories, the attribution of sovereignty or administrative subordination to any specific area does not imply recognition of the status claimed by an administering power.

a-ak (ancient East Asian music): *see* gagaku.

a cappella (Italian: "in the church style"), performance of a polyphonic (multipart) musical work by unaccompanied voices. Originally referring to sacred choral music, the term now refers to secular music as well.

The a cappella style arose about the time of the composer Josquin des Prez, in the late 15th century, and reached preeminence with Palestrina in the late 16th century in the music that he wrote for the Sistine Chapel of the Vatican. Because no independent instrumental parts were written, later scholars assumed that the choir sang unaccompanied, but the evidence is now that an organ or other instruments exactly "doubled" some or several of the vocal parts. By the 17th century, a cappella music was giving way to the cantata, for which parts were written specifically for instruments as well as for voices.

A-ch'eng, Pinyin ACHENG, formerly (until 1909) ASHIIHO, city in Heilungkiang sheng (province), China. Located southeast of Harbin (Ha-erh-pin) in the basin of the A-shih River, it is a collecting and commercial centre for a rich agricultural district that provides part of Harbin's food supply. A-ch'eng is also an industrial centre with brickworks, engineering works specializing in electrical equipment and other machinery, and various industries based on local agricultural production, such as breweries, sugar refineries, and a flax-processing plant. A-ch'eng also developed a small iron industry in the late 1950s. Most of its industries are closely integrated with those in Harbin.

To the south of A-ch'eng are the remains of an ancient walled city known as Pai-ch'eng, or Pei-ch'eng. This site is thought to be the remains of Hui-ning, which was the capital of the Chin (Juchen) dynasty from 1122 to 1234 and a subsidiary capital after 1173. Pop. (1989 est.) 188,600.

A-erh-chin Mountains, also called ALTUN TAGH, Chinese (Wade-Giles) A-ERH-CHIN SHAN, or (Pinyin) ALTUN SHAN, mountain range in southern Sinkiang Uighur Autonomous Region, China. Branching off from the Kunlun Mountains, the range runs from southwest to northeast to form the boundary between the Tarim Basin to the north and the minor basin of A-ya-k'o-k'u-mu Lake and the Tsaidam Basin areas of interior drainage to the south.

The range falls into three divisions. The southwest section, bordering the Kunlun, is extremely rugged and complex; some ranges and peaks rise to heights of more than 20,000 feet (6,100 m) and are covered with perpetual snows. The central portion, forming the border of the western Tsaidam Basin, is lower, averaging about 13,000 feet (4,000 m) in height, and is much narrower. The eastern section, in which the range joins the Nan Mountains, is again higher, with peaks of 16,500 feet (5,000 m); it is structurally more complicated, consisting of a series of short ranges, the axes of which gradually adapt to the main northwest-to-southeast axis of the Nan system.

There are very few rivers, because the area is one of extreme aridity, particularly in its central section. In the west various small streams run off into the Takla Makan Desert in the north, into the A-ya-k'o-k'u-mu Lake to the south, or into the western Tsaidam Basin. The main pass is the Tang-chin Pass at the eastern end, which is crossed by a motor road between eastern Sinkiang (via Kansu province), the Tsaidam Basin, and the Tibetan Autonomous Region (via Tsinghai province).

A-Ku-Ta (founder of Chin dynasty): *see* T'ai-tsu.

A-kuei, Pinyin AGUI (b. Sept. 7, 1717, China—d. Oct. 10, 1797, Peking), famous general and official during the middle years of the Ch'ing dynasty.

The scion of a noble family, A-kuei directed Chinese military expeditions that quelled uprisings in the western provinces of Szechwan and Kansu. He also conquered Ili and Chinese Turkestan, areas on China's northwestern frontier that are today part of the Sinkiang Uighur Autonomous Region. In addition, he helped subjugate Myanmar (Burma), making it a Chinese tributary state, and directed the campaign to stabilize China's position on the recently conquered island of Taiwan. He was one of the emperor's most trusted ministers, and he served until his 80th year as a senior member of the government's administrative cabinets, the Grand Council and the Grand Secretariat.

A-mdo, also called MDO-SMAD, one of three regions into which the area of central Asia inhabited by Tibetans is traditionally divided. During the 7th to 9th centuries, the central Tibetan kingdom was extended until it reached the Tarim Basin on the north, China on the east, India and Nepal on the south, and Kashmir on the west. The newly added dominions to the east and northeast were called Mdo-Khams. The A-mdo region, constituting the northeastern part of ethnic Tibet, reached from the Huang Ho (river) northeastward to Mchod-rten dkarpo (now in Kansu province, China). It passed under Ch'ing (Manchu) control in 1724 following the suppression of a Mongol revolt and was officially incorporated into the Chinese provincial system as part of Tsinghai province in 1928.

A-pao-chi, Pinyin ABAOJI, posthumous dynastic name LIAO T'AI TSU, Pinyin LIAO TAI ZU (d. 926, China), leader of the nomadic Mongol-speaking Khitan tribes who occupied the northwest border of China.

Elected to a three-year term as great khan of the Khitans, A-pao-chi refused to resign at the end of his term but made himself king of the Khitan nation. After the collapse in 907 of T'ang rule in China, A-pao-chi made himself emperor and by 916 had set up a Chinese-style dynasty, with his son as heir apparent. He organized his followers into fighting units known as *ordos* (similar to what Westerners later called a horde) and then joined 12 *ordos* into an administrative district.

In 926, in return for aiding the founder of the Later Chin dynasty (936-947) in the Chin ruler's conquest of North China, A-pao-chi was given the northeast corner of Hopeh province, an area inside the Great Wall encompassing the present site of Peking. After the death of A-pao-chi, the Khitans began to take on further Chinese mannerisms, and in 947 they proclaimed the Liao dynasty (947-1125), naming A-pao-chi as their dynastic founder with the posthumous title of T'ai Tsu (Grand Progenitor).

A-p'i-ta-mo chü-she lun (Buddhist compendium): *see* Abhidharmakośa.

a posteriori knowledge, knowledge derived from experience, as opposed to a priori knowledge (*q.v.*).

a priori knowledge, in Western philosophy since the time of Immanuel Kant, knowledge that is independent of all particular experiences, as opposed to a posteriori knowledge, which derives from experience alone. The Latin phrases *a priori* ("from what is before") and *a posteriori* ("from what is after") were used in philosophy originally to distinguish between arguments from causes and arguments from effects.

The first recorded occurrence of the phrases is in the writings of the 14th-century logician Albert of Saxony. Here, an argument a priori is said to be "from causes to the effect" and an argument a posteriori to be "from effects to causes." Similar definitions were given by many later philosophers down to and including G.W. Leibniz, and the expressions still

occur sometimes with these meanings in non-philosophical contexts. It should be remembered that medieval logicians used the word "cause" in a syllogistic sense corresponding to Aristotle's *aitia* and did not necessarily mean by *prius* something earlier in time. This point is brought out by the use of the phrase *demonstratio propter quid* ("demonstration on account of what") as an equivalent for *demonstratio a priori* and of *demonstratio quia* ("demonstration that, or because") as an equivalent for *demonstratio a posteriori*. Hence the reference is obviously to Aristotle's distinction between knowledge of the ground or explanation of something and knowledge of the mere fact.

Latent in this distinction for Kant is the antithesis between necessary, deductive truth and probable, inductive truth. The former applies to a priori judgments, which are arrived at independently of experience and hold universally; the latter applies to a posteriori judgments, which are contingent on experience and therefore must acknowledge possible exceptions. In his *Critique of Pure Reason* Kant used these distinctions, in part, to explain the special case of mathematical knowledge, which he regarded as the fundamental example of a priori knowledge.

Although the use of a priori to distinguish knowledge such as that which we have in mathematics is comparatively recent, the interest of philosophers in that kind of knowledge is almost as old as philosophy itself. No one finds it puzzling that one can acquire information by looking, feeling, or listening, but philosophers who have taken seriously the possibility of learning by mere thinking have often considered that this requires some special explanation. Plato maintained in his *Meno* and in his *Phaedo* that the learning of geometrical truths was only the recollection of knowledge possessed in a previous existence when we could contemplate the eternal ideas, or forms, directly. Augustine and his medieval followers, sympathizing with Plato's intentions but unable to accept the details of his theory, declared that the ideas were in the mind of God, who from time to time gave intellectual illumination to men. René Descartes, going further in the same direction, held that all the ideas required for a priori knowledge were innate in each human mind. For Kant the puzzle was to explain the possibility of a priori judgments that were also synthetic (*i.e.*, not merely explicative of concepts), and the solution that he proposed was the doctrine that space, time, and the categories (*e.g.*, causality), about which we were able to make such judgments, were forms imposed by the mind on the stuff of experience.

In each of these theories the possibility of a priori knowledge is explained by a suggestion that we have a privileged opportunity for studying the subject matter of such knowledge. The same conception recurs also in the very un-Platonic theory of a priori knowledge first enunciated by Thomas Hobbes in his *De Corpore* and adopted in the 20th century by the logical empiricists. According to this theory, statements of necessity can be made a priori because they are merely by-products of our own rules for the use of language.

Aachen, Dutch AKEN, French AIX-LA-CHAPELLE, city, Nordrhein-Westfalen Land (North Rhine-Westphalia state), northwestern

Germany. Its municipal boundaries coincide on the west with the frontiers of Belgium and The Netherlands. It was a Roman spa, called Aquisgranum, and rose to prominence in the 8th century as the favourite residence of Charlemagne, becoming the second city of his empire and a centre of Western culture and learning. From the coronation of Otto I in 936 until the 16th century, most German kings were crowned at Aachen. Fortified in the late 12th century and granted municipal rights in 1166 and 1215, Aachen became a free imperial city c. 1250.

Eisenbrunnen, a spa, with Aachen cathedral in the background, Aachen, Ger.

Hans Huber

It began to decline in the 16th century because of its insecure position near the French frontier and its distance from the centre of the Holy Roman Empire. The coronation site was changed to Frankfurt am Main in 1562.

Aachen was the scene of several peace conferences, including those ending the War of Devolution (1668) and the War of the Austrian Succession (1748). Occupied by the French in 1794 and annexed by France in 1801, it was given to Prussia after the Congress of Vienna (1814–15). The Congress of Aix-la-Chapelle, sealed in 1818, was one of those that regulated the affairs of Europe after the Napoleonic Wars. The city was occupied for a period by the Belgians after World War I; it suffered severe damage in World War II and was the first large German city to fall to the Allies (Oct. 20, 1944).

The noteworthy medieval churches of St. Foillan, St. Paul, and St. Nicholas were demolished or heavily damaged in World War II, but there has been much reconstruction. The Rathaus (town hall), built c. 1530 on the ruins of Charlemagne's palace and containing the magnificent hall of the emperors, has been restored.

The cathedral suffered relatively little damage. It incorporates two distinct styles: the Palace Chapel of Charlemagne (built 790–805), modeled on S. Vitale at Ravenna, is Carolingian-Romanesque; and the choir (c. 1355) is Gothic. In the gallery (Hochmünster) around the chapel is the marble *Königsstuhl* (royal chair) of Charlemagne, long used for coronations. Charlemagne's tomb is marked by a stone slab over which hangs a bronze chandelier presented by Frederick I Barbarossa in 1168. The rich cathedral treasury contains examples of fine medieval workmanship and sacred relics that are displayed to pilgrims about every seven years.

Other notable landmarks are the Suermond Museum of Art and the fountain, surmounted by a statue of Charlemagne, in the market square. The Aachen Museum of the International Press deals with newspapers from the 16th century on. There are numerous educational institutions, including the Rhenish-Westphalian Technical University, founded in 1870. The sulfur springs are much-frequented; Schwertbad-Quelle, in the suburb of Burtscheid, is the warmest spring in Germany (169° F [76° C]).

Aachen is a rail hub and the industrial and commercial centre of a coal-mining region; almost every branch of the iron and steel industry functions in the vicinity. Other products include textiles, furniture, glass, machinery, and needles and pins. Pop. (1989 est.) 233,255.

Aaiún (Western Sahara): see El Aaiún.

Aakjær, Jeppe (b. Sept. 10, 1866, Aakjær, Den.—d. April 22, 1930, Jenle), poet and novelist, leading exponent of Danish regional literature and of the literature of social consciousness.

Aakjær grew up in the Jutland farming area and so was well aware of the harsh conditions endured by farm labourers in his country. His early novels deal primarily with this theme. As a young man he went to study in Copenhagen, earning his living as a proofreader and later as a journalist. *Vredens born, et tyendes saga* (1904; "Children of Wrath: A Hired Man's Saga"), which is considered to be his most powerful novel, was a strong plea for the betterment of the farm labourer's lot. The book initiated much public discussion and helped lead the way to some minimal reforms. He was best-known, however, for his poems, especially those collected in *Fri felt* (1905; "Free Fields") and *Rugens sange* (1906; "Songs of the Rye"). A number of modern Danish composers have set Aakjær's poems to music; his "Jens Vejmand" (music by Carl Nielsen) is virtually a modern folk song. Only a few of his poems have been translated into English.

Aalborg (Denmark): see Ålborg.

Aalen, city, Baden-Württemberg *Land* (state), southern Germany, on the Kocher River, at the northern foot of the Schwäbische Alb (Swabian Alps), 30 miles (48 km) north of Ulm. It originated around a large Roman fort, much of which remains; nearby are the remains of the Roman *limes* (frontier wall). It became a free imperial city in 1360 and was severely damaged by fire in 1634. It passed to Württemberg in 1802. The old city hall dates from 1636 and the church of Sankt Nikolaus from 1765. The Limesmuseum of Roman relics was opened in 1964. In 1975 the adjoining city of Wasseralfingen was annexed to Aalen, enlarging it by nearly a third. A communications centre, Aalen also has metal, textile, and chemical industries. Pop. (1989 est.) 62,812.

Aalsmeer, *gemeente* (municipality), Noord-holland *provincie* (province), western Netherlands, 8 miles (13 km) southwest of Amsterdam, on the Ring Canal and Westeinder Lake, a remnant of Haarlem Lake. The older part of the town is on peaty soil at about sea level, surrounded by polders with loamy soil 9–15 feet (3–5 m) below sea level. Once known for its eels, whence its name (*aal*, "eel"; *meer*, "lake"), it is the flower-growing centre of The Netherlands, with numerous nurseries, the largest flower auction in the world, and a state experimental station for floriculture. Blooms include carnations, roses, lilacs,

Float in the Bloemencorso, an annual flower festival held in September in Aalsmeer, The Netherlands

The J. Allan Cash Photolibrary

freesias, chrysanthemums, and potted plants such as cyclamens and begonias. Many flowers are exported by air, and there is a thriving trade in seeds and nursery plants. Pop. (1984 est.) 20,379.

Aalst (Flemish), French *Alost*, municipality, East Flanders province, north-central Belgium, on the Dender River, 15 miles (24 km) northwest of Brussels. The town hall (begun

Marketplace, Aalst, Belgium, with (centre) the belfry of the town hall

Beeldbank & Uitgeefprojecten B.V., Amsterdam

in the middle of the 12th century), with its 52-bell carillon, is the oldest in Belgium, and its archives include 12th-century manuscripts. Ravaged by fire in 1360, the town hall was subsequently rebuilt and its 13th-century belfry restored in the 15th century. The first printing shop in the Low Countries was established there in 1473 by Thierry Martens (later a professor at the Catholic University of Louvain). The French took Aalst in 1667 during the War of Devolution that gave southern Flanders to France. The Germans occupied the town in both world wars. Industry is dominated by the manufacture of textiles, clothing, and textile machinery. The surrounding region supplies hops for long-established breweries. The unfinished Gothic St. Martin's Church (begun c. 1480) has vault paintings, a picture by Rubens, and a remarkable tabernacle (1605) containing sculptures executed by Hieronymus Duquesnoy the Elder. Pop. (1983 est.) mun., 78,068.

Aalto, (Hugo) Alvar (Henrik) (b. Feb. 3, 1898, Kuortane, Fin., Russian Empire—d. May 11, 1976, Helsinki), Finnish architect, city planner, and furniture designer, whose international reputation rests on a distinctive blend of modernist refinement, indigenous materials, and personal expression in form and detail. His mature style is epitomized by the Säynätsalo, Fin., town hall group (1950–52).

Early work. Aalto's architectural studies at the Technical Institute of Helsinki in Otaniemi, Fin., were interrupted by the Finnish War of Independence, in which he participated. Following his graduation in 1921, Aalto toured Europe and upon his return began practice in Jyväskylä, in central Finland. In 1927 he moved his office to Turku, where he worked in association with Erik Bryggman until 1933, the year in which he moved to

Aalto, 1970

By courtesy of the Consulate General of Finland, New York City

Helsinki. In 1925 he married Aino Marsio, a fellow student, who served as his professional collaborator until her death in 1949. The couple had two children.

The years 1927 and 1928 were significant in Aalto's career. He received commissions for three important buildings that established him as the most advanced architect in Finland and brought him worldwide recognition as well. These were the Turun Sanomat Building (newspaper office) in Turku, the tuberculosis sanatorium at Paimio, and the Municipal Library at Viipuri (now Vyborg). His plans for the last two were chosen in a competition, a common practice with public buildings in Finland. Both the office building and the sanatorium emphasize functional, straightforward design and are without historical stylistic references. They go beyond the simplified classicism common in Finnish architecture of the 1920s, resembling somewhat the building designed by Walter Gropius for the Bauhaus school of design in Dessau, Ger. (1925–26). Like Gropius, Aalto used smooth white surfaces, ribbon windows, flat roofs, and terraces and balconies.

The third commission, the Viipuri Municipal Library, although exhibiting a similar dependence on European prototypes by Gropius and others, is a significant departure marking Aalto's personal style. Its spatially complex interior is arranged on various levels. For the auditorium portion of the library Aalto devised an undulating acoustic ceiling of wooden strips, a fascinating detail that, together with his use of curved laminated wood furniture of his own design, appealed both to the public and to those professionals who had held reservations about the clinical severity of modern architecture. The warm textures of wood provided a welcome contrast to the general whiteness of the building. It was Aalto's particular success here that identified him with the so-called organic approach, or regional interpretation, of modern design. He continued in this vein, with manipulation of floor levels and use of natural materials, skylights, and irregular forms. By the mid-1930s Aalto was recognized as one of the world's outstanding modern architects; unlike many of his peers, he had an identifiable personal style.

Finnish pavilions for two world's fairs (Paris, 1937; New York City, 1939–40) further enhanced Aalto's reputation as an inventive designer of free architectural forms. In these designs, both chosen in competition, he continued to use wood for structure and for surface effects. Also during this period, in 1938, the Museum of Modern Art in New York City held an exhibition of his work, showing furniture that he had designed and photographs of his buildings.

Aalto's experiments in furniture date from the early 1930s, when he furnished the sanatorium at Paimio. His furniture is noted for its use of laminated wood in ribbonlike forms

that serve both structural and aesthetic ends. In 1935 the Artek Company was established by Aalto and Mairela Gullichsen, the wife of the industrialist and art collector, to manufacture and market his furniture. The informal warmth of Aalto's interiors is best seen in the much admired country home Villa Mairela, which he built for the Gullichsens near Noor-markku, Fin.

Mature style. The decade of the 1940s was not productive; it was disrupted by war and saddened by his wife's death. In 1952 he married Elissa Mäkinen, a trained architect, who became his new collaborator.

Aalto's commissions after 1950, in addition to being greater in number, were more varied and widely dispersed: a high-rise apartment building in Bremen (1958), a church in Bologna (1966), an art museum in Iran (1970). His continuing work in Finland, however, remained the measure of his genius. Many of his projects involved site planning of building groups. Two such projects were the master plans of colleges at Otaniemi (1949–55) and at Jyväskylä (1952–57). Aalto's experience in planning originated early with such industrial commissions as the Sunila cellulose factory (1936–39, extended 1951–54), which included workers' housing and was a triumph of comprehensive planning.

The single work that epitomizes Aalto's mature style is perhaps the Säynätsalo town hall group. Modest in scale in its forest setting, it nonetheless asserts a quiet force. Its simple forms are in red brick, wood, and copper, all traditional materials of Finland. Viewing it, a person feels the achievement of a perfect building, in that the essence of the time, the place, the people, and their purpose is brought into focus by the awareness of the architect.

Aalto received many honours. He was a member of the Academy of Finland (Suomen Aketemia) and was its president from 1963 to 1968; he was a member of the Congrès Internationaux d'Architecture Moderne from 1928 to 1956. His awards included the Royal Gold Medal for Architecture from the Royal Institute of British Architects (1957) and the Gold Medal from the American Institute of Architects (1963).

Assessment. Aalto, whose work exemplifies the best of 20th-century Scandinavian architecture, was one of the first to depart from the stiffly geometric designs common to the early period of the modern movement and to stress informality and personal expression. His style is regarded as both romantic and regional. He used complex forms and varied materials, acknowledged the character of the site, and gave attention to every detail of building. Aalto achieved an international reputation through his more than 200 buildings and projects, ranging from factories to churches, a number of them built outside Finland.

Aalto's preliminary plans were freely sketched, without the use of T-square and triangle, so that the unfettered creative urge for inventive shapes and irregular forms was allowed full play before functional relationships and details were resolved. The absence of theoretical rigidity revealed itself in his final designs, which happily retained the spontaneity and individuality of his early sketches. As a Swiss art historian expressed it, he dared "the leap from the rational-functional to the irrational-organic." Since Aalto's staff was small (some six to eight architects), all of the work bore the imprint of his personality.

Aalto wrote little to explain his work, but his architecture conveyed a variable, lively temperament, free from dogma and without monotony. His work was said to express the spirit of Finland and its people, primitive yet lyrical. His friendships with such artists as Fernand Léger, Jean Arp, and Constantin Brancusi may have nourished his fondness for curvilinear shapes. While his work was never

compulsively innovative, neither was it static. His late designs showed an increased complexity and dynamism that some regarded as incautious. In particular, his work of the late 1960s and early 1970s was marked by splayed, diagonal shapes and clustered, overlapping volumes. Energy and imagination were ever present.

(H.F.K.)

MAJOR WORKS. Turun Sanomat Building, Turku, Fin. (1930); Municipal Library at Viipuri, now Vyborg, Russia (designed 1927, built 1930–35, destroyed 1943); Sulfate Paper Mill at Toppila, Fin. (1931); Sanatorium at Paimio, Fin. (1933); cellulose factory at Sunila, Kotka, Fin. (1936–39; extended 1951–54); Villa Mairela (Gullichsen House) near Noor-markku, Fin. (1938–39); sawmill at Varkaus, Fin. (1945); Baker House (senior dormitory), Massachusetts Institute of Technology, Cambridge, Mass. (1947–48); town hall group, Säynätsalo, Fin. (1950–52); House of Culture, Helsinki (1955–58); house for Louis Carré, Bazoches, Fr. (1956–58); church at Vuoksenniska, Imatra, Fin. (1956–58); Nordjyllands Kunstmuseum, Ålborg, Den. (1958–72); post and telegraph office, Baghdad (1958); Community Centre, Wolfburg, Ger. (1959–62); Community Centre, Seinäjoki, Fin. (1962); theatre added, 1967; Edgar J. Kaufmann Conference Rooms, Institute of International Education, New York City (1964–65); Mount Angel Abbey Library, near Salem, Ore. (1967–70); Finlandia Hall, Helsinki (1971, enlarged 1974); Taidemuseo, Jyväskylä, Fin. (1973, later called the Alvar Aalto Museum).

BIBLIOGRAPHY. A definitive review of Aalto's work, extremely well illustrated with photographs and plans, is the two-volume work edited by Karl Fleig: *Alvar Aalto* (1963) and *Alvar Aalto 1963–1970* (1971). A brief essay by Frederick Gutheim, *Alvar Aalto* (1960), contains descriptive and critical comments as well as many photographs. A similar book is George Baird, *Alvar Aalto* (1970). A substantial chapter on Aalto appears in Sigfried Giedion, *Space, Time and Architecture*, 5th ed. rev. (1967), and is an excellent critical treatment of Aalto's architecture. No purely biographical work exists.

Aarau, capital of Aargau canton, northern Switzerland, at the southern foot of the Jura Mountains, on the right bank of the Aare River, west of Zürich. Founded about 1240 by the counts of Kyburg, it passed to the Habsburgs in 1264 and was taken by the Bernese in 1415. In 1798 it became the capital of the Helvetic Republic. Notable landmarks include several 13th-century towers, the town church (1471), the town hall (1762), and a cantonal library, containing a Bible with marginal notes made by the religious reformer Huldrych Zwingli. To the northeast is the ruined Habsburg, or Habichtsburg (Hawk's Castle), the original home of the Habsburg family. The medieval Lenzburg castle, located east of Aarau, houses a historical museum and a conference centre. There is considerable industry in the newer parts; manufactures include electrical goods, bells, precision instruments, shoes, cotton textiles, and chemicals. The population is largely German speaking and nearly 75 percent Protestant. Pop. (1987 est.) 15,750.

aardvark, also called AFRICAN ANT BEAR (*Oryzomys afer*), heavily built mammal, ranging south of the Sahara in forest or plain, that constitutes the family Oryzomysidae and the order Tubulidentata. The name aardvark—Afrikaans for "earth pig"—refers to its stout, piglike body, up to 180 centimetres (6 feet) long, including the 60-cm tail. Its coat varies from glossy black and full to sandy yellow and scant. The aardvark has a long snout, rabbitlike ears, and short legs. The toes are long and equipped with large, flattened claws; the second and third toes are united by a web of tissue.

One young is born in summer. The aardvark

excavates a burrow, in which it rests by day. It ventures out at night to rip open ant and termite nests and rapidly lap up the routed insects, using its sticky 30-centimetre-long tongue. Although not aggressive, the aardvark can fend off such formidable attackers as lions and leopards by parrying with its claws.

Aardvark (*Orycteropus afer*)
Shostal—EB Inc

Though formerly classified with the true anteaters, sloths, and armadillos in the order Edentata, aardvarks differ from them and from all other mammals in having permanent teeth traversed by tubules that radiate from a central pulp cavity; hence, the ordinal name Tubulidentata. The tubulidentate line may be 60 million years old. The relationship of tubulidentates to other orders of mammals remains uncertain.

aardwolf (species *Proteles cristatus*), African carnivore generally placed in the family Hyaenidae but separated by some authorities as the family Protelidae. The aardwolf, whose name in Afrikaans means "earth wolf," re-

Aardwolf (*Proteles cristatus*)
Simon Trevar—Bruce Coleman Ltd

sembles a small striped hyena. It is yellowish with vertical black stripes and a bushy, black-tipped tail, and it bears a long, coarse mane of erectile hairs along the length of its back.

It has longer front than hind legs, large ears, a pointed muzzle, and weak jaws and teeth. Its length varies from 55 to 80 cm (22 to 32 inches) exclusive of the 20- to 30-centimetre tail, and it weighs from 8 to 12 kg (17 to 26 pounds).

The aardwolf lives on the open, grassy plains of southern and eastern Africa. There are two geographically separate populations, one centred in South Africa and the other extending from central Tanzania northward to southern Egypt. The aardwolf feeds largely on termites, particularly on the species *Trinervitermes trinervoides*. It is nocturnal, lives in a burrow, and is usually solitary but may forage in small packs. The litter generally consists of three or four young. The aardwolf is harmless and shy; when attacked, as by dogs, it emits a musky-smelling fluid and may fight.

Aare River, also spelled **AAR**, tributary of the Rhine and the longest stream (183 miles

[295 km]) entirely within Switzerland; it drains an area of 6,865 square miles (17,779 square km). The river rises in the Aare Glacier of the Bernese Alps in Bern canton, below the Finsteraarhorn and west of the Grimsel Pass, in the south-central part of Switzerland. As the Aare flows north past Meiringen, the river cuts through the scenic Aare Gorge. After turning west, it expands into the glacial Lake Brienz. The river is canalized at Interlaken above its entry into Lake Thun, at the lower end of which the river flows northwest in a deeply entrenched valley and almost encircles the medieval core of the city of Bern. It turns west to Lake Wohlensee and then flows north to Aarberg, where it is diverted west by the Hagneck Canal into Lake Biel. Continuing northeastward, the river parallels the foot of the Jura Mountains. Below Brugg, the Reuss and Limmat rivers join the Aare before it enters the Rhine River at Koblenz, Switz.

Aargau (German), French **ARGOVIE**, *canton*, northern Switzerland. It borders Germany to the north and is bounded by the half canton of Basel-Laandschaft and by the cantons of Solothurn to the west, Luzern to the south, and Zug and Zürich to the east. It has an area of 542 square miles (1,405 square km) and forms the northeastern section of the great Swiss Plateau between the Alps and the Jura Mountains, taking in the lower course of the Aare River, whence its name. Its valleys alternate with pleasantly wooded hills. In 1415 the region was taken by the Swiss Confederation from the Habsburgs, whose ancestral seat was near Aarau (*q.v.*), now the cantonal capital. Bern kept the southwestern portion. In 1798 the Bernese part became Aargau canton of the Helvetic Republic, and the remainder formed the canton of Baden. In 1803 the two halves (and Frick, ceded to the Helvetic Republic by Austria in 1802) were united and admitted to the Swiss Confederation as Aargau canton.

One of the most fertile parts of Switzerland, Aargau includes among its principal economic activities dairying, fruit and cereal growing, and straw plaiting. Industries include electrical engineering, the manufacture of precision instruments, textiles, cement, cigars, and the mining and refining of salt. Several nuclear power stations are in operation at Beznau. The picturesque landscape, ancient castles, and rich museums of the canton attract considerable tourist traffic, as do the hot springs at Schinznach Bad and Baden. The population is almost exclusively German-speaking with a small Protestant majority. Pop. (1989 est.) 484,308.

Aaron (fl. c. 14th century BC), the traditional founder and head of the Jewish priesthood, who, with his brother Moses, led the Israelites out of Egypt. The figure of Aaron as it is now found in the Pentateuch is built up from several sources of traditions. In the Talmud and Midrash he is seen as the leading personality at the side of Moses. He has appeared in different roles in Christian thought.

Life. Aaron is described in the Old Testament book of Exodus as a son of Amram and Jochebed of the tribe of Levi, three years older than his brother Moses. He acted together with his brother in the desperate situation of the Israelites in Egypt and took an active part in the Exodus. Although Moses was the actual leader, Aaron acted as his "mouth." The two brothers went to the pharaoh together, and it was Aaron who told him to let the people of Israel go, using his magic rod in order to show the might of Yahweh. When the pharaoh finally decided to release the people, Yahweh gave the important ordinance of the Passover, the annual ritual remembrance of the Exodus, to Aaron and Moses. But Moses alone went up on Mount Sinai, and he alone was

Aaron, detail of a 3rd-century fresco from the synagogue at Doura-Europus, Syria; in the National Museum, Damascus

By courtesy of the Direction Generale des Antiquites et des Musees, Damascus

allowed to come near to Yahweh. Moses later was ordered to "bring near" Aaron and his sons, and they were anointed and consecrated to be priests "by a perpetual statute." Aaron's sons were to take over the priestly garments after him. Aaron is not represented as wholly blameless. It was he who, when Moses was delayed on Mount Sinai, made the golden calf that was idolatrously worshiped by the people.

Once a year, on Yom Kippur (the Day of Atonement), Aaron was allowed to come into the Holy of Holies, the most sacred part of the tabernacle, or sanctuary, in which the Hebrew tribes worshiped, bringing his offering. Together with his sister, Miriam, Aaron spoke against Moses because he had married a foreigner (a Cushite woman); but, as in the episode of the golden calf, the narrative tells how Aaron was merely reproved, though Miriam was punished, for the offense. In the rebellion of Korah the Levite, however, Aaron stood firmly at the side of Moses. According to Numbers 20, Aaron died on the top of Mount Hor at the age of 123; in Deuteronomy 10, which represents another tradition, he is said to have died in Moserah and was buried there.

Aaron is a central figure in the traditions about the Exodus, though his role varies in importance. At the beginning he seems to be coequal with Moses, but after the march out of Egypt he is only a shadow at Moses' side. Moses is obviously the leading figure in the tradition, but it is also clear that he is pictured as delegating his authority in all priestly and cultic matters to Aaron and "his sons."

Aaron and the biblical critics. Scholars have long been aware that the figure of Aaron as it is now found in the Pentateuch, or first five books of the Old Testament, is built up from several sources or layers of traditions. According to Julius Wellhausen, a German biblical scholar, and his followers, the Yahwist source was the oldest one, followed in order by the Elohist, Deuteronomist, and Priestly code. Scholars have attributed the passages about Aaron to one or the other of these sources. Although their results differ, they do agree in ascribing about 90 percent of the material about Aaron to the Priestly source. According to Wellhausen, Aaron was not mentioned at all in the Yahwist narrative, but he may have been inserted by later redactors.

Other scholars, such as Sigmund Mowinckel, believe that the narrative about the golden calf, which presents Aaron in an unfavourable light, was part of the ancient tradition in the Yahwist work, being the only passage in it that mentions him. This narrative, according to these scholars, originally came from the northern kingdom of Israel and described Aaron as the ancestor of the priests in northern Israel; later it was rewritten in a way defamatory to Aaron. But there are also features in the

narrative that may indicate that a later source (or traditionist), the Elohist, tried to excuse Aaron and to put the main responsibility on the people. The Elohist narrator was credited with making Aaron the brother and helper of Moses, who stood at the side of Moses in the conflict with the pharaoh and assisted him as a leader in battles and in the cult. It may also be the Elohist who provides the unfavourable story about Aaron's objection to Moses' wife. On the other hand, it seems to be the same narrator who mentions Aaron at the side of Moses in the revolt at Meribah, but here also Aaron, together with Moses, is actually reproached. There is reason to believe that Aaron was not mentioned in the Deuteronomist work by the original author but that his name has been added by a redactor. The main bulk of the traditions about Aaron and the frequent addition of "and Aaron" after the mention of Moses are found in the Priestly source, which was written at a time when the priests had a more dominant position in Judah than they had before the exile. By then Moses had ceased to be the hero of the priests, and Aaron had taken over that role.

Many modern scholars speak of traditions where their predecessors spoke of sources, but, apart from this terminology, the view concerning Aaron has not greatly changed. There have been new attempts, however, to see the contrasting figures of Moses and Aaron in a new light. It has been suggested that the traditions about Moses represent a southern Judaean tradition, while the old traditions about Aaron originated in the northern kingdom. It has also been indicated that the traditions about Moses are primarily concerned with a prophet, while those about Aaron are connected with priesthood. There may be a kernel of truth in all these suggestions, as also in the theory of Ivan Engnell that Moses represents the royal ideology while Aaron stands for priesthood, and priesthood alone. The standing struggle between the king and the leading priests is reflected both in the laws and in the narratives of the historical books.

Aaron in later Jewish and Christian thought. Aaron continued to live as a symbol in Jewish religion and traditions, and the position of the priests was strengthened after the exile. Also, in the Qumrān sect, a Jewish community that flourished in the era just before and contemporary with the birth of Christianity, Aaron was a symbol for a strong priesthood, as can be seen from the Dead Sea Scrolls. At the end of time, men of the community should be set apart, as a select group in the service of Aaron. Only the sons of Aaron should "administer judgment and wealth," and, according to the *Manual of Discipline*, two messiahs were expected, one of Aaron, the priestly one, and one of Israel. According to a fragment found near Qumrān, the priest would have the first seat in the banquets in the last days and bless the bread before the messiah of Israel. Here "the sons of Aaron" have the highest position.

In Talmud and Midrash (Jewish commentative and interpretative writings), Aaron is seen less as a symbol than as the leading personality at the side of Moses. The relationship between the two brothers is painted as prototypical in the Haggada ("Narrative"—the nonlegal parts of Talmud and Midrash). Rabbi Hillel, the great liberal sage, praised Aaron as peace-loving, a man of goodwill, who wanted to teach his fellowmen the Law.

In Jewish exegesis little is said about him, though he is mentioned as a man who created peace among men. Many attempts have been made to explain Aaron's participation in the episode of the golden calf. According to some exegetes, Aaron had to make the calf in order to avoid being killed. In the 11th century, the French commentator Rashi contended that the calf was a symbol of the leader, Moses, who was at that time on the mountain. The

relationship between Moses and Aaron is also discussed in the Talmud. Some traditionists have wondered why Aaron, and not Moses, was appointed high priest. The answer has been found in an indication that Moses was rejected because of his original unwillingness when he was called by Yahweh. It also seems to have been hard for some traditionists to accept that Aaron was described as older than Moses. The death of Aaron is related in the Midrash *Petirat Aharon*.

The first Christian communities admitted that Aaron, "the sons of Aaron," or "the order of Aaron" constituted symbols of the highest priesthood. But in The Letter to the Hebrews, Christ is described as a high priest according to the order of Melchizedek, which was set against "the order of Aaron." Of the Church Fathers, Cyril of Alexandria says that Aaron was divinely called to a priesthood and that he was a type of Christ. Gregory the Great translates the name Aaron as "mountain of strength" and sees in him a redeemer who mediated between God and man. (A.S.K.)

BIBLIOGRAPHY. F.S. North, "Aaron's Rise in Prestige," in *Zeitschrift für die alttestamentliche Wissenschaft*, 66:191-199 (1954), is a short study of Aaron's position. Roland De Vaux, *Ancient Israel: Its Life and Institutions* (1961, reissued 1973; originally published in French, 2 vol., 1958-60); and Aelred Cody, *A History of Old Testament Priesthood* (1969), include discussions of Aaron and his place in ancient Israelite life and cult. Walter Beyerlin, *Origins and History of the Old-Sinaitic Traditions* (1965; originally published in German, 1961), focuses on the traditions behind the story of Moses and Aaron. H.H. Rowley, *Worship in Ancient Israel: Its Form and Meaning* (1967, reissued 1976), surveys the religious life in Israel, including Aaron and his role. Bertil E. Gärtner, *The Temple and the Community in Qumran and the New Testament* (1965), treats the religious cult in the Qumrān society, in which "Aaron" was synonymous with the chief priest. Heinrich Valentin, *Aaron: eine Studie zur vorpriesterlichen Aaron-Überlieferung* (1978), analyzes the various interpretations of the biblical references about Aaron.

Aaron, Hank, byname of HENRY LOUIS AARON (b. Feb. 5, 1934, Mobile, Ala., U.S.), American professional baseball player who, during 23 seasons in the major leagues (1954-76), surpassed batting records set by some of the greatest hitters in the game, including Babe Ruth, Ty Cobb, and Stan Musial.

Aaron, a righthander six feet tall and weighing 180 pounds, began his professional career in 1952, playing a few months as a shortstop with the Indianapolis Clowns of the Negro American League. His contract was bought

Hank Aaron
Pictorial Parade

by the Boston Braves of the National League, who assigned him to minor-league teams, first at Eau Claire, Wis., then at Jacksonville, Fla. He joined the Braves, who meanwhile had moved to Milwaukee, in 1954, thereafter playing mostly as an outfielder. In 1956 he won the league batting championship with an average of .328 and in 1957, leading his team to victory in the World Series, was named the league's Most Valuable Player. Before the Braves moved to Atlanta, at the end of 1965, Aaron had hit 398 home runs. In Atlanta on April 8, 1974, he hit his 715th, breaking Babe Ruth's record, which had stood since 1935. After the 1974 season, he was traded to the Milwaukee Brewers of the American League. After the 1976 season, Aaron retired as a player and rejoined the Atlanta Braves as an executive. He was elected to the Baseball Hall of Fame on Jan. 13, 1982.

Aaron's batting records include totals of 755 home runs, 1,477 extra-base hits, and 2,297 runs batted in. His other career statistics include 2,174 runs scored (second to Ty Cobb) and 12,364 times at bat in 3,298 games (second to Pete Rose). His hits (3,771) were exceeded only by those of Ty Cobb and Pete Rose. Aaron's lifetime batting average was .305.

Aaron ben Elijah (b. 1328/30, Nicomedia, Ottoman Empire [modern Izmit, Turkey]—d. 1369), theologian of Constantinople (now Istanbul), the only scholar to seek a philosophical basis for Karaitic beliefs. Karaism, a Jewish movement originating in 8th-century Iran, rejected the oral tradition and challenged the authority of the Talmud, the rabbinical compendium of law, lore, and commentary.

Aaron ben Elijah's views are summarized in his compilation of Karaitic lore, in three books. In the first book, *Eiz hayyim* (1346; "Tree of Life"), modeled after the 12th-century Jewish philosopher Maimonides' *Moreh nevuḥim* (*The Guide for the Perplexed*), he attempts to create a Karaitic counterpart to Maimonides' Aristotelian outlook. In the second book, *Gan Eden* (1354; "The Garden of Eden"), he attempts to justify the Karaitic code of law. The third book, *Keter Torah* (1362; "Crown of Law"), is a commentary on the Pentateuch, based on literal interpretations of the text.

Aaronic priesthood, in the Church of Jesus Christ of Latter-day Saints, the lesser of the two categories of priests, concerned principally with church finances and administration. See Mormon.

AARP: see American Association of Retired Persons.

Aasen, Ivar, in full IVAR ANDREAS AASEN (b. Aug. 5, 1813, Sunnmøre, Nor.—d. Sept. 23, 1896, Kristiania [Oslo]), language scholar and dialectologist, who created the written standard of Nynorsk (New Norwegian), one of the two official languages of Norway.

After studying Old Norwegian, Aasen undertook a survey of the contemporary Norwegian dialects. These he judged to be the true offshoots of Old Norwegian, as distinct from the Danish-influenced written language of Norway. The results of his research were published in *Det norske folkesprog grammatik* (1848; "Grammar of the Norwegian Dialects") and *Ordbog over det norske folkesprog* (1850; "Dictionary of the Norwegian Dialects"), texts that prepared the way for the wide cultivation of Nynorsk. Advancing the view that the proper literary language of Norway was a purer Norwegian, rather than the official Dano-Norwegian hybrid, Aasen composed poems and plays in his composite dialect, while continuing to augment and refine his grammar and dictionary. His definitive grammar was published in 1864, followed in 1873 by his

definitive dictionary of Nynorsk. With certain modifications, the language Aasen fostered (which bears the most resemblance to Norway's western dialects) rapidly gained national prominence and eventually achieved co-official status with Dano-Norwegian. Quite early in his career (1842) Aasen received a stipend to enable him to give his entire attention to his linguistic investigations.

Aba, city, Abia state, southern Nigeria. It lies along the west bank of the Aba River, at the intersection of roads from Port Harcourt, Owerri, Umuahia, Ikot Ekpene, and Ikot Abasi (Opobo). Aba was a traditional market town for the Igbo (Ibo) people of the tropical rainforest before the establishment of a British military post there in 1901. With the construction of the railway in 1915 from Port Harcourt (36 miles [58 km] southwest), the city became a major collecting point for agricultural produce (especially palm oil and palm kernels). By the 1930s Aba was a settled urban community, and it is now a large industrial and commercial centre. An 18.5-mile- (30-kilometre-) long pipeline from the Imo River natural-gas field provides power for Aba's industrial estate. Textiles, pharmaceuticals, soap, plastics, cement, footwear, and cosmetics are manufactured in the city, and there are also a brewery and a distillery. Aba has a school of arts and science, secondary schools, a teacher-training college, and several technical and trade institutes. The city is noted for its handicrafts. Pop. (1993 est.) 277,300.

abaca (*Musa textilis*), plant of the family Musaceae, and its fibre, which is second in importance among the leaf fibre (*q.v.*) group. Abaca fibre, unlike most other leaf fibres, is obtained from the plant leaf stalks (petioles). Although sometimes known as Manila hemp, Cebu hemp, or Davao hemp, the abaca plant is not related to true hemp.

The plant, native to the Philippines, achieved importance as a source of cordage fibre in the 19th century. In 1925 the Dutch began cultivating it in Sumatra, and the U.S. Department of Agriculture established plantings in Central America. A small commercial operation was started in British North Borneo (now Sabah, part of Malaysia) in 1930. During World War II, with Philippine abaca no longer available to the Allies, American production greatly increased. The Philippines remain the world's largest producer of abaca.

Stripping fibre from abaca (*Musa textilis*) in the Philippines

Charles W. Miller—Shostal Associates

The abaca plant is closely related to and resembles the banana plant (*Musa sapientum*). The abaca plant grows from rootstock that produces up to about 25 fleshy, fibreless stalks, forming a circular cluster called a mat, or hill. Each stalk is about 5 cm (2 inches) in diameter and produces about 12 to 25 leaves with overlapping leaf stalks, or petioles, sheathing the plant stalk to form an herbaceous (nonwoody) false trunk about 30 to 40 cm in diameter. The oblong, pointed leaf blade topping each petiole is bright green on the upper surface and yellowish green below and grows to about 1 to 2.5 m (3 to 8 feet) in length and 20 to 30 cm in width at its widest portion.

The first petioles grow from the plant stalk base; others develop from successively higher points on the stalk, so that the oldest leaves are on the outside and the youngest on the inside, extending to the top, which eventually reaches a height of 4 to 8 m. The position of the petiole determines its colour and the colour of the fibre it yields, with outer sheaths being darkest and inner sheaths lightest. When the plant stalk has its full complement of sheathing petioles, a large flower spike emerges from its top. The small flowers, which are cream to dark rose in colour, occur in dense clusters. The inedible, banana-shaped fruits, about 8 cm long and 2–2.5 cm in diameter, have green skins and white pulp; the seeds are fairly large and black.

The plants grow best in fairly rich, loose, loamy soils that have good drainage. Propagation is mainly from pieces of mature rootstock usually planted at the start of the rainy season. Within 18 to 24 months after planting, two or three of the plant stalks in each mat are ready for harvesting, and two to four stalks can be harvested at intervals of four to six months thereafter. The stalk, with its surrounding petioles, is cut off close to the ground, usually at the time of blossoming. Abaca plants are generally replaced within 10 years.

In the Philippines the fibre-bearing outer layer is usually removed from the petiole by an operation in which strips, or tuxies, are freed at one end and pulled off. In the cleaning operation that follows, pulpy material is scraped away by hand or machine, freeing the fibre strands, which are dried in the sun. In machine decortication, which is widely practiced in Central America, the stalks, cut into lengths of 0.6 to 2 m, are crushed and scraped by machine, and the fibre strands are dried mechanically.

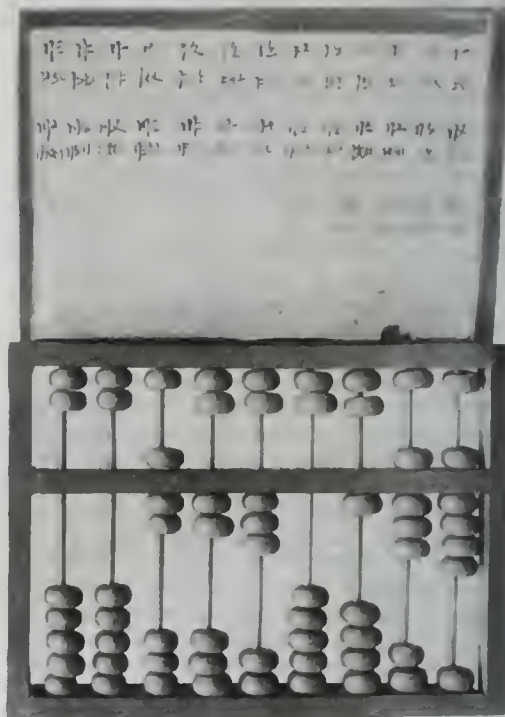

The strands average 1 to 3 m in length, depending on petiole size and the processing method used. The lustrous fibre ranges in colour from white through brown, red, purple, or black, depending on plant variety and stalk position; the strongest fibres come from the outer sheaths.

Abaca fibre is valued for its exceptional strength, flexibility, buoyancy, and resistance to damage in salt water. These qualities make the fibre exceptionally suitable for marine cordage. Abaca is chiefly employed for ships' ropes, hawsers, and cables and for fishing lines, hoisting and power-transmission ropes, well-drilling cables, and fishing nets. Some abaca is used in carpets, table mats, and paper. The plant's inner fibres can be used without spinning to manufacture lightweight, strong fabrics, mainly used locally for garments, hats, and shoes.

abacus, plural **ABACI**, or **ABACUSES**, calculating device, probably of Babylonian origin, that was long important in commerce. It is the ancestor of the modern calculating machine and computer.

The earliest "abacus" likely was a board or slab on which a Babylonian spread sand so he could trace letters for general writing purposes. The word *abacus* is probably derived, through its Greek form *abakos*, from a Semitic word such as the Hebrew *ibeq* ("to

wipe the dust"; noun *abaq*, "dust"). As the abacus came to be used solely for counting and computing, its form was changed and improved. The sand ("dust") surface is thought to have evolved into the board marked with lines and equipped with counters whose positions indicated numerical values—*i.e.*, ones, tens, hundreds, and so on. In the Roman abacus the board was given grooves to facilitate moving the counters in the proper files. Another form, common today, has the counters strung on wires.

Chinese abacus, the *hsüan-pan* ("computing tray")

"British Crown Copyright," Science Museum, London

In the Chinese abacus shown, each of the two beads in the upper section of the frame represents five units, and each of the five beads in the lower section one unit (of the numerical order represented by the file). In performing addition, appropriate beads are moved to the dividing bar. The number represented on the bar in the picture is 7,230,189.

The abacus, generally in the form of a large calculating board, was in universal use in Europe in the Middle Ages, as well as in the Arab world and in Asia. It reached Japan in the 16th century. The introduction of the Hindu-Arabic notation, with its place value and zero, gradually replaced the abacus, though it was still widely used in Europe as late as the 17th century and survives today in the Middle East, China, and Japan; an expert practitioner can compete against many modern mechanical calculating machines.

Ābādān, Arabic 'ABBĀDĀN, city, extreme southwestern Iran. The city is situated in Khūzestān, part of the oil-producing region of Iran. Ābādān lies on an island of the same name along the eastern bank of the Shaṭṭ Al-'Arab (river), 33 miles (53 km) from the Persian Gulf. The city thus lies along Iran's border with Iraq. Ābādān Island is bounded on the west by the Shaṭṭ Al-'Arab and on the east by the Bahmanshīr, which is an outlet of the Kārūn River. The island is 42 miles (68 km) long and from 2 to 12 miles (3 to 19 km) wide.

Reputedly founded by a holy man, 'Abbād, in the 8th century, Ābādān was a prosperous coastal town in the 'Abbāsīd period and was known for its salt and woven mats. But the extension of the delta of the Shaṭṭ Al-'Arab by silt deposition caused the coast of the Persian Gulf to gradually recede from Ābādān. By the time the town was visited by the Arab geographer Ibn Battūṭah in the 14th century, it was described as little more than a large village in a flat, salty plain.

Persia and the Ottomans long disputed Ābādān's possession, but Persia acquired it in 1847. Its village status remained unchanged until the early 20th century, when rich oil fields were discovered in Khūzestān. In 1909 the Anglo-Persian Oil Company (its Iranian properties were nationalized in 1951 as the National Iranian Oil Company) established its pipeline terminus refinery at Ābādān. The refinery began operating in 1913, and by 1956 Ābādān had become a city of more than 220,000 inhabitants, with an economy almost entirely based on petroleum refining and shipping. The refinery complex was served by pipelines running from oil fields to the north, and pipelines were subsequently constructed from Ābādān to Tehrān and to Shirāz. By the late 1970s the city's oil refinery was perhaps the largest in the world.

In September 1980, however, Ābādān was almost overrun in the course of Iraq's surprise invasion of Khūzestān. The Iraqis failed to take Ābādān, but their artillery and aerial bombardments destroyed its refineries and reduced most of the city to rubble. After the Iran-Iraq War ended in 1988, Iran restarted petroleum refining and petrochemical production in Ābādān on a smaller scale using reconstructed plants. The city's port reopened in 1993. Pop. (1986) 21,879; (1996) 206,873.

A list of the abbreviations used in the MICROPAEDIA will be found at the end of this volume

Abae, ancient town in the northeast corner of Phocis, Greece. The town was famous for its oracle of Apollo, which was one of those consulted by the Lydian king Croesus. Although the Persians sacked and burned the temple in 480 BC, the oracle continued to be consulted—e.g., by the Thebans before the Battle of Leuctra (371 BC). The temple, burned again during the Sacred War (355–346 BC), was partly restored by the Roman emperor Hadrian. Ruins of the town walls and the acropolis remain on the town's site.

Abaha (people): *see* Ha.

Abahai, reign titles (Wade-Giles romanization) T' IEN-TS'UNG and CH'UNG-TE (b. Nov. 28, 1592, Manchuria [now in China]—d. Sept. 21, 1643, Manchuria). Manchurian tribal leader who, in 1636, became emperor of the Manchus, Mongols, and Chinese in Manchuria and, for his family, adopted the name of Ch'ing.

Abahai was the eighth son of Nurhachi (1559–1626), the great Manchu leader who extended his people's rule over the tribes of the Inner Asian steppes and organized his tribesmen into a bureaucratic Chinese-style state. Soon after his father's death, Abahai eliminated his brothers as rivals and consolidated his personal rule. He was successful largely because of his extraordinary ability as a military leader. He led armies into Inner Mongolia and Korea and made those countries vassal states of the Manchus. With the increased monetary and food supplies available from Korea and with the additional manpower and horses from the Mongols, he perfected the military machine known as the Eight Banners. After four expeditions he finally occupied the formerly Chinese-controlled Amur region of northern Manchuria and three times broke through the Great Wall on raids into North China.

As more Chinese were captured and taken into Manchu service, the government was able to duplicate more exactly the organizational structure of its Chinese counterpart. Thus other talented Chinese were induced to join. On the advice of his Chinese advisers, Abahai changed his dynastic name from Chin to Ch'ing ("Pure") and began the conquest of China. Although he died before his goal

was realized, his reign greatly strengthened the foundations of Manchu rule. A year after his death the Manchus conquered Peking, the capital of China's Ming dynasty, and shortly after subdued the remainder of the country.

Abaiang Atoll, also spelled APAIANG, also called APIA, formerly CHARLOTTE ISLAND, coral atoll of the Gilbert Islands, part of Kiribati, in the west-central Pacific Ocean. Comprising six islets in the northern Gilberts with a total land area of 6 square miles (16 square km), the atoll has a lagoon (16 by 5 miles [26 by 8 km]) that provides sheltered anchorage. Captain Thomas Gilbert, its European discoverer (1788), named it Matthew's Island, after the owner of his ship, the *Charlotte*. He called the lagoon Charlotte Bay and the main islet Point Charlotte. Subsequent errors in identification led to the island's being known as Charlotte Island. The area's first influential missionary, the American Hiram Bingham, arrived there in 1857. The atoll, occupied by the Japanese in 1941–43, was subsequently used by U.S. forces as a base for attacking the Marshall Islands. The administrative centre and main village is Taburao. Copra is exported. Pop. (1995) 6,020.

Abakaliki, town, Enugu state, southeastern Nigeria. It lies at the intersection of roads from Enugu, Afikpo, and Ogoja. An agricultural trade centre (yams, cassava, rice, and palm oil and kernels) for the Igbo (Ibo) people, the town is located in an area known for its lead, zinc, and limestone deposits. Although lead has been mined since precolonial times, the deposits are worked only when the world market price is high. Limestone is quarried for a cement plant at Nkalagu, 22 miles (35 km) west-northwest. Abakaliki's government farm promotes egg and poultry production. Pop. (1991 prelim.) 83,651.

Abakan, formerly (until 1931) UST-ABAKANSKOE, city and administrative centre of the republic of Khakasiya, south-central Russia. The city lies on the left bank of the Abakan River near its confluence with the Yenisey River. The starting point of a southern Siberian railway line (opened in 1960), Abakan is connected with Novokuznetsk and thence to Barnaul, Akmolinsk, and Magnitogorsk. The city has metalworking, footwear, and food-processing industries, and coal and iron ore are mined in the vicinity. Pop. (1997 est.) 166,000.

abalone, any of several marine snails of the subclass Prosobranchia (class Gastropoda) constituting the genus *Haliotis* and family Haliotidae, in which the shell has a row of holes on its outer surface. Abalones are one-shelled snails found in warm seas worldwide. The dishlike shell is perforated near one edge by a single row of small holes that become progressively filled during the animal's growth; the last five to nine holes remain open to serve as outlets for the snail's waste products. Depending on the species, abalones range from 10 to 25 cm (4 to 10 inches) across and up to 7.5 cm in depth. The shell's lustrous, iridescent interior is used in the manufacture of orna-

Abalone (*Haliotis*)
Jacques Six

ments. The large muscular foot of the abalone is eaten as a delicacy in several countries. Commercial fisheries for abalones exist in California, Mexico, Japan, and South Africa. The largest abalone is the 30-centimetre red abalone (*H. rufescens*) of the western coast of the United States.

Abancay, capital of Abancay provincia and of Apurímac departamento, southern Peru. It is situated on the eastern bank of the Marino River at 7,798 feet (2,377 m) above sea level, in a cool, dry intermontane basin. The exact date of the founding of Abancay (from the Quechua Indian *amankay*, the name of a wildflower similar to a white lily) is unknown, but it was a leading commercial centre during the Spanish colonial era. Proclaimed a town in 1873, it was given city status in 1874. Abancay is the agricultural and industrial centre of much of Apurímac. The growing and milling of sugar, liquor and rum distilling, copper mining, and sericulture are important.

Abancay lies about 300 miles (480 km) east-southeast of Lima and is fairly isolated. Roads link it to the Andean cities of Ayacucho and Cuzco and to the coastal Pan-American Highway at Nazca. Pop. (1993) city, 46,997.

abandonment, in Anglo-American property law, the relinquishment of possession of property with an intent to terminate all ownership interests in that property. Abandonment may occur by throwing away the property, by losing it and making no attempt to retrieve it, by vacating the property with no intention of returning to it, or by any other act manifesting a complete disclaimer of ownership in the property. The general effect of abandonment is to give full ownership of the property to the first taker.

In the French and civil-law systems, the term abandonment is more technical and means the surrender by a debtor of his property to be used in satisfaction of claims by his creditors.

Abariringa Atoll (Kiribati): *see* Kanton Atoll.

Abasıyanık, Sait Faik (b. Nov. 23, 1906, Adapazarı, Ottoman Empire [now in Turkey]—d. May 11, 1954, Istanbul, Turkey), short-story writer, a major figure in modern Turkish literature.

Educated in Constantinople (now Istanbul) and Bursa, Abasıyanık was in France from 1931 to 1935, primarily in Grenoble. On his return to Turkey, he began to publish his short stories in *Varlık* ("Existence"), the nation's leading avant-garde periodical.

Abasıyanık's stories were written in a style new to Turkish literature; despite their formlessness and lack of a conventional story line, they convey in a single, compelling episode a wide range of human emotion. In 1936 he published his first volume of short stories, *Semaver* ("The Samovar"). A dozen others followed, including *Lüzumsuz adam* (1948; "The Useless Man"), *Kumpanya* (1951; "The Company"), and *Alemdağda var bir yılan* (1953; "There's a Snake at Alem Mountain"). He also wrote an experimental novel, *Bir takım insanlar* (1952; "A Group of People"), which was censored because it dealt strongly with class differences.

Abate, Niccolò dell' (Italian painter): *see* Abbate, Niccolò dell'.

abatement, in law, interruption of a legal proceeding upon the pleading by a defendant of a matter that prevents the plaintiff from going forward with the action at that time or in that form. Pleas in abatement raise such matters as objections to the place, mode, or time of the plaintiff's claim. At one time, abate-

ment of proceedings in equity differed from abatement in law, in that the former merely suspended the action, subject to revival when the defect was cured, whereas the latter terminated it, although the plaintiff could start the action anew. The latter is now the more common usage.

The term abatement is also used in law to mean the removal or control of annoyance.

Abauzit, Firmin (b. Nov. 11, 1679, Uzès, Fr.—d. March 20, 1767, Geneva, Switz.), scholar who contributed to a French translation of the New Testament.

Abauzit was born of Huguenot parents and was sent at age 10 to live in Geneva so that he would escape the strictures (enforced Roman Catholicism) brought about by the revocation of the Edict of Nantes. In 1698 he undertook an extensive journey through Germany, the

Abauzit, detail of an oil painting by Robert Gardelle, 1741; in the Bibliothèque Publique et Universitaire, Geneva

Netherlands, and England. While on this journey he met such prominent people as Pierre Bayle and Isaac Newton. He was offered residence in England, which he declined, and in 1723 he also turned down the offer of a professorship of philosophy at the University of Geneva. Widely known for his erudition and modest nature, Abauzit was appreciated by many of the leading thinkers of his time. He collaborated on the French-language New Testament in 1726. In 1727 he was granted citizenship in Geneva, and that same year he accepted a post as an honorary librarian there. This position enabled him to write a number of theological and scholarly works, including the article "Apocalypse," which Denis Diderot commissioned for his *Encyclopédie*.

A list of the abbreviations used in the MICROPAEDIA will be found at the end of this volume

'Abbādid DYNASTY, Muslim-Arab dynasty of Andalusia that arose in Seville in the 11th century, in the period of the factions, or "party kingdoms" (*taifas*), following the downfall of the caliphate of Córdoba.

In 1023 the qadi (religious judge) Abū al-Qāsim Muḥammad ibn 'Abbād declared Seville independent of Córdoba. His son Abu 'Amr 'Abbād, known as al-Mu'tamid (1042–69), greatly enlarged his territory by forcibly annexing the minor kingdoms of Mertola, Niebla, Huelva, Saltés, Silves, and Santa María de Algarve.

A poet and patron of poets, al-Mu'tamid also had a reputation for ruthlessness and cruelty; in 1053 he suffocated a number of Berber chiefs of southern Andalusia in a steam bath in Seville and then seized their kingdoms of Arcos, Morón, and Ronda.

The last member of the dynasty, the poet-king Muḥammad ibn 'Abbād al-Mu'tamid

(1069–95), made Seville a brilliant centre of Spanish-Muslim culture. In 1071 he took Córdoba, maintaining a precarious hold on the city until 1075; he held it again, 1078–91, while Ibn 'Ammār, his vizier and fellow poet, conquered Murcia.

The 'Abbāids' position was weakened, however, by an outbreak of hostilities with the Castilian king Alfonso VI; Christian progress in Aragon and Valencia and the fall of Toledo (1085), together with pressure from religious enthusiasts at home, forced al-Mu'tamid to seek an alliance with Yūsuf ibn Tāshufin of the Almoravid dynasty. Despite 'Abbāid support of Ibn Tāshufin at the Battle of Az-Zallāqah in 1086, Ibn Tāshufin later turned against his ally and besieged Seville; the city was betrayed by Almoravid sympathizers in 1091 after a heroic defense by al-Mu'tamid. With the exile of al-Mu'tamid and his family to Morocco began the ascendancy in Spain of the Almoravids.

Abbadie, Antoine-Thomson d'; and Abbadie, Arnaud-Michel d' (respectively b. Jan. 3, 1810, Dublin, Ire.—d. March 19, 1897, Pirinei, Italy; b. July 24, 1815, Dublin—d. Nov. 13, 1893, Urrugne, Fr.), two brothers who, as geographers and travelers, conducted extensive investigations of the geography, geology, archaeology, and natural history of Ethiopia.

Their parents, a French father and an Irish mother, moved to France in 1818. In 1835 the French Academy sent Antoine on a scientific mission to Brazil. Arnaud spent some time in Algeria before the two brothers started for Ethiopia in 1837, landing at Mitsiwa (Mas-sawa) in 1838. After collecting much information on the geography and natural history of the country, the brothers returned to France in 1848. Antoine published a classified list and description of 234 Ethiopian manuscripts (1859), topographical findings (1860–73), and part of a geography of Ethiopia (1890). He became involved in controversies regarding his geographic findings, but subsequent explorers proved that his statements were correct, though he erred in contending that the Blue Nile was the main headstream of the Nile. In 1873 he published, along with findings from his stay in Ethiopia, the results of his earlier scientific mission to Brazil.

Arnaud visited Ethiopia again in 1853. A general account of the expedition that he undertook with his brother was included in his work *Douze ans de séjour dans la Haute Éthiopie* (1868; "Twelve Years in Upper Ethiopia").

Abbado, Claudio (b. June 26, 1933, Milan, Italy), Italian conductor and music director of the Vienna State Opera (1986–91) and principal conductor of the Vienna Philharmonic Orchestra (from 1971), the London Symphony Orchestra (1979–88), and the Berlin Philharmonic (from 1989).

One of a long line of Milanese musicians—his father, Michelangelo Abbado, was a violinist—Claudio Abbado at first studied privately. He entered the Giuseppe Verdi Conservatory at 16 to concentrate on piano, composition, and conducting and then studied conducting at the Chigiana Academy of Siena and at the Vienna Academy of Music, working with conductor Hans Swarowsky.

In 1958 Abbado won the Serge Koussevitzky conducting prize at the Tanglewood (Mass.) Festival and in 1963 the Dimitri Mitropoulos conducting prize. He made his British debut in 1965, leading the Hallé Orchestra in Manchester, and in 1966 he began his long association with the London Symphony Orchestra; he directed it regularly before he succeeded André Previn as principal conductor in 1979. Abbado was for several years the music director at La Scala, Milan, where he helped make the opera house more accessible to the working-class operagoer. He was especially known for his Germanic orchestral

repertory and, later, his special interest in the music of Gioacchino Rossini and Giuseppe Verdi.

EGYPT

• '**Abbās I** (b. 1813—d. July 13, 1854, Banhā, Egypt), khedive (viceroy) of Egypt under the Ottomans from 1848 to 1854. During his reign he deliberately opposed change, such as the Western-inspired reforms initiated by his grandfather Muḥammad 'Alī Pasha (viceroy 1805–48).

'Abbās, distrustful of Europeans and European-educated Egyptians, reacted to the reforms of Muḥammad 'Alī by closing down or neglecting the public and military schools and factories. He reduced the armed forces, stopped the construction of the Delta Dam, and opposed the construction of the Suez Canal that had been proposed by the French. He allowed the construction, however, of the Alexandria-Cairo Railway by the British, who in return assisted him in his dispute with the Ottoman government over the application of the Western-inspired reforms (*tanzimat*) in Egypt. Although he was opposed to the reforms, 'Abbās showed his loyalty by sending an expeditionary force to assist the Ottomans in the Crimean War (1853); he also abolished the state trade monopolies, which had defied Ottoman treaties with the European powers.

Although 'Abbās' aversion to reforms won him the reputation of a reactionary, his curtailment of government spending benefited the poorer classes, who received tax remissions and suffered less from compulsory labour and conscription into the army. A man of secretive nature, 'Abbās lived in isolation in his palace at Banhā, where he was strangled by two of his servants.

• '**Abbās II**, also called 'ABBĀS ḤILMĪ PASHA (b. July 14, 1874, Alexandria, Egypt—d. Dec. 20, 1944, Geneva, Switz.), last khedive (viceroy) of Egypt, from 1892 to 1914, when British hegemony was established. His opposition to British power in Egypt made him prominent in the nationalist movement.

At the beginning of his reign, 'Abbās attempted to rule independently of Lord Cromer, the British agent and consul general in Egypt. Encouraged by popular discontent with the increasing British influence over Egypt and by the enthusiastic support of the nationalists, he appointed a prime minister who was well-known for his opposition to the British. When in 1894 he criticized the military efficiency of the British troops, Lord Cromer took steps to curb the viceroy's independence of action.

After 1894, although 'Abbās no longer headed the nationalist movement, he provided financial assistance to the pan-Islamic and anti-British daily newspaper *Al-Mu'ayyad*. When in 1906 the nationalists demanded constitutional government for Egypt, however, 'Abbās, now reconciled with the British, rejected their demands. The following year he agreed to the formation of the National Party, headed by Muṣṭafā Kāmil, to counter the Ummah Party of the moderate nationalists, which was supported by the British. With the appointment of Lord Kitchener as consul general (1912–14), the leaders of the National Party were exiled or imprisoned, and 'Abbās' authority was curtailed.

At the beginning of World War I 'Abbās issued an appeal to the Egyptians and the Sudanese to support the Central Powers and to fight the British. On Dec. 18, 1914, Britain declared Egypt its protectorate and deposed 'Abbās the following day. His uncle Ḥusayn Kāmil (reigned 1914–17) replaced him and assumed the title of sultan. In 1922, when Egypt was declared independent, 'Abbās lost

all rights to the throne. He passed the rest of his life in exile, mainly in Switzerland.

PERSIA

• **‘Abbās I**, byname **‘ABBĀS THE GREAT** (b. Jan. 27, 1571—d. Jan. 19, 1629), shah of Persia from 1588 to 1629, who strengthened the Ṣafavid dynasty by expelling Ottoman and Uzbek troops from Persian soil and by creating a standing army. He also made Isfahan the

‘Abbās I, detail of a painting by the Mughal school of Jahāngir, c. 1620; in the Freer Gallery of Art, Washington, D.C.

capital of Persia and fostered commerce and the arts, so that Persian artistic achievement reached a high point in his reign.

Life. The third son of Solṭān Moḥammad Shah, ‘Abbās came to the throne in October 1588, at a critical moment in the fortunes of the Ṣafavid dynasty. The weak rule of his semiblind father had allowed usurpation by the amirs, or chiefs, of the Turkmen tribes, who had brought the Ṣafavid to power and still constituted the backbone of Ṣafavid military strength. Moreover, the intertribal factionalism of these Turkmens (known as Kizilbash [Red Heads] because of the distinctive red headgear that they had adopted to mark their adherence to the Ṣafavids) had so weakened the state that its traditional enemies, the Ottoman Turks to the west and the Uzbeks to the east, had been able to make large inroads into Persian territory.

Shah ‘Abbās thus had two immediate tasks: to reassert the authority of the monarchy and to expel Ottoman and Uzbek troops from Persian soil. Because he was unable to fight a war on two fronts simultaneously, in 1589–90 he signed a peace treaty with the Ottomans, thus freeing himself for an offensive against the Uzbeks. By the treaty, large areas in west and northwest Persia were ceded to the Ottomans. Despite the breathing space thus gained, ‘Abbās for 10 years was unable to launch a major offensive against the Uzbeks, and Iran suffered further loss of territory both to the Uzbeks and to the Mughals of India.

The delay was caused by ‘Abbās’ decision to create a standing army—a concept novel to Ṣafavid kings, who traditionally levied armies in time of need from the tribal cavalry. The creation of a standing army immediately caused a budgetary problem, because the old tribal cavalry had been paid from the revenues of the provinces governed by Kizilbash chiefs. ‘Abbās solved the problem in the short term by bringing a number of these provinces directly under the control of the Shah; the taxes in these new “crown” provinces were remitted to the royal treasury. In the long run the inevitable result of this policy, the reduction in the numbers of Kizilbash troops, seriously weakened the country’s military strength.

The new standing army was composed mainly of Georgians, Armenians, and Circassians (who had been brought to Persia as prisoners during the reign of ‘Abbās’ grandfather) and their descendants. After their conversion to Islām, they were trained for service either in the army or in the administration of the

state or the royal household. Shah ‘Abbās felt that he could rely on the loyalty of these *ghulāms* (“slaves”) of the shah, as they were known, and he used them to counterbalance the influence of the Kizilbash, whom he distrusted. *Ghulāms* soon rose to high office and were appointed governors of crown provinces.

Eventually, ‘Abbās was able to take the offensive against his external foes. In 1598 he inflicted a major defeat on the Uzbeks and regained control of Khorāsān. From 1602 onward he conducted a series of successful campaigns against the Ottomans and recovered the territory lost to them.

After his great victory over the Uzbeks, ‘Abbās transferred the capital from Kazvin to Isfahan. Under his guidance, Isfahan rapidly became one of the most beautiful cities in the world. He adorned the city with many mosques and theological colleges and constructed numerous caravansaries and public baths. He laid out the city with spacious boulevards and a splendid square. The Shah’s building energies were not confined to Isfahan; the extension and restoration of the famous shrine at Meshed and the construction, along the swampy littoral of the Caspian Sea, of the celebrated stone causeway, designed to give access to his favourite winter retreats, were among his most notable achievements.

To Isfahan came ambassadors from European countries, merchants seeking to establish trade relations, representatives of foreign monastic orders seeking permission to found convents at Isfahan and elsewhere, and gentlemen of fortune, such as the brothers Sir Anthony and Sir Robert Sherley—the former an adventurer, the latter a loyal servant of the Shah who distinguished himself in the wars against the Ottomans. The reign of Shah ‘Abbās was a period of intense commercial and diplomatic activity, and, in the Persian Gulf, the Portuguese, the Dutch, and the English strove to make themselves masters of trade there and in the Indian Ocean.

‘Abbās’ reign also marks a peak of Persian artistic achievement. Under his patronage, carpet weaving became a major industry, and fine Persian rugs began to appear in the homes of wealthy European burghers. Another profitable export was textiles, which included brocades and damasks of unparalleled richness. The production and sale of silk was made a monopoly of the crown. In the illumination of manuscripts, bookbinding, and ceramics, the work of the period of ‘Abbās is without equal; in painting it is among the most notable in Persian history.

Assessment. Shah ‘Abbās ruled with a passionate zeal for justice and the welfare of his subjects. He frequented meeting places of the ordinary people in order to learn of extortion and oppression on the part of his officials; his punishment of corrupt officials was swift. He showed unusual religious tolerance, granting privileges to many Christian groups.

The dark side of his character was reserved for his own sons and members of his own family. The experiences of his youth, when he was marked for execution by his uncle, Shah Esmā’il II, had left him with a morbid fear of conspiracy. Originally, he followed the practice of his predecessors in appointing the princes of the blood royal as provincial governors, but after a series of revolts and intrigues in favour of his sons, the royal princes were confined to the harem, where their only companions were women and eunuchs. As his obsessive fear of assassination increased, ‘Abbās began to put to death or to blind any member of the royal family who caused him anxiety in this regard. In this way, one son was executed (an act that caused ‘Abbās bitter remorse) and two were blinded, and his father and brothers were blinded and imprisoned. ‘Abbās died without an heir capable of succeeding him.

Though ‘Abbās possessed great stature as a monarch—even in an age notable for its out-

standing rulers—his great achievement in first saving the Ṣafavid Empire from collapse and then raising it to new heights of splendour is marred by his treatment of his own family and the fact that his reforms contained within them the seeds of the future decay of both dynasty and state.

(R.M.Sa.)

Abbas, Ferhat (b. Aug. 24, 1899, Taher, near Constantine, Alg.—d. Dec. 24, 1985, Algiers), politician and leader of the national independence movement who served as the first president of the Provisional Government of the Algerian Republic.

Son of a Muslim official in the Algerian civil service, Abbas received an entirely French education at Philippeville (now Skikda) and Constantine and at the University of Algiers. After two years’ service with the French Army, he became a pharmacist at Sétif and was elected first to the municipal council of Sétif and then to the general council in Constantine. Early in his political career, he advocated collaboration with the French, the assimilation of the “native element in French society,” and the abolition of colonialism to bring about the emancipation of the Algerian Muslims as French citizens. Disillusioned by the French in 1938, he organized the Union Populaire Algérienne, which proposed equal rights for French and Algerians while preserving the Algerian culture and language. Nevertheless, at the outbreak of World War II, Abbas enlisted in the medical corps of the French Army.

On Feb. 10, 1943, the “Manifesto of the Algerian People,” prepared by Abbas, was proclaimed. It was subsequently presented to the French and the Allied authorities in North

Ferhat Abbas

Camera Press Ltd.—Pictorial Parade/EB Inc

Africa. The manifesto, which reflected a fundamental change in its author’s political position, not only condemned French colonial rule but also called for the application of the principle of self-determination and demanded an Algerian constitution granting equality to all inhabitants of Algeria. In May, Abbas, along with a number of his colleagues, wrote an addendum to the manifesto, which envisioned a sovereign Algerian nation. It was presented to the French on June 26. On its rejection by the French governor general, Ferhat Abbas and an Algerian working-class leader, Messali Hadj, formed the Amis du Manifeste et de la Liberté (AML; Friends of the Manifesto and Liberty), which envisioned an Algerian autonomous republic federated to a renewed, anti-colonial

France. After the suppression of the AML and a year's imprisonment, in 1946 he founded the Union Démocratique du Manifeste Algérien (UDMA; Democratic Union of the Algerian Manifesto), which advocated cooperation with France in the formation of the Algerian state. Abbas' moderate and conciliatory attempts failed to evoke a sympathetic response from the French colonial officials, however, and in 1956 he escaped to Cairo to join the Front de Libération Nationale (FLN), an Algerian organization committed to revolutionary struggle for independence from France.

On Sept. 18, 1958, the Provisional Government of the Algerian Republic was formed with Ferhat Abbas as president. He resigned in 1961 but was elected president of the Algerian Constituent Assembly in 1962, when Algeria gained independence. Despite his political alliance with the revolutionary and Socialist FLN, he remained an exponent of parliamentary institutions and constitutionalism. To protest the drafting of the Algerian constitution by the FLN outside the Constituent Assembly, he resigned his post as the assembly's president in August 1963 and was expelled from the FLN. He was placed under house arrest in 1964 but was released the following year.

Ferhat Abbas described the Algerian War of Independence in *La Nuit coloniale* (1962; "The Colonial Night"). He is also the author of *Le Jeune Algérien: de la colonie vers la province* (1931; "The Young Algerian: From Colony to Province") and *Autopsie d'une guerre* (1980; "Autopsy of a War").

Abbas, Mahmoud, also known as ABU MAZEN (b. 1935, Zefat, Palestine [now in Israel]), Palestinian politician who became president of the Palestinian Authority (*q.v.*; PA) in 2005.

Abbas was born in the Arab-Jewish town of Zefat and fled with his family to Syria during the 1948 Arab-Israeli war. He earned a law degree from the University of Damascus and, in the late 1950s, was one of the founders of Fatah, which came to dominate the Palestine Liberation Organization (PLO). As head of the PLO's international department in the late 1970s, Abbas was instrumental in forging contacts with Israeli peace groups. In 1982 Abbas received a doctorate in history from Moscow State University.

In the early 1990s Abbas shaped Palestinian negotiating strategy and the resulting Oslo Accords (1993), and he was a senior member of the Palestinian delegation to the Camp David peace talks in 2000; he adamantly rejected Israel's peace offer but opposed the violent Palestinian uprising called the *intifādah* (Arabic: "shaking off") that followed. In 2003 he became prime minister of the PA and quickly renounced terrorism and called for an end to the *intifādah*, but he soon resigned from office. Following the death of PLO leader Yāsir 'Arafāt in late 2004, Abbas was named head of the PLO. In January 2005 he was elected to succeed 'Arafāt as president of the PA.

'**Abbās Ḥilmī Pasha**: see 'Abbās II (Egypt).

'**Abbās Mīrzā** (b. September 1789, Navā, Qājār Iran—d. Oct. 25, 1833, Meshed), crown prince of the Qājār dynasty of Iran who introduced European military techniques into his country.

Although he was not the eldest son of Fath 'Alī Shāh (1797–1834), 'Abbās Mīrzā was named crown prince and appointed governor of the province of Azerbaijan in 1798 or 1799. When war broke out between Russia and Iran in 1804, he was made commander of the Iranian expeditionary force of 30,000 men. The war (1804–13) resulted in the loss of most of Iran's Georgian territory and showed 'Abbās Mīrzā the necessity of reforming the Qājār

military forces. He began sending Iranian students to Europe to learn Western techniques. In 1812 a printing press was established in Tabriz, the capital of Azerbaijan, and the translation of European military handbooks was encouraged. A gunpowder factory and an artillery foundry were also started.

The new army was drilled by British military advisers, who taught such tactics as the use of infantry formations and close cooperation between infantry and artillery. This army distinguished itself in campaigns against the Ottoman Turks in 1821–23. During the second Russo-Iranian war (1826–28) 'Abbās Mīrzā again led the Iranian forces. In the first year of the war he was able to recapture all of Iran's lost territory. In the end, however, Russian numerical superiority and discipline, coupled with Fath 'Alī Shāh's refusal to reinforce and replace 'Abbās Mīrzā's losses, led to a disastrous defeat. At the cessation of hostilities (1828), Iran had lost all its Georgian and Caucasian territories.

'Abbās Mīrzā was shattered by this defeat. He lost interest in military reform and spent the last five years of his life trying to maintain his own position as crown prince and feuding with his many brothers.

'**Abbāsīd DYNASTY**, second of the two great dynasties of the Muslim Empire of the Caliphate. It overthrew the Umayyad caliphate in AD 750 and reigned as the 'Abbāsīd caliphate until destroyed by the Mongol invasion in 1258.

The name is derived from that of the uncle of the Prophet Muḥammad, al-'Abbās (died c. 653), of the Hāshimite clan of the Quraysh tribe in Mecca. From c. 718, members of his family worked to gain control of the empire, and by skillful propaganda won much support, especially from Shī'ī Arabs and Persians in Khorāsān. Open revolt in 747, under the leadership of Abū Muslim, led to the defeat of Marwān II, the last Umayyad caliph, at the Battle of the Great Zāb River (750) in Mesopotamia and to the proclamation of the first 'Abbāsīd caliph, Abū al-'Abbās as-Saffāh.

Under the 'Abbāsīds the caliphate entered a new phase. Instead of focussing, as the Umayyads had done, on the West—on North Africa, the Mediterranean, and southern Europe—the caliphate now turned eastward. The capital was moved to the new city of Baghdad, and events in Persia and Transoxania were closely watched. For the first time the caliphate was not coterminous with Islām; in Egypt, North Africa, Spain, and elsewhere, local dy-

nasties claimed caliphal status. With the rise of the 'Abbāsīds the base for influence in the empire became international, emphasizing membership in the community of believers rather than Arab nationality. Since much support for the 'Abbāsīds came from Persian converts, it was natural for the 'Abbāsīds to take over much of the Persian (Sāsānian) tradition of government. Support by pious Muslims likewise led the 'Abbāsīds to acknowledge publicly the embryonic Islāmīc law and to profess to base their rule on the religion of Islām. Between 750 and 833 the 'Abbāsīds raised the prestige and power of the empire, promoting commerce, industry, arts, and science, particularly during the reigns of al-Manṣūr, Hārūn ar-Rashīd, and al-Ma'mūn. Their temporal power, however, began to decline when al-Mu'taṣim introduced non-Muslim Berber, Slav, and especially Turkish mercenary forces into his personal army. Although these troops were converted to Islām, the base of imperial unity through religion was gone, and some of the new army officers quickly learned to control the caliphate through assassination of any caliph who would not accede to their demands.

The power of the army officers had already weakened through internal rivalries when the Iranian Būyids entered Baghdad in 945, demanding of al-Mustakfī (944–946) that they be recognized as the sole rulers of the territory they controlled. This event initiated a century-long period in which much of the empire was ruled by local secular dynasties. In 1055 the 'Abbāsīds were overpowered by the Seljuqs, who took what temporal power may have been left to the caliph but respected his position as religious leader, restoring the authority of the caliphate, especially during the reigns of al-Mustarshid (1118–35), al-Muqtafi, and an-Nāṣir. Soon after, in 1258, the dynasty fell during a Mongol siege of Baghdad.

Abbate, Niccolò dell', Abbate also spelled ABATE (b. c. 1512, Modena, Duchy of Modena—d. 1571, Fontainebleau, France), painter of the Bolognese school who, along with others, introduced the post-Renaissance Italian style of painting known as Mannerism to France and helped to inspire the French classical school of landscape painting.

He began his career in Modena as a student of the sculptor Antonio Begarelli. His "Martyrdom of St. Peter and St. Paul" in the church of S. Pietro, Modena (1547), probably established his reputation. During his stay in Bologna (1548–52), his style matured, influenced by his contemporaries Correggio and

"The Story of Aristaeus," oil painting by Niccolò dell'Abbate; in the National Gallery, London

By courtesy of the trustees of the National Gallery, London; photograph, A. C. Cooper Ltd

Parmigianino. His stucco-surface landscapes in the Poggi (now Palazzo dell'Università) survive to show his understanding of nature.

In 1552 Abbate was called to the court of the king of France, Henry II, at Fontainebleau, and remained in France for the rest of his life. With Francesco Primaticcio he composed immense murals, most of them later lost. His easel works, which included an enormous number of lyrical landscapes based upon pagan themes, were burned in 1643 by the Austrian regent, Anna. Among his later paintings executed for Charles IX were a series of landscapes with mythologies that influenced the 17th-century French painters Claude Lorrain and Nicolas Poussin. He also designed a series of tapestries, "Les Mois arabesques," and some of his designs were adopted by the painted enamel industry of Limoges. His last works are believed to be 16 murals (1571) in which he was assisted by his son, Giulio Camillo. His work in France is recognized as a principal contribution to the first significant, wholly secular movement in French painting, the Fontainebleau style.

Abbazia (Croatia): see Opatija.

Abbe, Ernst (b. Jan. 23, 1840, Eisenach, Grand Duchy of Saxe-Weimar-Eisenach—d. Jan. 14, 1905, Jena, Ger.), physicist whose theoretical and technical innovations in optical theory led to great improvements in microscope design (such as the use of a condenser to provide strong, even illumination, introduced in 1870) and clearer understanding of magnification limits. He discovered the optical formula now called the Abbe sine condition, one of the requirements that a lens must satisfy if it is to form a sharp image, free from the blurring or distortion caused by coma and spherical aberration.

In 1863 he joined the University of Jena, rising to professor of physics and mathematics (1870) and director of the astronomical and meteorological observatories (1878). In 1866 he became research director of the Zeiss optical works. Two years later Abbe invented the apochromatic lens system for microscopes, which eliminates both the primary and secondary colour distortion of light.

In 1891 Abbe established the Carl Zeiss Foundation for research in science and social improvement. Five years later he reorganized the Zeiss optical works into a cooperative.

abbess, the title of a superior of certain communities of nuns following the Benedictine Rule, of convents of the Second Order of St. Francis (Poor Clares), and of certain communities of canonesses. The first historical record of the name is on a Roman inscription dated c. 514.

To be elected, an abbess must be at least 40 years old and a professed nun for at least 10 years. She is solemnly blessed by the diocesan bishop in a rite similar to that of the blessing of abbots. Her blessing gives her the right to certain pontifical insignia: the ring and sometimes the crosier.

In medieval times abbesses occasionally ruled double monasteries of monks and nuns and enjoyed various privileges and honours. See also abbot.

Abbeville, town, Somme *département*, Picardie region, northern France, near the mouth of the canalized Somme, northwest of Amiens. Stone Age artifacts unearthed by Boucher de Crèvecœur de Perthes in 1844 attesting to early occupation of the site are displayed at the Musée Boucher-de-Perthes. The town originated as Abbatis Villa, a 9th-century dependency of the abbots of Saint-Riquier, and was chartered in 1184. Under the English (1272–1435), it was capital of Ponthieu. Louis XII's marriage (1514) to Mary, sister of Henry VIII of England, took place there.

13th-century tower survived air bombardment during World War II. Pop. (1999) 24,567.

Abbeville, city, seat (1854) of Vermilion parish, southern Louisiana, U.S., on the Vermilion River, 20 miles (32 km) south-southwest of Lafayette. Founded in 1843 by a Capuchin missionary, Père Antoine Desire Mègret, who patterned it on a French Provençal village, it was first called La Chapelle and settled by Acadians from Nova Scotia and Mediterranean immigrants. St. Marie Madeleine Church (1910) now occupies the site of Mègret's chapel, which was destroyed by fire in 1854. The city is a trade centre for agricultural produce (rice, cotton, and sugar) and seafood and provides services for nearby oil and natural gas fields. It is linked with the Gulf of Mexico via the Freshwater Bayou Deepwater Channel. Avery Island, with a bird sanctuary and salt dome, is 15 miles (24 km) southeast. Inc. town, 1850; city, 1956. Pop. (2004 est.) 11,683.

Abbeville, city, seat of Abbeville county, northwestern South Carolina, U.S. In 1764 French Huguenots settled the site, which was named for Abbeville, France. The city is regarded by some as the "Cradle and the Grave of the Confederacy"; it was there that a secessionist meeting was held (Nov. 22, 1860) and there that the Confederate president, Jefferson Davis, held (May 2, 1865, at Burt-Stark House) one of his last cabinet meetings. John

C. Calhoun was born on an outlying farm. A services-based economy prevails with some light manufacturing. A portion of Sumter National Forest is nearby. Inc. 1895. Pop. (2004 est.) 5,777.

Abbevillian industry, prehistoric stone-tool tradition generally considered to represent the oldest occurrence in Europe of a bifacial (hand-ax) technology. The Abbevillian industry dates from an imprecisely determined part of the Middle Pleistocene, somewhat less than 700,000 years ago. It was recovered from high terrace sediments of the lower Somme valley, in a suburb of Abbeville, France. The distinctive stone tools include massive core-tools (hand-axes), bifacially flaked, with deep flake scars and sinuous or jagged edges, along with thick, usually unretouched, flakes. The assemblage is usually considered closely related to the Acheulian industry and may, in fact, represent merely a variant or temporal expression of it. See also Acheulian industry.

abbey, group of buildings housing a monastery or a convent, centred on an abbey church or a cathedral and under the direction of an abbot or an abbess. In this sense, an abbey consists of a complex of buildings serving the needs of a self-contained religious community. The term abbey is also used loosely to refer to priories, smaller monasteries under a prior. In England, since the dissolution of the monasteries under Henry VIII, all that remains in many cases is the abbey church, now simply called an abbey; Westminster Abbey is the best known example.

Monasteries originally developed in the Middle East and Greece from the earlier streets of hermits' huts, or lauras. Walls were built for defense, and the cells were later constructed against the walls, leaving a central space for church, chapels, fountain, and dining hall, or refectory. This Eastern type of monastery can be seen at Mt. Athos in Greece.

The first European abbey was Montecassino (see Cassino) in Italy, founded in 529 by St. Benedict of Nursia, who wrote the order that formed the basic foundation of monastic life in the Western world. His plan for an ideal abbey was circulated (about 820) to orders throughout Europe, and abbeys were generally built in accord with it in subsequent centuries. The cloister (*q.v.*) linked the most important elements of the abbey together and also served the monks for their contemplative meditation; it was usually an open, arcaded court, surfaced with grass or paving and sometimes with a fountain in the centre. The side adjoining the nave of the church had book presses and formed an open-air but sheltered library.

The ruins of Fountains Abbey, a Cistercian monastery founded in the 12th century, near Ripon, North Yorkshire, England
Andy Williams

The dormitory was often built over the refectory on the east side of the cloister and was linked to the central church by a "day-stair," which led to the arcaded cloister and so into the church, and by a "night-stair," which led directly to the church. The church assembly room, the chapter house (*q.v.*), was often attached to the chancel near the eastern side of the cloister.

The western side of the cloister provided for dealings with the outside world. There was the almonry, for example, where gifts of money or clothing were made to the poor, and guest rooms, lay brothers' quarters, cellars, and stables. The abbot's rooms were near the gatehouse, which controlled the only opening to the outer courtyard, where the general public was permitted. On the south side of the cloisters were a central kitchen, a brewery, and workshops for smiths, enamellers, coopers, shoemakers, and saddlers.

An important building within the inner walls housed the novitiate and the infirmary. In the manner of an early isolation hospital, it had its own chapel, bathhouse, refectory, kitchen, and garden. The doctor's house, with its physic garden of essential medicinal herbs and with small sickrooms, was nearby.

Buildings for the intensive agriculture practiced by most orders were to the south of the other buildings.

In the 12th and 13th centuries, many abbeys were built in England, Scotland, Spain, Italy, Germany, and Austria. In France the monastic movement flourished to a greater extent than in any other country. Perhaps the most remarkable abbey was established by the Benedictines on the rocky island of Mont-Saint-Michel (*q.v.*) in 966.

Abbey, Edwin Austin (b. April 1, 1852, Philadelphia, Pa., U.S.—d. Aug. 1, 1911, London, Eng.), American-British painter and one of the foremost illustrators of his day.

While working as an illustrator for the publishing house of Harper and Brothers, New York City, Abbey was sent to England to gather material for illustrations of the poems of Robert Herrick. These were followed by illustrations for works of Oliver Goldsmith and William Shakespeare. He spent many of his most productive years in England, where he was elected (1883) to the Royal Institute of Painters in Water-Colours. He became a member of the National Academy of Design in 1902. His later works include decorative schemes for several public buildings, among them the state capitol at Harrisburg, Pa., and the official picture of the coronation of King Edward VII of England (1902).

Abbey Theatre, Dublin theatre, established in 1904. It grew out of the Irish Literary Theatre (founded in 1899 by William Butler Yeats and Isabella Augusta, Lady Gregory, and devoted to fostering Irish poetic drama), which in 1902 was taken over by the Irish National Dramatic Society, led by W.G. and Frank J. Fay and formed to present Irish actors in Irish plays. In 1903 this became the Irish National Theatre Society, with which many leading figures of the Irish literary renaissance were closely associated. The quality of its productions was quickly recognized, and in 1904 an Englishwoman, Annie Horniman, a friend of Yeats, paid for the conversion of an old theatre in Abbey Street, Dublin, into the Abbey Theatre. The Abbey opened in December of that year with a bill of plays by Yeats, Lady Gregory, and John Millington Synge (who joined the other two as codirector). Founder members included the Fays, Arthur Sinclair, and Sara Allgood.

The Abbey's staging of Synge's satire *The Playboy of the Western World*, on Jan. 26, 1907, stirred up so much resentment in the

audience over its portrayal of the Irish peasantry that there was a riot. When the Abbey players toured the United States for the first time in 1911, similar protests and disorders were provoked when the play opened in New York City and Philadelphia.

The years 1907–09 were difficult times for the Abbey. Changes in personnel affected the management of the theatre, and the Fay brothers, whose commitment to nationalistic and folk drama conflicted with Yeats's art-theatre outlook, departed for the United States. Horniman withdrew her financial support, and the management of the theatre changed hands several times with little success until the post was filled by the playwright-director Lennox Robinson in 1910. The onset of World War I and the Irish Rebellion of 1916 almost caused the closing of the theatre. Its luck changed, however, in 1924, when it became the first state-subsidized theatre in the English-speaking world. The emergence of the playwright Sean O'Casey also stimulated new life in the theatre, and from 1923 to 1926 the Abbey staged three of his plays: *The Shadow of a Gunman*, *Juno and the Paycock*, and *The Plough and the Stars*, the last a provocative dramatization of the Easter Rising of 1916. In the early 1950s the Abbey company moved to the nearby Queen's Theatre after a fire had destroyed its playhouse. A new Abbey Theatre, housing a smaller, experimental theatre, was completed in 1966 on the original site. Although the Abbey has broadened its repertory, it continues to rely primarily on Irish plays.

abbot, Late Latin and Greek *ABBAS*, the superior of a monastic community that follows the Benedictine Rule (Benedictines, Cistercians, Camaldolese, Trappists) and of certain other orders (Premonstratensians, canons regular of the Lateran). The word derives from the Aramaic *ab* ("father"), or *aba* ("my father"), which in the Septuagint (the Greek translation of the Old Testament) and in New Testament Greek was written *abbas*. Early Christian Egyptian monks renowned for age and sanctity were called *abbas* by their disciples, but, when monasticism became more organized, superiors were called *proestos* ("he who rules") in the East and the Latin equivalent, *praepositus*, in the West.

St. Benedict of Nursia (c. 480–c. 547) restored the word *abbas* in his rule, and to this early concept of spiritual fatherhood through teaching he added the concept of *patria potestas*, authority wielded by a father according to Roman law. Thus, the abbot has full authority to rule the monastery in both temporal and spiritual matters.

An abbot is elected by the chapter of the monastery in secret ballot. He must be at least 30 years old, of legitimate birth, professed at least 10 years, and an ordained priest. He is elected for life except in the English congregation, where he is elected for a term of 8–12 years. The election must be confirmed by the Holy See or by some other designated authority. The bishop of the diocese in which the monastery is situated confers the abbatial blessing, assisted by two abbots.

Chief among the privileges of an abbot are the rights to celebrate the liturgy according to pontifical rite, to give many blessings normally reserved to a bishop, and to use the pontifical insignia.

In Eastern monasticism, self-governing monasteries are ruled by several elder monks, whose leader is called abbot. *See also* abbes.

Abbot, C.G., in full CHARLES GREELEY ABBOT (b. May 31, 1872, Wilton, N.H., U.S.—d. Dec. 17, 1973, Riverdale, Md.), American astrophysicist who is thought to have been the first scientist to suspect that the radiation of the Sun might vary over time. His continued studies of solar radiation led him to discover, in 1953, a connection between solar varia-

tions and weather on Earth, allowing general weather patterns to be predicted as many as 50 years in advance.

After receiving B.S. and M.S. degrees in 1894 from the Massachusetts Institute of Technology, Abbot joined the staff of the Smithsonian Institution (1895), later serving (1928–44) as the institution's secretary. Abbot's research in solar radiation won him many awards.

Abbotsford, former home of the 19th-century novelist Sir Walter Scott, situated on the right bank of the River Tweed, district of Roxburgh, Borders region, Scotland. Scott purchased the

original farm, then known as Carley Hole, in 1811 and transformed it (1817–25) into a Gothic-style baronial mansion. The surrounding area was a major source of inspiration for the author's historical novels.

Still the home of Scott's direct descendants, Abbotsford remains virtually unchanged; it contains Scott's valuable library, family portraits, and an interesting collection of historical relics and is open to the public during the summer.

Abbott, Berenice (b. July 17, 1898, Springfield, Ohio, U.S.—d. Dec. 9, 1991, Monson, Maine), photographer best known for preserving the works of photographer Eugène Atget and for her photographic documentation of New York City in the late 1930s.

In 1918 Abbott left Ohio for New York City, where she independently studied drawing and sculpture until 1921. She studied sculpture briefly in Berlin and then became an assistant to Man Ray in Paris. While in Paris she came into contact with Atget, whose work was at the time virtually unknown. In 1925 Abbott set up her own photography studio and made several well-known portraits of Parisian expatriates, artists, writers, and aristocrats, including Peggy Guggenheim, James Joyce, Djuna Barnes, Jean Cocteau, Leo Stein, and Atget. After Atget's death in 1927, Abbott retrieved his prints and negatives from destruction and classified them, and in the following years she dedicated herself to promoting his work.

She remained in Paris until 1929, at which time she returned to New York City. Freelancing for a time, Abbott began photographing the city. She accepted a job with the

Foundations

Federal Art Project of the Works Progress Administration (WPA) in 1935. Until the end of the decade she systematically documented the city's changing architectural character in a series of highly objective photographs, some of which were published in 1939 in the book *Changing New York* (reissued as *New York in the Thirties*, 1973).

During the next two decades Abbott experimented with photography as a tool for the illustration of scientific phenomena such as magnetism and motion. She also continued to document the landscape around her; for one project she photographed scenes along U.S. Route 1 from Florida to Maine.

Abbott, Bud; and Costello, Lou, in full WILLIAM A. ABBOTT and LOUIS FRANCIS CRISTILLO (respectively b. Oct. 2, 1896, Asbury Park, N.J., U.S.—d. April 25, 1974, Woodland Hills, Calif.; b. March 6, 1908, Paterson, N.J., U.S.—d. March 3, 1959, Beverly Hills, Calif.), popular American comedic duo who performed on stage, radio, and television and in motion pictures between 1929 and 1957.

Abbott was born into a theatrical family and operated burlesque houses and worked in box offices before he met Costello. Costello worked as an actor, prizefighter, and motion-picture stuntman before becoming a comedian in vaudeville. Their partnership began when Costello's regular straight man fell ill during an engagement at the Empire Theatre in New York City. Abbott, who was working in the box office, offered to substitute. They worked so well together that Abbott played straight man to Costello's buffoon from then on.

In 1938 Abbott and Costello gave their first performance on radio. The duo made their Broadway debut the following year in *The Streets of Paris*. Their first motion-picture comedy, *Buck Privates*, which was released in 1941, became a popular hit and was followed by eight other comedies in the next two years. Their most famous vaudeville routine—a farcical baseball commentary entitled "Who's on First?"—was also performed on radio and television, and it was made into a popular recording.

Abbott, George, in full GEORGE FRANCIS ABBOTT (b. June 25, 1887, Forestville, N.Y., U.S.—d. Jan. 31, 1995, Miami Beach, Fla.), American theatrical director, producer, playwright, actor, and motion-picture director who staged some of the most popular Broadway productions from the 1920s to the '60s.

After graduating from the University of Rochester, N.Y., in 1911, Abbott began acting on Broadway in 1913. He soon began writing and directing plays as well, and he achieved his first big hits in 1925 and 1926 with, respectively, *The Fall Guy* and *Broadway*. After directing the popular farce *Three Men on a Horse* (1935), he wrote, produced, or directed a long succession of highly successful musical comedies and farces. Some of the most notable were *Jumbo* (1935), *Boy Meets Girl* (1935), *The Boys from Syracuse* (1938), *Pal Joey* (1940), *High Button Shoes* (1947), *Where's Charley?* (1948), *Call Me Madam* (1950), *Wonderful Town* (1953), *The Pajama Game* (1954), *Damn Yankees* (1955), *Fiorello!* (1959), and *A Funny Thing Happened on the Way to the Forum* (1962).

The dean of Broadway showmen, Abbott was known for his skillful use of material, his mastery of pacing and humour, and his ability to maintain effective action onstage. He directed the motion-picture versions of several of his plays, including *The Pajama Game* (1957) and *Damn Yankees* (1958). He published his autobiography, *Mister Abbott*, in 1963 and remained active on the New York theatrical scene into the 1990s.

Abbott, Grace (b. Nov. 17, 1878, Grand Island, Neb., U.S.—d. June 19, 1939, Chicago, Ill.), American social worker, public admin-

istrator, educator, and reformer who was important in the field of child-labour legislation.

In 1908 Abbott became director of the newly formed Immigrants' Protective League, Chicago, and lived for a time at Hull House, the pioneer settlement house founded by Jane Addams, with whom she was closely associated. In a series of weekly articles ("Within the City's Gates," 1909–10) in the *Chicago Evening Post*, she attacked the exploitation of immigrants. Later she wrote *The Immigrant and the Community* (1917).

As director of the child-labour division of the U.S. Children's Bureau (1917–19), she administered the first federal statute limiting the employment of juveniles, the Keating-Owen Act (1916). This law was declared unconstitutional by the U.S. Supreme Court in 1918, but she secured a continuation of its policy by having a child-labour clause inserted into all war-goods contracts between the federal government and private industries. Later Abbott was director of the entire Children's Bureau (1921–34). She worked hard to win public approval of a constitutional amendment against child labour, which was submitted to the states in 1924 but never ratified. She was professor of public welfare at the University of Chicago from 1934 to 1939. Her book *The Child and the State* (2 vol.) appeared in 1938.

Abbott, Jacob (b. Nov. 14, 1803, Hallowell, Maine, U.S.—d. Oct. 31, 1879, Farmington, Maine), American teacher and writer, best known for his many books for young readers.

Abbott attended Hallowell Academy and Bowdoin College and studied at Andover Newton Theological School. After teaching at Amherst College, he moved in 1829 to Boston, where he founded and was the first principal of the Mount Vernon School, a secondary school for girls.

Abbott was sole author of 180 books and coauthor or editor of 31 others, notably the "Rollo" series (28 vol.). To accompany the earlier books (*Rollo at Work*, *Rollo at Play*), Abbott wrote a volume for teachers, *The Rollo Code of Morals; or, The Rules of Duty for Children, Arranged with Questions for the Use of Schools* (1841). In following Rollo's world travels with his all-knowing Uncle George, the young reader could improve his knowledge of ethics, geography, science, and history. Abbott also wrote 22 volumes of biographical histories and the *Franconia Stories* (10 vol.).

Abbott, Sir John, in full SIR JOHN JOSEPH CALDWELL ABBOTT (b. March 12, 1821, St. Andrews, Lower Canada [now St.-André-Est, Quebec, Canada]—d. Oct. 30, 1893, Montreal), lawyer, statesman, and prime minister of Canada from 1891 to 1892.

Educated at McGill University, Montreal, Abbott became a lawyer in 1847 and was made queen's counsel in 1862. He served as dean of the McGill faculty of law from 1855 to 1880. He was elected to the Legislative Assembly of the then-united province of Canada in 1857 and continued to represent his native county, Argenteuil, until 1887, except during 1874–80. In 1862 he served briefly as solicitor general in the Liberal administration of Sir John Macdonald and Louis Sicotte before going over to the Conservatives in 1865.

As legal adviser to the shipping magnate Sir Hugh Allan, Abbott was implicated in the Pacific Scandal of 1873, in which Prime Minister Macdonald was accused of awarding a railway construction contract to Allan in return for campaign funds. Abbott accordingly was defeated in the 1874 election and was not reelected to the House of Commons until 1880. Seven years later he was appointed to the Senate, in which he was made government leader. On the death of Macdonald in June 1891, Abbott emerged as compromise choice for prime minister, but he resigned the following year because of ill health. He was knighted in 1892.

Abbott, Lyman (b. Dec. 18, 1835, Roxbury, Mass., U.S.—d. Oct. 22, 1922, New York, N.Y.), American Congregationalist minister and a leading exponent of the Social Gospel movement.

Abbott left law practice to study theology and was ordained in 1860. After serving in two pastorates he became associate editor of *Harper's Magazine* and in 1870 editor of

Lyman Abbott, 1901

the *Illustrated Christian Weekly*. In 1876 he joined Henry Ward Beecher's *Christian Union*, a nondenominational religious weekly, and in 1881 Abbott became its editor in chief. He succeeded in 1888 to Beecher's pulpit in the Plymouth Congregational Church, Brooklyn, where he served until 1899.

Abbott early became interested in industrial problems. Under his editorship the *Christian Union* (renamed *Outlook* in 1893) promulgated the Social Gospel, which sought to apply Christianity to social and industrial problems. His *Christianity and Social Problems* (1897), *The Rights of Man* (1901), *The Spirit of Democracy* (1910), and *America in the Making* (1911) present his moderate sociological views, which rejected both socialism and laissez-faire economics. On other problems Abbott presented the viewpoint of liberal evangelical Protestantism. He sought to interpret, rather than condemn, the effect of the theory of evolution on religion.

Abbottābād, city, east-central North-West Frontier Province, northern Pakistan. It is situated 38 miles (61 km) northeast of Rāwalpindi. A hill station (4,120 feet [1,256 m]), it lies on a plateau at the southern corner of the Rāsh (Orāsh) Plain and is the gateway to the picturesque Kāgān Valley. It is connected by road with the Indus Plain and Kashmir and by railhead (at Haveliān, 10 miles [16 km] south) with Peshāwar. Abbottābād is a district market centre. It was founded in 1853 and named after Major James Abbott, the first British deputy commissioner of the region. There are two parks, a preparatory school, several colleges affiliated with the University of Peshāwar, and a forest research centre. The Pakistan Military Academy is at Kākul, 5 miles (8 km) northeast. Three major iron-ore deposits are nearby. Pop. (1998) 105,999.

abbreviation, in communications (especially written), the process or result of representing a word or group of words by a shorter form of the word or phrase.

A list of abbreviations used in the MICROPAEDIA may be found at the end of each volume of the MICROPAEDIA. For a separate list of mathematical abbreviations (and symbols), see mathematics. A separate list of abbreviations used in the INDEX may be found in each of the INDEX volumes.

Abbreviations take many forms and can be found in ancient Greek inscriptions, in medieval manuscripts (e.g., "DN" for "Dominus Noster"), and in the Qur'ān. Cicero's sec-

retary, Marcus Tullius Tiro, devised many abbreviations that have survived to modern times, such as the character ampersand, &, for *et* (Latin: "and"). But it was the so-called information explosion of the 20th century that made abbreviation a common practice in communication.

A major factor in the trend toward abbreviation is that of economy. In telegraphy, for example, as well as in computerized communications, the extra time, space, and materials required for rendering long words and phrases is an important concern. Fortunately, redundancy of information exists in all speech, and this redundancy increases dramatically if the context is not known or if the message is long. Scientific studies indicate that up to 75 percent of all information in relatively long communications is redundant, and this knowledge makes abbreviation not only possible but convenient.

Another factor in the development of abbreviations is the proliferation of new products and organizations that need to be named. Long descriptive terms can be shortened into mnemonic units.

The need for speed in shorthand and the desire to avoid redundancy in codes makes abbreviation an important element in stenography and cryptography as well.

There are several important forms of abbreviation. One form entails representing a single word either by its first few letters (as "n" for "noun," or "Co." for "Company"), by its most important letters (as "Ltd." for "Limited"), or by its first and last letters (as "Rd." for "Road"). These abbreviations are usually spoken as the whole word they represent (though Ltd. is sometimes spoken as "el-tee-dee").

Truncation is especially common in popular speech, as, for example, "Mets" for "Metropolitans."

The combination of the first syllables or letters of component words within phrases or within names having more than one word is common and often produces acronyms, which are pronounced as words and which often cease to be considered abbreviations. An example of this type of abbreviation is the word flak (from German *Fliegerabwehrkanone*, "anti-aircraft cannon"). Such combinations are especially common in the U.S. military, which has provided "COMFLOGWING" for "Commander Fleet Logistics Air Wing." An example from the Soviet era is "Narkomvneshtorg" for "Narodny Komissariat Vneshney Torgovli" (Russian: "People's Commissariat of Foreign Trade"). Other popular acronyms are the well-known "radar" ("radio detecting and ranging") and "snafu" ("situation normal, all fouled up").

Acronyms are to be distinguished from initialisms such as U.S.A. and NCAA, which are spoken by reciting their letters.

The symbolic notations used in mathematics and other sciences may also be regarded as forms of abbreviation.

ABC: *see* American Broadcasting Company.

ABC, tabloid daily newspaper published in Madrid and long regarded as one of Spain's leading papers. It was founded as a weekly in 1903 by a distinguished journalist, Torcuato Luca de Tena y Alvarez-Ossorio, who later (1929) was made the Marqués de Luca de Tena by King Alfonso XIII in recognition of his accomplishments with *ABC*. The paper became a daily in 1905 and after 1929 published a Seville edition.

ABC was monarchist in orientation from its founding, and during the Spanish Civil War it was taken over by the Republican government—nominally in 1931 and then, after several months' suspension in 1932 and continued resistance to censorship, completely in

1936. It was returned to private control under Franco in 1939 but remained critical of government excesses, although it did support the Franco regime.

ABC has always been noted for its graphics; it was a heavy user of photography from its inception, and the front page is typically an action photograph that covers nearly the entire page. In more recent times, the paper has won wide acclaim for its coverage of Spanish culture and the arts.

Abchazija (Georgia): *see* Abkhaziya.

Abd al-Aziz, Arabic in full 'ABD AL-'AZIZ IBN AL-HASAN IBN MUHAMMAD AL-HASANĪ AL-'ALAWĪ (b. Feb. 24, 1878, or Feb. 18, 1881—d. June 10, 1943, Tangier, Mor.), sultan of Morocco from 1894 to 1908, whose reign was marked by an unsuccessful attempt to introduce European administrative methods in an atmosphere of increasing foreign influence.

Abd al-Aziz was proclaimed sultan upon the death of his father, Hassan I, but did not begin direct rule until after the death in 1900 of his grand vizier, Ba Ahmed (Ahmad ibn Musa). Upon his actual accession, Abd al-Aziz sought European advice in an attempt to modernize the country and in particular to reform the methods of taxation. These endeavours, defeated because of the complete lack of administrators trained in modern practices, caused great resentment among influential notables of the old school. Rival European interests in North Africa complicated the issue, and in 1907 Abd al-Aziz' brother, Abd al-Hafid (Moulay Hafid), fomented a rebellion in Marrakech. He defeated Abd al-Aziz in battle on Aug. 19, 1908. Two days later the sultan abdicated. Pensioned by his brother, he spent the rest of his life at Tangier. The Franco-Spanish occupation of Morocco followed his abdication by four years.

'Abd al-'Aziz ibn 'Abd ar-Rahmān ibn Fayṣal ibn Turki 'Abd Allāh ibn Muḥammad Al Sa'ūd (Arab leader): *see* Ibn Sa'ūd.

'Abd al-Ghanī, in full 'ABD AL-GHANĪ IBN ISMĀ'IL AN-NĀBULUSĪ (b. March 19, 1641, Damascus—d. March 5, 1731), Syrian mystic prose and verse writer on the cultural and religious thought of his time.

Orphaned at an early age, 'Abd al-Ghanī, joined the Islāmic mystical orders of the Qādiriyah and the Naqshbandiyah. He then spent seven years in isolation in his house, studying the mystics on their expression of divine experiences. 'Abd al-Ghanī traveled extensively throughout the Islāmic world, visiting Istanbul in 1664, Lebanon in 1688, Jerusalem and Palestine in 1689, Egypt and Arabia in 1693, and Tripoli in 1700.

His more than 200 written works can be divided into three categories: Sūfism (mysticism, largely within the main body of Islām, the Sunnīs); travel accounts; and miscellaneous subjects, including poetry, eulogies, correspondence, prophecy, the interpretation of dreams, and the question of the lawfulness of the use of tobacco. The main component in his original Sūfī writing, as distinguished from his commentaries on the works of others, is the concept of *waḥdat al-wujūd* ("divine existential unity" of God and the universe and, hence, of man). His travel accounts are considered by many scholars to be the most important of his writings; the descriptions of his journeys provide vital information on the customs, beliefs, and practices of the peoples and places he visited.

Abd al-Hafid, Arabic 'ABD AL-ḤAFĪD (b. 1875 or 1880, Fès, Mor.—d. April 4, 1937, Enghien-les-Bains, Fr.), sultan of Morocco (1908–12), the brother of Sultan Abd al-Aziz, against whom he revolted beginning in 1907.

Appointed caliph of Marrakech by Abd al-Aziz, Abd al-Hafid had no difficulty there in

rousing the Muslim community against his brother's Western ways. With Marrakech his, Abd al-Hafid routed his brother's forces and pensioned off the sultan. Recognized as sultan by the Western powers (1909), Abd al-Hafid invoked French aid against another pretender in 1912 and then was forced to recognize a French protectorate over Morocco.

'Abd al-Ilāh (b. 1913, aṭ-Ṭā'if, Arabia—d. July 14, 1958, Baghdad), regent of Iraq (1939–53) and crown prince to 1958.

Son of the Hāshimite king 'Alī ibn Ḥusayn of the Hejaz (northwestern Arabia), who was driven from Arabia by Ibn Sa'ūd, 'Abd al-Ilāh accompanied his father to Iraq in 1925. Upon King Ghāzi's death in 1939, he was appointed regent for his four-year-old nephew, Fayṣal II. 'Abd al-Ilāh ruled Iraq for 14 turbulent years, loyally serving the throne and supporting the Allies during World War II. In April 1941, faced with an uprising of army officers led by

'Abd al-Ilāh
BBC Hulton Picture Library

Rashīd 'Āli al-Gaylānī, who was sympathetic to Germany and Italy, the regent was forced to leave Iraq. With British assistance, however, the revolt was suppressed by the end of May, and 'Abd al-Ilāh returned to Baghdad. Thereafter, in close collaboration with Nuri as-Said, he pursued a policy of moderate Iraqi nationalism and maintained strong ties with the West. When King Fayṣal reached legal age on May 23, 1953, the regent relinquished his functions but remained as the young king's chief adviser and companion until both were killed during the Iraq revolution of 1958.

'Abd al-Karīm Quṭb ad-Dīn ibn Ibrāhīm al-Jilī: *see* Jilī, al-.

'Abd al-Malik, in full 'ABD AL-MALIK IBN MARWĀN (b. 646/647, Medina, Arabia—d. October 705, Damascus), fifth caliph (685–705) of the Umayyad Arab dynasty centred in Damascus. He reorganized and strengthened governmental administration and, throughout the empire, adopted Arabic as the language of administration.

Life. 'Abd al-Malik spent the first half of his life with his father, Marwān ibn al-Ḥakam, fourth Umayyad caliph, in Medina, where he received religious instruction and developed friendly relations with the pious circles of that city that were to stand him in good stead in his later life. At the age of 16, he was entrusted by his kinsman, the caliph Mu'āwiyah, with administrative responsibilities. He remained at Medina until 683, when he and his father were driven out of the city by Medinese rebels

in revolt against the central government in Damascus. He then met the Syrian Umayyad army that was marching on Medina and gave its commander advice about the best means of attacking the city, advice that was followed and proved successful. When the caliph Yazid died in November 683, Marwān was proclaimed caliph in 684 and was able to effect a partial rally of Umayyad rule but at the cost of a bitter feud that arose between northern and southern Arab tribes. When Marwān died in 685 and 'Abd al-Malik succeeded to the caliphate, the forces opposing the Umayyads were still formidable.

There were, first, the northern Arab tribes who, under their leader Zufar, were holding out in northern Syria and Iraq. They were finally pacified only in 691. The second focus of resistance was in Iraq, where three main groups, opposed to each other but united in their resistance to the Umayyads, held sway: the Khārījites, the Shī'ah, and the forces of the anticaliph 'Abd Allāh ibn az-Zubayr, who was proclaimed caliph in Mecca in 685 and had received at least nominal allegiance from many provinces. The initial attempts by the former Umayyad governor of Iraq, 'Ubayd Allāh ibn Ziyād, to regain the province failed, and he was killed by the Shī'ah in 686. For three years 'Abd al-Malik made no further attempt to interfere in Iraq but bided his time as the various groups in Iraq exhausted themselves in internecine warfare. Muṣ'ab, the brother of the anticaliph Ibn az-Zubayr, defeated the Shī'ah in 687 but then had to deal with the Khārījites, committing a large part of his forces.

'Abd al-Malik first took the field against Muṣ'ab in 689 but had to turn back to quell a rebellion in Damascus. In the following year, the campaign again proved fruitless. Only after the defeat of the northern Arab tribes in 691 was 'Abd al-Malik finally able to face Muṣ'ab. The decisive battle took place at Dayr al-Jā Thaliq. The forces of Muṣ'ab were weakened by their wars against the Khārījites, and 'Abd al-Malik bribed many of them to desert Muṣ'ab, who was then killed in battle. The whole of Iraq now fell into his hands, and the only remaining centre of opposition was the now aging anticaliph, Ibn az-Zubayr. 'Abd al-Malik publicly chided him for his temerity and then sent his famous governor al-Ḥajjāj to Arabia. Al-Ḥajjāj besieged Ibn az-Zubayr in Mecca and killed him in September 692. The Muslim community was finally unified.

At first, the reestablishment of Umayyad rule was more apparent than real. The Khārījites were still either restless or in open revolt. The Khārījites in Persia were especially dangerous. It was only after 'Abd al-Malik had appointed al-Ḥajjāj to govern Basra that campaigns against them began to prove successful (the Persian Khārījites were finally wiped out in 697). But north of Kūfah, another Khārījite trouble centre developed. In 695 these Khārījites captured Mosul and occupied large areas of central Iraq. Al-Ḥajjāj, leading his Syrian troops, defeated them too in 697. The Khārījite movement, however, remained strong, especially among the Bakr tribes between Mosul and Kūfah.

Al-Ḥajjāj had now become governor of all the eastern provinces. He was a ruthless and efficient administrator, intent upon pacifying all the provinces entrusted to him by 'Abd al-Malik. A great Muslim army, led by an Arab aristocrat, Ibn al-Ash'ath, and operating in the Afghanistan region, mutinied, swore allegiance to its commander, and turned back to Iraq. Al-Ḥajjāj, with the aid of Syrian reinforcements, was able to defeat the rebels, and their leader was murdered in 704 in Afghanistan. Al-Ḥajjāj, realizing that he could no longer trust the Iraqis, built a new city, Wāsiṭ, which he planned as a garrison city for Syrian troops and as his private residence. Thereafter, he ruled Iraq as enemy territory.

Under 'Abd al-Malik, the conquest of North Africa was resumed in 688 or 689. There, the Arabs were opposed by both the native Berbers and the Byzantines. The governor appointed by 'Abd al-Malik succeeded in winning the Berbers over to his side and then captured Carthage, seat of the Byzantine province, in 697. Other coastal cities fell, and the work of pacification and Islāmization continued apace. 'Abd al-Malik also resumed campaigns against the Byzantines in Anatolia in 692, but no permanent conquest ensued. These campaigns were partly designed to keep the Syrian troops fit.

Assessment. In general, Umayyad rule was greatly strengthened by 'Abd al-Malik, who enjoyed good relations with the Medinese religious circles, an element with considerable moral influence in the Islāmic world. 'Abd al-Malik was more pious than any of his Umayyad predecessors. His long sojourn in Medina had enabled him to know the sentiments of Medinese religious scholars. As caliph, he treated them respectfully, and his private life was close to their ideals. As a result, many were to abandon their earlier opposition to Umayyad rule.

'Abd al-Malik adopted Arabic instead of the local languages as the language of administration. Government officials had been mostly non-Muslim, but the measures of 'Abd al-Malik enabled Arab Muslims more easily to control affairs of government. A new Muslim currency was also struck, modelled on Greek and Persian coinage, but with Muslim inscriptions. A wave of Islāmization set in, but the privileged position of the Arabs was maintained. In fact, the problem of non-Arab Muslims grew more acute and was to become one of the main threats to Umayyad rule in later years.

The Umayyad family lived in Damascus and surrounded the Caliph. Many of them were appointed as governors, but many were also recalled for inefficiency. 'Abd al-Malik enjoyed the support of his clan, but he was more autocratic than Mu'āwiyah, the first Umayyad caliph, with whom he is often compared. He abandoned the policy of consulting with a council of advisers and reserved all major decisions for himself. Despite his religious interests and ideals (e.g., he built the Dome of the Rock in Jerusalem), he was a master politician. In Syria he succeeded in placating the northern Arab tribes, to the chagrin of the southern Arabs.

'Abd al-Malik was a shrewd judge of character. His choice of al-Ḥajjāj as viceroy of the East was a wise one, and he supported his lieutenant loyally. In appearance, he was dark, thickset, and had a long beard. He was nicknamed "Dew of the Stone" for his miserliness. The sources describe him as eloquent in his speech and a lover of poetry. He maintained his calm during periods of crisis and was decisive in his opinions but was capable of great cruelty if necessary. He pursued his enemies relentlessly and closely supervised all affairs of state.

Shortly before his death the question of succession became acute. His brother, 'Abd al-'Aziz, governor of Egypt, had been designated by their father to succeed 'Abd al-Malik. Against the advice of his courtiers, 'Abd al-Malik had begun to take steps to exclude his brother from succession in favour of his own children. He had tried to pressure 'Abd al-'Aziz to renounce his claims but without success. Luckily for 'Abd al-Malik, 'Abd al-'Aziz died in May 705. 'Abd al-Malik now felt free to name three of his own children to succeed him, al-Walid, Sulaymān, and Yazid. 'Abd al-Malik died in Damascus shortly thereafter and was succeeded without difficulty by his eldest son, al-Walid. (T.Kh.)

BIBLIOGRAPHY. The best account of 'Abd al-Malik's reign is in J. Wellhausen, *Das arabische Reich und sein Sturz* (1902; *The Arab Kingdom and Its Fall*, 1927). Also useful are Sir William Muir, *The*

Caliphate: Its Rise, Decline, and Fall, new ed. (1924); and P.K. Hitti, *History of the Arabs*, 10th ed. (1970).

'**Abd al-Mu'min**, in full 'ABD AL-MU'MIN IBN 'ALI (b. Tagra, Kingdom of the Ḥammāids—d. 1163, Rabat, Almohad Empire), Berber caliph of the Almohad dynasty (reigned 1130–63), who conquered the North African Maghrib from the Almoravids and brought all the Berbers under one rule.

Life. 'Abd al-Mu'min came from a humble family: his father had been a potter. He seems to have been well instructed in the Muslim faith and must have had a good knowledge of Arabic, for he wished to continue his studies at one of the centres of Muslim learning in the East. A chance meeting with Ibn Tūmart, a Berber religious reformer, made him abandon this idea and begin his brilliant career.

Around 1117, Ibn Tūmart, the founder of the Almohad movement, was returning from a long stay in the East. He landed at Mah-dīyah in Tunisia and began a journey to southern Morocco, his native country. Wherever he stopped along the way, he proclaimed a twofold message: strict adherence to the doctrine of the oneness of God (hence the name Almohads or al-Muwahhīdūn, Unitarians) and scrupulous observance of Islāmic law. 'Abd al-Mu'min heard Ibn Tūmart preach at Mellala, near Bejaia, Alg. He was an attentive listener and from that time attached himself to the man who had revealed to him the true doctrine.

'Abd al-Mu'min does not seem to have played any special role among Ibn Tūmart's disciples during the slow journey that took them to Marrakech. But when his master declared his opposition to the ruling Almoravid regime, proclaimed himself the *mahdī* ("divinely guided one"), and took refuge in the remote High Atlas region, 'Abd al-Mu'min went with him. Ibn Tūmart won a following in the mountains and founded a small Almohad state there, centred on the village of Tinmel. When al-Bashīr, the reformer's second in command, was killed in an attack on Marrakech, 'Abd al-Mu'min took his place and became Ibn Tūmart's designated successor. The *mahdī* died in 1130. His death was kept secret at first to allow 'Abd al-Mu'min—a stranger to the High Atlas—time to win support from the Almohad leaders. When he was proclaimed leader of the Almohads, he assumed the prestigious title of caliph.

His first task was to carry on the struggle against the Almoravids. Learning from the failure at Marrakech, he realized that he must conquer Morocco from the mountains. On the plains, the Christian knights who served the Almoravids could easily repulse the Almohads' Berber infantry. He spent the next 15 years winning control of the High Atlas, Middle Atlas, and Rif regions, finally moving into his native country, north of Tlemcen.

Near that town, the Almoravids, having suffered the loss of Reverter, the leader of their Catalan mercenaries, were defeated by 'Abd al-Mu'min in open battle in 1145. The Almohad forces then moved west, subjugating Morocco's Atlantic coastal plain. They then laid siege to Marrakech and took it by storm in 1147, massacring the Almoravid inhabitants.

Arab historians have left a description of the man who had now become master of Northwest Africa. He was a sturdy Berber of medium height, with dark hair and regular features. A good soldier, with great courage and endurance, he was at the same time learned in Islām and a gifted orator. Although he had personal charm and could, when necessary, show patience and moderation, he was at times as harsh as his master, Ibn Tūmart. When a revolt broke out in the Atlantic plain

area following the capture of Marrakech, he conducted a methodical purge there in which more than 30,000 people were executed.

The capture of Marrakech posed the moral question of whether to abandon this city founded by the Almoravid heretics. He contented himself with destruction of their palace and mosques and retained Marrakech as the capital of his new empire.

Soon he had to choose between two imperial policies: to complete the conquest of North Africa or to concentrate his energies on Spain, where the Christians were threatening the former Almoravid domains. Showing good judgment as well as feeling for his native country, he gave priority to North Africa.

In 1151 he subjugated the area around Constantine and fought a battle near Sétif against a powerful coalition of Arab tribes that had been wandering over the Berber country for a century, gradually destroying its way of life. 'Abd al-Mu'min was victorious, but instead of punishing these people who had showed themselves to be the worst enemies of the Berbers and the Almohad government, he came to rely on them to strengthen his dynasty against internal opposition from the family of Ibn Tūmart. He also wished to use the Arab cavalry in his holy war against the Christians in Spain.

In 1158–59 'Abd al-Mu'min conquered Tunisia and Tripolitania. This marked the zenith of Berber power in Islām: a Berber caliph reigned over all of North Africa west of Egypt, and his authority was acknowledged by most of Muslim Spain as well.

'Abd al-Mu'min's government. Even while he was pursuing his conquest, 'Abd al-Mu'min had established a central government for his empire. To the traditional clan organization of the Maṣmudāh and other Berber peoples supporting the Almohads he added an organization to promote the spread of Almohad doctrine and a central administration (the *makhzan*) modeled on those of Muslim Spain, which was staffed largely by Spanish Muslims. A government land registry was improvised to assure the dynasty regular revenue. 'Abd al-Mu'min fully accepted the responsibilities of an art patron, but remembering the puritanical austerity of Ibn Tūmart, he sometimes imposed on the mosques built for him a plainness that became more precious than the prevailing elaborate ornamentation.

'Abd al-Mu'min died in 1163. His work, faithfully carried on by his successors, was maintained for more than half a century. Disturbances caused by the rebellious Arab tribes impoverished the country without endangering the dynasty. After their defeat by the Spanish Christians at Las Navas de Tolosa in 1212, however, the Almohads began to decline, and their empire soon disintegrated.

Though in the long run 'Abd al-Mu'min's successors proved unable to perpetuate his achievements, he himself had written one of the most glorious chapters in the history of the Muslim West. (H.-L.-É.T.)

BIBLIOGRAPHY. Information about 'Abd al-Mu'min and his work may be found in the general histories by Henri Terrasse, *Histoire du Maroc*, vol. 2, pp. 261–316 (1950); and Ambrosio Huici Miranda, *Historia política del Imperio Almohade*, 2 vol. (1956–57), both with numerous bibliographic references.

'Abd al-Qādir al-Jīlānī (b. 1077/78, Nif, Persia—d. 1166, Baghdad), founder of the Qādirīyah order of the mystical Ṣūfī branch of Islām.

He studied Islāmīc law in Baghdad and was introduced to Ṣūfism rather late in life, first appearing as a preacher in 1127. His great reputation as a preacher and teacher attracted disciples from the entire Islāmīc world, and he is said to have converted numerous Jews

and Christians to Islām. His achievement as a thinker was to have reconciled the mystical nature of the Ṣūfī calling with the sober demands of Islāmīc law. His concept of Ṣūfism was that of a holy war or *jihād* waged against one's own will in order to conquer egotism and worldliness and to submit to God's will. Numerous legends of his saintliness arose after his death, and he retains a popular following among those who consider him a divine mediator.

'Abd al-Wādid DYNASTY, also called ZAYYĀNID DYNASTY, or BANŪ ZAYYĀN, dynasty of Zanātah Berbers (1236–1550), successors to the Almohad empire in northwestern Algeria. In 1236 the Zanātahs, loyal vassals to the Almohads, gained the support of other Berber tribes and nomadic Arabs and set up a kingdom at Tilimsān (Tlemcen), headed by the Zanātah *amīr* Yaghmurāsan (ruled 1236–83). Yaghmurāsan was able to maintain internal peace through the successful control of the rival Berber factions, and, in the face of the Marīnid threat in the west, he formed an alliance with the sultan of Granada and the king of Castile.

After his death, however, the Marīnid sultan Abū Ya'qūb besieged Tilimsān for eight years (1298–1306). The city was finally taken in 1337 by Abū al-Hasan, and a 10-year period of Marīnid domination followed. Recaptured by the 'Abd al-Wādid in 1348, Tilimsān was again stormed by the Marīnids in 1352, who ruled for another seven years.

'Abd al-Wādid attempts at expansion eastward into Ḥafṣid Tunis also proved disastrous, and, for a time in the early 15th century, they were virtual vassals of the Ḥafṣid state. The kingdom's chronic weakness may be traced to its lack of geographical and cultural unity, the absence of fixed frontiers, and constant internal rebellions. It further suffered from a shortage of manpower, having to rely on intractable Arab nomads for soldiers. Its economic prosperity was based on the position of Tilimsān along the trade route between the Mediterranean ports and Saharan oases. The 'Abd al-Wādid state collapsed in 1550, when Tilimsān was seized by the Ottoman Turks after a half century of alternating Spanish-Turkish suzerainty.

'Abd Allāh (Arabic personal name): *see under* Abdullah, except as below.

'Abd Allāh, in full 'ABD ALLĀH IBN MUḤAMMAD AT-TA'ĪSHĪ, also called 'ABDULLAHI (b. 1846, Sudan—d. Nov. 24, 1899, Kordofan), political and religious leader, who succeeded Muḥammad Aḥmad (al-Mahdī) as head of a religious movement and state within the Sudan.

In about 1880 'Abd Allāh became a disciple of Muḥammad Aḥmad, who announced that he had a divine mission, became known as al-Mahdī, and appointed 'Abd Allāh a caliph (*khaṭīfah*). When al-Mahdī died in 1885, 'Abd Allāh became leader of the Mahdist movement. Although al-Mahdī had clearly designated him as successor, the Ashraf, a portion of al-Mahdī's supporters, tried to reverse this decision. By promptly securing control of the vital administrative positions and obtaining the support of the most religiously sincere group of al-Mahdī's followers, 'Abd Allāh neutralized this opposition.

'Abd Allāh believed he could best control the disparate elements that supported him by maintaining the expansionist momentum begun by al-Mahdī. He launched attacks against the Ethiopians and invaded Egypt. But he had greatly overestimated the support his forces would receive from the Egyptian peasantry and underestimated the potency of the Anglo-Egyptian military forces. In 1889 his troops suffered a crushing defeat in Egypt. 'Abd Allāh also suffered famine and military defeats in the eastern Sudan. The most serious challenge to his authority came from a revolt

of the Ashraf in 1891, but he kept this from reaching extensive proportions.

During the next four years, 'Abd Allāh consolidated his authority. The famine and the expense of large-scale military campaigns ended. 'Abd Allāh modified his policies, making them more acceptable to the people. Taxation became less burdensome. 'Abd Allāh created a new military corps, the *mulazimiyah*, of whose loyalty he felt confident.

But in 1896 Anglo-Egyptian forces began their reconquest of the Sudan. Although 'Abd Allāh resisted for almost two years, he could not prevail against British machine guns. In September 1898 he was forced to flee his capital, Omdurman, but he remained at large with a considerable army. Many Egyptians and Sudanese resented the Condominium Agreement of January 1899, by which the Sudan became almost a British protectorate, and 'Abd Allāh hoped to rally support. But on Nov. 24, 1899, a British force engaged the Mahdist remnants, and 'Abd Allāh died in the fighting.

'Abd Allāh, in full 'ABD ALLĀH IBN 'ABD AL-'AZĪZ (b. c. 1923), king of Saudi Arabia from 2005.

One of King 'Abd al-'Azīz's 37 sons, 'Abd Allāh was named crown prince and first deputy prime minister in 1982. In 1995 King Fahd suffered a stroke, and 'Abd Allāh briefly served as regent in 1996. Although Fahd returned to power, 'Abd Allāh continued to run the country's daily affairs and became king after Fahd died in 2005.

'Abd Allāh sought strong ties with the West, especially the United States. Relations between the two countries grew strained in 2001 following the September 11 attacks (*q.v.*) and the later revelation that most of the attackers were Saudi nationals. Tensions also arose after 'Abd Allāh refused to support a U.S.-led attack on Iraq or to allow the use of Saudi military facilities for such an act. Domestically, reliance on oil revenue was of particular concern, and 'Abd Allāh introduced such economic reforms as limited deregulation, foreign investment, and privatization. He also faced growing violence within the country targeting the Sa'ūdī dynasty and the West.

'Abd Allāh, channel (*khawr*) separating Kuwait and Iraq, probably a drowned river mouth of the Shatt (stream) al-Arab, whose mouth is now farther north and forms the southeastern part of the border between Iraq and Iran. It extends into Iraqi territory in the form of the Khawr az-Zubayr, on which the Iraqi port of Umm Qaşr is located and which is linked by canal northwestward to the Tigris-Euphrates River System. The channel borders the northeastern coast of the Jazīrat (island) Būbiyān and the northern coast of Jazīrat Warbah. Both islands are generally considered to be part of Kuwait but are also claimed by Iraq.

'Abd Allāh ibn al-'Abbās, also called IBN ABBĀS, byname AL-ḤIBR ("the Doctor"), or AL-BAḤR ("the Sea") (b. c. 619—d. 687/688, at-Ṭā'if, Arabia), a Companion of the prophet Muḥammad, one of the greatest scholars of early Islām, and the first exegete of the Qur'ān.

In the early struggles for the caliphate, Ibn 'Abbās supported 'Alī and was rewarded with the governorship of Baṣra. Subsequently he defected. During the reign of Mu'āwīyah he lived in the Hejaz, but frequently traveled to Damascus, the capital. After the death of Mu'āwīyah, he opposed Ibn az-Zubayr, whom he refused to recognize as caliph, and was forced to flee to at-Ṭā'if, where he died.

Ibn 'Abbās is renowned for his knowledge of both sacred and profane tradition and for his critical interpretations of the Qur'ān. From his youth he gathered information concerning the words and deeds of Muḥammad from other Companions and gave classes on interpretation of the Qur'ān, his commentaries on which were later collected.

'Abd Allāh ibn al-Ḥusayn: *see* Abdullah.

'Abd Allāh ibn az-Zubayr (b. May 624, Medina, Arabia—d. November 692, Mecca), leader of a rebellion against the Umayyad ruling dynasty of the Islāmic empire, and the most prominent representative of the Muslim nobility of faith, which resented the Umayyad assumption of caliphal authority.

As a youth Ibn az-Zubayr went on many of the military campaigns that marked the initial expansion of Islām, and in 651 he was nominated by the caliph (the titular leader of the Islāmic empire) 'Uthmān to aid in compiling an official recension of the Qur'ān. Subsequently remaining politically inactive, he took little part in the civil wars that followed the death of 'Uthmān in 656. Resenting the Umayyad victory that was the eventual outcome of the civil wars, he refused to take an oath of allegiance to Yazīd, the son and heir presumptive of Mu'āwiyah, the first Umayyad caliph. When Yazīd became caliph in 680, Ibn az-Zubayr still refused the oath of allegiance and fled to Mecca. There he secretly gathered an army. Yazīd learned of this and dispatched forces of his own, which besieged Ibn az-Zubayr in Mecca. In 683 Yazīd died, and the besieging army withdrew. Ibn az-Zubayr was left in peace until 692, when the caliph 'Abd al-Malik sent an army to Mecca to force him to submit. Mecca was again besieged, and Ibn az-Zubayr was killed in the fighting.

'Abd Allāh ibn Lutf Allāh ibn 'Abd ar-Rashīd al-Bīhdādīnī Ḥāfiẓ-i Abrū: *see* Ḥāfiẓ-i Abrū.

Abd ar-Rahman, also called 'ABD AR-RAḤMĀN IBN HISHĀM (b. 1789/90—d. Aug. 28, 1859, Meknès, Mor.), sultan of Morocco (1822–59) who was the 24th ruler of the 'Alawī dynasty. His reign was marked by both peaceful and hostile contacts with European powers, particularly France.

Having succeeded to the throne without internal conflict, Abd ar-Rahman became an able administrator and active builder of public works. During his long reign his authority was often challenged by dissident tribes and disaffected notables; he suppressed revolts in 1824, 1828, 1831, 1843, 1849, and 1853.

The more serious challenge to his kingdom came from abroad. The traditional policy of the 'Alawīs of encouraging piracy to raise funds led to conflict with the European powers. As a reprisal for seizing their ships, the English blockaded Tangier, and the Austrians bombarded the ports of Arzila, Larache (al-'Arā'ish), and Tétouan. The port of Salé was bombarded in 1851, again as a reprisal for Moroccan piracy. Abd ar-Rahman attempted to expand his influence eastward by supporting Abdelkader, leader of Algerian resistance against the French. This policy led to a disastrous war with France in 1844. By the Treaty of Tangier, October 1844, Abd ar-Rahman was obliged to recognize France's dominant position in Algeria. During his reign, however, he also signed a number of commercial treaties with the European powers, and he preserved Moroccan independence by his astute diplomacy.

'Abd ar-Raḥmān I, also called AD-DĀKHIL RAḤMĀN (fl. 750–788), member of the Umayyad ruling family of Syria who founded an Umayyad dynasty in Spain.

When the 'Abbāsids overthrew the Umayyad caliphate in 750 and sought to kill as many members of the Umayyad family as possible, 'Abd ar-Raḥmān fled, eventually reaching Spain. The Iberian Peninsula had for some time been occupied by Muslim Arab forces, and he recognized political opportunity for himself in the rivalries of the Qais and Yaman, the dominant Arab factions there. By shifting alliances and using mercenary support, he placed himself in a position of power, attacking and defeating the Governor of al-Andalus

in 755 and making Córdoba his capital. As news of his success spread eastward, men who had previously worked in the Umayyad administrative system came to Spain to work with 'Abd ar-Raḥmān, and his administrative system came to resemble that formerly operative in Damascus.

'Abd ar-Raḥmān secured his realm against external attack by defeating armies sent by Charlemagne and the 'Abbāsīd caliph. Although he faced a series of rebellions by Muslim Spaniards, Berbers from the mountainous areas, and various Arab clans, his authority and dynasty remained firmly in power.

'Abd ar-Raḥmān II, fourth Umayyad ruler of Muslim Spain who enjoyed a reign (822–852) of brilliance and prosperity, the importance of which has been underestimated by some historians.

'Abd ar-Raḥmān II was the grandson of his namesake, founder of the Umayyad dynasty in Spain. His reign was an administrative watershed. As the influence of the 'Abbāsīd Caliphate, then at the peak of its splendour, grew, Córdoba's administrative system increasingly came into accord with that of Baghdad, the 'Abbāsīd capital. 'Abd ar-Raḥmān carried out a vigorous policy of public works, made additions to the Great Mosque in Córdoba, and patronized poets, musicians, and men of religion. Although palace intrigues surrounded his death in 852, they did not diminish his accomplishments.

'Abd ar-Raḥmān III, byname AN-NĀṢIR LIDĪN ALLĀH (Arabic: Victor for the Religion of Allah), in full 'ABD AR-RAḤMĀN IBN MUḤAMMAD IBN 'ABD ALLĀH IBN MUḤAMMAD IBN 'ABD AR-RAḤMĀN IBN AL-ḤAKAM AR-RABḌĪ IBN HISHĀM IBN 'ABD AR-RAḤMĀN AD-DĀKHIL (b. January 891—d. Oct. 15, 961, Córdoba), first caliph and greatest ruler of the Umayyad Arab Muslim dynasty of Spain. He reigned as hereditary *amīr* (prince) of Córdoba from October 912 and took the title of caliph in 929.

Accession as amīr. 'Abd ar-Raḥmān succeeded his grandfather 'Abd Allāh as *amīr* of Córdoba in October 912 at the age of 21. Because of his intelligence and character he had been the obvious favourite of his grandfather, who had designated him heir presumptive in preference to the other royal princes. In appearance he is described as having been light-skinned, handsome, thickset, and short-legged. He appeared to be very short when he walked but was imposing on horseback.

Public homage was paid to him in Córdoba immediately after his accession. He set about at once and with great energy to restore the authority of Córdoba in Spain—an authority that had been curtailed during the latter years of the reign of his grandfather by a host of rebels entrenched in mountain forts throughout the land. Ten days after his accession he had the head of the first rebel exhibited in Córdoba. Thereafter, for a score or so of years, he led almost annual expeditions against the rebels, first in southern and later in central and eastern Spain.

His greatest enemy was a crypto-Christian rebel, 'Umar ibn Ḥafṣūn, lord of Bobastro. 'Abd ar-Raḥmān's strategy was one of continuous harassment of Ibn Ḥafṣūn's forts. Beginning with the campaign of Monteleón, 'Abd ar-Raḥmān captured 70 forts in the provinces of Elvira, Granada, and Jaén—all of which had been directly or indirectly controlled by Ibn Ḥafṣūn. In 913 Seville was captured, followed by Algeciras, Rayyu, Sidonia, and Carmona. When Ibn Ḥafṣūn died in 917, the rebellion collapsed. His children were captured or killed, and the centre of the rebellion, Bobastro, was finally stormed in 928. In 933 Toledo fell after a bitter siege, and, with its fall, the last Muslim centre of resistance to Córdoba hegemony disappeared.

Campaigns against the Christians. Meanwhile, 'Abd ar-Raḥmān also had to check threats from the Christian north. The main danger came from the Kingdom of Leon. An expedition commanded by Ordoño II, then vassal king of Galicia and later king of Leon, into Muslim territory in the summer of 913, especially his sack of Evora (Talavera) and the massacre of its Muslim population, produced widespread resentment in Muslim Spain. 'Abd ar-Raḥmān decided to counterattack, which he began in earnest in 920, leading the campaign of Muez in person. He captured the forts of Osma and San Esteban de Gormaz and then inflicted a crushing defeat on the combined armies of Leon and Navarre at Valdejunquera on July 26, 920. Four years later, in the spring of 924, he led another campaign into Navarre and sacked the capital, Pamplona. With these two campaigns, 'Abd ar-Raḥmān was able to secure his frontiers with Christian Spain for the next seven years. But the next king of Leon, Ramiro II, who ascended the throne in 932, proved a formidable adversary and began immediately to mount attacks against Muslim territory. The encounter between the two rulers finally took place in 939, when, at the so-called ditch of Simancas (Shānt Mānkus), Ramiro severely defeated the Muslims, and 'Abd ar-Raḥmān narrowly escaped with his life. After that defeat 'Abd ar-Raḥmān resolved never to take personal charge of another expedition. The Christian victory, however, was not followed up. When Ramiro died in 950 and civil war broke out in the Christian territories, 'Abd ar-Raḥmān made good his earlier losses so thoroughly that in 958 Sancho, exiled king of Leon, Garcia Sánchez, king of Navarre, and his mother, Queen Toda, all paid personal homage to 'Abd ar-Raḥmān in Córdoba.

In North Africa the policy of 'Abd ar-Raḥmān was directed against the Fāṭimids in al-Qayrawān (now in modern Tunisia). In order to check their control over North Africa he financed rebellions against them and sent naval expeditions to sack the coastal cities. The city of Ceuta was fortified in 931 as a base of operations in North Africa. Toward the end of his reign, however, Fāṭimid power increased, and the Fāṭimid general Jawhar was able to repulse the allies of 'Abd ar-Raḥmān. The struggle with the Fāṭimids, however, was inconclusive and was to continue throughout the 10th century.

As a result of his early successes, and probably at his own suggestion, some of his court poets urged 'Abd ar-Raḥmān to adopt the title of caliph. He assumed that dignity in 929, shortly after the fall of Bobastro, and chose the honorific title an-Nāṣir li-Dīn Allāh (He Who Fights Victoriously for the Religion of God). His reasons were, internally, to enhance his prestige and, externally, to counter the Fāṭimid claim to this honour.

Significance. The consolidation of power brought great prosperity to Muslim Spain—one indication of which was his building of a mint where pure gold and silver coins were struck. 'Abd ar-Raḥmān was also a great builder; he renovated and added considerably to the Great Mosque at Córdoba and to the royal palace. At vast expense he built a new royal city, Madīnat az-Zahrā', to house his household and government. He kept a very strict control over the affairs of state and his civil service, changing his governors frequently to avoid the growth of local dynasties. In 949 he executed his own son for conspiring against him.

Christian and Jewish communities flourished during his tolerant reign. His fame spread so far beyond his domains that Córdoba by the end of his reign enjoyed almost as much fame as Constantinople in the Mediterranean

world. In Córdoba he received emissaries from such distant rulers as Otto I of Germany and the Byzantine emperor. Córdoba was said to have contained 3,000 mosques and more than 100,000 shops and houses. His reign, the second longest of any Muslim caliph, afforded his wise and courageous policies the fullest chance of development. (T.Kh.)

Abd el-Kader (Algerian leader): see Abdelkader.

Abd el-Krim, in full MUHAMMAD IBN 'ABD AL-KARIM AL-KHAṬṬĀBĪ (b. 1882, Ajdir, Mor.—d. Feb. 6, 1963, Cairo, Egypt), leader of a resistance movement against Spanish and French rule in North Africa and founder of the short-lived Republic of the Rif (1921–26). A skilled tactician and a capable organizer, he led a liberation movement that made him the hero of the Maghrib (northwest Africa). A precursor of the anticolonial struggle for independence, Abd el-Krim was defeated only by the military and technological superiority of the colonial powers.

Son of an influential member of the Berber tribe Banū Uriaghel, Abd el-Krim received a Spanish education in addition to the traditional Muslim schooling. He was employed as a secretary in the Bureau of Native Affairs. In 1915 he was appointed the *qāḍī al-quḍāt*, or chief Muslim judge, for the district of Melilla, where he also taught at a Hispano-Arabic school and was the editor of an Arabic section of *El Telegrama del Rif*.

During his employment with the Spanish protectorate administration he began to be disillusioned with Spanish rule, eventually opposed Spanish policies, and was imprisoned. He escaped and in 1918 was made chief Muslim judge at Melilla again, but he left the post in 1919 to return to Ajdir.

Soon Abd el-Krim, joined by his brother, who later became his chief adviser and commander of the Rif army, was organizing tribal resistance against foreign domination of Morocco. In July 1921 at Annoual he defeated a Spanish army and pursued it to the suburbs of Melilla. At that time the Republic of the Rif was founded with Abd el-Krim as its president. Overcoming tribal rivalries, he began organizing a centralized administration based upon traditional Berber tribal institutions. He defeated another Spanish army in 1924; in 1925 he almost reached the ancient city of Fès in his drive against French forces that had captured his supply base in the Wargha valley.

Faced with Abd el-Krim's successes and seeing in his movement a threat to their colonial possessions in North Africa, the Franco-Spanish conference meeting in Madrid decided upon joint action. As a Spanish force landed at Alhucemas near Ajdir, a French army of 160,000 men under Marshal Philippe Pétain attacked from the south. Confronted with this combined Franco-Spanish force of 250,000 men with overwhelming technological superiority, Abd el-Krim surrendered on May 27, 1926, and was exiled to the island of Réunion in the Indian Ocean. Receiving permission in 1947 to live in France, he left Réunion and was granted political asylum en route by the Egyptian government; for five years he presided over the Liberation Committee of the Arab West (sometimes called the Maghrib Bureau) in Cairo. After the restoration of Moroccan independence, King Muhammad V invited him to return to Morocco, which he refused to do as long as French troops remained on North African soil.

'**Abd-uṣ-Ṣamad, Khwāja** (b. Shirāz, Iran; fl. 16th century), Persian painter who, together with Mīr Sayyid 'Alī, was one of the first members of the imperial atelier in India and is thus credited with playing a strong part in the foundation of the Mughal school of miniature painting (see Mughal painting).

'Abd-uṣ-Ṣamad was born into a family of good social standing in Iran, and he had already gained a reputation as a calligrapher as well as a painter when he met the Mughal emperor Humāyūn, who was in exile in Iran. At Humāyūn's invitation, he followed him to India in 1548, first to Kābul and later to Delhi. He instructed both Humāyūn and his young son, the future emperor Akbar, in drawing. Among his students while he was superintendent of Akbar's atelier were Dasvant and Basāvan, Hindus who became two of the most renowned Mughal painters. 'Abd-uṣ-Ṣamad received many honours from Akbar. In 1576 he was appointed master of the mint, and in 1584 at the end of his career he was made dewan (revenue commissioner) of Multān.

Among 'Abd-uṣ-Ṣamad's greatest achievements was the supervision, together with his fellow Persian Mīr Sayyid 'Alī, of a large part of the illustrations of the *Dāstān-e* ("Stories of") *Amīr Ḥamzeh*, a series that numbered about 1,400 paintings, all of unusually large size. As none of the paintings is signed, it is not certain whether he himself did any of them. Among the miniatures bearing his signature is one in the Royal Library in the Golestān Palace, Tehrān, depicting Akbar presenting a miniature to his father, Humāyūn. The work, though Persian in its treatment of many details, hints of the Indian style to come, evident in the realistic presentation of the life of the court. A more thoroughly Indianized version of 'Abd-uṣ-Ṣamad's painting style is found in an illustrated manuscript of the *Khamseh* of Neẓāmī dated 1595, now part of the collection of the British Museum.

Abdālī: see Durrānī.

'**Abdali sultanate**, former semi-independent state in the southern Arabian Peninsula, in what is now Yemen. Located just north of Aden city, it was one of the most important tribal areas of the Aden Protectorate, which was the forerunner of independent Yemen (Aden); its capital was Lahij. The sultanate was earlier tributary to western Yemen (*i.e.*, Yemen [Ṣan'ā']) but gained its independence in 1728. The 'Abdali tribal people then seized Aden and remained independent until 1839, when they signed the first of several treaties with the British that led to the formation of the Aden Protectorate. The sultanate was held by the Turks during World War I. The Ṣubayḥī (Subeihi) tribal area to the west came under 'Abdali jurisdiction in 1948, and the sultanate became part of Yemen (Aden) in 1967 and of the unified Yemen in 1990. The lands comprise a fertile area that has a settled population and produces fruit, grain, and other crops.

Abdallah (Arabic personal name): see under 'Abd Allāh, or Abdullah.

Abdelkader, also spelled ABD EL-KADER, or ABDUL-QADIR, Arabic in full 'ABD AL-QĀDIR IBN MUḤĪY AD-DĪN IBN MUṢṬAFĀ AL-ḤASANĪ AL-JAZĀ'IRĪ (b. Sept. 6, 1808, Guetna, near Mascara, Alg.—d. May 26, 1883, Damascus, Syria), *amīr* of Mascara (from 1832), the military and religious leader who founded the Algerian state and led the Algerians in their 19th-century struggle against French domination (1840–46).

Early career. His physical handsomeness and the qualities of his mind had made Abdelkader popular even before his military exploits. Of medium height, lithe and elegant, with regular features and a black beard, his demeanour was exceptionally refined, and his life-style simple. He was known as a religious and educated man who could excite his co-religionists with his poetry and oratorical eloquence.

Algeria was an Ottoman regency when the French army landed there in 1830. The government was controlled by a dey (governor) and by the Turkish Janissaries who had chosen him. These rulers, supported by the Koulouglis (people of mixed Turkish and Algerian ancestry) and by certain privileged tribes, and aided by the fact that they were of the same religion as the people, long held Algeria firmly in their grip.

Nevertheless, the Algerians detested them, and there were continual rebellions in the early 19th century. As a result, the country was left too divided to oppose the French invaders.

The western tribes laid siege to French-occupied Oran and tried to organize themselves, unified by their common Muslim religious sentiment, which was cultivated by the schoolmasters and particularly by members of the religious brotherhoods. The leader of one of the brotherhoods, Mahieddin, director of the *zāwiyah* (religious school) near Mascara, was asked to lead the harassment of the French troops in Oran and Mostaganem.

In November 1832 the aging Mahieddin had his young son Abdelkader elected in his place. The youth, already renowned for his piety and military prowess, took over the war of harassment. The ensuing Desmichels Treaty of 1834 gave him the whole interior of the Oran, with the title commander of the believers. In a move to unify his new territories, Amīr Abdelkader, taking advantage of this treaty, imposed his rule on all the tribes of the Chelif, occupied Miliana and then Médéa, and succeeded in defeating General Camille Trézel at Macta. Although pressed by generals Bertrand Clauzel and T.R. Bugeaud, he managed to rally support from Algerians who had become indignant over the French use of violence. By able negotiation, he convinced General Bugeaud to sign the Treaty of Tafna (1837), which further increased his territory and made him master of the whole interior of Oran and the Titteri, with the French having to be content with a few ports.

Creation of a new state. In two years Abdelkader had organized a true state, the capital of which was sometimes Mascara and sometimes the fortress of Tiaret (now Tagdempt). He established juridical equality among population groups by suppressing the privileges of the warlike tribes (*makhzen*) and by imposing equal taxes on all his subjects. First he extended his influence to the Sahara by fighting at-Tijini, who dominated the southern oases, and rallying the desert peoples to him. Then he strengthened his authority in the valley of the Chelif and in the Titteri as far as the borders of the province of the east, where he was resisted by the bey of Constantine, Hajj Ahmed. He also exacted harsh punishment of the Koulouglis of Zouatna, who had joined the French. By the winter of 1838, his authority extended across the borders of Kabylie and, in the south, from the oasis of Biskra to the Moroccan border. To destroy the power of at-Tijini, he besieged his capital, Ain Mahdi, for six months and demolished it, while all the Saharan tribes paid him homage.

Abdelkader was an absolute leader who only rarely called in the *grandees* to advise him. Algerian religious sentiment was his support, the one force that could bring his subjects together and unify them in the face of the invader. But that did not prevent him from employing competent persons of all nation-

alities, whether Jews or Christians, to help him build a modern state. The best known of these Europeans was the future diplomat Léon Roches, who later recounted his adventures in a fanciful book, *Trente-deux ans à travers l'Islam* ("Thirty-two Years Through Islām"). Abdelkader organized a regular army of approximately 2,000 men, to be supported by either volunteers or contingents furnished by the tribes. As towns near French territory would have been too vulnerable, he fortified interior sites, such as Sebdou, Saïda, Tiaret, Taza, and Boghar, where he opened arsenals, warehouses, and workshops, and where he stored surplus crops whose sales were to finance his arms purchases, mainly in England. He set up a new administration, with officials on fixed salaries. He taught his people austerity and set a personal example, living without ceremony in a tent. By expanding education, he slowly spread the concepts of independence and nationality to his people.

When the columns of the Duc d'Orléans crossed the Iron Gates, the Amīr took it as a violation of the territories granted him by the Treaty of Tafna. Even though he was still far from having completed his own work of organization, he made a surprise attack and destroyed the French colonization of the Mitidja Plain. From then on the war languished until General Bugeaud was named governor general in 1840. Bugeaud convinced the French government to arm him for the conquest of all Algeria. The resulting war was bitter and lasted seven years. The Amīr avoided big battles, preferring to use his rifle-armed cavalry in incessant skirmishes, from which it would retreat almost as soon as it had fired. But he was fighting a French army composed of infantry organized by Bugeaud into extremely mobile columns, and he had to contend with the devastation of the countryside practiced by Bugeaud and his lieutenants so as to force the starving inhabitants to desert their leader.

In 1841 the French destroyed the Amīr's fortified sites, and he was forced to become a nomad in the interior of Oran. The following year he lost Tlemcen, and communication with his Moroccan allies became difficult. Yet, despite further reverses and French penetration in the south, he succeeded in reaching Morocco. But after Bugeaud's defeat of the Moroccans at Isly, the Sultan was forced to hold Abdelkader in the midst of his empire. The Amīr, however, proved to have unflagging energy. Taking advantage of a revolt in the Dahra, he reentered Algeria, took the Sidi Brahim outpost, and penetrated deep into the interior, all the while escaping the pursuing French columns.

Surrender to the French. In July 1846, with only a handful of men left, Abdelkader again took refuge in Morocco, the Sultan of which by then considered him to be a burden. Deprived of this last area of support, Abdelkader returned to Algeria and with great dignity turned himself over to Gen. Christophe de Lamoricière and to Bugeaud's successor, King Louis-Philippe's son, the Duc d'Aumale, who promised him transport to the East.

Louis-Philippe, however, failed to respect his son's promise. Abdelkader was held prisoner in France, first at the Château de Pau, where he learned the principles of Freemasonry, and later at Amboise. It was the prince-president Louis-Napoléon who, in 1852, authorized his return to Bursa and then to Damascus, where he led an exemplary life and wrote *Rappel à l'intelligent, avis à l'indifférent* ("Call to the Intelligent, Warning to the Indifferent"). The French government provided him with a large pension and with a Kabyle guard and even attempted to obtain a throne for him somewhere between Turkey and Egypt, which they wished to remove from Ottoman control. At the time of the 1871 Algerian insurrection, he disowned one of his sons who had tried to arouse the tribes of southern Constantine.

When he died, he was respected by all. French efforts to make him the symbol of Algerian support for colonial rule were erroneous. Abdelkader believed he was carrying out God's will in admitting that his political role had ended. Present-day Algerians consider him to be the greatest hero of their people.

Abdera, in ancient Greece, town on the coast of Thrace near the mouth of the Néstos River. The people of Teos, evacuating Ionia when it was overrun by the Persians under Cyrus (c. 540 BC), succeeded in establishing a colony there that developed a brisk trade with the Thracian interior. Abdera was a prosperous member of the Delian League in the 5th century BC but was crippled early in the 4th century BC by Thracian incursions and declined sharply in importance. The philosophers Protagoras and Democritus were citizens of Abdera. The site is occupied by the modern town of Ávdhira, Greece.

abdominal cavity, largest hollow space of the body. Its upper boundary is the diaphragm, a sheet of muscle and connective tissue that separates it from the chest cavity; its lower

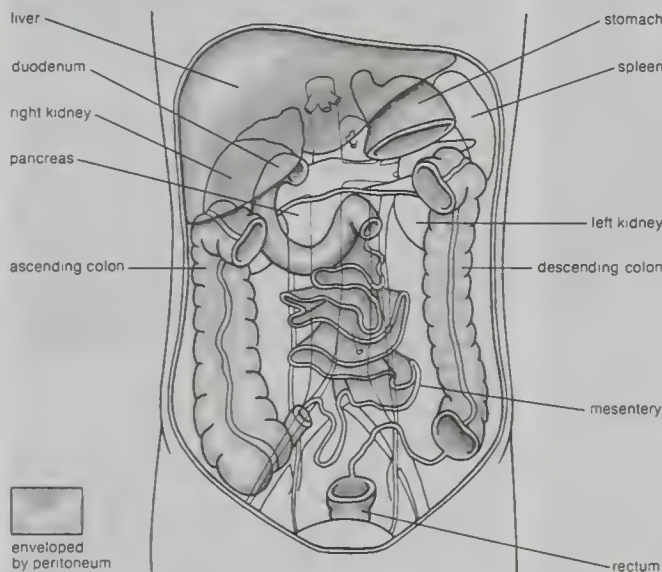

is located behind the stomach and is connected to the rest of the peritoneal cavity, the greater sac, by the foramen (opening) of Winslow.

Some of the viscera are attached to the abdominal walls by broad areas of the peritoneum, as is the pancreas. Others—e.g. the liver—are attached by folds of the peritoneum and ligaments, usually poorly supplied by blood vessels.

The peritoneal ligaments are actually rather strong peritoneal folds, usually connecting viscera to viscera or viscera to the abdominal wall; their name usually derives from the structures connected by them (e.g., the gastrocolic ligament, connecting the stomach and the colon; the splenocolic ligament, connecting the spleen and the colon), or from their shape (e.g., round ligament, triangular ligament).

The mesenteries are folds of peritoneum that are attached to the wall of the abdomen and enclosing viscera. They are richly supplied with vessels that carry blood to or from the organs they enfold. The three most important mesenteries are the mesentery for the small intestine; the transverse mesocolon, which attaches the transverse portion of the colon to the back wall of the abdomen; and the mesosigmoid, which enfolds the sigmoid portion of the colon.

The omenta are folds of peritoneum enclosing nerves, blood vessels, lymph channels, and fatty and connective tissue. There are two

Abdominal cavity, showing relationship of the peritoneum and the abdominal viscera

boundary is the upper plane of the pelvic cavity. Vertically it is enclosed by the vertebral column and the abdominal and other muscles. The abdominal cavity contains the greater part of the digestive tract, the liver and pancreas, the spleen, the kidneys, and the adrenal glands located above the kidneys.

The abdominal cavity is lined by the peritoneum, a membrane that covers not only the inside wall of the cavity (parietal peritoneum) but also every organ or structure contained in it (visceral peritoneum). The space between the visceral and parietal peritoneum, the peritoneal cavity, is a potential space only, normally containing a small amount of serous fluid that permits free movement of the viscera inside the peritoneal cavity. This motion is particularly true of the gastrointestinal tract. The peritoneum, by connecting the visceral with the parietal portions, assists in the support and fixation of the abdominal organs. The diverse attachments of the peritoneum divide the abdominal cavity into several compartments, of which the compartment called the lesser sac is of particular importance; it

contains the greater omentum hangs down from the small intestine like an apron; the lesser omentum is much smaller and extends between the stomach and the liver.

The presence of fluid in the peritoneal cavity (a condition known as ascites) is not noticeable until such a volume is attained as to distend the abdomen. The accumulation of fluid will produce pressure against the abdominal viscera and veins and also against the thoracic cavity by pressing upon the diaphragm. Treatment is directed toward alleviation of the cause. Decrease in portal vein pressure in many cases relieves the ascites that accompanies cirrhosis. Chylous ascites is best treated by closure of the leaking lymphatic vessel. Adequate treatment of heart failure will usually produce regression of the ascites that the heart failure has caused.

Peritonitis, another disorder, is usually secondary to an inflammatory process elsewhere, which may come from an adjacent structure or organ; may be introduced from the outside by surgery or by injury; may come from organs in the abdomen; or may be borne

by the bloodstream or the lymphatics. The most common origin of peritonitis is the gastrointestinal tract. Peritonitis may be acute or chronic, generalized or localized, and may be due to one agent or to a number of them. It is secondary to perforation of the intestines, for example. The severity of the reactions is related, at least in part, to the extent of the peritoneal contamination. In localized peritonitis, the surrounding structures, mainly the greater omentum, will enclose the infected area and temporarily control the infection. If no treatment is started, the infection may progress throughout the entire abdominal cavity. Often the period in which the peritonitis is localized is short, and the peritoneal inflammation becomes generalized with great rapidity.

Control of the source of inflammation, either by surgical or by medical means, is followed by remission of all evidence of peritoneal inflammation or infection or by formation of localized abscesses inside of the peritoneal cavity. Antibiotic therapy has considerably decreased the incidence of the latter complication. When an abscess does develop, antibiotic therapy and adequate external drainage are necessary. The most frequent sites for development of abscesses are the spaces between the diaphragm and the pelvic cavity.

abdominal muscle, any of the muscles of the anterolateral walls of the abdominal cavity, composed of three flat muscular sheets, from without inward: external oblique, internal oblique, and transverse abdominis, supplemented in front on each side of the midline by rectus abdominis.

For a depiction of the abdominal muscles in human anatomy, shown in relation to other parts of the body, see the colour Trans-Vision in the PROPÆDIA: Part Four, Section 421.

The first three muscle layers extend between the vertebral column behind, the lower ribs above, and the iliac crest and pubis of the hip bone below. Their fibres all merge toward the midline, where they surround the rectus abdominis in a sheath before they meet the fibres from the opposite side at the linea alba. Strength is developed in these rather thin walls by the crisscrossing of fibres. Thus, the fibres of the external oblique are directed downward and forward, those of the internal oblique upward and forward, and those of the transverse horizontally forward.

Around the rectus abdominis, which extends from the pubis upward to the ribs, the above muscles are all fibrous. In the region of the groin, between the pubic bone and the anterior superior iliac spine, a specialized arrangement of these fibres permits the formation of the inguinal canal, a passage through the muscular layers. This develops at birth as the testes descend out of the abdominal cavity through its wall into the scrotum. In the female this is replaced by a fibrous cord from the uterus. This gap is a potentially weak area where inguinal hernias can occur.

The muscles of the abdominal walls perform a variety of functions: (1) They provide a tonic, elastic muscular support for the viscera and, by their recoil, pull down the rib cage in expiration. (2) They contract against blows to form a rigid protective wall for the viscera. (3) When the glottis is closed and the thorax and pelvis are fixed, these muscles take part in the expulsive efforts of urination, defecation, childbirth, vomiting, and of singing and coughing. (4) When the pelvis is fixed, they initiate the movement of bending the trunk forward. Thereafter, gravity comes into play, the abdominal muscles relax, and the muscles of the back then take on the strain. (5) Conversely, the abdominal muscles come into play in preventing hyperextension. (6) When the thorax is fixed, the abdominal muscles can

pull up the pelvis and lower limbs. (7) The muscles of one side can bend the vertebral column sideways and assist in its rotation.

‘Abdor Raḥmān Khān (b. c. 1844, Kābul, Afg.—d. 1901, Kābul), *amir* of Afghanistan (1880–1901) who played a prominent role in the fierce and long-drawn struggle for power waged by his father and his uncle, A‘zam Khān, against his cousin Shīr ‘Alī, the successor of Dōst Moḥammad Khān.

‘Abdor Raḥmān was the son of Afzal Khān, whose father, Dōst Moḥammad Khān, had established the Barakzāi dynasty in Afghanistan. Shīr ‘Alī’s victory in 1869 drove ‘Abdor Raḥmān into exile in Russian Turkistan, where he lived at Samarkand until Shīr ‘Alī’s death in 1879, a year after the outbreak of the war between the British and the Afghans. ‘Abdor Raḥmān returned to Afghanistan in 1880, was heartily welcomed by his people, and remained in northern Afghanistan until the British negotiated a settlement recognizing ‘Abdor Raḥmān as *amir* in return for his acknowledgment of the British right to control his foreign relations. ‘Abdor Raḥmān pacified the country and consolidated his authority. During the years 1880–87, he crushed a revolt by the powerful Ghilzai tribe and an unexpected rebellion led by his cousin Ishāq Khān; he also decisively defeated Shīr ‘Alī’s son Ayūb, who raided intermittently from his base in Herāt.

‘Abdor Raḥmān’s reign is notable for the agreement reached on the demarcation of Afghanistan’s northwestern border with Russia, the result of talks held near Kābul in 1893 with a British delegation led by Sir Mortimer Durand, under which ‘Abdor Raḥmān accepted the Durand line as his frontier, relinquishing some hereditary rights over the tribes on the eastern border.

‘Abdor Raḥmān also reorganized the administrative system of the country and initiated internal reforms. He brought in foreign experts, imported machinery for making munitions, introduced manufacture of consumer goods and new agricultural tools, and established Afghanistan’s first modern hospital. He imposed an organized government upon a divided population and maintained the balance in dealing with the British in India and the Russian Empire.

Abdu (city, ancient Egypt): see Abydos.

abduction, in law, the carrying away of any female for purposes of concubinage or prostitution. The taking of a girl under a designated age for purposes of marriage is in most jurisdictions also included in the crime of abduction. Abduction is generally regarded as a form of kidnapping (*q.v.*).

abductor muscle, any of the muscles that cause movement of a limb away from the mid-plane of the body or away from a neighbouring part or limb (*compare* adductor muscles), as in raising the arms to the side (effected by the deltoideus muscle) or spreading the fingers or toes. In man certain muscles of the hands and feet are named for performing this function. In the hand, the abductor digiti minimi manus acts upon the little finger, and both the abductor pollicis longus and abductor pollicis brevis act upon the thumb. The corresponding foot muscles are the abductor digiti minimi pedis and the abductor hallucis, which act on the little and great toes, respectively.

‘Abduh, Muḥammad (b. 1849, Nile Delta area, Egypt—d. July 11, 1905, near Alexandria), religious scholar, jurist, and liberal reformer, who led the late 19th-century movement in Egypt and other Muslim countries to revitalize Islāmic teachings and institutions in the modern world. As *muftī* (Islāmic legal counsellor) for Egypt (from 1899), he effected reforms in Islāmic law, administration, and higher education and, although resisted by

conservatives, broke the rigidity of Muslim ritual, dogma, and family ties. His writings include the “Treatise on the Oneness of God” and a commentary on the Qur’ān.

Life. ‘Abduh attended the mosque school in Tanṭā and subsequently al-Azhar University in Cairo, receiving the degree of *‘ālum* (scholar) from the latter in 1877. After an early infatuation with mysticism, in 1872 he fell under the influence of Jamāl ad-Din al-Afghānī, the revolutionary pan-Islāmic preacher of Persian origin who had settled in Cairo and who stimulated ‘Abduh’s interest in theology, philosophy, and politics. In punishment for political activity, Afghānī was expelled from Egypt in 1879 and ‘Abduh was exiled to his village, but the next year ‘Abduh’s fortunes changed. He became editor of the government’s official gazette, which he made a platform for preaching resistance to Anglo-French political encroachment and the need for social and religious reform. He was implicated in ‘Urābī Pasha’s rebellion against foreign control in 1882 and, following the British military occupation of Egypt, was exiled. Rejoining Afghānī in Paris for several months in 1884, ‘Abduh helped his mentor publish the revolutionary journal *al-Urwat al-wuḥqā* (“The Firmest Bond”), which was smuggled to Egypt, India, and elsewhere. After brief visits to England and Tunisia, ‘Abduh settled for three years in Beirut and taught in an Islāmic college there. In 1888 ‘Abduh was permitted to return to Egypt, where he began a judicial career that spanned the rest of his life. He was appointed a judge in the National Courts of First Instance, then in 1891 at the Court of Appeal; in 1899, with British help, he became *muftī* of Egypt. In the latter post he effected several reforms in the administration of Islāmic law and of religious endowments. He also issued advisory opinions to private petitioners, including such controversially liberal judgments as the permissibility of eating meat slaughtered by Christian and Jewish butchers and of accepting interest paid on loans. ‘Abduh also lectured at al-Azhar and, against much conservative opposition, induced reforms in the administration and curriculum of that ancient institution. He established a benevolent society that operated schools for poor children. He served on the Legislative Council, preaching political cooperation with Britain and a long-term effort to bring about legal and educational reforms in Egypt; these views, differing markedly from those he had espoused earlier in life under Afghānī’s influence, earned him the approval of Lord Cromer, the British Resident, but also the hostility of the khedive (ruling prince) ‘Abbās Hilmī and of the nationalist leader Mustafā Kāmil. Late in life ‘Abduh learned French and pursued an interest in European thought.

Achievements. In addition to his numerous articles in the official gazette and *al-Urwat al-wuḥqā*, ‘Abduh’s most important writings included *Risālat al-tawḥīd* (“Treatise on the Oneness of God”); a polemic on the superiority of Islām to Christianity in its inherent receptivity to science and civilization; and a fragmentary commentary on the Qur’ān, completed after his death by a disciple. In theology ‘Abduh sought to establish the harmony of reason and revelation, the freedom of the will, and the primacy of the ethical implications of religious faith over ritual and dogma. He deplored the blind acceptance of traditional doctrines and customs and asserted that a return to the pristine faith of the earliest age of Islām not only would restore the Muslims’ spiritual vitality but would provide an enlightened criterion for the assimilation of modern scientific culture.

In matters of Islāmic law, which governed Muslim family relationships, ritual duties, and personal conduct, ‘Abduh tried to break through the rigidities of scholastic interpretation and to promote considerations of equity,

welfare, and common sense, even if this occasionally meant disregarding the literal texts of the Qur'an. From his death to the present day, 'Abduh has been widely revered as the chief architect of the modern reformation of Islâm.

(M.H.K.)

BIBLIOGRAPHY. Charles C. Adams, *Islam and Modernism in Egypt: A Study of the Modern Reform Movement Inaugurated by Muḥammad 'Abduh* (1933, reprinted 1968), is a classic work that deals at length with Rashîd Ridâ and other followers of 'Abduh. A substantial analysis of 'Abduh's thought and legacy is found in Malcolm H. Kerr, *Islamic Reform: The Political and Legal Theories of Muḥammad 'Abduh and Rashîd Ridâ* (1966). Elie Kedourie, *Afghani and 'Abduh* (1966), portrays 'Abduh as a clandestine religious and political subversive.

Abdul (Arabic personal name, combining form): *see under* 'Abd al-.

Abdul-Jabbar, Kareem, also called (until 1971) **LEW ALCINDOR**, byname of **FERDINAND LEWIS ALCINDOR, JR.** (b. April 16, 1947, New York, N.Y., U.S.), collegiate and professional basketball player, who as a 7-foot 1³/₈-inch centre dominated the game throughout the 1970s and early '80s.

Alcindor played for Power Memorial Academy (at 6 feet 8 inches) on the varsity for four years, and his total of 2,067 points set a New York City high school record. He entered the University of California at Los Angeles (UCLA) in 1965 and set a UCLA scoring record with 56 points in his first game. He helped lead UCLA to three National Collegiate Athletic Association championships (1966-68), and during his stay at UCLA the team lost only two games.

Alcindor joined the National Basketball Association (NBA) Milwaukee Bucks in 1969 and was rookie of the year in 1970. In 1971 the Bucks won the NBA championship, and Alcindor led in scoring (2,596 points) and game point average (31.7); he also led in these statistics in 1972 (2,822 points; 34.8). In 1971 Alcindor, who had converted to Islâm while at UCLA, took his Arabic name. In 1975 he was traded to the Los Angeles Lakers, who won the NBA championship in 1980, 1982, 1985, 1987, and 1988. In 1984 he surpassed Wilt Chamberlain's career scoring total of 31,419 points. Abdul-Jabbar retired at the end of the 1988-89 season, having been voted Most Valuable Player a record six times. By the end of his extraordinarily long career, he had set NBA records for most points (38,387), most field goals made (15,837), and most minutes played (57,446). He was elected to the Basketball Hall of Fame in 1995.

Abdul Rahman, Tuanku (King) (b. Aug. 24, 1895, Sri Menanti, Malaya [now Malaysia]—d. April 1, 1960, Kuala Lumpur), first supreme chief of state of the Federation of Malaya. After the declaration of independence from Great Britain in 1957, the *tuanku* became the first head of state, or paramount ruler, elected by and from the Malay rulers for a five-year term. Abdul Rahman died before completion of his term.

The son of Tuanku Mohammed, ruler of the state of Negri Sembilan, Abdul Rahman in 1925 accompanied his father to England, where he remained to study law; he was called to the bar from the Inner Temple in 1928. After returning to Malaya, he held a variety of posts in the civil service. On the death of his father in 1933, he succeeded to the throne of Negri Sembilan.

Abdul Rahman was a retiring and kindly man who learned from his father a deep respect for constitutional law and a sympathy for his people. (He should not be confused with Tunku Abdul Rahman, who was independent Malaya's first prime minister.)

Abdul Rahman Putra Alhaj, Tunku (Prince) (b. Feb. 8, 1903, Alor Star, Kedah,

Malaya [now Malaysia]—d. Dec. 6, 1990, Kuala Lumpur, Malaysia), first prime minister of independent Malaya (1957-63) and then of Malaysia (1963-70), under whose leadership the newly formed government was stabilized.

After studies in England (1920-31), Abdul Rahman returned to Malaya to enter the

Tunku Abdul Rahman

Camera Press

Kedah civil service. In 1947 he returned to England, was called to the bar in 1949, and was appointed a deputy public prosecutor in the Malayan Federal Legal Department, a post he resigned in 1951 to begin a political career. He became president of the United Malays National Organization (UMNO) and effected the alliance of UMNO with the Malayan Chinese Association (1951) and with the Malayan Indian Congress (1955). His Alliance Party won an overwhelming majority in the election of 1955, and Abdul Rahman became chief minister and home minister of Malaya.

The mission he led to London (January 1956) to negotiate for independence secured immediate internal self-government and the pledge of independence by August 1957. When Malaya became independent, he became its first prime minister and foreign minister, and he continued in that post when the federation of Malaysia was formed in 1963.

In September 1970, one year after the outbreak of riots between the Chinese and the Malays following an election in which the Chinese had made gains, Abdul Rahman relinquished his post as prime minister and was succeeded by Abdul Razak.

Abdul Razak bin Hussein, Tun Haji (b. March 11, 1922, Pekan, Pahang state, Federated Malay States [now Malaysia]—d. Jan. 14, 1976, London, Eng.), prime minister, foreign minister, and defense minister of Malaysia from 1970 to 1976.

A lawyer by training, Abdul Razak joined the civil service in 1950, entered politics in 1955, and was a key figure in gaining his country's independence from Britain in 1957. As deputy prime minister and defense minister (1957-70) and as minister of rural development (1959-69) under Tunku Abdul Rahman, first prime minister of independent Malaya (Malaysia from 1963), Abdul Razak was largely responsible for the country's progress in rural and national development. Appointed head of the National Operations Council set up with emergency powers in 1969, he steered the country through that year's violent disturbances between Malays and Chinese. As prime minister from 1970, he pursued a policy of nonalignment, in furtherance of which he established relations with mainland China in 1974.

In 1959 he was awarded the Seri Maharaja Mangku Negara, one of Malaya's (and Malaysia's) highest honours, which carries the title of *tun*.

Abdülaziz, in full **ABDÜLAZİZ OĞLU MAHMUD II** (b. Feb. 9, 1830, Constantinople, Ottoman

Empire [now Istanbul, Tur.]—d. June 4, 1876, Constantinople), Ottoman sultan (1861-76) who continued the westernizing reforms that had been initiated by his predecessors until 1871, after which his reign took an absolutist turn.

Like his brother Abdülmecid I, whom he succeeded as sultan on June 25, 1861, Abdülaziz was an ardent admirer of the material progress in western Europe. Educated in the Ottoman tradition, however, he could not always accept the adoption of Western institutions and customs. Abdülaziz was a member of the Mawlawiyah (Mevlevi) order of dervishes (Muslim mystics).

Between 1861 and 1871, reforms were continued under the leadership of Abdülaziz' able chief ministers, Fuad Paşa and Âli Paşa. New administrative districts (*vilayets*) were set up (1864); on French advice a council of state was established (1868); public education was organized on the French model and a new university founded; and the first Ottoman civil code was promulgated. Abdülaziz cultivated good relations with France and Great Britain and was the first Ottoman sultan to visit western Europe.

By 1871 Abdülaziz' ministers Âli and Fuad were dead, and France, his western European model, had been defeated by Germany. Abdü-

Abdülaziz, detail of a portrait by an unknown artist, 19th century; in the Topkapı Palace Museum, Istanbul

Sonia Halliday

laziz, willful and headstrong, without powerful ministers to limit his authority, became the effective ruler and placed greater emphasis on the Islâmîc character of the empire. In foreign policy, he turned to Russia for friendship, as turmoil in the Balkan provinces continued.

When insurrection in Bosnia and Herzegovina spread to Bulgaria (1876), ill feeling mounted against Russia for its encouragement of the rebellions. The crop failure of 1873, the sultan's lavish expenditures, and the mounting public debt had also heightened public discontent. Abdülaziz was deposed by his ministers on May 30, 1876; his death a few days later was attributed to suicide.

Abdülhak Hâmid, in full **ABDÜLHAK HÂMİD TARHAN** (b. Feb. 2, 1852, Constantinople, Ottoman Empire [now Istanbul, Tur.]—d. April 12, 1937, Istanbul, Tur.), poet and playwright, considered one of the greatest Turkish Romantic writers. He was instrumental in introducing Western influences into Turkish literature.

Born into a family of famous scholars, Hâmid was educated in Istanbul and in Paris. Later in Tehrân, he studied Arabic and Persian poetry. Following in his father's footsteps, Hâmid became a diplomat, holding posts in Paris, Greece, Bombay, The Hague, London, and Brussels. In 1908 he became a member of the Turkish Senate and after World War I, following a stay in Vienna, returned to Turkey, where he was elected a member of the Grand National Assembly in 1928. A follower of the

Tanzimat (a 19th-century Turkish political reform movement) school of literature and inspired by his patriotic predecessor, the Young Ottoman writer Namık Kemal, Abdülhak Hâmid's plays exhibit a strong French influence. Deeply moved by the death of his wife, he dedicated many poems to her, such as his famous "Makber" ("The Tomb"), written in 1885. His best dramas, notable among which are *Tarik* and *Ibn-i Musa*, feature personages in Turkish history and are written in prose and poetry, although *Finten* (1887) deals with London society. This sensitive poet paved the way for more radical literary reform. He was given a national funeral.

Abdülhamid I (b. March 20, 1725—d. April 7, 1789), Ottoman sultan from 1774 to 1789 who concluded the war with Russia by signing the humiliating Treaty of Küçük Kaynarca. By the terms of the treaty, Russia obtained the fortresses on the coast of the Sea of Azov, the area between the Dnepr and Bug rivers, and navigation and commercial privileges in the Ottoman Empire. Bukovina was ceded to Austria in 1775. Russia annexed the Crimea (an Ottoman vassal state) in 1783 and planned to partition the Ottoman Empire. Confronted with Russian designs, Abdülhamid in 1787 declared war, which was not ended until after his death.

A pious and benevolent man with a keen interest in state affairs, he favoured reform and appointed able grand viziers to whom he entrusted wide powers. He initiated army reforms and opened the Imperial Naval Engineering School. He also endeavoured to strengthen the central government against provincial rulers, particularly in Syria, Egypt, and Iraq.

Abdülhamid II (b. Sept. 21, 1842, Constantinople—d. Feb. 10, 1918, Constantinople), Ottoman sultan from 1876 to 1909, under whose autocratic rule the reform movement of Tanzimat (Reorganization) reached its climax and who adopted a policy of pan-Islamism in opposition to Western intervention in Ottoman affairs.

Abdülhamid II, oil painting by an unknown artist

By courtesy of the Topkapı Sarayı Museum, Istanbul

A son of Sultan Abdülmecid I, he came to the throne at the deposition of his mentally deranged brother, Murad V, on Aug. 31, 1876. He promulgated the first Ottoman constitution on Dec. 23, 1876, primarily to ward off foreign intervention at a time when the Turks' savage suppression of the Bulgarian uprising (May 1876) and Ottoman successes in Serbia and Montenegro had aroused the indignation of Western powers and Russia. After a disastrous war with Russia (1877), Abdülhamid was convinced that little help could be expected from the Western powers without their intrusion into Ottoman affairs. He dismissed the Parliament, which had met in March 1877, and suspended the constitution in February 1878. Thenceforth for 40 years

he ruled from his seclusion at Yıldız Palace (in Constantinople), assisted by a system of secret police, an expanded telegraph network, and severe censorship.

After the French occupation of Tunisia (1881) and assumption of power by the British in Egypt (1882), Abdülhamid turned for support to the Germans. In return, concessions were made to Germany, culminating in permission (1899) to build the Baghdad Railway. Eventually, the suppression of the Armenian revolt (1894) and the turmoil in Crete, which led to the Greco-Turkish War of 1897, once more resulted in European intervention.

Abdülhamid used pan-Islamism to solidify his internal absolutist rule and to rally Muslim opinion outside the empire, thus creating difficulties for European imperial powers in their Muslim colonies. The Hejaz Railway, financed by Muslim contributions from all over the world, was a concrete expression of his policy.

Internally, the most far-reaching of his reforms were in education; 18 professional schools were established; Darülfünun, later known as the University of Istanbul, was founded (1900); and a network of secondary, primary, and military schools was extended throughout the empire. Also, the Ministry of Justice was reorganized, and railway and telegraph systems were developed.

Discontent with Abdülhamid's despotic rule and resentment against European intervention in the Balkans, however, led to the military revolution of the Young Turks in 1908. After a short-lived reactionary uprising (April 1909), Abdülhamid was deposed, and his brother was proclaimed sultan as Mehmed V.

Studies of Abdülhamid include *Life of Abdul-Hamid* (1917), by Sir E. Pears, and *The Sultan: The Life of Abdul Hamid* (1958), by Joan Haslip.

Abdulla, Muhammed Said (b. April 25, 1918, Zanzibar, Tanz.), African novelist generally regarded as the father of Swahili popular literature.

Abdulla, after completing his formal education, began his career as an inspector in the Colonial Health Department. After 10 years there, however, he decided to become a journalist. In 1948 he was made editor of the newspaper *Zanzibari*, and during the next decade he also served as assistant editor of *Al Falaq*, *Al Mahda*, and *Afrika Kwetu*. In 1958 he became editor of *Mkulima*, the national agricultural magazine, where he served until his retirement in 1968.

Coinciding with his shift to *Mkulima* was Abdulla's first success as a writer of fiction. His "Mzimu wa Watu wa Kale" ("Shrine of the Ancestors") won first prize in the Swahili Story-Writing Competition of 1957–58, conducted by the East African Literature Bureau, and was published as a novel in 1960. In this work, Abdulla introduced his detective hero, Bwana Msa—loosely based on Sir Arthur Conan Doyle's Sherlock Holmes—and other characters who recur in most of his subsequent novels, which include *Kisiwa cha Giningi* (1968; "The Well of Giningi"), also a prizewinner; *Duniani Kuna Watu* (1973; "In the World There Are People"); *Siri ya Sifuri* (1974; "The Secret of the Zero"); *Mke Mmoja Waume Watatu* (1975; "One Wife, Three Husbands"); and *Mwana wa Yungi Hulewa* (1976; "The Devil's Child Grows Up"). With each new title, Abdulla's work developed in complexity and sophistication of plot; his use of the Swahili language is admired throughout East Africa, and his works—reprinted several times—are widely used as school texts. The novels characteristically pit the hero's powers of reason against a web of ignorance and superstition that serves to conceal the true nature of the narrative conflict.

Abdullah (Arabic personal name); see under 'Abd Allāh, except as below.

Abdullah, in full 'ABD ALLAH IBN AL-HUSAYN (b. 1882, Mecca—d. July 20, 1951, Jerusalem), statesman who became the first ruler (1946–51) of the independent Arab kingdom of Jordan.

Abdullah, the second son of Husayn ibn 'Ali, the ruler of the Hejaz, was educated in Istanbul. After the Turkish Revolution of 1908 he represented Mecca in the Ottoman Parliament. Early in 1914 he joined the nationalist Arab movement, which sought independence for Arab territories in the Ottoman Empire. In 1915–16 he played a leading role in clandestine negotiations between the British in Egypt and his father that led to the proclamation (June 10, 1916) of the Arab revolt against the Ottomans.

With dubious legality Abdullah was proclaimed constitutional king of Iraq on March 8, 1920, by the so-called Iraqi Congress in Damascus. But he declined the Iraqi throne, which in August 1921 was given to his brother Faysal I. After French troops drove Faysal out of Damascus (July 1920), Abdullah occupied Transjordan and threatened to attack Syria. He was successful in gradually negotiating the legal separation of Transjordan from the Palestine mandate.

The creation of a united Arab kingdom encompassing Syria, Iraq, and Transjordan was Abdullah's ambition. During World War II, he actively sided with Great Britain, and his army—the Arab Legion—took part in the British occupation of Syria and Iraq in 1941. In 1946 Transjordan became independent, and he was crowned in Amman on May 25, 1946. He was the only Arab ruler prepared to accept the United Nations' partitioning of Palestine into Jewish and Arab states (1947). In the war with Israel in May 1948, his armies occupied the West Bank of the Jordan River and captured Old Jerusalem. Two years later he annexed the West Bank territory into the kingdom of Jordan, a move that angered his former Arab allies, Syria, Saudi Arabia, and Egypt, which wanted to see the creation of a Palestinian Arab state on the West Bank. His popularity at home declined, and he was assassinated by a Palestinian nationalist.

Abdullah, Sheikh Muhammad, byname LION OF KASHMIR (b. Dec. 5, 1905, Soura, near Srinagar, Kashmir, India—d. Sept. 8, 1982, Srinagar, Jammu and Kashmir), a prominent figure in India's struggle for independence, who fought for the rights of Kashmir and won for it a semiautonomous status within India.

Abdullah was educated at the Prince of Wales College (Jammu) and the Islamia College (Lahore) and received an M.S. degree in physics from Aligarh Muslim University in 1930. He championed the rights of the Muslim majority of the state during British rule in India and fought against the discrimination exercised by the Hindu ruling house. After Abdullah served the first of many terms of imprisonment in 1931, he founded the Kashmir Muslim (later National) Conference. He supported the concept of a secular state, and when India was granted independence he strongly opposed the idea of joining Muslim Pakistan.

In 1948 Abdullah became prime minister of Kashmir. Despite his early support for Indian leader Jawaharlal Nehru, many Indians believed that Abdullah's ultimate aim was independence for Kashmir; therefore, in 1953 he was dismissed and imprisoned. During the next 11 years he refused to pledge his loyalty to India and spent most of the time under detention. When he was released by Nehru in 1964, he received an enthusiastic reception from his people. In subsequent talks with the Indian government, he worked out the basis of a possible solution to the Kashmir problem.

He was dispatched on a foreign tour to gain the goodwill of Pakistan and Algeria, but India's relations with Pakistan had by then deteriorated and Abdullah's foreign tour was

seen as seditious. At the same time, his support in Kashmir had been eroded by the apparent lack of progress in negotiations with India. Abdullah was again arrested and not released until 1968. From then until his appointment as chief minister of Jammu and Kashmir in 1975, his Plebiscite Front gained some successes, but it lost to the Congress Party in the 1972 elections. His relations with Indian Prime Minister Indira Gandhi were sometimes strained, but he persuaded her to allow Kashmir a form of autonomy. Abdullah's government was later accused of corruption, but, though his popularity waned, he was still admired for his outstanding contribution to the cause of Kashmiri national rights.

Abdullah II, in full ABDULLAH IBN HUSSEIN (b. Jan. 30, 1962, Amman, Jordan), king of Jordan from 1999. A member of the Hashimite dynasty, he was considered by pious Muslims to be a direct descendant of the Prophet Muhammad (see *Ahl al-Bayt*).

Abdullah, the eldest son of King Hussein, served as the crown prince until age three, when unrest in the Middle East prompted Hussein to name Abdullah's uncle, Prince Hassan, heir to the throne. In 1980 Abdullah graduated from the Royal Military Academy in Sandhurst, Eng. He later served in the British Armed Forces, and in 1993 he was appointed deputy commander of Jordan's elite Special Forces. That year Abdullah married a Palestinian, Rania al-Yasin, with whom he had two children, Hussein and Imam.

In January 1999 Hussein named Abdullah the new heir to the Hashimite crown. About a month later Hussein died, and Abdullah was officially crowned king on June 9. He followed many of his father's policies, including supporting an Arab-Israeli peace agreement. Abdullah also backed U.S. efforts to combat terrorism and focused on stemming the power of Islāmic in Jordan. In addition, he sought to improve the status of women in his country.

Abdullah bin Abdul Kadir, also called MUNSĪ ABDULLAH BIN ABDUL KADIR (b. 1796, Malacca, Malaya—d. 1854, Jiddah, Turkish Arabia [now in Saudi Arabia]), Malayan-born writer who, through his autobiographical and other works, played an important role as a progenitor of modern Malay literature.

Of mixed Arab (Yemeni) and Tamil descent, and Malayo-Muslim culture, Abdullah was born and grew up in a Malacca newly British, and he spent most of his life interpreting Malay society to Westerners and vice versa. Styled *munshi* (teacher) from an early age, in recognition of his teaching Malay to Indian soldiers of the Malacca garrison (and later to a whole generation of British and American missionaries, officials, and businessmen), he rapidly became an indispensable functionary in the fledgling Straits Settlements. He was copyist and Malay scribe for Sir Stamford Raffles, was translator of the Gospels and other texts into Malay for the London Missionary Society in Malacca from 1815, and 20 years later served as printer to the press of the American Board of Missions in Singapore.

An American missionary, Alfred North, seems to have encouraged Abdullah in 1837, on the strength of a lively account published in that year of North's experiences on a voyage up the east coast of Malaya, to embark on the story of his life. Completed in 1843, *Hikayat Abdullah* ("Abdullah's Story") was first published in 1849; it has been reprinted many times and translated into English and other languages. Its chief distinction—beyond the vivid picture it gives of his life and times—was the radical departure it marked in Malay literary style. In contrast to the largely court literature of the past, the *Hikayat Abdullah* provided a lively and colloquial descriptive account of events and people with a freshness and immediacy hitherto unknown. Abdullah's criticisms of his own society, and his eagerness

to embrace standards set by the West (though he remained a staunch Muslim), have caused him to be treated with some caution by a more recent generation of nationalists, but he continues to be widely acknowledged as the father of modern Malay literature.

Abdūlmecid, also spelled ABDUL-MEDJID, or ABDUL-MEJID, name of Ottoman sultans grouped below chronologically.

Abdūlmecid I (b. April 25, 1823, Constantinople, Ottoman Empire [now Istanbul, Tur.]—d. June 25, 1861, Constantinople), Ottoman sultan from 1839 to 1861, who issued two major social and political reform edicts known as the Hatt-ı Şerif of Gülhane (Noble Edict of the Rose Chamber) in 1839 and the Hatt-ı Hümayun (Imperial Edict) in 1856, heralding the new era of Tanzimat ("Reorganization").

Well educated, liberal minded, and the first sultan to speak French, Abdūlmecid continued the reform program of his father, Mahmud II, and was strongly assisted by his ministers Mustafa Reşid Paşa, Mehmed Emin Âli Paşa, and Fuad Paşa. The reform edicts were in part directed toward winning the support of European powers. The edicts proclaimed the equality of all citizens under the law and granted civil and political rights to the Christian subjects. The main purpose of the reforms, however, remained the preservation of the Ottoman state. The army was reorganized (1842) and conscription introduced; new penal, commercial, and maritime codes were promulgated; and mixed civil and criminal courts with European and Ottoman judges were established. In 1858 a new land law confirmed the rights of ownership, and an attempt was made to establish a new system of centralized provincial administration. The sultan's educational reforms included the formation of a Ministry of Education and the establishment of military preparatory schools and secondary schools; he also established an Ottoman school in Paris (1855).

Abdūlmecid's foreign policy was directed toward maintaining friendly relations with the European powers to preserve the territorial integrity of the Ottoman state. He ascended the throne as a mere boy a few days after the Ottoman defeat by the Viceroy of Egypt at the Battle of Nizip (June 1839). Only an alliance of European powers (excluding France) saved

Abdūlmecid I, detail of a portrait by an unknown artist, 19th century; in the Topkapı Saray Museum, Istanbul
Sonia Halliday

the Ottomans from accepting disastrous terms from Egypt (Treaty of London, July 1840). In 1849 Abdūlmecid's refusal to surrender Lajos Kossuth and other Hungarian revolutionary refugees to Austria won him the respect of European liberals. Finally, in 1853 the Ottomans were assisted by France, Great Britain, and Sardinia in the Crimean War against Russia and were admitted as participants in the Treaty of Paris (1856).

The European powers, however, obstructed the sultan's efforts at centralization and at recovering power in Bosnia and Montenegro in

the Balkans. They also forced the Ottomans to grant autonomy in Lebanon (1861), while the effect of the Treaty of Paris was to unify the Danubian principalities, paving the way for the independence of Romania (1878).

Abdūlmecid restored Hagia Sophia, built the Dolmabahçe Palace, and founded the first French theatre in Constantinople. See also Âli Paşa, Mehmed Emin; Reşid Paşa, Mustafa.

Abdūlmecid II (b. May 30, 1868, Constantinople, Ottoman Empire [now Istanbul, Tur.]—d. Aug. 23, 1944, Paris, France), the last caliph and crown prince of the Ottoman dynasty of Turkey.

Following Ottoman custom, Abdūlmecid was confined to the palace until he was 40, during which time his father, Abdūlaziz, and three of his cousins reigned. When his fourth cousin took the throne as Mehmed VI in 1918, Abdūlmecid became crown prince. He was elected caliph by the Grand National Assembly on Nov. 18, 1922, after the sultanate was abolished; and he lost his title of crown prince after Mehmed left Constantinople on the assumption of power by the Young Turks under Mustafa Kemal (Atatürk). Although the caliphate was severed from all political power, Abdūlmecid, a gentle and scholarly man, was the living symbol of Turkey's link to the Islāmic-Ottoman past. The forces of tradition and the opponents of Mustafa Kemal's regime rallied around him. Mustafa Kemal, determined to break with the Islāmic past, first proclaimed the Turkish Republic (Oct. 29, 1923), and on March 3, 1924, the Grand National Assembly abolished the caliphate. The next day Abdūlmecid was exiled.

Abe Isoo (b. March 1, 1865, Fukuoka, Japan—d. Feb. 10, 1949, Tokyo), one of the founders of the Japanese socialist movement and titular head of the Social Mass Party (Shakai Taishūtō) from its inception in 1932 until 1940. He is also remembered for introducing the game of baseball to Japan.

Abe was attracted to socialism while studying in the United States, where he graduated from the Hartford (Conn.) Theological Seminary. He returned to Japan in 1899 and two years later became a professor at Tokyo Semmon Gakkō (later Waseda University), a position he held for 25 years. He helped the embryonic Japanese labour movement and helped found the Social Democratic Party (1899), which was suppressed by the government. A pacifist, Abe opposed the Russo-Japanese War (1904–05); when the antiwar newspaper *Heimin shimbun* ("People's Weekly News") was banned, Abe started his own magazine, *Shinkigen* ("A New Era"), as a platform to promote parliamentary socialism rooted in Christian humanism.

After the war Abe objected to the takeover of the socialist movement by radical anarcho-syndicalist groups and to their terrorist activities; he retired from politics and devoted himself to educational causes. After World War I he again became active in socialist activities; he established the Fabian Society of Japan (1921), and five years later he resigned from the university to become secretary-general of the new People's Socialist Party. In 1928 he was elected to the first of his five terms in the lower house of the Japanese Diet. When his party reorganized in 1932 as the much more popular Social Mass Party, he became chairman of its executive committee. He resigned in 1940, however, over the issue of cooperation with the government's militaristic policies; the government dissolved the party soon after.

Abe Kōbō, pseudonym of ABE KIMIFUSA (b. March 7, 1924, Tokyo, Japan—d. Jan. 22, 1993, Tokyo), Japanese novelist and playwright noted for his use of bizarre and alle-

gorical situations to underline the isolation of the individual man.

He grew up in Mukden (now Shen-yang), in Manchuria, where his father, a physician, taught at the medical college. The youngster was interested in insect collecting, mathematics, and the writings of Fyodor Dostoyevsky, Martin Heidegger, Karl Jaspers, Franz Kafka,

Abe Kōbō

Friedrich Nietzsche, and Edgar Allan Poe. Abe went to Japan in 1941 and in 1943 began studying medicine at the University of Tokyo but returned to Manchuria to face the end of World War II. Repatriated to Japan, he was graduated in medicine in 1948 but never practiced. He started writing poetry, publishing in 1947 *Mumei shishū* ("Poems of an Unknown Poet") at his own expense. The critical acceptance of his novel *Owarishi michi no shirube ni* ("The Road Sign at the End of the Street") in 1948 established his reputation.

Among his important novels, many of which have been called Kafkaesque, are *Suna no onna* (1962; *The Woman in the Dunes*), which was adapted into an internationally successful film; *Daiyon kampyōki* (1959; *Inter Ice Age 4*); *Tanin no kao* (1964; *The Face of Another*); *Moetsukita chizu* (1967; *The Ruined Map*); *Hako otoko* (1973; *The Box Man*); *Mikkai* (1977; *Secret Rendezvous*); and *Hakobune Sakura-maru* (1984; *The Ark Sakura*). *Beyond the Curve* (1990) was Abe's first collection of short fiction to appear in English. Of his many plays, which met with great success in Japan, *Tomodachi* (1967; *Friends*) and a few others were performed in English, in Honolulu. He directed his own theatre company in Tokyo, for which he wrote several plays each season.

Abe Masahiro (b. Dec. 3, 1819, Edo [now Tokyo], Japan—d. Aug. 6, 1857, Edo), statesman who negotiated the opening of Japan to trade and communication with Western nations after the arrival of Commodore Matthew C. Perry and his U.S. Navy fleet.

Born into an influential noble family, Abe was only 25 years old when he was appointed head of the *rōjū* (senior councillors), the highest administrative office under the shogun, or hereditary military dictator of Japan. The government had previously been in the hands of a group of conservative reformers whose attempts to restore the past virtues of the Japanese state had created considerable unrest among the population; Abe's first years in power were marked by his successful attempt to alleviate the discontent caused by these changes. Western ships had begun to appear off the Japanese coast in the early 19th century, however, and Abe, determined to preserve Japan's traditional isolationism, worked to strengthen coastal defenses. He welcomed Western learning only as a means of increasing Japan's military and economic potential.

When Perry's fleet arrived in 1853, it was readily apparent that Japanese armaments were no match for the U.S. warships. After Perry returned the following February, Abe signed the Treaty of Kanagawa (March 31, 1854), opening Japan to limited communication with the United States. Similar treaties were concluded with Great Britain, Russia, and The Netherlands in the following months. Meanwhile, fueled by the seeming weakness of the shogunate, the movement for the restoration of power to the old imperial family began to grow, and Abe, overwhelmed by criticism that he had betrayed his country, was forced to relinquish a great deal of his power; thereafter he devoted himself exclusively to internal affairs.

Abéché, town, eastern Chad, between the wadis Chao and Sao. Historically it was the site of the capital of the Muslim sultanate of Ouaddaï (q.v.), which dominated much of the area of Chad before French conquest was accomplished in 1912. The remains of the ancient capital include a palace, tombs of former sultans, and the ruins of a mosque, all surrounded by a thick wall. The town has many mosques.

Abéché is surrounded by savanna-type terrain that is an important cattle-raising area, but the distance from suitable markets hinders development of the cattle industry. Abéché is linked by main road to the capital, N'Djamena (formerly Fort-Lamy), Sarh (formerly Fort-Archambault), and The Sudan. The Lycée Franco-Arabe (a secondary school) is in the town, which has an airport and a hospital and supports some light industry, including the manufacture of camel-hair blankets. Pop. (1988 est.) 40,000.

Abel, John (Seneca Indian leader): *see* Cornplanter.

Abegg, Richard Wilhelm Heinrich (b. Jan. 9, 1869, Danzig, Prussia [now Gdansk, Pol.]—d. April 3, 1910, Köslin, Ger.), physical chemist whose work contributed to the understanding of valence (the capacity of an atom to combine with another atom) in light of the newly discovered presence of electrons within the atom.

Abegg became professor of chemistry at the University of Breslau, Ger. (now Wrocław, Pol.), in 1897 and two years later gained the chair of chemistry at the Technical Academy, Breslau. From his study of valence, he concluded that, for the most stable configuration, the number of electrons in the outer group of an atom is eight, which is the number found in the inert gases.

Abel, in the Old Testament, second son of Adam and Eve, who was slain by his older brother, Cain (Genesis 4:1-16). According to Genesis, Abel, a shepherd, offered the Lord the firstborn of his flock. The Lord respected Abel's sacrifice but did not respect that offered by Cain. In a jealous rage, Cain murdered Abel. Cain then became a fugitive because his brother's innocent blood put a curse on him.

The storyteller in Genesis assumes a world of conflicting values, and he makes the point that divine authority backs self-control and brotherhood but punishes jealousy and violence. Cain had not mastered sin (v. 7); he had let it master him. The narrator takes a somber look at the human condition, seeing a dangerous world of Cains and Abels. Nevertheless, God is on the side of the martyrs; he avenges their deaths in the ruin of the Cains. In the New Testament the blood of Abel is cited as an example of the vengeance of violated innocence (Matthew 23:35; Luke 11:51).

Abel, Carl Friedrich (b. Dec. 22, 1723, Köthen, duchy of Anhalt-Köthen [Germany]—d. June 20, 1787, London, Eng.), symphonist of the pre-Classical school and one of the last virtuosos of the viola da gamba.

After playing in the Dresden court orchestra (1743-58), Abel went to London in 1759 and became chamber musician to Queen Charlotte in 1764. When J.C. Bach arrived in London in 1762, they became friends and in 1765 established the "Bach and Abel" concerts

Carl Friedrich Abel, engraving by A. Saint-Aubin after a portrait by C.-N. Cochin, 1781

J.P. Ziolo

that included the first public performances in England of Joseph Haydn's symphonies. Abel wrote 23 symphonies, one of which, the so-called Köchel 18, was long attributed wrongly to the youthful W.A. Mozart.

Abel, Sir Frederick Augustus (b. July 17, 1827, Woolwich, London, Eng.—d. Sept. 6, 1902, Westminster, London), English chemist and explosives specialist who, with the chemist Sir James Dewar, invented cordite (1889), later adopted as the standard explosive of the British army. Abel also made studies of dust explosions in coal mines, invented a device for testing the flash point of petroleum, and found a way to prevent guncotton from exploding spontaneously.

Abel studied chemistry at the Royal Polytechnic Institution and in 1845 became one of the original 26 students of A.W. von Hofmann at the Royal College of Chemistry. In 1852 he was appointed lecturer in chemistry at the Royal Military Academy in Woolwich, succeeding Michael Faraday, who had held that post since 1829. From 1854 until 1888 Abel served as ordnance chemist at the Chemical Establishment of the Royal Arsenal at Woolwich, establishing himself as the leading British authority on explosives.

He was elected a fellow of the Royal Society in 1860, knighted in 1883, and created a baronet in 1893.

Abel, John Jacob (b. May 19, 1857, Cleveland, Ohio, U.S.—d. May 26, 1938, Baltimore, Md.), American pharmacologist and physiological chemist who made important contributions to a modern understanding of the ductless, or endocrine, glands. He isolated adrenaline in the form of a chemical derivative (1897) and crystallized insulin (1926). He also invented an artificial kidney.

Abel taught at the University of Michigan, Ann Arbor (1891-93), and at Johns Hopkins University, Baltimore (1893), and directed the Laboratory for Endocrine Research (1932). He served as editor of the *Journal of Pharmacology and Experimental Therapeutics* from 1909 to 1932.

Abel, Niels Henrik (b. Aug. 5, 1802, island of Finnøy, near Stavanger, Nor.—d. April 6, 1829, Froland), Norwegian mathematician, a pioneer in the development of several branches of modern mathematics.

Abel was the son of a poor Protestant minister. Soon after Abel was born, his family moved to the parish of Gjerstad, near the town of Risør (southeast Norway), where the boy grew up. In 1815, when he entered the cathedral school in Oslo, his mathematical talent was recognized by a teacher who introduced him to the classics in mathematical literature and proposed original problems for

solution. Thoroughly challenged, Abel studied the works of the 17th-century English mathematician and physicist Isaac Newton

Niels Henrik Abel, lithograph after a drawing by Johan Gørbitz, 1826

By courtesy of the Royal Norwegian Embassy, Washington D C

and the contemporary mathematicians Leonhard Euler (German), Joseph-Louis Lagrange (French), and Carl Friedrich Gauss (German) and learned to detect gaps in their mathematical reasoning.

Although when Abel's father died in 1820 the family was left in straitened circumstances, the boy was able to enter the University of Christiania (Oslo) in 1821 because his teacher contributed and raised funds. He obtained a preliminary degree from the university in 1822 and continued his studies independently with further subsidies obtained by his teacher.

His first papers, published in 1823 in the new periodical *Magazin for Naturvidenskaberne*, were on functional equations and integrals, his solution of an integral equation being the first. Abel's friends urged the Norwegian government to grant him a fellowship for study in Germany and France. While waiting for the royal decree to be issued, in 1824 he published at his own expense his proof of the impossibility of solving algebraically the general equation of the fifth degree, which he hoped would bring him recognition. He sent the pamphlet to Gauss, who dismissed it, failing to recognize that the famous problem had indeed been settled.

Abel spent the winter of 1825–26 with Norwegian friends in Berlin, where he met August Leopold Crelle, civil engineer and self-taught enthusiast of mathematics, who became his close friend and mentor. With Abel's warm encouragement, Crelle founded the *Journal für die reine und angewandte Mathematik* ("Journal for Pure and Applied Mathematics"), the first volume of which (1826) contains papers by Abel, including a more elaborate version of his work on the quintic equation. Other papers dealt with equation theory, functional equations, integration in finite forms, and problems from theoretical mechanics. In Berlin new directions in mathematics stimulated him to do further independent work. Soon distracted socially, however, Abel traveled throughout Europe.

Arriving in Paris in the summer of 1826, he called on the foremost mathematicians and completed a memoir on transcendental functions. This major work presented a theory of integrals of algebraic functions, in particular the result known as Abel's theorem: there is a finite number, or genus, of independent integrals of this nature. This theorem is the basis for the later theory of Abelian integrals and Abelian functions. Abel was accepted with restrained civility in Paris, for his work was still

unknown. He submitted his memoir for presentation to the Academy of Sciences, hoping to establish his reputation, but he waited in vain. Before leaving Paris, thinking he had a persistent cold, Abel consulted a physician, who informed him he had tuberculosis.

Abel returned to Norway heavily in debt. He subsisted by tutoring, by receiving a small grant from the university, and, in 1828, by accepting a substitute-teaching position. His poverty and ill health did not decrease his production; he wrote a great number of papers during this period, principally on equation theory and elliptic functions. Among them are the theory of the Abelian equations with Abelian groups. He rapidly developed the theory of elliptic functions in competition with Karl Gustav Jacobi. By this time Abel's fame had spread to all mathematical centres, and strong efforts were made to secure a suitable position for him by a group from the French Academy, who addressed Bernadotte, the king of Norway–Sweden; Crelle worked to secure a professorship for him in Berlin.

In the fall of 1828, Abel became seriously ill, and his condition deteriorated on a sled trip at Christmas time to visit his fiancée at Froland, where he died. The French Academy of Sciences published his memoir in 1841.

BIBLIOGRAPHY. The *Oeuvres complètes de N.H. Abel*, new ed., 2 vol. (1881, reprinted 2 vol. in 1, 1973), includes a short biographical note. For further information, see Øystein Ore, *Niels Henrik Abel, Mathematician Extraordinary* (1957, reprinted 1974); and Eric T. Bell, *Men of Mathematics* (1937, reprinted 1986), pp. 307–326.

Abel, Rudolf (Ivanovich), original name WILLIAM AUGUST FISHER (b. July 11, 1903, Newcastle upon Tyne, Northumberland, Eng.—d. Nov. 15, 1971, Moscow), Soviet intelligence officer, convicted in the United States in 1957 for conspiring to transmit military secrets to the Soviet Union. He was exchanged in 1962 for the American aviator Francis Gary Powers, who had been imprisoned as a spy in the Soviet Union since 1960.

Genrich Fischer (or Fisher), Abel's father and a friend of Lenin's, emigrated to Britain around 1901, where he spent 20 years attempting to organize and indoctrinate his fellow factory workers before returning to Russia. His son, born in England and going to Russia with his father, joined the Soviet intelligence and security agency GPU (the predecessor of the KGB) in 1927 and operated in western European countries and the Soviet Union in the next two decades. In about 1948 he illegally entered the United States and, under the name of Emil R. Goldfus, lived for some time as an artist and photographer in a Brooklyn studio apartment, where he concealed shortwave-radio transmitting and receiving equipment. On June 21, 1957, he was arrested by the FBI, and on Oct. 25, 1957, a federal district court in Brooklyn found him guilty of espionage, relying in part on testimony by Soviet Lieutenant Colonel Reino Hayhanen, who had defected to the West and who stated that he had been Abel's chief coconspirator in the United States. The court sentenced Abel to 30 years' imprisonment.

The U.S. government then used Abel to secure the release of Powers, whose aircraft had been forced down near Sverdlovsk (now Yekaterinburg), in the central Soviet Union, on May 1, 1960. President John F. Kennedy commuted Abel's sentence, and, on Feb. 10, 1962, on a bridge between West Berlin and East Germany (Potsdam), Abel was exchanged for Powers and Frederic L. Pryor, an American student who had been held without charge in East Germany since August 1961.

Abel, Theodora Mead (b. Sept. 9, 1899, Newport, R.I., U.S.—d. Dec. 2, 1998, Forestburgh, N.Y.), American clinical psychologist and educator who combined sociology and psychology in her work.

She was educated at Vassar College, where she received her B.A. (1921), Columbia University, where she received her M.A. (1924), and the University of Paris, where she received a diploma in psychology (1923). She obtained her Ph.D. from Columbia University (1925). Abel taught at numerous universities, including the University of Illinois (1925–26), Sarah Lawrence College (1929–33), and the Manhattan Trade School for Girls. From 1940 to 1946 she was chief psychologist for the New York State Department of Mental Hygiene and from 1947 to 1971 was director of psychology at the New York City Post-graduate Center for Mental Health. After moving to New Mexico in 1971, Abel became chief of family therapy at the Child Guidance Center in Albuquerque and also established a private practice.

Her writings include coauthorship of *The Subnormal Adolescent Girl* (1940), *Facial Disfigurement* (1952), *Psychological Testing in Cultural Contexts* (1973), and *Culture and Psychotherapy* (1974).

Abel Tasman National Park, wildlife preserve in northwestern South Island, New Zealand. Established in 1942, it was named for Abel Tasman, the Dutch navigator. With an area of 55,699 acres (22,541 hectares), it extends inland for about 6 miles (10 km) from the beaches of Tasman Bay on its western shores between Separation Point and Marahau Inlet, about 50 miles (80 km) northwest of Nelson. The park includes the Tata Islands in Golden Bay and Tonga, Adele, and Fisherman islands in Tasman Bay. The park is largely covered in shrubland and pasture, though in the river valleys there are rain forests consisting of beech, rata, matai, miro, hinau, and tussock.

Abel Tasman National Park is unique in New Zealand in that its bush-clad slopes exhibit a mixture of the vegetation types characteristic of both North and South Islands, a phenomenon that is found nowhere else in New Zealand. Birdlife in the park includes petrel, shag, penguin, gull, tern, heron, and numerous other varieties. Animal life includes deer, goat, wild pig, and opossum. The park's headquarters are at Totaranui.

Abelard, Peter, French PIERRE ABÉLARD, or ABAILARD, Latin PETRUS ABAELARDUS, or ABEILARDUS (b. 1079, Le Pallet, near Nantes, Brittany [now in France]—d. April 21, 1142, Priory of Saint-Marcel, near Chalon-sur-Saône, Burgundy [now in France]), French

Abelard, with Héloïse, miniature portrait by Jean de Meun, 14th century; in the Musée Condé, Chantilly, Fr.

By courtesy of the Musée Condé Chantilly Fr photograph Giraudon—Art Resource/EB Inc

theologian and philosopher best known for his solution of the problem of universals and for his original use of dialectics. He is also known for his poetry and for his celebrated love affair with Héloïse.

Early life. The outline of Abelard's career is well known, largely because he described so much of it in his famous *Historia calamitatum* ("History of My Troubles"). He was born the son of a knight in Brittany south of the Loire. He sacrificed his inheritance and the prospect of a military career in order to study philosophy, particularly logic, in France. He provoked bitter quarrels with two of his masters, Roscelin of Compiègne and Guillaume de Champeaux, who represented opposite poles of philosophy. Roscelin was a Nominalist who asserted that universals are nothing more than mere words; Guillaume in Paris upheld a form of Platonic Realism according to which universals exist. Abelard in his own logical writings brilliantly elaborated an independent philosophy of language. While showing how words could be used significantly, he stressed that language itself is not able to demonstrate the truth of things (*res*) that lie in the domain of physics.

Abelard was a peripatetic both in the manner in which he wandered from school to school at Paris, Melun, Corbeil, and elsewhere and as one of the exponents of Aristotelian logic who were called the Peripatetics. In 1113 or 1114 he went north to Laon to study theology under Anselm of Laon, the leading biblical scholar of the day. He quickly developed a strong contempt for Anselm's teaching, which he found vacuous, and returned to Paris. There he taught openly but was also given as a private pupil the young Héloïse, niece of one of the clergy of the cathedral of Paris, Canon Fulbert. Abelard and Héloïse fell in love and had a son whom they called Astralabe. They then married secretly. To escape her uncle's wrath Héloïse withdrew into the convent of Argenteuil outside Paris. Abelard suffered castration at Fulbert's instigation. In shame he embraced the monastic life at the royal abbey of Saint-Denis near Paris and made the unwilling Héloïse become a nun at Argenteuil.

Career as a monk. At Saint-Denis Abelard extended his reading in theology and tirelessly criticized the way of life followed by his fellow monks. His reading of the Bible and of the Fathers of the Church led him to make a collection of quotations that seemed to represent inconsistencies of teaching by the Christian Church. He arranged his findings in a compilation entitled *Sic et non* ("Yes and No"); and for it he wrote a preface in which, as a logician and as a keen student of language, he formulated basic rules with which students might reconcile apparent contradictions of meaning and distinguish the various senses in which words had been used over the course of many centuries. He also wrote the first version of his book called *Theologia*, which was formally condemned as heretical and burned by a council held at Soissons in 1121. Abelard's dialectical analysis of the mystery of God and the Trinity was held to be erroneous, and he himself was placed for a while in the abbey of Saint-Médard under house arrest. When he returned to Saint-Denis he applied his *Sic et non* methods to the subject of the abbey's patron saint; he argued that St. Denis of Paris, the martyred apostle of Gaul, was not identical with Denis of Athens (also known as Dionysius the Areopagite), the convert of St. Paul. The monastic community of Saint-Denis regarded this criticism of their traditional claims as derogatory to the kingdom; and, in order to avoid being brought for trial before the king of France, Abelard fled from the abbey and sought asylum in the territory of Count Theobald of Champagne. There he sought the solitude of a hermit's life but was pursued by students who pressed him to resume his teaching in philosophy. His combination of the teaching of secular arts with his profession as a monk was heavily crit-

icized by other men of religion, and Abelard contemplated flight outside Christendom altogether. In 1125, however, he accepted election as abbot of the remote Breton monastery of Saint-Gildas-de-Rhuys. There, too, his relations with the community deteriorated, and, after attempts had been made upon his life, he returned to France.

Héloïse had meanwhile become the head of a new foundation of nuns called the Paraclete. Abelard became the abbot of the new community and provided it with a rule and with a justification of the nun's way of life; in this he emphasized the virtue of literary study. He also provided books of hymns he had composed, and in the early 1130s he and Héloïse composed a collection of their own love letters and religious correspondence.

Final years. In about 1135 Abelard went to the Mont-Sainte-Geneviève outside Paris to teach, and he wrote in a blaze of energy and of celebrity. He produced further drafts of his *Theologia* in which he analyzed the sources of belief in the Trinity and praised the pagan philosophers of classical antiquity for their virtues and for their discovery by the use of reason of many fundamental aspects of Christian revelation. He also wrote a book called *Ethica* or *Scito te ipsum* ("Know Thyself"), a short masterpiece in which he analyzed the notion of sin and reached the drastic conclusion that human actions do not make a man better or worse in the sight of God, for deeds are in themselves neither good nor bad. What counts with God is a man's intention; sin is not something done (it is not *res*); it is uniquely the consent of a human mind to what it knows to be wrong. Abelard also wrote *Dialogus inter philosophum, Judaeum et Christianum* ("Dialogue Between a Philosopher, a Jew, and a Christian") and a commentary on St. Paul's letter to the Romans, the *Expositio in Epistolam ad Romanos*, in which he outlined an explanation of the purpose of Christ's life, which was to inspire men to love him by example alone.

On the Mont-Sainte-Geneviève Abelard drew crowds of pupils, many of them men of future fame, such as the English humanist John of Salisbury. He also, however, aroused deep hostility by his criticism of other masters and by his apparent revisions of the traditional teachings of Christian theology. Within Paris the influential abbey of Saint-Victor was critical of his doctrines, while elsewhere William of Saint-Thierry, a former admirer of Abelard, recruited the support of Bernard of Clairvaux, perhaps the most influential figure in Western Christendom at that time. At a council held at Sens in 1140, Abelard underwent a resounding condemnation, which was soon confirmed by Pope Innocent II. He withdrew to the monastery of Cluny in Burgundy. There, under the skillful mediation of the abbot, Peter the Venerable, he made peace with Bernard of Clairvaux and retired from teaching. Now both sick and old, he lived the life of a Cluniac monk. After his death, his body was first sent to the Paraclete; it now lies alongside that of Héloïse in the cemetery of Père-Lachaise in Paris. Epitaphs composed in his honour suggest that Abelard impressed some of his contemporaries as one of the greatest thinkers and teachers of all time. (D.E.L.)

BIBLIOGRAPHY. *The Letters of Abelard and Héloïse* have been translated into English by C.K. Scott Moncrieff (1925, reprinted 1964) and by J.T. Muckle (1947), who has also published separately a translation of *The Story of Abelard's Adversities* (1954). The historical novel *Peter Abelard*, by Helen Waddell (1933), is justly popular and has been reprinted many times. More general studies are Étienne Gilson, *Héloïse et Abélard* 938; *Héloïse and Abelard*, 1953; and Lief Grane, *Pierre Abélard* (1964; *Peter Abelard*, 1970). Information concerning editions of Abelard's writings and studies of his thought may be found in D.E. Luscombe's edition and English translation of *Peter Abelard's "Ethics"*

(1971). On the reception of Abelard's thought and teaching in his own time, see D.E. Luscombe, *The School of Peter Abelard* (1969). The best study of Abelard's philosophy is Jean Jolivet, *Arts du langage et théologie chez Abélard* (1969).

Abell, A(runah) S(hepardson) (b. Aug. 10, 1806, East Providence, R.I., U.S.—d. April 19, 1888, Baltimore, Md.), newspaper editor and publisher, and founder, with two other investors, of the Philadelphia *Public Ledger* and the Baltimore *Sun*.

Abell left school at the age of 14 to become a clerk in a store dealing in West Indian wares. He had hoped to become a printer, and in 1822 he was taken on as an apprentice by the *Providence Patriot*. He set up shop as a printer in Boston and then in New York. He came to the conclusion that Philadelphia was a likely market for a new penny paper. He and his partners, William M. Swain and Azariah H. Simmons, founded the *Public Ledger* in 1836. Within two years the paper had absorbed the rival Philadelphia *Transcript*. Meanwhile, in 1837, Abell and his partners founded the Baltimore *Sun*, which had 12,000 subscribers after a year. Both the *Public Ledger* and the *Sun* were oriented to the working man, but whereas the *Ledger* dealt freely in scandal and sensation, the *Sun* did not. As manager of the *Sun*, Abell, in cooperation with the publishers of the New Orleans *Daily Picayune*, established a "pony express" of relay riders between Baltimore and New Orleans to speed the transmission of news. In a historic "news beat," the express delivered in Baltimore the news of the U.S. Army victory at Vera Cruz, Mexico, before the U.S. government had learned of it. Abell then sent word of the victory by telegram to Pres. James K. Polk. He had encouraged Samuel F.B. Morse in developing the telegraph and was one of its most enthusiastic pioneer users.

An innovator who stressed technical progress, Abell used telegraph machines and carrier pigeons to speed news transmission. Under his direction, the Baltimore *Sun* became the first American newspaper to install a rotary press. In 1861, when the Civil War began, the *Sun* had a circulation estimated at 30,000. Abell directed the *Sun* until his death.

Abell, Kjeld (b. Aug. 25, 1901, Ribe, Den.—d. March 5, 1961, Copenhagen), dramatist and social critic, best known outside Denmark for two plays, *Melodien, der blev væk* (1935; English adaptation, *The Melody That Got Lost*, 1939) and *Anna Sophie Hedvig* (1939; Eng. trans., 1944), which defends the use of force by the oppressed against the oppressor.

Abell studied political science but afterward began a career as a stage designer in Paris. He then went on to become Denmark's most unconventional man of the theatre, not only as an original dramatist but also as a stage designer who made full use of the technical apparatus of the theatre to achieve new and striking scenic effects, as in *Daga paa en sky* (1947; "Days on a Cloud") and *Skrige* (1961; "The Scream").

Abelson, Philip Hauge (b. April 27, 1913, Tacoma, Wash., U.S.—d. Aug. 1, 2004, Bethesda, Md.), physical chemist who proposed the gas diffusion process for separating uranium-235 from uranium-238 and in collaboration with the U.S. physicist Edwin M. McMillan discovered the element neptunium.

After receiving a Ph.D. (1939) in nuclear physics from the University of California at Berkeley, Abelson worked as an assistant physicist (1939–41) in the department of terrestrial magnetism of the Carnegie Institution of Washington, D.C. There he began investigating a material that emitted beta rays (electrons) and that was produced by irradiating uranium with neutrons. After joining forces with McMillan, he proved the material to be a new element, later named neptunium.

During World War II Abelson worked with the Naval Research Laboratory, Washington, D.C. His uranium-separation process proved essential to the development of the atomic bomb. At the end of the war his report on the feasibility of building a nuclear-powered submarine led to the U.S. nuclear fleet.

In 1946 Abelson returned to the Carnegie Institution and pioneered in utilizing radioactive isotopes. As director of the Geophysics Laboratory of the Carnegie Institution from 1953 to 1971, he found amino acids in fossils, and fatty acids in rocks more than 1,000,000,000 years old. He was president of the Carnegie Institution from 1971 to 1978 and trustee from 1978. From 1962 through 1984 he was the editor of *Science*.

Abemama Atoll, also spelled APAMAMA, formerly ROGER SIMPSON ISLAND, coral atoll of the northern Gilbert Islands, part of Kiribati, in the west-central Pacific Ocean. Captain Charles Bishop, who discovered the atoll in 1799, named it Roger Simpson Island for one of his associates. Seat of the area's ruling family in the 19th century, the atoll was the site of the formal British annexation of the Gilbert Island group in 1892. Occupied by Japanese forces from 1942 to 1943, Abemama became a U.S. military base for the following two years. The administrative headquarters of Abemama Atoll is at Kariatebike. There is also a hospital and airfield. Pop. (1995) 3,442.

Abengourou, town, eastern Côte d'Ivoire (Ivory Coast), on the road from Abidjan (the national capital) to Ghana. The major trading centre for a productive forest region, it is also the residence of the Anyi (Agni) paramount chief, who is the present king of Indénié (an Anyi kingdom founded in the mid-18th century). The king's official residence (built in 1882) is decorated with Indénié relics and tapestries. Abengourou has an agricultural-vocational-training institute and research station for coffee and cocoa, the region's major crops, which are sent to Abidjan (100 miles [161 km] south-southwest) for export. The town is the seat of a Roman Catholic bishop, several schools, and one of the largest hospitals in the interior. Pop. (1988) 58,974.

Åbenrå, also spelled AABENRAA, city, seat of Sønderjyllands *amtskommune* (county commune), southeastern Jutland, Denmark, at the head of Åbenrå Fjord. First mentioned in the 12th century when attacked by the Wends, it was granted a charter (1335) and grew from a fishing village into a thriving port in the 17th and 18th centuries. Medieval landmarks include the St. Nicholas Church (a 13th-century church; restored 1949–56) and Brøndlund Slot (a fortress, begun 1411, rebuilt 1807). The city was German from 1864 until a plebiscite in 1920 and was known as Apenrade. Åbenrå is a marketing centre with a large import trade and the largest port in southeastern Jutland. Local industries include machinery production, food processing, pipe-organ building, and fishing. Pop. (2000 est.) city, 16,126; mun., 22,020.

Abensperg und Traun, Otto Ferdinand, Graf von (count of): see Traun, Otto Ferdinand, Graf von Abensperg und.

Abeokuta, town, capital of Ogun state, southwestern Nigeria. It is situated on the east bank of the Ogun River, around a group of rocky outcroppings that rise above the surrounding wooded savanna. It lies on the main railway (1899) from Lagos, 48 miles (78 km) south, and on the older trunk road from Lagos to Ibadan; it also has road connections to Ilaro, Shagamu, Iseyin, and Kétou (Benin).

Abeokuta ("Refuge Among Rocks") was founded in about 1830 by Sodeke (Shodeke), a hunter and leader of the Egba refugees who fled from the disintegrating Oyo empire. The town was also settled by missionaries (in the

1840s) and by Sierra Leone Creoles, who later became prominent as missionaries and as businessmen. Abeokuta's success as the capital of the Egbas and as a link in the Lagos-Ibadan oil-palm trade led to wars with Dahomey (now Benin). In the battle at Abeokuta in 1851, the Egba, aided by the missionaries and armed by the British, defeated King Gezo's Dahomeyan army (unique in the history of western Africa for its common practice of using women warriors). Another Dahomeyan attack was repulsed in 1864. Troubles in the 1860s with the British in Lagos led the Egba to close the trade routes to the coast and to expel (1867) its missionaries and European traders. After the Yoruba civil wars (1877–93), in which Abeokuta opposed Ibadan, the Egba *alake* ("king") signed an alliance with the British governor, Sir Gilbert Carter, that recognized the independence of the Egba United Government (1893–1914). In 1914 the kingdom was incorporated into the newly amalgamated British Colony and Protectorate of Nigeria. The Abeokuta riots of 1918 protested both the levying of taxes and the "indirect rule" policy of Lord Frederick Lugard, the British governor-general, which made the *alake*, formerly *primus inter pares* ("first among equals"), the supreme traditional leader to the detriment of the other quarter chiefs.

Modern Abeokuta is an agricultural trade centre (rice, yams, cassava, corn [maize], palm oil and kernels, cotton, fruits, vegetables) and an exporting point for cocoa, palm produce, fruits, and kola nuts. Rice and cotton were introduced by the missionaries in the 1850s, and cotton weaving and dyeing (with locally grown indigo) are now traditional crafts of the town. Abeokuta is the headquarters for the Federal Ogun-Oshin River Basin Authority with programs to harness land and water resources for Lagos, Ogun, and Oyo states for rural development. Irrigation, food-processing, and electrification projects are included. Local industry is limited but now includes fruit-canning plants, a plastics factory, a brewery, sawmills, and an aluminum-products factory. South of the town are the Aro granite quarries, which provide building materials for much of southern Nigeria, and a huge, modern cement plant at Ewekoro (18 miles [29 km] south).

Abeokuta was a walled town, and relics of the old wall still exist. Notable buildings include the Ake (the residence of the *alake*) and Centenary Hall (1930). Secondary schools and primary teachers' colleges at Abeokuta are now supplemented by the University of Lagos Abeokuta campus (1984), which specializes in science, agriculture, and technology. Pop. (1991) 352,735.

Aberbrothock (Scotland): see Arbroath.

Aberconwy, former district (1974–96) in Gwynedd county, northwestern Wales. The region is now part of the county borough of Conwy.

Abercrombie, James, Abercrombie also spelled ABERCROMBY (b. 1706, Glassaugh, Banffshire, Scot.—d. April 23/28, 1781, Stirling, Stirlingshire), British general in the French and Indian Wars, commander of the British forces in the failed attack on the French at Ticonderoga.

A lieutenant colonel of the Royal Scots early in his military career, Abercrombie was promoted to colonel in 1746 and served in the Flemish campaign in the War of Austrian Succession. Promoted to major general in 1756, he was ordered to accompany Lord Loudoun to America as his second in command. Abercrombie's first independent command came in December 1757, when William Pitt, at the insistence of George II, made him commander in chief. His title notwithstanding, his actions were largely determined by the ministry in London. With Augustus Lord Howe as his second in command, Abercrom-

bie was directed to take Fort Ticonderoga by way of preparation for an assault on Montreal. Although he had a force of 15,000 British and colonial troops, Abercrombie was defeated by General Montcalm's army of 3,600 at Ticonderoga in July 1758. In September, Pitt recalled Abercrombie and gave his command to Jeffrey Amherst.

Despite his failure, Abercrombie was promoted to lieutenant general in 1759 and general in 1772. His remaining years were spent in Parliament, as deputy governor of Stirling Castle, and on his estate at Glassaugh, Banffshire.

Abercrombie, Lascelles (b. Jan. 9, 1881, Ashton upon Mersey, Cheshire, Eng.—d. Oct. 27, 1938, London), poet and critic who was associated with Georgian poetry.

He attended Malvern College, Worcester-shire, and Owens College, Manchester, after which he became a journalist and began to write poetry. His first book, *Interludes and Poems* (1908), was followed by *Mary and the Bramble* (1910), a dramatic poem—*Deborah*—and *Emblems of Love* (1912), and the prose work *Speculative Dialogues* (1913). All were marked by lyric power, lucidity, love of natural beauty, and mysticism.

After World War I, in which he served as a munitions examiner, Abercrombie was appointed to the first lectureship in poetry at the University of Liverpool. As professor of English literature at Leeds (1922–29) and London (1929–35) and as reader in English literature at the University of Oxford (1935–38), he showed keen critical and philosophical powers. His critical works include *An Essay Towards a Theory of Art* (1922) and *Poetry, Its Music and Meaning* (1932). *Collected Poems* (1930) was followed by his most mature poetic work, *The Sale of St. Thomas* (1931), a poetic drama.

Aberdare, Welsh ABERDÂR TOWN ("community"), Rhondda Cynon Taff county borough, historic county of Glamorgan (Morgannwg), Wales, on the River Cynon. The community dates from the Middle Ages. Its Saint John's Church was built about 1189. Aberdare's main growth in the 19th century was based on iron ore (first ironworks, 1799) and coal, particularly steam coal for export after 1836. A branch (1811) of the Glamorganshire Canal and, later, railways provided outlets to the South Wales coast. In the 20th century the town's iron industry ceased, and coal mining declined in the vicinity. Aberdare now serves as the chief shopping and service centre for the Cynon valley. Modern industries include the manufacture of cables, smokeless fuel, and, at Hirwaun to the northwest, light engineering and electrical products. Pop. (1991) 29,040.

Aberdare Range, mountain range, forming a section of the eastern rim of the Great Rift Valley in west-central Kenya, northeast of Naivasha and Gilgil and just south of the Equator. The range has an average elevation of 11,000 feet (3,350 m) and culminates in Oldoinyo Lesatima (13,120 feet [3,999 m]) and Ilkinangop (12,815 feet [3,906 m]). The Aberdares slope gradually east and southeast, providing a fine example of an immature, consequent drainage pattern, before the ground rises again to the cone of Mount Kenya (17,058 feet [5,199 m]).

Aberdaugleddyf (Wales): see Milford Haven.

Aberdeen, city and historic royal burgh (town) astride the Rivers Dee and Don on Scotland's North Sea coast. Aberdeen is a busy seaport, a centre of Scotland's fishing industry, and the commercial capital of northeastern Scotland. It also is the principal British centre of the North Sea oil industry. Aberdeen city

constitutes an independent council area that covers the burgh of Aberdeen and the surrounding countryside. Most of the city, including the historic centres of Old Aberdeen and New Aberdeen, lies in the historic county of Aberdeenshire, but the city also includes a small area in the south that belongs to the historic county of Kincardineshire. Aberdeen is the historic county town (seat) of Aberdeenshire.

Aberdeen originated as two separate burghs: Old Aberdeen, the cathedral and university settlement on the Don, and New Aberdeen, the neighbouring trading and fishing village on the Dee. Old Aberdeen, reputedly founded in 580 by St. Machar, a disciple of the Celtic missionary St. Columba, became the seat of the bishopric of Aberdeen and was virtually destroyed by the English in 1336. The present St. Machar's Cathedral, begun in 1424, is a fortified granite building. Royal charters of 1489 and 1498 created a "free burgh" with the church as its administrator. Remnants of this ecclesiastical power survived until 1891, when the episcopal burgh was incorporated with New Aberdeen to form the present city. The oldest surviving charter (1179) confers several trade privileges on the burgesses of Aberdeen.

Some of the oldest streets, from the 13th and 14th centuries, survive near the Castlegate, the historic marketplace of New Aberdeen and commercial heart of the modern city. The Castlegate still contains an old Market (City) Cross (1686). Nearby are two ancient houses, Provost Skene's House (c. 1545), now a local history museum, and Provost Ross's House (1593). The parish church of St. Nicholas (Union Street) is divided into two parts: the West Church (built in 1755 by James Gibbs) is separated from the East Church (built in 1838 by Archibald Simpson) by the original 13th-century transept and 19th-century steeple. Two medieval bridges have survived, the Brig o' Balgownie (1320), spanning the Don, and the Old Bridge of Dee (1527).

The University of Aberdeen was formed in 1860 by the union of two medieval colleges: King's College, founded as a Roman Catholic institution in 1495, and the Protestant Marischal College, founded in 1593. Other educational institutions include the Robert Gordon University (founded as Robert Gordon Hospital, 1750), Aberdeen College, and the Scottish Agricultural College, and there are research institutes for fisheries (Marine Laboratory Aberdeen), soil science (Macaulay Land Use Research Institute), and animal nutrition (Rowett Research Institute).

Aberdeen is an important transport centre by road, rail, sea, and air. The original harbour, the Dee estuary, has been continually improved. It was Scotland's premier fishing port from the introduction of steam trawling until the rise of the North Sea oil industry. Today it is the chief port of northern Scotland, trading mainly with Scandinavia and the Baltic. Typical port industries—chemicals, fertilizers, and engineering, as well as Britain's largest granite-exporting industry—exist alongside a flourishing tourist sector. The North Sea oil boom of the late 20th century benefited Aberdeen more than any other city of Scotland, bringing more than 200 new companies and thousands of new foreign residents and financing the construction of housing, offices, and schools. Some 800 acres (324 hectares) of industrial land were allocated to attract industry associated with oil technology. Area 71 square miles (184 square km). Pop. (1999 est.) 212,650.

Aberdeen, town, Harford county, northeastern Maryland, U.S., near Chesapeake Bay, 26 miles (42 km) northeast of Baltimore. Settled about 1800, it was named for the city in Scotland. Aberdeen is the principal trading centre

for the nearby 113-square-mile (293-square-km) Aberdeen Proving Ground (established 1917), a U.S. Army test site for guns, ammunition, and military vehicles; one of the world's largest collections of weapons is displayed there in the U.S. Army Ordnance Museum. Inc. 1892. Pop. (2000) 13,842.

Aberdeen, city, seat (1880) of Brown county, northeastern South Dakota, U.S., in the James River valley. Established in 1880 as a railway junction, it was named for Aberdeen in Scotland by Alexander Mitchell, president of the Chicago, Milwaukee, and St. Paul Railroad. The city is now the financial and trading centre for a wide agricultural area. It also has some notable light manufacturing. It is the home of Northern State College (1901) and Presentation (junior) College (1951). Author Hamlin Garland, known for his autobiographical "Middle Border" series, and L. Frank Baum, who wrote *The Wonderful Wizard of Oz*, spent their early years in Aberdeen. Inc. town, 1882; city, 1883. Pop. (2000) 24,658.

Aberdeen, George Hamilton-Gordon, 4th Earl of, VISCOUNT GORDON OF ABERDEEN, VISCOUNT OF FORMARTINE, LORD HADDO, METHLICK, TARVES, AND KELLIE, original name **GEORGE GORDON** (b. Jan. 28, 1784, Edinburgh, Scot.—d. Dec. 14, 1860, London, Eng.), British foreign secretary and prime minister (1852–55) whose government involved Great Britain in the Crimean War against Russia (1853–56).

Orphaned at age 11, George Gordon (who added his deceased first wife's family name to his own surname in 1818) was reared by his guardians, the politicians William Pitt the Younger and Henry Dundas (afterward Viscount Melville), and inherited the earldom and associated titles from his grandfather in 1801. In 1813 he was appointed special ambassador to Austria. He was a central figure in European diplomacy at that time, helping to form the coalition that defeated Napoleon I. In 1814, after signing the Treaty of Paris on behalf of his king, he was created Viscount Gordon of Aberdeen in the peerage of the United Kingdom. In the government of the Duke of Wellington, he was chancellor of the duchy of Lancaster (January–June 1828) and foreign secretary (June 1828–November 1830), while in the brief first administration of Sir Robert Peel (November 1834–April 1, 1835), he was secretary for war and the colonies. As foreign secretary again (September 1841–July 1846) in Peel's second government, Aberdeen settled long-standing disputes over the eastern and western boundaries between Canada and the United States, by the Webster-Ashburton Treaty (1842) and the Oregon Treaty (1846).

On Dec. 28, 1852, Aberdeen formed a coalition Cabinet of Peelites (of whom he had been acknowledged leader after Peel's death in 1850), Whigs, and a Radical. In 1853, as his ministry reluctantly neared war with Russia over conflicts of interest in the Middle East,

Aberdeen, detail of an oil painting by Sir Thomas Lawrence, 1828; in the collection of Viscount Cowdray

By courtesy of the Scottish National Portrait Gallery, Edinburgh

his indecision hampered the peacekeeping efforts of his foreign secretary, the 4th Earl of Clarendon. War became inevitable after Aberdeen and Clarendon sent the British fleet to Constantinople (September 23) and then, three months later, into the Black Sea. Both Great Britain and France declared war against Russia on March 28, 1854. Although he was ill-informed by the British generals in the Crimean War, Aberdeen was constitutionally responsible for their mistakes, and he resigned on Jan. 29, 1855.

BIBLIOGRAPHY. Muriel E. Chamberlain, *Lord Aberdeen: A Political Biography* (1983).

Aberdeenshire, also called **ABERDEEN**, council area and historic county of eastern Scotland. It projects eastward into the North Sea and encompasses coastal lowlands in the north and east and part of the Grampian Mountains in the west. The council area and the historic county occupy somewhat different areas. The city of Aberdeen is part of the historic county of Aberdeenshire but constitutes an independent council area that forms an enclave within the council area of Aberdeenshire. The rest of the historic county lies within the council area of the same name, which also incorporates the entire historic county of Kincardineshire and the northeastern portion of the historic county of Banffshire.

Although Aberdeenshire lies north of the Highland Boundary Fault, it mainly comprises an agricultural lowland drained by rivers that generally flow east. The land is in the rain shadow of the Grampians, resulting in a generally dry climate with parts of the coast receiving less than 25 inches (63.5 cm) of precipitation annually. Temperatures are warm for the latitude, but exposure to cold winds from the north and east produces winters that are harsh by British standards.

Although one or two long cairns from the Neolithic Period survive, the effective settlement of the area dates from the establishment of the Beaker culture, arriving from the south at the commencement of the Bronze Age, c. 2000–1800 BC. The stone circles and round cairns that are so common in the historic county date from this period. Numerous earthen houses and a group of massive stone hill forts survive from the Iron Age. At the dawn of history, Celtic tribes that the 2nd-century Greek geographer Ptolemy called Taixali occupied the historic county. Later, Aberdeenshire formed part of the territories of the northern Picts. Roman marching camps exist at Culter, Kintore, and Ythan Wells. Christianity spread to the county relatively early, and Celtic monasteries included those at Old Deer and Monymusk.

Aberdeenshire played a part in the long struggle between the rival houses of Canmore and Macbeth. It was at Lumphanan that Macbeth fell in 1057. During the Anglo-Norman penetration, great families such as the Balliols, the Bruces, and the Comyns obtained a footing in the shire. When the contested succession between these three houses resulted in the Scottish Wars of Independence, the English king Edward I twice traversed the county, in 1296 and 1303. Robert the Bruce's victory in 1307 near Inverurie was a turning point in the struggle. His ultimate triumph resulted in the settlement of new families, most notably the Forbesees and the Gordons, who emerged as the principal rivals in the period of feudal strife during the 14th and 15th centuries. The bitterness later intensified when the Forbesees generally accepted the Protestant Reformation while the Gordons adhered to Roman Catholicism. As a stronghold of royalism and episcopalianism during the English Civil Wars of the 17th century, Aberdeenshire inevitably was the site of much fighting, notably by the army led by the marquess of Montrose.

Meanwhile, trade with the Low Countries, Germany, and Poland had flourished, and in

the 17th century this produced new wealth among some of the ancient county families. The foundation of three universities marked the growth of learning—King's College in Old Aberdeen (1494), Marischal College in New Aberdeen (1593), and the short-lived University of Fraserburgh (1597). The episcopalianism of the northeast, more receptive to cultural expression than was Calvinism, reached its flowering in the celebrated school of scholars known as the "Aberdeen Doctors."

From 1690, after settlement of the Revolution of 1688, more tranquil conditions prevailed. Still, local devotion to Jacobitism and episcopalianism persisted and found vent in the risings of 1715 and 1745. Upon the collapse of the 1745 rebellion, the penal laws destroyed the ascendancy of episcopalianism and the feudal power of the landowners and paved the way for the ensuing era of agricultural and industrial progress.

The economy of the council area rests on a mixture of agriculture, fishing, industry, and services. The raising of dairy and beef cattle is the main agricultural activity, but sheep are important on the higher ground. Peterhead and Fraserburgh are among the most important fishing ports in the United Kingdom and are also boatbuilding centres. Elsewhere fishing has declined, and the small fishing villages have turned to tourism; Stonehaven combines both. Tourism is also important in the Grampians and their scenic valleys. Whisky distilling and light manufacturing occur in several towns. However, the exploitation of North Sea oil is probably the single most important economic activity in Aberdeenshire. Pipelines bring oil ashore at Peterhead and St. Fergus, and the production of goods and services for the oil industry is important in other parts of the council area. Balmoral Castle, the Scottish Highland residence of the British royal family, stands amid the Grampians in western Aberdeenshire. Aberdeen city is the historic county town (seat) and administrative centre of Aberdeenshire, although it is not part of the council area. Area council area, 2,428 square miles (6,289 square km). Pop. (1999 est.) council area, 227,440.

Abergavenny, Welsh *Y Fenni*, town ("community"), historic and present county of Monmouthshire (Sir Fynwy), Wales, at the confluence of the Rivers Gavenny and Usk.

The strategic nature of this site, guarding a main valley corridor between the Black Mountains and the Brecon Beacons into South Wales, was recognized by the Romans, who built the fortress of Gobannium, and by the Normans, who built an 11th-century castle. The market town that grew under the castle's protection was attacked at various times over the next 500 years. Abergavenny held important cattle and horse fairs in the 18th and 19th centuries and developed some flannel making; it never participated in the industrial growth of the coalfield towns to the west. Now a service centre and a popular holiday resort, it has also become a residential base for commuters employed in other Monmouthshire towns nearby. Pop. (1991) 14,092.

Abernathy, Ralph David (b. March 11, 1926, Linden, Ala., U.S.—d. April 17, 1990, Atlanta, Ga.), African American pastor and civil-rights leader who was Martin Luther King's chief aide and closest associate during the Civil Rights Movement of the 1950s and '60s.

The son of a successful farmer, Abernathy was ordained as a Baptist minister in 1948 and graduated with a B.S. degree from Alabama State University in 1950. His interest then shifted from mathematics to sociology, and he earned an M.A. degree in the latter from Atlanta University in 1951. That same year he became pastor of the First Baptist Church in Montgomery, Ala., and he met King a few years later when the latter became pastor of

another Baptist church in the same city. In 1955–56 the two men organized a boycott by black citizens of the Montgomery bus system that forced the system's racial desegregation in 1956. This nonviolent boycott marked the beginning of the Civil Rights Movement that was to desegregate American society during the following two decades.

King and Abernathy continued their close collaboration as the Civil Rights Movement gathered momentum, and in 1957 they founded the Southern Christian Leadership Conference (SCLC; with King as president and Abernathy as secretary-treasurer) to organize the nonviolent struggle against segregation throughout the South. In 1961 Abernathy relocated his pastoral activities to Atlanta, and that year he was named vice president at large of the SCLC and King's designated successor there. He continued as King's chief aide and

closest adviser until King's assassination in 1968, at which time Abernathy succeeded him as president of the SCLC. He headed that organization until his resignation in 1977, after which he resumed his work as the pastor of a Baptist church in Atlanta. His autobiography, *And the Walls Came Tumbling Down*, appeared in 1989.

Aberpennar (Wales); see Mountain Ash.

aberration, in optical systems, such as lenses and curved mirrors, the deviation of light rays through lenses, causing images of objects to be blurred. In an ideal system, every point on the object will focus to a point of zero size on the image. Practically, however, each image point occupies a volume of finite size and unsym-

Several types of aberration
Encyclopedia Britannica, Inc.

metrical shape, causing some blurring of the whole image. Unlike a plane mirror, which yields images free of aberrations, a lens is an imperfect image producer, becoming ideal only for rays passing through its centre parallel to the optical axis (a line through the centre, perpendicular to the lens surfaces). The equations developed for object-image relations in a lens having spherical surfaces are only approximate and deal only with paraxial rays—i.e., rays making only small angles with the optical axis. When light of only a single wavelength is present, there are five aberrations to be considered, called spherical aberration, coma, astigmatism, curvature of field, and distortion. A sixth aberration found in lenses (but not mirrors)—namely, chromatic aberration—results when light is not monochromatic (not of one wavelength).

In spherical aberration, rays of light from a point on the optical axis of a lens having spherical surfaces do not all meet at the same image point. Rays passing through the lens close to its centre are focused farther away than rays passing through a circular zone near its rim. For every cone of rays from an axial object point meeting the lens, there is a cone of rays that converges to form an image point, the cone being different in length according to the diameter of the circular zone. Wherever a plane at right angles to the optical axis is made to intersect a cone, the rays will form a circular cross section. The area of the cross section varies with distance along the optical axis, the smallest size known as the circle of least confusion. The image most free of spherical aberration is found at this distance.

Coma, so called because a point image is blurred into a comet shape, is produced when rays from an off-axis object point are imaged by different zones of the lens. In spherical aberration, the images of an on-axis object point that fall on a plane at right angles to the optical axis are circular in shape, of varying size, and superimposed about a common centre; in coma, the images of an off-axis object point are circular in shape, of varying size, but displaced with respect to each other. The accompanying diagram shows an exaggerated case of two images, one resulting from a central cone of rays and the other from a cone passing through the rim. The usual way for reducing coma is to employ a diaphragm to eliminate the outer cones of rays.

Astigmatism, unlike spherical aberration and coma, results from the failure of a single zone of a lens to focus the image of an off-axis point at a single point. As shown in the three-dimensional schematic the two planes at right angles to one another passing through the optical axis are the meridian plane and the sagittal plane, the meridian plane being the one containing the off-axis object point. Rays not in the meridian plane, called skew rays, are focused farther away from the lens than those lying in the plane. In either case the rays do not meet in a point focus but as lines perpendicular to each other. Intermediate between these two positions the images are elliptical in shape.

Curvature of field and distortion refer to the location of image points with respect to one another. Even though the former three aberrations may be corrected for in the design of a lens, these two aberrations could remain. In curvature of field, the image of a plane object perpendicular to the optical axis will lie on a paraboloidal surface called the Petzval surface (after József Petzval, a Hungarian mathematician). Flat image fields are desirable in photography in order to match the film plane and projection when the enlarging paper or projection screen lie on a flat surface. Distortion refers to deformation of an image. There are two kinds of distortion, either of which may be

present in a lens: barrel distortion, in which magnification decreases with distance from the axis, and pincushion distortion, in which magnification increases with distance from the axis.

The last aberration, chromatic aberration, is the failure of a lens to focus all colours in the same plane. Because the refractive index is least at the red end of the spectrum, the focal length of a lens in air will be greater for red and green than for blue and violet. Magnification is affected by chromatic aberration, being different along the optical axis and perpendicular to it. The first is called longitudinal chromatic aberration, and the second, lateral chromatic aberration.

aberration, constant of, in astronomy, the maximum amount of the apparent yearly aberrational displacement of a star or other celestial body, resulting from the Earth's orbital motion around the Sun. The value of the constant, about 20.49" of arc, depends on the ratio of Earth's orbital velocity to the velocity of light. James Bradley, the British astronomer who in 1728 discovered the aberration of starlight, estimated the value of the constant at about 20" and from this calculated a remarkably close value for the velocity of light at 295,000 kilometres (183,300 miles) per second. The aberrational ellipse described by the image of a star in the course of a year has a major axis equal in angular distance to twice the constant of aberration.

Abertillery, town, Blaenau Gwent county borough, historic county of Monmouthshire (Sir Fynwy), Wales, in the valley of the River Ebbw. Coal mining was its main economic interest from about 1850 until the last mines closed in the 1980s. Nantyglo, to the north, was the site of famous ironworks. Some light manufacturing has been introduced to Abertillery since the 1930s, mostly with government assistance, and the town is a commercial centre. Pop. (1991) 11,680.

Aberystwyth, coastal town, Ceredigion county (historic county of Cardiganshire), Wales, where the River Rheidol flows into Cardigan Bay. Traces of extensive Iron Age earthworks have been found on the hill Pen Dinas, which overlooks the old port and town. The medieval walled town grew around the castle erected by the Normans (1277) on a rocky headland immediately north of the mouth of the River Rheidol. The town spread northward along the coast, especially after the coming of railways. The port, now virtually unused, once handled coastal, Irish, and even transatlantic shipping (Welsh emigrants, for example, would sail direct for the United States) and served as the outlet for the once-flourishing Cardiganshire lead mines.

The town has grown since the late 19th century as a holiday resort and rural service centre and is the headquarters of many regional services of western Wales. Though established by English conquerors in the Welsh heartland, Aberystwyth has become a principal stronghold of Welsh culture. The founder college of the University of Wales was established there in 1872. Modern university buildings and the National Library of Wales, one of Britain's copyright libraries, overlook the town from Penglais Hill to the northeast. In the Rheidol valley the inland hamlet of Llanbadarnfawr has become a suburb; its church was once a great centre of Dark Ages learning and Celtic Christianity. Pop. (1991) 11,154.

abettor, in law, a person who becomes equally guilty in the crime of another by knowingly and voluntarily aiding the criminal during the act itself. An abettor is one kind of accomplice (*q.v.*), the other being an accessory, who aids the criminal prior to or after the crime.

Abgar legend, in early Christian times, a popular myth that Jesus had an exchange of

letters with King Abgar V Ukkama of Osroene, whose capital was Edessa, a Mesopotamian city on the northern fringe of the Syrian plateau. According to the legend, the king, afflicted with leprosy, had heard of Jesus' miracles and wrote to Jesus acknowledging his divine mission, asking to be cured, and inviting him to come to Edessa as a safe refuge from persecution. In his reply, Jesus allegedly commended the king for his faith, expressed regret that his mission in life precluded a visit, but promised that after his Ascension into heaven a disciple would visit Edessa and heal the king.

A developed form of the legend exists in the *Doctrine of Addai*, a Syriac document containing suggestions of primitive Christianity in Edessa. In any event, the letters, probably composed early in the 4th century, have been considered spurious since the 5th century. They were translated from Syriac into Greek, Armenian, Latin, Arabic, and other ancient languages, clear evidence of the popularity of the legend.

Abhā, city, southwestern Saudi Arabia. It is situated on a plain at the western edge of Mouni al-Hijaz and is surrounded by hills. The valley of the Wadi Abhā near the city is filled with gardens, fields, and streams. The city consists of four quarters, the largest of which contains an old fortress. Abhā was freed from Ottoman rule following World War I and brought under the control of the Wahhabīs, a Muslim puritanical group, in 1920 by 'Abd al-'Aziz ibn Sa'ud. It is characterized by forts built on top of the neighbouring hills. Abhā lies 50 miles (80 km) east of the Red Sea and 528 miles (850 km) southwest of Riyadh, the national capital. A coastal road, completed in 1979, connects Jidda with Abhā. Pop. (1992) 112,316.

Abhayagiri, important ancient Theravāda Buddhist monastic centre (*vihāra*) built by King Vaṭṭagāmaṇi Abhaya (29–17 BC) on the northern side of Anurādhapura, the capital of Ceylon (Sri Lanka) at that time. Its importance lay, in part, in the fact that religious and political power were closely related, so that monastic centres had much influence on the secular history of the nation. But it is also important in the history of Theravāda Buddhism itself. It was originally associated with the nearby Mahāvihāra ("Great Monastery"), which was the traditional centre of religious and civil power built by Devānapiya-Tissa (307–267 BC). But Abhayagiri seceded from the Great Monastery toward the end of Vaṭṭagāmaṇi's reign in a dispute over the relations between monks and the lay community and the use of Sanskrit works to augment Pāli texts as scripture.

Although viewed as heretical by the monks at the Great Monastery, the Abhayagiri monastery advanced in prestige and wealth under the patronage of King Gajabāhu I (AD 113–135). Abhayagiri continued to flourish until Anurādhapura was abandoned in the 13th century. Even then, two of its main colleges continued to operate until the 16th century.

abhibhvāyatana (Sanskrit: "total mastery over the senses"), Pāli ABHIBHĀYĀTANA, in Buddhist philosophy, one of the preparatory stages of meditation, in which the senses are completely restrained. In Buddhist canons, *abhibhvāyatana* is divided into eight substages during which man comes to realize that physical forms in the external world are different from himself, thus freeing himself from attachment to the sense objects. These stages become bases for man's deliverance from sensual pleasures and pains, which are understood to be sufferings.

Abhidhamma Piṭaka (Pāli: "Basket of Special Doctrine," or "Further Doctrine"), San-

skṛit ABHIDHARMA PĪṬAKA, the third—and historically the latest—of the three “baskets,” or collections of texts, that together comprise the Pāli canon of Theravāda Buddhism, the form predominant in Southeast Asia and Sri Lanka (Ceylon). The other two collections are *Sutta* (“Discourse”; Sanskrit *Sūtra*) and *Vinaya* (“Discipline”) *Piṭakas*. Unlike *Sutta* and *Vinaya*, the seven *Abhidhamma* works are not generally claimed to represent the words of the Buddha himself but of disciples and great scholars. Nevertheless, they are highly venerated, particularly in Burma.

These are not systematic philosophical treatises but a detailed scholastic reworking, according to schematic classifications, of doctrinal material appearing in the *Suttas*. As such they represent a development in a rationalistic direction of summaries or numerical lists that had come to be used as a basis for meditation—lists that, among the more mystically inclined, contributed to the *Prajñāpāramitā* (“Perfection of Wisdom”) literature of Mahāyāna Buddhism, the form predominant in East Asia. The topics dealt with in *Abhidhamma* books include ethics, psychology, and epistemology.

As the last major division of the canon, the *Abhidhamma* corpus has had a checkered history. It was not accepted as canonical by the Mahāsaṅghika (Sanskrit: Great Community) school, the forerunners of Mahāyāna. Another school included within it most of the *Khuddaka Nikāya* (“Short Collection”), the latest section of the *Sutta Piṭaka*. And various Mahāyāna texts have been classified as *Abhidhamma*, including the *Prajñāpāramitā-sūtras* in Tibet and, in China, the *Diamond Sūtra*.

The Pāli *Abhidhamma Piṭaka* encompasses the following texts, or *pakaraṇas*: (1) *Dhammasaṅgaṇi* (“Summary of Dharma”), a psychologically oriented manual of ethics for advanced monks but long popular in Ceylon; (2) *Vibhaṅga* (“Division,” or “Classification”—not to be confused with a *Vinaya* work or with several *suttas* bearing the same name), a kind of supplement to the *Dhammasaṅgaṇi*, treating many of the same topics; (3) *Dhātukathā* (“Discussion of Elements”), another supplementary work; (4) *Puggalapaññatti* (“Designation of Person”), largely a collection of excerpts from the *Aṅguttara Nikāya* of the *Sutta Piṭaka*, classifying human characteristics in relation to stages on the Buddhist path; generally considered the earliest *Abhidhamma* text; (5) *Kathāvatthu* (“Points of Controversy”), attributed to Moggaliputta, president of the third Buddhist Council (3rd century BC), the only work in the Pāli canon assigned to a particular author; historically one of the most important of the seven, the *Kathāvatthu* is a series of questions from a heretical (i.e., non-Theravāda) point of view, with their implications refuted in the answers; the long first chapter debates the existence of a soul; (6) *Yamaka* (“Pairs”), a series of questions on psychological phenomena, each dealt with in two opposite ways; (7) *Paṭṭhāna* (“Activations,” or “Causes”), a complex and voluminous treatment of causality and 23 other kinds of relationships between phenomena, mental or material.

Abhidhammattha-saṅgaha (Pāli: “Summary of the Meaning of *Abhidhamma*”), probably the most important Buddhist manual of psychology and ethics. A highly popular primer, or digest, of the *Abhidhamma* corpus (the scholastic section of the canon) of the Theravāda tradition, it was composed in India or in Burma, the chief centre for *Abhidhamma* studies. Written in Pāli by the monk Anuruddha, it dates from no earlier than the 8th century AD and probably from the 11th or 12th.

This is a handbook rather than an expository work; it is extremely condensed, dealing

in less than 50 pages with the entire contents of the seven texts of the *Abhidhamma Piṭaka*. It is the most widely read work of its kind, is held in very high esteem, especially in Burma and Sri Lanka (Ceylon), and has been the subject of an extensive exegetical literature in the centuries since its composition.

The subject matter of the *Abhidhammattha-saṅgaha* includes enumerations of 89 classes of consciousness, 52 mental properties in various combinations, the qualities of matter, the kinds of relations between phenomena, the varieties of rebirth, and a number of meditation exercises. The purpose of all this analysis is to elicit a realization of the impermanence of all things, leading to Enlightenment and emancipation.

Abhidhammāvatāra (Pāli: “Coming of *Abhidhamma*”), the earliest effort at systematizing, in the form of a manual, the doctrines dealt with in the *Abhidhamma* (scholastic) section of the Theravāda Buddhist canon. The *Abhidhammāvatāra* was written in Pāli, apparently in the 5th century, by the poet and scholar Buddhadatta in the region of the Kāveri River, in southern India.

Following the closing of the canon in the final centuries BC, a number of commentaries (known in Pāli as *aṭṭhakathā*) on particular canonical texts appeared and culminated in those produced by Buddhadatta’s contemporary, Buddhaghosa. In the *Abhidhammāvatāra* Buddhadatta then both summed up and gave an original systematization to that part of the commentary literature dealing with *Abhidhamma*. (Among his other works is the *Vinaya-vinicchaya* [“Analysis of the Vinaya”], which similarly summarizes the commentaries on the *vinaya* [monastic discipline] section of the canon.)

The *Abhidhammāvatāra* is written largely in verse and has 24 chapters. To a certain extent it was superseded in the 12th century by Anuruddha’s *Abhidhamnautha-saṅgaha*.

Abhidharma Piṭaka: see *Abhidhamma Piṭaka*.

Abhidharmakośa, also called ABHIDHARMAKOŚA-ŚĀSTRA (Sanskrit: “Treasury of Higher Law”), Chinese A-P’I-TA-MO CHŪ-SHE LUN, Japanese ABIDATSUMA-KUSHA-RON, encyclopaedic compendium of *Abhidharma* (scholasticism), the position of which within Buddhism has often been likened to that of St. Thomas Aquinas’ *Summa theologiae* for Roman Catholicism.

Its author, Vasubandhu, who lived in the 4th or 5th century in the northwestern part of India, wrote the work while he was still a monk of the Sarvāstivāda (Doctrine That All Is Real) order, before he embraced Mahāyāna, on whose texts he was later to write a number of commentaries. As a Sarvāstivāda work the *Abhidharmakośa* is one of few surviving treatments of scholasticism not written in Pāli and not produced by Theravādins, who follow the Pāli canon. The product of both great erudition and considerable independence of thought, the *Abhidharmakośa* authoritatively completed the systematization of Sarvāstivāda doctrine and at the same time incorporated Mahāyānist tendencies.

Translated into Chinese within a century or two, the *Abhidharmakośa* has been used in China, Japan, and Tibet both as a standard introduction to the Hinayāna Buddhism of the southern countries and as a great authority in matters of doctrine. In China it provided the basis for the *Abhidharma* (Chinese Chū-she; Japanese Kusha) sect. The work has inspired numerous commentaries. It also provides scholars with a unique amount of information on the doctrinal differences between ancient Buddhist schools.

The text is composed of 600 stanzas of poetry plus the equivalent of 8,000 stanzas of prose commentary supplied by the author

himself. As an introduction to the seven *Abhidharma* treatises in the Sarvāstivāda canon and a systematic digest of their contents, the *Abhidharmakośa* deals with a wide range of philosophical, cosmological, ethical, and salvational doctrine.

abhijñā (Sanskrit: “supernatural knowledge”), Pāli ABHIÑÑĀ, in Buddhist philosophy, miraculous power obtained especially through meditation and wisdom. Usually five kinds of *abhijñā* are enumerated: the ability (1) to travel any distance or take on any form at will; (2) to see everything; (3) to hear everything; (4) to know another’s thoughts; (5) to recollect former existences.

A sixth miraculous power, freedom by undefiled wisdom, is exclusively the prerogative of Buddhas and *arhats* (saints). An earlier enumeration of three knowledges (*tisro-vidyās*) consists of this sixth *abhijñā* together with the powers of recollecting previous existences and of seeing everything and thus knowing the future destinies of all beings.

The first five *abhijñās* enumerated in Buddhism are identical with the *siddhis* (miraculous powers) known to Indian ascetics in general. Patañjali, for example, mentions them in his *Yoga-sūtra* (the classical exposition of Yoga) as magical virtues of meditation. Goblins and deities are said to be endowed naturally with such powers.

Attainment of the *abhijñās* by monks is possible only through continual meditation directed toward the final goal of perfect freedom; the powers themselves are regarded as indications of spiritual progress. According to the Buddha, however, indulgence in the *abhijñās* is to be avoided, since their use is a powerful distraction from the path toward Enlightenment, which is the sixth *abhijñā* and the final goal.

Abhinavagupta (fl. 1014, Kashmir, India), philosopher, ascetic and aesthete, and outstanding representative of the “recognition” (*pratyabhijñā*) school of Kashmiri Śaivite monism. This school conceived of the god Śiva (the manifestation of ultimate reality), the individual soul, and the universe as essentially one; *pratyabhijñā* refers to the way of realizing this identity. Abhinavagupta was a prolific writer on philosophy and aesthetics. Among his most notable philosophic works are the *Īśvara-pratyabhijñā-vimarsīnī* and the more detailed *Īśvara-pratyabhijñā-vivṛti-vimarsīnī*, both commentaries on *Īśvara-pratyabhijñā* (“Recognition of God”), by Utpala, an earlier philosopher of the *pratyabhijñā* school.

Abhisamayālaṅkāraloka (Sanskrit: “Illumination of the *Abhisamayālaṅkāra*”), important contribution to exegetical literature on the *Prajñāpāramitā* (“Perfection of Wisdom”) *sūtras* of the Mahāyāna Buddhist tradition and one of the texts most often studied in Tibetan monasteries.

The *Prajñāpāramitā-sūtras*, with their emphasis on the doctrine of ontological “emptiness” and the attainment of Nirvāṇa through perfect wisdom, had been systematized in a terse commentary known as the *Abhisamayālaṅkāra*. (*Abhisamaya* means either “insight” or “uniting” and designates Buddhist training toward Enlightenment; *alaṅkāra* is a literary form in verse.) This latter text required its own commentaries, which continued to be produced in Tibet into modern times. It was paraphrased in the present treatise, the *Abhisamayālaṅkāraloka*, which also offered a detailed commentary on the *Aṣṭasāhasrikā* (“8,000-Verse”) *Prajñāpāramitā*.

The author was Haribhadra. He wrote around AD 750, and his text was translated from Sanskrit into Tibetan in the 10th or 11th century.

abhiseka, Sanskrit ABHIṢĒKA ("sprinkling"), in esoteric Buddhism, a purificatory or initiatory rite in which a candidate is sprinkled with water or other liquid, signifying a change in status.

Originally, abhiseka was an integral part of the ancient Indian royal consecration rite. Water from the four oceans was poured out of golden jars onto the head of the seated monarch during his accession ceremony and also during the investiture ceremony of his heir apparent. In Tantric, or esoteric, Buddhism, the abhiseka rite is a necessary prelude to initiation into mystical teaching or rites. Four classes of abhiseka are known, each of them associated with one of the four Tantras (teachings) suitable to four groups of people with progressively superior levels of sensibility. They are the master consecration, secret consecration, knowledge of prajna ("wisdom"), and the fourth consecration.

Abia, state, east-central Nigeria. Abia was administratively created in 1991 from the eastern half of former Imo state. It is bordered by the states of Enugu to the north, Cross River and Akwa Ibom to the east, Rivers to the south, and Imo and Anambra to the west. Abia includes areas of oil-palm bush and tropical rain forest in its southern part and woodland savanna in its hilly north. Most of the population is engaged in agriculture; yams, taro, corn (maize), rice, and cassava are the staple crops, and oil palm is the main cash crop. Mineral resources include lead and zinc.

The state's chief industrial centre is Aba, which lies on the railway north from Port Harcourt and manufactures textiles, pharmaceuticals, soap, plastics, cement, footwear, and cosmetics. Umuahia, the state capital, has a palm-oil-processing plant and several breweries. Abia state is mainly inhabited by the Igbo (Ibo) people and is one of the most densely populated areas in Nigeria. The main highway network serves Umuahia and Aba. Pop. (1991) 2,297,978.

'**Abid al-Bukhārī**, also called BUĀKHAR, army of Saharan blacks organized in Morocco by the 'Alawī ruler Ismā'il (reigned 1672–1727). Earlier rulers had recruited black slaves (Arabic: 'abīd) into their armies, and these men or their descendants eventually formed the core of Ismā'il's guard.

The 'abīd were sent to a special camp at Mechra' er-Remel to beget children. The communal children, male and female, were presented to the ruler when they were about 10 years old and proceeded to a prescribed course of training. The boys acquired such skills as masonry, horsemanship, archery, and musketry, whereas the girls were prepared for domestic life or for entertainment. At the age of 15 they were divided among the various army corps and married, and eventually the cycle would repeat itself with their children.

Ismā'il's army, numbering 150,000 men at its peak, consisted mainly of the "graduates" of the Mechra' er-Remel camp and supplementary slaves pirated from black Saharan tribes, all foreigners whose sole allegiance was to the ruler. The 'abīd were highly favoured by Ismā'il, well paid, and often politically powerful; in 1697–98 they were even given the right to own property.

After Ismā'il's death the quality of the corps could not be sustained. Discipline slackened, and, as preferential pay was no longer forthcoming, the 'abīd took to brigandage. Many left their outposts and shifted into the cities, and others became farmers or peasants. Those who remained in the army were an unstable element, ready for intrigue. Under strong rulers, the 'Abīd al-Bukhārī were periodically reorganized, though they never regained their former military and numerical strength. The

'abīd were finally dissolved late in the 19th century, with only a nominal number retained as the king's personal bodyguard.

Abidjan, chief port, capital, and largest city of Côte d'Ivoire (Ivory Coast). It lies along the Ébrié Lagoon, which is separated from the Gulf of Guinea and the Atlantic by the Vridi Plage sandbar. A village in 1898, it became

Abidjan and the Ébrié Lagoon, Côte d'Ivoire
Q Picou—De Wys Inc

a town in 1903. Abidjan was a rail terminus from 1904 but had to depend on the meagre facilities of Port-Bouët on the sandbar's ocean shore. It succeeded Bingerville as capital of the French colony in 1934 and retained that position after independence in 1960. Districts within the city include Plateau, Cocody (site of the National University of Côte d'Ivoire), Treichville, Adjame, Koumassi, and Marcory.

The Vridi Canal opened the lagoon to the sea in 1950, and the city soon became the financial centre of French-speaking West Africa. The first of two bridges linking the mainland to Petit-Bassam Island was built in 1958. Abidjan's modern deepwater port exports coffee, cocoa, timber, bananas, pineapples, and manganese. From the administrative and business sectors on the mainland, the city stretches southward to the industrial area on Petit-Bassam and the mineral and petroleum docks along the Vridi Canal. There are a number of wide, shady streets and garden squares in the city; the university (1958) lies on the eastern mainland. Abidjan has a museum of traditional Ivorian art, a national library, and several agricultural and scientific research institutes. The city is a communications centre and the site of an international airport (at Port-Bouët, an autonomous municipality within Abidjan). North of the city is Banco National Park, a magnificent tropical rain forest. Pop. (1990 est.) 2,168,000.

abietic acid, the most abundant of several closely related organic acids that constitute most of rosin, the solid portion of the oleo-resin of coniferous trees. Commercial abietic acid is usually a glassy or partly crystalline, yellowish solid that melts at temperatures as low as 85° C (185° F). It belongs to the diterpene group of organic compounds (compounds derived from four isoprene units).

Rosin has been used for centuries for caulking ships. It is also rubbed on the bows of musical instruments to make them less slippery. In modern times methods have been developed for improving the properties of the rosin acids, which are soft, tacky, and low-melting and subject to rapid deterioration by oxidation in air. Stability is greatly increased by heat treatment.

Rosin acids are converted into ester gum by reaction with controlled amounts of glycerol or other polyhydric alcohols. Ester gum has drying properties and is used in paints, varnishes, and lacquers.

Abigail, in the Old Testament, the wife of Nabal of southern Judah, on whose death she became one of the first wives of David

(1 Samuel 25) and the mother of his son Chileab. The name Abigail was also borne by David's sister (1 Chronicles 2:16), who was the mother of Amasa, commander of the army of Absalom. From the former (self-styled "handmaid"; 1 Samuel 25:25) is derived the colloquial use of the word for a waiting woman.

Abildgaard, Nicolai Abraham, also spelled NIKOLAJ-ABRAHAM ABILGAARD (b. Sept. 11, 1743, Copenhagen, Den.—d. June 4, 1809, Frederiksdal), the most renowned Danish painter of the late 18th century and one of the early Neoclassicists.

During 1772–77 Abildgaard studied in Rome, where he was primarily influenced by antique sculpture and Roman wall paintings. His style was classical, though with a romantic trend, and he had a remarkable sense of colour. Many of his paintings are melodramatic interpretations of episodes from ancient literature. He taught at the Danish Royal Academy of Fine Arts, of which he became director in 1789. Bertel Thorvaldsen, the prominent Danish sculptor, was his pupil.

Abilene, city, seat (1861) of Dickinson county, east-central Kansas, U.S. The city lies along the Smoky Hill River. Settled in 1858 and known as Mud Creek, it was named about 1860 for the biblical Abilene (which means "grassy plain"). Development was slow until Joseph McCoy, a cattle entrepreneur and later mayor of Abilene, selected it for the northern terminus of the Texas cattle drives in 1867, the year the Kansas Pacific Railroad reached this point. The biggest year of cattle

Place of Meditation, Eisenhower Center, Abilene, Kan.

Alan Pitcairn from Grant Heilman

drives to Abilene over the Chisholm Trail was 1871, when more than 5,000 cowboys driving 700,000 cows arrived at the yards. With the prosperity of the cattlemen came an era of lawlessness. The famed gunman Wild Bill Hickok served as the town's marshal in 1871. The appearance of homesteaders and fenced ranges discouraged the Texas cattle trade, much of which was diverted to Wichita. Abilene is still a shipping point for livestock, as well as for grain and other agricultural products, and it has some light industry. President Dwight D. Eisenhower spent his boyhood in Abilene, and he is buried at the Eisenhower Center, which also encompasses his family home and library. Inc. 1869. Pop. (1990) 6,242.

Abilene, city, seat (1883) of Taylor county (and partly in Jones County), west-central Texas, U.S. It lies on low, rolling plains 153 miles (246 km) west of Fort Worth. Founded in 1881 as the new railhead (Texas and Pacific Railway) for the overland Texas cattle drives, it took not only the business of the previous railhead, Abilene, Kan., but also its biblical name. The city's economy, originally based solely on livestock and agriculture, has expanded to include industry. Petroleum and

natural gas are produced in a multicounty area, of which Abilene is the centre. The city's manufactures include light machinery, aerospace structures, and band instruments. Abilene is the site of Hardin-Simmons University (1891), Abilene Christian University (1906), and McMurry University (1923). Dyess Air Force Base lies just southwest. The West Texas Fair, rodeos, and livestock shows are annual events. Old Abilene Town (northeast) is a reconstructed Texas frontier town. Inc. 1881. Pop. (1994 est.) city, 110,034; Abilene MSA, 121,904.

Abingdon, town ("parish"), Vale of White Horse district, county of Oxfordshire, England. It lies south of Oxford at the confluence of the Rivers Thames and Ock.

The town was founded by the Saxons and grew up around a Benedictine abbey established in 676. In 1556, after the abbey had been dissolved, Abingdon was granted its first royal charter. The abbey remains include a Perpendicular gateway and the restored Checker Hall, now used as an Elizabethan-style theatre. The arched bridge over the Thames (1416; widened 1929) provides a view of the Early English tower and Perpendicular spire of St. Helen's Church. The county hall (1677–80) houses a museum collection. St. Nicholas' Church, the west front of which was built in 1180, stands nearby. Schools in the town include Abingdon (Royse's) School—one of the oldest public (independent) schools in England—and Radley College (1847). The town also has a number of light industries and is a popular Thames-side resort. Pop. (1991) 35,234.

Abington, town ("township"), Plymouth county, eastern Massachusetts, U.S. It lies 20 miles (32 km) southeast of Boston. Known as Manamooskeagin ("Land of Many Beavers") to the Indians, it was settled in 1668, incorporated in 1712, and named for Abington, Eng. An iron foundry was established there in 1769, and about 1815 Jesse Reed invented a machine that mass-produced tacks, thus enabling the footwear industry to thrive. Abington is reputed to have produced half of all the boots worn by the Union Army in the American Civil War. From 1846 to 1865 it was a centre of the Abolitionist movement. Now primarily residential, it has some light manufacturing, notably printing and machine-tool industries. Pop. (2000) 14,605.

Abington, urban township, Montgomery county, southeastern Pennsylvania, U.S. Abington is a northern suburb of Philadelphia, encompassing the communities of Ardsley, Glenside, McKinley, Noble, North Glenside, and Roslyn. Organized in the 1700s, it became a station on the North Pennsylvania Railroad in 1855. During the U.S. War of Independence, an American skirmish with the British took place at nearby Edge Hill. The township's manufactures include pressed steel, chemicals, and metal and plastic products. The Ogontz campus of Pennsylvania State University opened in Abington in 1950. Inc. 1906. Pop. (1999 est.) 55,077.

Abington, Fanny, née FRANCES BARTON (b. 1737, London, Eng.—d. March 4, 1815, London), English actress admired both for her craft and for her leadership in fashion.

She was at first a flower girl, hence her later nickname, Nosegay Fan, and a street singer. Employment by a French milliner gave her taste in dress and a knowledge of French that she later found useful. She first appeared on the stage at the Haymarket Theatre, London, in 1755. In 1756 she joined the Drury Lane company but was overshadowed by Hannah Pritchard and Kitty Clive. After an unfortunate marriage to her music master in 1759, she was known as Mrs. Abington. She spent five successful years in Ireland and was then invited by David Garrick to rejoin Drury Lane.

There she remained for 18 years, creating many important roles, among them Lady Teazle in Richard Brinsley Sheridan's *The School for Scandal* (1777). She was equally successful in tragedy and comedy. In 1782 Mrs. Abington went from Drury Lane to Covent Garden. She left the stage in 1790, returning in 1797 for another two years. She was a leader of fashion, and a headdress of hers called the Abington cap was very widely worn.

abiogenesis: see spontaneous generation.

Abipón, South American Indian people who formerly lived on the lower Bermejo River in the Argentine Gran Chaco. They spoke a language (also called Callaga) belonging to the Guaycuruan group of the Guaycurú-Charruan languages. About 1750 their numbers were estimated at 5,000, but in the second half of the 19th century they became extinct as a people. Seminomadic bands of Abipón hunted, fished, gathered food, and practiced a limited degree of agriculture before the introduction of the horse. The latter event transformed the whole social system of the Chaco. Agriculture was practically abandoned, and semi-wild cattle, rhea, guanaco, deer, and peccary were hunted on horseback. Abipón horsemen also raided Spanish farms and ranches, even threatening large cities such as Asunción and Corrientes.

By 1750 the Jesuits had settled the Abipón on missions that later became the Argentine cities of Reconquista and Resistencia. White military pacification campaigns in the 19th century circumscribed the Abipón's hunting grounds. Many of the Indians were slaughtered, and others were assimilated into the general population.

Abitibi River, river, northeastern Ontario, Canada. From its source in the shallow 359-square-mile (931-square-kilometre) Abitibi Lake, lying across the Ontario-Quebec border, the river descends 868 feet (265 m) as it flows generally northward for 340 miles (547 km) to join the Moose River and empty into the southern end of James Bay. The heavily forested Abitibi River valley supports an extensive pulp and paper industry, centred at Iroquois Falls. Gold mining has long been important in the lake region, and tourism has become increasingly significant in the economy. Abitibi is an Algonkian Indian term (*abitah*, "middle," and *nipi*, "water") describing the lake's midway location on an old canoe route between the Ottawa Valley and James Bay.

Abkhaz, also called ABKHAZIAN, Abkhaz APSWA, any member of a Caucasian people living chiefly in the Abkhazia republic in northwesternmost Georgia. The Bzyb Abkhaz, who have a distinct dialect, are found around the Bzyb River; the Abzhui Abkhaz, on whose dialect the literary language is based, live near the Kodori River; and the Zamurzakan Abkhaz are found in the southeast. The Abaza people, who speak a similar language, dwell north of the main Caucasus mountain chain around the sources of the Kuban and Zelenchuk rivers in Karachay-Cherkessia, Russia. Abaza and Abkhaz are so similar that many linguists consider them to be dialects of a single language. The traditional economy of the Abkhaz is based on cattle breeding, agriculture, viticulture, and beekeeping. In religion they are chiefly Sunnite Muslims and Eastern Orthodox Christians.

Abkhazia, also spelled ABKHAZIYA, republic in northwestern Georgia, between the Black Sea (south) and the crest line of the Great Caucasus range (north).

Bordering the eastern shores of the Black Sea, the republic consists of a narrow coastal lowland broken by mountain spurs, followed by a hilly foreland zone of eroded marine and river terraces that merge into the steep slopes of the Caucasus Mountains.

The sharp relief in close proximity to the sea gives Abkhazia a wet climate. Near-subtropical conditions prevail in the lowland, where the average January temperature remains above freezing point and annual rainfall is 47 to 55 inches (1,200 to 1,400 mm). On the mountain slopes, climatic conditions are more severe and rainfall is heavier. Wide areas of the lowland and foreland zones have been cleared of the forests of oak, beech, and hornbeam that once covered Abkhazia.

The Abkhaz were vassals of the Byzantine Empire when they became Christian under Justinian I (c. 550). In the 8th century the independent kingdom of Abkhazia was formed. Later a part of Georgia, it secured its independence in 1463 only to come under the rule of the Ottoman Empire in the 16th century. Islām subsequently replaced Christianity in parts of the region. In 1810 a treaty with Russia was signed acknowledging a protectorate. Russia annexed Abkhazia in 1864, and the Soviet authorities proclaimed its autonomy as a region in 1919 and raised it to the status of a republic in 1921. It became an autonomous republic within the Georgian republic in 1930, and it remained part of Georgia when the latter attained independence in 1991. In 1992, however, secessionists in Abkhazia staged an armed revolt against the Georgian central government in a bid to obtain Abkhazian independence. The rebels established control over Abkhazia in 1993, and the following year they declared an independent sovereign republic, though this was opposed by Russia as well as Georgia.

Prior to the rebellion, ethnic Georgians had made up almost half of Abkhazia's population, while ethnic Abkhaz had accounted for less than one-fifth; Armenians and Russians made up the remainder. In 1993, however, most Georgians and some Russians and Armenians fled Abkhazia for other parts of Georgia. The majority of the population is concentrated in the coastal lowland, where the larger settlements are located—the capital, Sokhumi (*q.v.*), Ochamchire, and the resort centres of Gagra and Novy Afon. Although the amount of arable land is small, agriculture constitutes the predominant economic activity in the republic. In the foreland zone an excellent tobacco is grown; the coastal zone is noted for its tea, silk, and fruits. Oil is extracted from the nut of the tung tree, which is widely grown together with eucalyptus and bamboo. Grapes have been cultivated in the area since ancient times. Inland, on the higher slopes, timber production is the major occupation. Coal mining centres on Tqvarcheli, the largest inland city. Power is supplied by several hydroelectric plants. The coastal resorts and Lake Ritsa are popular holiday and convalescent centres.

The main line of communication in the republic is the electrified railway along the coast, with a branch to Tqvarcheli. Roads also parallel the coast and lead inland. Area 3,343 square miles (8,600 square km). Pop. (1993 est.) 516,600.

Abkhazo-Adyghian languages, also called NORTHWEST CAUCASIAN LANGUAGES, group of languages spoken primarily in the northwestern part of the Caucasus Mountains. The languages of this group—Abkhaz, Abaza, Adyghian, Kabardian (Circassian), and the nearly extinct Ubykh—are noted for the great number of distinctive consonants and limited number of distinctive vowels in their sound systems.

Ableman v. Booth (1859), case in which the U.S. Supreme Court upheld both the constitutionality of the Fugitive Slave Act and the supremacy of the federal government over state governments.

Sherman Booth was an Abolitionist newspaper editor in Wisconsin who had been sentenced to jail by a federal court for assisting a runaway slave—a clear violation of the 1850 Fugitive Slave Act, which required all Americans to cooperate in the capture and return of escaped slaves. Wisconsin (as well as several other Northern states), however, had responded to the federal act by passing a “personal liberty law,” severely impeding enforcement by federal authorities of the Fugitive Slave Act within its borders.

As a consequence, Booth was released on a writ of habeas corpus, issued by a judge of the Wisconsin Supreme Court. U.S. District Marshal Ableman, however, obtained a writ of error from the U.S. Supreme Court in order to have the state court’s action reviewed. The Supreme Court rendered a unanimous opinion reversing the Wisconsin court. Chief Justice Roger B. Taney’s opinion denied the right of state courts to interfere in federal cases, prohibited states from releasing federal prisoners through writs of habeas corpus, and upheld the constitutionality of the Fugitive Slave Act.

ablu­tion, in religion, a prescribed washing of part or all of the body or of possessions, such as clothing or ceremonial objects, with the intent of purification or dedication. Water, or water with salt or some other traditional ingredient, is most commonly used, but washing with blood is not uncommon in the history of religions, and urine of the sacred cow has been used in India.

The devout follower of Shintō, for example, rinses hands and mouth with water before approaching a shrine. Monks of the Theravāda Buddhist tradition wash themselves in the monastery pool before meditation. The upper-caste Hindu bathes ceremonially in water before performing daily morning worship (*pūjā*) in the home. Jewish law requires ritual immersion of their whole bodies by women prior to marriage and after menstruation, as well as by new converts to Judaism. Washing of the hands after rising in the morning and before meals that include bread are also examples of ablu­tion in Judaism. The Roman Catholic priest (and priests of some Orthodox churches) celebrating the eucharistic liturgy prepares himself by ritual washing of his hands in the lavabo. Seven days after Baptism those newly baptized in Eastern Orthodox churches often go through a ceremony in which holy oil is washed from the forehead. Among some of the Brethren sects in the rural United States, ceremonial foot washing is performed on certain occasions. Muslim piety requires that the devout wash their hands, feet, and face before each of the five daily prayers; the use of sand is permitted where water is unavailable.

Like most ritual acts, ablu­tion may carry a wide range of meanings to those who perform it. The stain of ritual uncleanness may be felt to be as real as contamination with unseen germs is for the medically minded; the act of cleansing may be only a gesture, symbolic of desired purity of soul. Or, as Carl Jung and others have suggested in studies of unconscious elements in religious symbolism, both objective and subjective aspects may be fused in the ritual act.

Abnaki, also called **WABANAKI**, a confederacy of Algonkian-speaking Indian tribes in northeast North America, which was organized to furnish resistance and protection against the Iroquois League, especially the Mohawk, of what is now northern New York state. In its earliest known organization it consisted of tribes east and northeast of present New York: Malecite in present New Brunswick; Passamaquoddy and Penobscot in present Maine; and tribes in present Vermont and

New Hampshire. Later it included some eastern tribes as far south as the Delaware tribe.

Although they relied primarily on hunting and fishing, some corn (maize) was grown throughout the coastal region, more intensively from north to south. In the north the typical dwelling was the birch-bark-covered wigwam occupied by several families. The birch-bark canoe was in general use. Game was taken in snares and traps and by bow and arrow. Each tribe consisted of small bands under a headman, or civil chief, who advised but had little compulsory authority; there was a separate war chief. A general council of all the men and women decided matters relating to war; a grand council of chiefs and representatives of each family decided other questions of importance to the group. There was institutionalized comradeship with mutual responsibility, which united two men for life. Belief in a culture hero who will return to help the people in time of great need persists to the present.

Chiefly as a result of missionary influence, beginning in the 17th century the Abnaki favoured French interests and carried on a war against the English. After several severe defeats in 1724 and 1725, the Abnaki were reduced in number, and most withdrew to Canada, eventually settling at Saint-François-du-Lac in Quebec. The population in the late 20th century was about 5,000.

Abney, Sir William de Wiveleslie (b. July 24, 1843, Derby, Derbyshire, Eng.—d. Dec. 3, 1920, Folkestone, Kent), a specialist in the chemistry of photography, especially noted for his development of a photographic emulsion that he used to map the solar spectrum far into the infrared.

Abney
BBC Hulton Picture Library

Commissioned in the Royal Engineers (1861), he taught chemistry and photography at the School of Military Engineering at Chatham. He succeeded to various educational posts there and elsewhere.

In 1874 Abney made the first quantitative measurements of the action of light on photographic materials. In 1880 he discovered the photographic developing properties of hydroquinone. Elected to the Royal Society (1876), he also held posts with other learned societies and won various honours. He was knighted in 1900.

abnormal psychology: see psychopathology.

Åbo (Finland): see Turku.

Åbo, Treaty of (1743), peace settlement that concluded the Russo-Swedish War of 1741–43 by obliging Sweden to cede a strip of southern Finland to Russia and to become temporarily dependent on Russia. As a result of the Great Northern War (Treaty of Nystad, 1721), Sweden had lost Estonia, Livonia, Ingria, and part of Karelia to Russia. In 1741 Sweden reached a secret understanding (through French mediators) with Elizabeth, a daughter of Peter I the Great; Elizabeth agreed to return the Baltic territories to Sweden in exchange for Swedish support in her efforts to seize the

Russian throne from the infant emperor Ivan VI. In July 1741 the Swedes declared war on Russia, announcing that they would withdraw when Elizabeth became the Russian empress. Although they lost a major battle at Vilmanstrand (August 1741), the Swedes advanced toward St. Petersburg; their threat to the Russian capital enabled Elizabeth to stage a successful coup d’etat (Dec. 6 [Nov. 25, old style], 1741); thereupon the Swedes retreated into Finland.

But Elizabeth reneged on the agreement. Russian troops conquered Helsingfors and Åbo (modern Turku, then the capital of Finland) and occupied a large portion of Finland. Hostilities ended in 1742; Russia, taking advantage of a succession crisis in Sweden, offered to return most of Finland if Sweden would accept the Russian-supported candidate—Adolf Frederick of Holstein-Gottorp-Eutin—as heir apparent.

The Swedes agreed; the final settlement, signed at Åbo (August 1743), gave Russia a strip of southern Finland that included the cities of Vilmanstrand and Frederikshamn. Russian troops were to leave the remainder of Finland when Adolf Frederick was officially designated crown prince; in the meantime, Russian forces were to be allowed to occupy Sweden to make sure that nothing interfered with his selection. Russia was thus able to exert a tremendous influence on Swedish affairs. But after the peace settlement, Russian influence was short-lived; all the Russian troops were withdrawn from Sweden by July 1744, and Adolf Frederick quickly ended his dependence on Russia.

The territorial provisions of the treaty were longer lasting. In 1788, while Russia was at war with Turkey, Sweden tried to alter the treaty’s provisions. King Gustav III, demanding the return of Karelia and Finland, declared war on Russia (June 1788). Although the Swedes presented a threat to St. Petersburg and won a major victory at Svenskund (July 9–10, 1790, new style), the Treaty of Värälä (August 1790) restored the prewar (1788) borders, which remained as they had been set by the Treaty of Åbo until 1809 (Treaty of Frederikshamn).

ABO blood group system, method of classifying human blood on the basis of the inherited properties of red blood cells (erythrocytes) as determined by their possession or lack of the so-called antigens A (including A₁ and A₂) and B. Persons may, thus, have type A, type B, type O, or type AB blood. (Antigens of other blood group systems may also be present.)

An antigen is a substance that can, in certain circumstances, excite the production of a corresponding antibody. An antibody is a substance capable of reacting specifically with particular antigens. Blood group antigens are carried on the surface of the red cells.

Blood containing red cells with type A antigen on their surface has in its serum (fluid) antibodies against type B red cells. If, in transfusion, type B blood is injected into persons with type A blood, the red cells in the injected blood are destroyed by the antibodies in the recipient’s blood. In the same way, type A red cells are destroyed by anti-A antibodies in type B blood. Type O blood can be injected into persons with type A, B, or O blood unless there is incompatibility with respect to some other blood group system also present. Persons with type AB blood can receive type A, B, or O blood.

Blood group O is commonest throughout the world, reaching a frequency of 100 percent in Amerindians of South and Central America and in the southern two-thirds of the United States. Type B is high in Asia, with a maximum in Northern India; it is low in Europe and Africa and absent among American Indians and in most Australian Aborigines. Type A₁ is common all over the world and appears to exist to the exclusion of type A₂ among

the Australian Aborigines and Eskimos and in parts of Indonesia, the Pacific, India, Canada, and the northern United States. The world high occurs among the Blackfoot and Blood Indians and surrounding tribes in Alberta and Montana; this concentration in a continent otherwise so strongly type O is a puzzle that some scholars believe is evidence for repeated waves of migration into the New World from Asia. Gene A_2 reaches a frequency of 50 percent in certain Lapps; it is uncommon or rare elsewhere.

Stomach cancer is 20 percent more frequent in persons of type A than in people of types O or B; pernicious anemia and possibly bronchopneumonia in infants are also associated with type A. Type O is associated with a 40 percent higher frequency of duodenal ulcer, especially in persons who do not secrete water-soluble antigen (nonsecretors); gastric ulcer is also more frequent in type O individuals. Erythroblastosis fetalis (a type of anemia) occurs in offspring of ABO-incompatible matings, particularly when the mother is O and the father A; early loss of embryos is also increased in ABO-incompatible matings.

The ABO antigens are developed well before birth and remain throughout life. ABO antibodies are acquired passively from the mother before birth, but by three months the infant is making his own—it is believed the stimulus for such antibody formation is from contact with ABO-like antigenic substances in nature.

abolitionism, also called ABOLITION MOVEMENT (c. 1783–1888), in western Europe and the Americas, the movement chiefly responsible for creating the emotional climate necessary for ending the transatlantic slave trade and chattel slavery. After the institution of Roman slavery was gradually converted into that of medieval serfdom, slavery was virtually unknown in western Europe until 1442, when the Portuguese brought back black slaves from the west coast of Africa. Soon after, the need for plantation labour in the colonies of North America, South America, and the West Indies created an immense market for slaves. Between the 15th and 19th centuries, an estimated total of 15 million Africans were forcibly transported to the Americas.

Despite its brutality and inhumanity, the slave system aroused little protest until the 18th century, when rationalist thinkers of the Enlightenment began to criticize it for its violation of the rights of man, and Quaker and other evangelical religious groups condemned it for its un-Christian qualities. By the late 18th century, moral disapproval of slavery was widespread, and antislavery reformers won a number of deceptively easy victories during this period. In Britain, Granville Sharp secured a legal decision in 1772 that West Indian planters could not hold slaves in Britain, since slavery was contrary to English law. In the United States, all of the states north of Maryland abolished slavery between 1777 and 1804. But antislavery sentiments had little effect on the centres of slavery themselves: the great plantations of the Deep South, the West Indies, and South America. Turning their attention to these areas, British and American abolitionists began working in the late 18th century to prohibit the importation of African slaves into the British colonies and the United States. Under the leadership of William Wilberforce and Thomas Clarkson, these forces succeeded in getting the slave trade to the British colonies abolished in 1807. The United States prohibited the importation of slaves that same year, though widespread smuggling continued until about 1862.

Antislavery forces then concentrated on winning the emancipation of those populations already in slavery. They were triumphant when slavery was abolished in the British West Indies by 1838 and in French possessions 10 years later.

The situation in the United States was more complex because slavery was a domestic rather than a colonial phenomenon, being the social and economic base of the plantations of 11 Southern states. Moreover, slavery had gained new vitality when an extremely profitable cotton-based agriculture developed in the South in the early 19th century. Reacting to abolitionist attacks that branded its "peculiar institution" as brutal and immoral, the South had intensified its system of slave control, particularly after the Nat Turner revolt of 1831. By that time, American abolitionists realized the failure of gradualism and persuasion, and they subsequently turned to a more militant policy, demanding immediate abolition by law.

Probably the best-known abolitionist was the aggressive agitator William Lloyd Garrison, founder of the American Anti-Slavery Society (1833–70). Others, drawn from the ranks of the clergy, included Theodore Dwight Weld and Theodore Parker; from the world of letters, John Greenleaf Whittier, James Russell Lowell, and Lydia Maria Child; and, from the free-black community, such articulate former slaves as Frederick Douglass and William Wells Brown.

American abolitionism laboured under the handicap that it threatened the harmony of North and South in the Union, and it also ran counter to the U.S. Constitution, which left the question of slavery to the individual states. Consequently, the Northern public remained unwilling to adopt abolitionist policy and was distrustful of abolitionist extremism. But a number of factors combined to give the movement increased momentum. Chief among these was the question of permitting or outlawing slavery in new Western territories, with Northerners and Southerners taking increasingly adamant stands on opposite sides of that issue throughout the 1840s and '50s. There was also revulsion at the ruthlessness of slave hunters under the Fugitive Slave Law (1850), and the far-reaching emotional response to Harriet Beecher Stowe's antislavery novel *Uncle Tom's Cabin* (1852) further strengthened the abolitionist cause.

Jolted by the raid (1859) of the abolitionist extremist John Brown on Harpers Ferry, the South became convinced that its entire way of life, based on the cheap labour provided by slaves, was irretrievably threatened by the election to the presidency of Abraham Lincoln (November 1860), who was opposed to the spread of slavery into the Western territories. The ensuing secession of the Southern states led to the American Civil War (1861–65). The war, which began as a sectional power struggle to preserve the Union, in turn led Lincoln (who had never been an abolitionist) to emancipate the slaves in areas of the rebellion by the Emancipation Proclamation (1863) and led further to the freeing of all other slaves in the United States by the 13th amendment to the Constitution in 1865.

Under the pressure of worldwide public opinion, slavery was completely abolished in its last remaining Latin-American strongholds, Cuba and Brazil, in 1880–86 and 1883–88, respectively. Some slavery still existed in parts of Africa and Asia, but the system of African slavery as a Western phenomenon had ceased to exist. *See also* slavery.

Abomey, town, southern Benin (formerly Dahomey). Probably founded in the early 17th century, it soon became the capital of the kingdom of Abomey (later Dahomey), which dominated production and trade with the European enterprises on the Slave Coast until the late 19th century. The town is located in an area where palm nuts and peanuts (groundnuts) are grown; it is connected by road and rail to Cotonou, the nation's main commercial centre, and to Porto-Novo, the capital. The Royal Palace, the tombs of the kings, and a

historical museum are maintained in Abomey. Pop. (1992) 66,600.

Abominable Snowman, Tibetan YETI, mythical monster supposed to inhabit the Himalayas at about the level of the snow line. Though reports of actual sightings of such a creature are rare, certain mysterious markings in the snow have traditionally been attributed to it. Those not caused by lumps of snow or stones falling from higher regions and bouncing across the lower slopes have probably been produced by bears. At certain gaits bears place the hindfoot partly over the imprint of the forefoot, thus making a very large imprint that looks deceptively like an enormous human footprint positioned in the opposite direction.

Aborigine, Australian: *see* Australian Aborigine.

abortion, the expulsion of a fetus from the uterus before it has reached the stage of viability (in human beings, usually about the 20th week of gestation). An abortion may occur spontaneously, in which case it is also called a miscarriage (*q.v.*), or it may be brought on purposefully, in which case it is often called an induced abortion.

Spontaneous abortions, or miscarriages, occur for many reasons, including disease, trauma, or genetic or biochemical incompatibility of mother and fetus. Occasionally a fetus dies in the uterus but fails to be expelled, a condition termed a missed abortion.

Induced abortions may be performed for reasons that fall into four general categories: to preserve the life or physical or mental well-being of the mother; to prevent the completion of a pregnancy that has resulted from rape or incest; to prevent the birth of a child with serious deformity, mental deficiency, or genetic abnormality; or to prevent a birth for social or economic reasons (such as the extreme youth of the pregnant female or the sorely strained resources of the family unit). By some definitions, abortions that are performed to preserve the well-being of the female or in cases of rape or incest are therapeutic or justifiable abortions.

Numerous medical techniques exist for performing abortions. During the first trimester (up to about 12 weeks after conception), endometrial aspiration, suction, or curettage may be used to remove the contents of the uterus. In endometrial aspiration, a thin, flexible tube is inserted up the cervical canal (the neck of the womb) and then sucks out the lining of the uterus (the endometrium) by means of an electric pump. This technique is used up to the 12th week of pregnancy.

In the related but slightly more onerous procedure known as dilatation and evacuation (also called suction curettage or vacuum curettage), the cervical canal is enlarged by the insertion of a series of metal dilators while the patient is under anesthesia, after which a rigid suction tube is inserted into the uterus to evacuate its contents. When, in place of suction, a thin metal tool called a curette is used to scrape (rather than vacuum out) the contents of the uterus, the procedure is called dilatation and curettage. When combined with dilatation, both evacuation and curettage can be used up to about the 16th week of pregnancy.

From 12 to 19 weeks the injection of a saline solution may be used to trigger uterine contractions; alternatively, the administration of prostaglandins by injection, suppository, or other method may be used to induce contractions, but these substances may cause severe side effects. Hysterotomy, the surgical removal of the uterine contents, may be used during the second trimester or later. In general, the more advanced the pregnancy, the greater the

risk to the female of mortality or serious complications following an abortion.

In the late 20th century a new method of induced abortion was discovered using the drug RU 486 (or mifepristone), an artificial steroid that is closely related to the contraceptive hormone norethidrone. RU 486 works by blocking the action of the hormone progesterone, which is needed to support the development of a fertilized egg. When ingested within weeks of conception, RU 486 effectively triggers the menstrual cycle and flushes the fertilized egg out of the uterus.

Whether and to what extent induced abortions should be permitted, encouraged, or severely repressed is a social issue that has divided theologians, philosophers, and legislators for centuries. Abortion was apparently a common and socially accepted method of family limitation in the Greco-Roman world. Although Christian theologians early and vehemently condemned abortion, the application of severe criminal sanctions to deter its practice became common only in the 19th century. In the 20th century such sanctions were modified in one way or another in various countries, beginning with the Soviet Union in 1920 and with Japan and several eastern European and Scandinavian countries in the 1950s. In some countries the unavailability of birth-control devices was a factor in the acceptance of abortion. In the late 20th century China used abortions on a large scale as part of its population-control policy.

A broad social movement for the relaxation or elimination of restrictions on the performance of abortions resulted in the passing of liberalized legislation in several states in the United States during the 1960s. The U.S. Supreme Court ruled in *Roe v. Wade* (1973) that unduly restrictive state regulation of abortion was unconstitutional, in effect legalizing abortion on demand for women in the first three months of pregnancy. A countermovement for the restoration of strict control over the circumstances under which abortions might be permitted soon sprang up, and the issue became entangled in social and political conflict. In rulings in 1989 and 1992 a more conservative Supreme Court upheld the legality of new state restrictions on abortion, though it proved unwilling to overturn *Roe v. Wade* itself. In 1995 Norma McCorvey, the "Jane Roe" of that case, reversed her position by saying she no longer supported the right to abortion.

Opponents of abortion, or of abortion for any reason other than to save the life of the mother, argue that there is no rational basis for distinguishing the fetus from a newborn infant; each is totally dependent and potentially a member of society, and each possesses a degree of humanity. Proponents of liberalized regulation of abortion hold that only a woman herself, rather than the state, has the right to manage her pregnancy and that the alternative to legal, medically supervised abortion is illegal and demonstrably dangerous, if not deadly, abortion. The public debate of the issue has demonstrated the enormous difficulties experienced by political institutions in grappling with the complex and ambiguous ethical problems raised by the question of abortion.

Aboukir Bay (Mediterranean Sea): *see* Abū Qīr Bay.

Aboukir Bay, Battle of: *see* Nile, Battle of the.

Abqaiq, Arabic BUQAYQ, town, eastern Saudi Arabia, about 25 miles (40 km) west of the Persian Gulf. It is situated in the southern end of the Abqaiq oil field, one of the largest and most productive in the kingdom. Abqaiq grew rapidly following the discovery of the field in

1940. By 1950 the town was the southern terminus of the Tapline (Trans-Arabian Pipeline), a 1,068-mile- (1,718-kilometre-) long pipeline to Şaydā (Sidon), Lebanon; the following year Abqaiq was linked to Riyadh and Ad-Dammām by rail. The town's facilities include pumping stations, gas-oil separator plants, and pipelines.

Abraha, also spelled ABREĪĪA (fl. 6th century AD), Ethiopian Christian viceroy of Yemen in southern Arabia.

Abraha was viceroy of the principality of Saba' in Yemen for the (Christian) emperors of Ethiopia. A zealous Christian himself, he is said to have built a great church at Şan'ā' and to have repaired the principal irrigation dam at the Sabaeen capital of Ma'rib. Abraha is chiefly famous, however, for the military expedition that he led northward against the city of Mecca in the same year as Muḥammad's birth, about 570. Though it was supported by elephants, the expedition failed, and Muslims believe that Mecca escaped capture only through a miracle. Abraha's rule ended in 575 when the Persian Sāsānians invaded the region and brought the Sabaeen kingdom to an end.

Abraham, Hebrew AVRAHAM, also called ABRAM, Hebrew AVRAM (fl. early 2nd millennium BC), first of the Hebrew patriarchs and a figure revered by the three great monotheistic religions: Judaism, Christianity, and Islām. According to the biblical book of Genesis, Abraham left Ur, in Mesopotamia, because God called him to found a new nation in an undesignated land that he later learned was Canaan. He obeyed unquestioningly the commands of God, from whom he received repeated promises and a covenant that his "seed" would inherit the land.

The critical problem of a "biography" of Abraham. There can be no biography of Abraham in the ordinary sense. The most that can be done is to apply the interpretation of modern historical finds to biblical materials so as to arrive at a probable judgment as to the background and patterns of events in his life. This involves a reconstruction of the patriarchal age (of Abraham, Isaac, Jacob, and Joseph; early 2nd millennium BC), which until the end of the 19th century was unknown and considered virtually unknowable. It was assumed, based on a presumed dating of hypothetical biblical sources, that the patriarchal narratives in the Bible were only a projection of the situation and concerns of a much later period (9th–5th century BC) and of dubious historical value.

Several theses were advanced to explain the narratives—*e.g.*, that the patriarchs were mythical beings or the personifications of tribes or folkloric or etiological (explanatory) figures created to account for various social, juridical, or cultic patterns. However, after World War I, archaeological research made enormous strides with the discovery of monuments and documents, many of which date back to the period assigned to the patriarchs in the traditional account. The excavation of a royal palace at Mari, an ancient city on the Euphrates, for example, brought to light thousands of cuneiform tablets (official archives and correspondence and religious and juridical texts) and thereby offered exegesis a new basis, which specialists utilized to show that, in the biblical book of Genesis, narratives fit perfectly with what, from other sources, is known today of the early 2nd millennium BC but imperfectly with a later period. A biblical scholar in the 1940s aptly termed this result "the re-discovery of the Old Testament."

Thus, there are two main sources for reconstructing the figure of father Abraham: the book of Genesis, from the genealogy of Terah, Abraham's father, and his departure from Ur to Harran in chapter 11 to the death of Abraham in chapter 25; and recent archaeological

discoveries and interpretations concerning the area and era in which the biblical narrative takes place.

The biblical account. According to the biblical account, Abram ("The Father [or God] Is Exalted"), who is later named Abraham ("The Father of Many Nations"), a native of Ur in Mesopotamia, is called by God (Yahweh) to leave his own country and people and journey to an undesignated land, where he will become the founder of a new nation. He obeys the call unquestioningly and (at 75 years of age) proceeds with his barren wife, Sarai, later named Sarah ("Princess"), his nephew Lot, and other companions to the land of Canaan (between Syria and Egypt).

There the childless septuagenarian receives repeated promises and a covenant from God that his "seed" will inherit the land and become a numerous nation. He not only has a son, Ishmael, by his wife's maidservant Hagar but has, at 100 years of age, by Sarah, a legitimate son, Isaac, who is to be the heir of the promise. Yet Abraham is ready to obey God's command to sacrifice Isaac, a test of his faith, which he is not required to consummate in the end because God substitutes a ram. At Sarah's death, he purchases the cave of Machpelah near Hebron, together with the adjoining ground, as a family burying place. It is the first clear ownership of a piece of the promised land by Abraham and his posterity. Toward the end of his life, he sees to it that his son Isaac marries a girl from his own people back in Mesopotamia rather than a Canaanite woman. Abraham dies at the age of 175 and is buried next to Sarah in the cave of Machpelah.

Abraham is pictured with various characteristics: a righteous man, with wholehearted commitment to God; a man of peace (in settling a boundary dispute with his nephew Lot), compassionate (he argues and bargains with God to spare the people of Sodom and Gomorrah), and hospitable (he welcomes three visiting angels); a quick-acting warrior (he rescues Lot and his family from a raiding party); and an unscrupulous liar to save his own skin (he passes off Sarah as his sister and lets her be picked by the Egyptian pharaoh for his harem). He appears as both a man of great spiritual depth and strength and a person with common human weaknesses and needs.

The Genesis narrative in the light of recent scholarship. The saga of Abraham unfolds between two landmarks, the exodus from "Ur of the Chaldeans" (Ur Kasdim) of the family, or clan, of Terah and "the purchase of" (or "the burials in") the cave of Machpelah. Tradition seems particularly firm on this point. The Hebrew text, in fact, locates the departure specifically at Ur Kasdim, the Kasdim being none other than the Kaldū of the cuneiform texts at Mari. It is manifestly a migration of which one tribe is the centre. The leader of the movement is designated by name: Terah, who "takes them out" from Ur, Abram his son, Lot the son of Haran, another son of Terah, and their wives, the best known being Sarai, the wife of Abram. The existence of another son of Terah, Nahor, who appears later, is noted.

Most scholars agree that Ur Kasdim was the Sumerian city of Ur, today Tall al-Muqayyar (or Mughair), about 200 miles (300 km) south-east of Baghdad in lower Mesopotamia, which was excavated from 1922 to 1934. It is certain that the cradle of the ancestors was the seat of a vigorous polytheism whose memory had not been lost and whose uncontested master in Ur was Nanna (or Sin), the Sumero-Akkadian moon god. "They served other gods," Joshua, Moses' successor, recalled, speaking to their descendants at Shechem.

After the migration from Ur (*c.* 2000 BC), the reasons for which are unknown, the first important stopping place was Harran, where the caravan remained for some time. The city has

been definitely located in upper Mesopotamia, between the Tigris and the Euphrates rivers, in the Balikh valley and can be found on the site of the modern Harran in Turkey. It has been shown that Harran was a pilgrimage city, for it was a centre of the Sin cult and consequently closely related to the moon-god cult of Ur. The Mari tablets have shed new light on the patriarchal period, specifically in terms of the city of Harran.

There have been many surprising items in the thousands of tablets found in the palace at Mari. Not only are the Hapiru ("Hebrews") mentioned but so also remarkably are the Banu Yamina ("Benjaminites"). It is not that the latter are identical with the family of Benjamin, a son of Jacob, but rather that a name with such a biblical ring appears in these extrabiblical sources in the 18th century BC. What seems beyond doubt is that these Benjaminites (or Yaminites, meaning "Sons of the Right," or "Sons of the South," according to their habits of orientation) are always indicated as being north of Mari and in Harran, in the Temple of Sin.

The Bible provides no information on the itinerary followed between Ur and Harran. Scholars think that the caravan went up the Euphrates, then up the Balikh. After indicating a stay of indeterminate length in Harran, the Bible says only that Terah died there, at the age of 205, and that Abraham was 75 when he took up the journey again with his family and his goods. This time the migration went from east to west, first as far as the Euphrates River, which they may have crossed at Carchemish, since it can be forded during low-water periods.

Here again, the Mari texts supply a reference, for they indicate that there were Benjaminites on the right bank of the river, in the lands of Yamhad (Aleppo), Qatanum (Qatna), and Amurru. Since the ancient trails seem to have been marked with sanctuaries, it is noteworthy that Nayrab, near Aleppo, was, like Harran and Ur, a centre of the Sin cult and that south of Aleppo, on the road to Hamāh, there is still a village that bears the name of Benjamin. The route is in the direction of the "land of Canaan," the goal of the journey.

If a stop in Damascus is assumed, the caravan must next have crossed the land of Bashan (the Hawrān of today), first crossing the Jabboq, then the Jordan River at the ford of Dāmiyā, and arriving in the heart of the Samaritan country, to reach at last the plain of Shechem, today Balāṭah, at the foot of the Gerizim and Ebal mountains. Shechem was at the time a political and religious centre, the importance of which has been perceived more clearly as a result of recent archaeological excavations. From the mid-13th to the mid-11th century BC, Shechem was the site of the cult of the Canaanite god Ba'al-Berit (Lord of the Covenant). The architecture uncovered on the site by archaeologists would date to the 18th century BC, in which the presence of the patriarchs in Shechem is placed.

The next stopping place was in Bethel, identified with present-day Baytīn, north of Jerusalem. Bethel was also a holy city, whose cult was centred on El, the Canaanite god par excellence. Its name does not lend itself to confusion, for it proclaims that the city is the *bet*, "house," or temple, of El (God). The Canaanite sanctuary was taken over without hesitation by Abraham, who built an altar there and consecrated it to Yahweh, at least if the Yahwistic tradition in Genesis is to be believed.

Abraham had not yet come to the end of his journey. Between Shechem and Bethel he had gone about 31 miles. It was about as far again from Bethel to Hebron, or more precisely to the oaks of Mamre, "which are at Hebron" (according to the Genesis account). The location of Mamre has been the subject of some indecision. At the present time, there is gen-

eral agreement in setting it 1.5 miles (3 km) northwest of Hebron at Rāmat al-Khalil, an Arabic name which means the "Heights of the Friend," the friend (of God) being Abraham.

Mamre marked the site of Abraham's encampment, but this did not at all exclude episodic travels in the direction of the Negeb, to Gerar and Beersheba. Life was a function of the economic conditions of the moment, of pastures to follow and to find, and thus the patriarchs moved back and forth between the land of Canaan and the Nile River delta. They remained shepherds and never became cultivators.

It was in Mamre that Abraham received the revelation that his race would be perpetuated, and it was there that he learned that his nephew Lot had been taken captive. The latter is an enigmatic episode, an "erratic block" in a story in which nothing prepared the way for it. Suddenly, the life of the patriarch was inserted into a slice of history in which several important persons ("kings") intervene: Amraphel of Shinar, Arioch of Ellasar, Ched-orlaomer of Elam, and Tidal of Goiim. Scholars of previous generations tried to identify these names with important historical figures—e.g., Amraphel with Hammurabi of Babylon—but little remains today of these suppositions. The whole of chapter 14 of Genesis, in which this event is narrated, differs completely from what has preceded and what follows. It may be an extract from some historical annals, belonging to an unknown secular source, for the meeting of Melchizedek, king of Salem and priest of God Most High (El 'Elyon), and Abraham is impressive. The king-priest greets him with bread and wine on his victorious return and blesses him in the name of God Most High.

In this scene, the figure of the patriarch takes on a singular aspect. How is his religious behaviour to be characterized? He swears by "the Lord God Most High"—i.e., by both Yahweh and El 'Elyon. It is known that, on the matter of the revelation of Yahweh to man, the biblical traditions differ. According to what scholars call the Yahwistic source (J) in the Pentateuch (the first five books of the Bible), Yahweh had been known and worshiped since Adam's time. According to the so-called Priestly source (P), the name of Yahweh was revealed only to Moses. It may be concluded that it was probably El whom the patriarchs, including Abraham, knew.

As noted before, in Mesopotamia the patriarchs worshiped "other gods." On Canaanite soil, they met the Canaanite supreme god, El, and adopted him, but only partially and nominally, bestowing upon him qualities destined to distinguish him and to assure his preeminence over all other gods. He was thus to become El 'Olam (God the Everlasting One), El 'Elyon (God Most High), El Shaddai (God, the One of the Mountains), and El Ro'i (God of Vision). In short, the god of Abraham possessed duration, transcendence, power, and knowledge. This was not monotheism but monolatry (the worship of one among many gods), with the bases laid for a true universalism. He was a personal god too, with direct relations with the individual, but also a family god and certainly still a tribal god. Here truly was the "God of our fathers," who in the course of time was to become the "God of Abraham, Isaac, and Jacob."

It is not surprising that this bond of the flesh should still manifest itself when it came to gathering together the great ancestors into the family burial chamber, the cave of Machpelah. This place is venerated today in Hebron, at the Hāram al-Khalil (Holy Place of the Friend), under the mosque. Abraham, "the friend of God," was forevermore the depository of the promise, the beneficiary of the Covenant, sealed not by the death of Isaac but by the sacrifice of the ram that was offered up in place of the child on Mount Moriah.

(A. Pa.)

BIBLIOGRAPHY. A study of the patriarch Abraham is based on scriptural documentation and particularly on Genesis. One should therefore first consult a critical translation of the first book of the Old Testament such as E.A. Speiser (ed. and trans.), *Genesis*, 3rd ed. (1979, reissued 1985); Gerhard von Rad, *Genesis*, rev. ed. (1972, reprinted 1985); and Claus Westermann, *Genesis 12-36* (1985). The world of the patriarchs has inspired numerous works; those which take into account recent archaeological discoveries include William F. Albright, *The Biblical Period from Abraham to Ezra* (1963); and Roland de Vaux, *Ancient Israel: Its Life and Institutions*, 2nd ed. (1965, reissued 1973). Centred on the city of Ur and the discoveries that were made there is Leonard Woolley, *Abraham: Recent Discoveries and Hebrew Origins* (1936), but some of his analogies must be rejected. André Parrot, *Abraham and His Times* (1968), presents a synthesis of the double archaeological and epigraphical documentation. Critical reappraisals of Abraham as a historical figure include Thomas L. Thompson, *The Historicity of the Patriarchal Narratives: The Quest for the Historical Abraham* (1974); and John Van Seters, *Abraham in History and Tradition* (1975, reissued 1987), which includes a discussion of literary tradition.

Abraham BEN MEIR IBN EZRA (Spanish-Jewish philosopher): see ibn Ezra, Abraham ben Meir.

Abraham, Karl (b. May 3, 1877, Bremen, Ger.—d. Dec. 25, 1925, Berlin), German psychoanalyst whose studies on the role of infant sexuality in character development and mental illness continue to be basic in the field of psychoanalysis.

While serving as an assistant to the psychiatrist Eugen Bleuler at the Burghölzi Mental Hospital in Zürich (1904-07), Abraham met the psychoanalyst Carl Jung and made his initial acquaintance with the ideas of Sigmund Freud. His first psychoanalytic paper dealt with childhood sexual trauma in relation to the symptoms of schizophrenia.

Entering psychoanalytic practice at Berlin (1907), where he helped to establish the first branch of the International Psychoanalytic Institute (1910), he began work that was to enrich the theory of symbols and myths. In a major paper (published in 1909) he connected myths with dreams and viewed both as wish-fulfillment fantasies.

Abraham devoted himself chiefly to pioneering efforts in the psychoanalytic treatment of manic-depressive psychosis. He suggested that the libido, or sexual drive, develops in six stages: earlier oral, oral-sadistic, anal expulsive, anal retentive, phallic, and adult genital. If an infant's development becomes arrested at any of the earlier stages, mental disorders will most likely result from a libidinal fixation at that level.

Abraham's most important work, *A Short Study of the Development of the Libido, Viewed in the Light of Mental Disorders*, was published in German in 1924 and appeared in English in his *Selected Papers* (1953). "Character-Formation on the Genital Level of Libido-Development," also contained in the *Selected Papers*, is a translation of his last major paper (1925).

Abraham, Plains of, also called HEIGHTS OF ABRAHAM, FRENCH PLAINES D'ABRAHAM, plains in Québec region, southern Québec province, Canada. The plains lie at the western edge of the city of Québec, overlooking the St. Lawrence River. The plateau was the scene of a battle (Sept. 13, 1759) between the French under the Marquis de Montcalm and the British under James Wolfe in which both leaders were killed but which secured Québec for the British. Named for Abraham Martin, a ship's pilot who formerly owned part of the land, the plains are now a national historic park.

Abraham bar Hiyya, also called **ABRAHAM BAR HIYYA HA-NASI** (Hebrew: "the Prince") (b. c. 1065—d. c. 1136), Spanish Jewish philosopher, astronomer, astrologer, and mathematician whose writings were among the first scientific and philosophical works to be written in Hebrew. He is sometimes known as *Savasorda*, a corruption of an Arabic term indicating that he held some civic office in the Muslim administration of Barcelona.

In addition to translating scientific books from Arabic into Latin and Hebrew, Abraham also wrote a number of original works, among them a scientific encyclopaedia (the first in the Hebrew language) and a book on mathematics, *Ḥibbur ha-Meshiḥah ve-ha-Tishboret* ("Treatise on Measurement and Calculation"), which, in its Latin translation, *Liber Embadorum* (1145), became a principal textbook in western European schools. Other notable works by Abraham include the philosophical treatise *Hegyon ha-Nefesh ha-Aziwa* (*Meditation of the Sad Soul*), which dealt with the nature of good and evil, ethical conduct, and repentance; and *Megillat ha-Megalleh* ("Scroll of the Revealer"), in which he outlined his view of history, based on astrology and purporting to forecast the messianic future.

Abraham Lincoln Battalion, a force of volunteers from the United States who served on the Republican side in the Spanish Civil War from January 1937 until November 1938. All seven International Brigades (*q.v.*)—each composed of three or more battalions—were formed by the Comintern (Communist International), beginning in late 1936, and all were disbanded by late 1938 as the war neared an end. Like the European battalions, the American one was composed largely of communists; but, unlike the Europeans, the majority of Americans were students, and none had previously seen military service. Briefly in 1937 there was a second American force, the George Washington Battalion, but the casualties of both were so heavy that in mid-year the two were merged. As time went on, other nationalities were admitted to the Lincoln Battalion so that, by late 1938, Spaniards outnumbered Americans in the battalion three to one. Its first and perhaps most noted commander was Robert Hale Merriman (1912?–38)—the son of a lumberjack, a graduate of the University of Nevada, and a former graduate student at the University of California at Berkeley—who rose to the rank of major and became chief of staff of the 14th International Brigade (which included the Lincoln Battalion); he fought in several battles and was killed in action. Of the total of about 2,800 American volunteers, about 900 were killed in action.

Abrahams, Israel (b. Nov. 26, 1858, London, Eng.—d. Oct. 6, 1925, Cambridge, Cambridgeshire), one of the most distinguished Jewish scholars of his time, who wrote a number of enduring works on Judaism, particularly *Jewish Life in the Middle Ages* (1896).

In 1902, after teaching for several years at Jews' College, London, Abrahams was appointed reader in Talmudics (rabbinic literature) at the University of Cambridge, a post he retained until his death. From 1888 to 1908 he was editor, jointly with the Anglo-Jewish scholar Claude G. Montefiore, of the *Jewish Quarterly Review*. Although of strict Orthodox upbringing, Abrahams was among the founders of the Liberal movement, an Anglo-Jewish group that stressed the universality of Jewish ethics, minimized ritual and custom, and originally eschewed Zionism.

In *Jewish Life in the Middle Ages*, Abrahams concluded that there was no medieval period in Jewish history but that Christian medievalism had a lasting effect on the Jews, particularly in the sense of having deepened the process

of Jewish isolation from the rest of society. Abrahams' book covers every facet of Jewish life of the times, including the functions of the synagogue, social customs and community organization, occupations and amusements, and Jewish-Christian relationships. *Studies in Pharisaism and the Gospels*, 2 vol. (1917–24), includes a series of essays based on an examination of the New Testament treatment of Judaism. Among his works on Jewish writings is *Chapters on Jewish Literature* (1899), a survey of the period from the fall of Jerusalem in AD 70 to the death of the Jewish philosopher Moses Mendelssohn in 1786.

Abrahams, Peter, in full **PETER HENRY ABRAHAMS** (b. March 19, 1919, Vrededorp, near Johannesburg, S.Af.), most prolific of South Africa's black prose writers, whose early novel *Mine Boy* (1946) was the first to depict the dehumanizing effect of racism upon South African blacks.

Abrahams left South Africa at the age of 20, settling first in Britain and then in Jamaica; nevertheless, most of his novels and short stories are based on his early life in South Africa. *Mine Boy*, for example, tells of a country youth thrown into the alien and oppressive culture of a large South African industrial city. Abrahams' semiautobiographical *Tell Freedom: Memories of Africa* (1954; new ed. 1970) deals with the related theme of his struggles as a youth in the slums of Johannesburg. *The Path of Thunder* (1948) depicts a young "mixed" couple who love under the menacing shadow of enforced segregation. *Wild Conquest* (1950) follows the great northern trek of the Boers, and *A Night of Their Own* (1965) sets forth the plight of the Indian in South Africa. The novel *A Wreath for Udumo* (1956; new ed. 1971) and the travel book *This Island Now* (1966; new ed. 1971) are set in western Africa and the Caribbean, respectively.

In the late 1950s, inspired by a visit to Jamaica, Abrahams moved his family to the island. There he became editor of the *West Indian Economist* and took charge of the daily radio news network, *West Indian News*, until 1964, when he gave up most of his duties so that he could devote himself full-time to writing. Many of his earlier works were reissued or translated into other languages in the 1960s and early '70s, as his reading public steadily widened.

abrasion platform: *see* wave-cut platform.

abrasive, relatively hard natural or synthetic material that is used to grind or polish materials softer than itself. Grinding wheels, oil-stones, and sandpaper are common examples of abrasives. The high-precision components and extremely smooth surfaces essential in modern machine tools, electronic equipment, and spacecraft can be obtained only through abrasive grinding operations.

A brief treatment of abrasives follows. For full treatment, *see* **MACROPAEDIA: Industrial Ceramics**.

The use of abrasives dates to prehistoric times, when stone tools and weapons were shaped by rubbing them against harder stones. Drawings in ancient Egyptian tombs show the polishing of jewelry and vases with abrasives. In later historical times, craftsmen used natural abrasive stones shaped into wheels, such as grindstones and mill wheels, and into blocks for use by hand in sharpening scythes, knives, axes, and woodworking tools. Powdered abra-

sives were used for polishing in much the same manner as they were employed by the Egyptians. It was not until late in the 19th century, when it became necessary to work with harder metals and to closer tolerances, that abrasives assumed a major role in the manufacturing industry.

Some natural abrasives are mined throughout the world; these include flint, a form of quartz that is the most common material used for sandpaper, and sand, which is naturally granulated quartz, used in sandblasting and other abrasive processes. Another fairly common natural abrasive is pumice, or hardened lava foam, which is widely used in metal polishes and scouring powders. Corundum and emery, which are natural forms of aluminum oxide, occur less commonly, as does garnet. Others occur only in relatively limited areas; diamonds, for example, are mined principally in South Africa and to a much lesser extent in Australia and South America. The diamonds and other precious stones used as abrasives are not of gem quality.

In the 20th century various synthetic abrasives, including silicon carbide (produced under such trade names as Carborundum, Crystolon, and Carbolon), synthetic diamonds, boron carbide, and alumina, were developed, and new machines were designed to utilize these abrasives to best advantage. Natural abrasives are still widely used in some applications, but in industrial grinding they have been largely replaced by synthetics.

Most abrasives intended for industrial use are first crushed into a powder, which may then be mixed with a liquid or paste, pressed into wheels or blocks, or glued to the surface of paper or cloth.

abraxas, also spelled **ABRASAX**, sequence of Greek letters considered as a word and formerly inscribed on charms, amulets, and gems in the belief that it possessed magical qualities. In the 2nd century AD, some Gnostic

Abraxas stone

By courtesy of the trustees of the British Museum

and other dualistic sects, which viewed matter as evil and the spirit as good and held that salvation came through esoteric knowledge, or gnosis, personified Abraxas and initiated a cult sometimes related to worship of the sun god. Basilides of Egypt, an early 2nd-century Gnostic teacher, viewed Abraxas as the supreme deity and the source of divine emanations, the ruler of all the 365 heavens, or circles of creation—one for each day of the year. The number 365 corresponds to the numerical value of the seven Greek letters that form the word abraxas.

Abreha (Arab ruler): *see* Abraha.

Abreu, Capistrano de, in full **JOÃO CAPISTRANO DE ABREU** (b. Oct. 23, 1853, Maranguape, Braz.—d. Aug. 13, 1927, Rio de Janeiro), Brazilian historian best known for

his large-scale interpretive work on Brazil's colonial history.

After serving at the National Library of Rio de Janeiro (1875–83), Abreu became professor of history at the Colégio Dom Pedro II in 1883. Influenced by the sociology of Auguste Comte and Herbert Spencer and the historical enterprises of Henry Buckle and Hippolyte Taine, Abreu wrote the *Capítulos de História Colonial* (1907; "Chapters of Colonial History"), his greatest work, as a broad study of Brazilian colonization from 1500 to 1800. His original emphasis on the culture of indigenous groups was an early and significant ethnological interpretation of the European settlement of Brazilian backlands. Abreu wrote additional works on linguistics, translated German and French documents on Brazilian history, and edited the writings of the eminent historian Francisco Adolfo de Varnhagen.

Abrikosov, Alexey A., in full ALEXEY ALEXEEVICH ABRİKOSOV (b. June 25, 1928, Moscow, U.S.S.R. [now Russia]), Russian physicist, who won the Nobel Prize for Physics in 2003 for his pioneering contribution to the theory of superconductivity. He shared the award with Vitaly L. Ginzburg of Russia and Anthony J. Leggett of Great Britain.

Abrikosov received doctorates in physics from the Institute for Physical Problems (now the P.L. Kapista Institute) in Moscow in 1951 and 1955. In the following decades he worked at scientific institutions and universities in the U.S.S.R. In 1991 he joined Argonne National Laboratory in Illinois, becoming a distinguished scientist in its materials science division.

Abrikosov's prizewinning work focused on superconductivity, the disappearance of electrical resistance in various solids when they are cooled below a certain critical (and typically very low) temperature. The phenomenon was first identified in 1911, and in the following decades scientists explained why certain metals, termed type I superconductors, lose electrical resistance. However, there was a second group of metals, termed type II superconductors, that continued to superconduct even in the presence of very powerful magnetic fields, with superconductivity and magnetism existing within them at the same time. Building on the work done by Ginzburg and others, Abrikosov devised a theoretical explanation for type II superconductivity. This enabled other scientists to create and test new superconducting materials and build more powerful electromagnets. Among the practical results were magnets critical for the development of magnetic resonance imaging (MRI) scanners used in medical diagnostics.

Abruzzi, also called ABRUZZO, *regione*, central Italy, fronting the Adriatic Sea and comprising the *province* of L'Aquila, Chieti, Pescara, and Teramo. Most of the region is mountainous or hilly, except for such intermontane basins as those of L'Aquila, Sulmona, and Fucino. The Apennines, the dominant physical feature, consist of three chains trending northwest-southeast, of which the easternmost, including the Gran Sasso d'Italia (9,560 feet [2,914 m]) and Maiella groups, is the highest. From the Gran Sasso, sand and clay hills present a gradual slope eastward to the narrow Adriatic shoreline. The few small coastal harbours have little economic importance for fishing or commerce. The principal rivers (the Tronto, Pescara, Sangro, and Trigno) drain to the Adriatic, providing irrigation in their lower courses. The course of these streams is irregular, and, because of massive deforestation on the upper slopes, floods and landslides occur frequently during the spring and fall rains.

The ancient Italic tribes that once inhabited the region long resisted conquest and retained their own character even after Roman rule was imposed on them. The name of the region, originally Aprutium, is believed to have come

from that of one of the ancient tribes, the Praetutii. Under Lombard rule during the early Middle Ages, the Abruzzi was controlled by the duchy of Spoleto, and Molise (the region to the south) by the duchy of Benevento. The Normans established themselves in the area in the 12th century, and the region sided with the Hohenstaufens in their long struggle with the papacy. After the fall of the Hohenstaufen dynasty in the 13th century, Abruzzi and Molise in turn came under Angevin (house of Anjou), Spanish, and Bourbon rulers. Under the last, as part of the Kingdom of Naples, they were divided into Abruzzo Ulteriore I, Abruzzo Ulteriore II, Abruzzo Citra, and Molise. As Abruzzi e Molise, they became part of the Kingdom of Italy in 1860 and in 1965 were divided into the separate regions of Abruzzi and Molise. The regional capital is L'Aquila.

The rugged terrain of Abruzzi long hindered its economic development. Construction of a motorway from the west to the Adriatic coast at Pescara opened the region to the rest of Italy. Agriculture is mainly of local importance, except in the intensively cultivated intermontane basins. Wheat, grapes, fruit, and olives are the most widespread crops, while tobacco, sugar beets, and saffron represent the cash crops. Livestock raising has been the mainstay of much of the region; migratory herding of sheep from mountain pastures in the Abruzzi to lowland winter pastures outside of the region continues, although on a decreasing scale. Pigs are raised, and the region's smoked ham and sausages are well known. Industrial development, concentrated chiefly in the provincial capitals, is slight. The main rail artery is the Rome-Pescara line, and local rail connections are slowly losing traffic to buses and trucks. Tourism is increasing in the coastal resorts but is not yet a major economic factor. Area 4,168 square miles (10,794 square km). Pop. (2002 est.) 1,273,384.

Abruzzi, Luigi Amedeo Giuseppe Maria Ferdinando Francesco, duke (duca) d' (b. Jan. 29, 1873, Madrid, Spain—d. March 18, 1933, Abruzzi City, near Mogadiscio, Italian Somaliland [now Mogadishu, Somalia]), Spanish mountaineer and explorer whose ventures ranged from Africa to the Arctic.

The son of King Amadeus of Spain (who was also the duke d'Aosta in Italy), Abruzzi was the first to ascend Mount St. Elias in Alaska (1897). His 1899 Arctic expedition reached latitude 86°34' N—a record for the time. In 1906 he was the first to scale the highest summits of the Ruwenzori Range in east-central Africa. His expedition investigated the geology, topography, and glaciology of the range; it mapped the range and named its major peaks, passes, and glaciers. In 1909 Abruzzi climbed the world's second highest mountain, K2, in the Himalayas, to a height of more than 20,000 feet (6,000 m). During World War I he held a naval command in the Adriatic until 1917. He was later involved in exploration and colonization in Italian Somaliland.

Abruzzo, Ben L. (b. June 9, 1930, Rockford, Ill., U.S.—d. Feb. 11, 1985, Albuquerque, N.M.), American balloonist who, with three crewmates, made the first transpacific balloon flight and the longest nonstop balloon flight, in the *Double Eagle V*.

Abruzzo graduated from the University of Illinois (Champaign-Urbana) in 1952 and served two years in the U.S. Air Force at Kirtland Air Force Base in Albuquerque, N.M. (1952–54). He settled in Albuquerque and became a real-estate developer. He, as well as his wife and children, became active in skiing, boating, sailing, tennis, flying, and ballooning. In 1978 Abruzzo, with Maxie Anderson (*q.v.*) and Larry Newman, made the first transatlantic balloon flight in the *Double Eagle II*. In 1979 Abruzzo and Anderson won the Gordon Bennett race in the *Double Eagle III*.

The transpacific flight, with Abruzzo as cap-

tain and teammates Larry Newman and Ron Clark, both of Albuquerque, and Rocky Aoki, a Japanese-American restaurateur from Miami, who partly financed the flight, was launched from Nagashima, Japan, on Nov. 9, 1981. The balloon landed, 84 hr 31 min later, in the Mendocino National Forest in California on November 12. The flight covered 5,768 miles (9,244 km), the longest balloon flight in history. Abruzzo, who died in a plane crash, held nine world balloon records, more than any other balloonist.

Absalom (fl. c. 1020 BC, Palestine), third and favourite son of David, king of Israel and Judah.

The picture of Absalom that is presented in 2 Samuel 13–19 suggests that he was the Alcibiades of the Old Testament, alike in his personal attractiveness, his lawless insolence, and his tragic fate. He is first mentioned as murdering his half brother Amnon, David's eldest son, in revenge for the rape of his full sister Tamar. For this he was driven into banishment, but he was eventually restored to favour through the good offices of his cousin Joab. Later, when some uncertainty seems to have arisen as to the succession, Absalom organized a revolt. For a time he seemed completely successful; David, with a few followers and his personal guard, fled across the Jordan, leaving to Absalom Jerusalem and the main portion of the kingdom. The usurper pursued the fugitives with his forces but was completely defeated in "the forest of Ephraim" (apparently west of Jordan) and killed by Joab, who found him caught by the hair in an oak tree. To the affectionate, chivalrous heart of David, the loss of his son, worthless and treacherous as he was, brought grief that more than outweighed his own safety and restoration.

Absalon (b. c. 1128, Fjenneslev, Den.—d. March 21, 1201, Sorö), archbishop, statesman, and close adviser of the Danish kings Valdemar I and Canute VI.

Scion of a powerful Zealand family, Absalon helped his childhood friend gain the Danish throne as Valdemar I in 1156–57 and was named bishop of Roskilde in 1158. As the king's closest adviser, he initially supported Valdemar's alliance with Frederick I Barbarossa, Holy Roman emperor, against Pope Alexander III. By 1167 Absalon and Valdemar had become reconciled with the pope.

Absalon helped end the Wend (Slav) threat to Danish shipping by leading a campaign in 1169 that captured the Wend stronghold of Rügen. The incorporation of Rügen into Absalon's diocese of Roskilde initiated a period of Danish supremacy in northern Germany that lasted until 1225. At that time he also directed the building of a fortress at Havn, which later developed into Copenhagen. He was a key advocate of the canonization of Valdemar's father, Canute Lavard, and of the coronation of Valdemar's son Canute VI as joint king (1170), which established the hereditary rights of the Valdemar dynasty.

Elected archbishop of Lund in 1177, Absalon was the guardian of Canute VI and guided him to a position of independence from Frederick I after Canute became sole ruler in 1182. The expedition that Absalon headed to the southern Baltic coast in 1184 led to Danish control of Pomerania and Mecklenburg. He later returned to his church duties.

Absaroka Range, mountain segment of the northern Rocky Mountains, in northwestern Wyoming and southern Montana, U.S. Extending in a northwest-southeast direction, the range is 170 miles (270 km) long and 50 miles wide. A large plateau, the result of volcanic action, was uplifted in the area, and stream

and glacial erosion have produced spectacular features. Eight summits exceed 12,000 feet (3,700 m), including Frances Peak (13,140 feet), the highest point. The range is a source for headstreams of the Bighorn River and embraces portions of the Gallatin, Shoshone, and Custer national forests and the extreme northeastern part of Yellowstone National Park. Granite Peak (12,799 feet), the highest point in Montana, is in the Beartooth Range, a northeastern spur of the Absarokas.

abscess, a localized collection of pus in a cavity formed from tissues that have been broken down by infectious bacteria. An abscess is caused when such bacteria as staphylococci or streptococci gain access to solid tissue (*e.g.*, by means of a small wound on the skin). The toxins released by these multiplying bacteria destroy cells and thus trigger an acute inflammation at the site, with its characteristic signs of redness, pain, swelling, and heat. (*See* inflammation.) White blood cells (leukocytes) collect at the site; these leukocytes break down the dead tissues and absorb the bacteria by means of phagocytosis. Thick yellowish pus is formed from the broken-down tissues, the dead bacteria and leukocytes, and the extracellular fluid that has accumulated. At the same time, nearby healthy cells form a capsule of tissue around the pus and develop a cell wall that delimits the abscess from nearby healthy tissues. When the abscess is ruptured, either naturally or through medical intervention, the pus escapes, the swelling and pain are relieved, and the delimiting cell wall eventually grows back into the abscess cavity.

Abscesses may occur on the skin surface or within the body on such internal organs as the lungs, brain, kidneys, or tonsils. Treatment for those abscesses that do not naturally resolve themselves consists of cutting into the capsule and draining its pus contents. Antibiotics are also administered to help fight the infection. Antihistamines may be prescribed to reduce swelling. Care must be taken to prevent the pus and other infective contents from entering the bloodstream and thus being carried to surrounding tissues, where they can result in new abscesses. *See also* boil.

absentee ownership, originally, ownership of land by proprietors who did not reside on the land or cultivate it themselves but enjoyed income from it. The term absentee ownership has assumed a derogatory social connotation not inherent in its literal meaning, based on the assumption that absentee owners lack personal interest in and knowledge of their lands and tenants.

Absentee ownership has been a social and political issue for centuries in many parts of the world. It was, for example, a basis for the criticism directed at a portion of the court nobility in pre-Revolutionary France and was also prominent in the debates concerning the exploitation of Irish tenants by English absentee owners in the 19th century. It continues to be a crucial economic issue in the land reform programs of many developing countries.

absentee voting, electoral process that enables persons who cannot appear at their designated polling places to vote from another location. The usual method of absentee voting is by mail, although provision is sometimes made for voting at prescribed places in advance of the polling date. Absentee voting requires special administrative arrangements to ensure the secrecy and legitimacy of the ballots cast. Within these basic provisions are variations in detail from country to country.

In all of the western European countries, the United States, Canada, and Australia (where voting is compulsory), provisions are made for the casting of absentee votes. Because the

proper use of absentee voting facilities is related to literacy, in countries where illiteracy is fairly widespread, absentee voting is either not allowed, as in Zaire and Burkina Faso, or allowed only with restrictions, as in India, Malaysia, and Jamaica.

Where qualifications for electors are not primarily geographical, the postal vote may be the normal form of voting. Such is the case in the voting for university seats in the Senate of the Republic of Ireland. In European countries in which elections are held on Sundays, persons traveling for pleasure are permitted to cast their votes at polling places other than those where they are registered, provided that they have first obtained a permit from the election officials. They must, however, cast their ballots for candidates from their own constituencies.

Abşeron Peninsula, also spelled **APŞERON**, Azerbaijani **ABŞERON YASAQLIĞI**, peninsula in Azerbaijan that extends 37 miles (60 km) eastward into the Caspian Sea and reaches a maximum width of 19 miles (30 km). An eastern extension of the Caucasus Mountains, the Abşeron Peninsula consists of a gently undulating plain, in part dissected by ravines and characterized by frequent salt lakes and lands flooded by tides. Vineyards and tea plantations are features of the regional economy. The national capital, Baku, lies on the peninsula's southern coast. The peninsula is especially noted for its oil-bearing strata, and the workings extend into the sea.

absinthe, flavoured, distilled liquor, yellowish green in colour, turning to cloudy, opalescent white when mixed with water. Highly aromatic, this liqueur is dry and somewhat bitter in taste. Absinthe is made from a spirit high in alcohol, such as brandy, and marketed with alcoholic content of 68 percent by volume. Wormwood (*Artemisia absinthium*) is the chief flavouring ingredient; other aromatic ingredients include licorice (which usually predominates in the aroma), hyssop, fennel, angelica root, aniseed, and star aniseed. The beverage was first produced commercially in 1797 by Henry-Louis Pernod, who purchased the formula from a French exile living in Switzerland.

Absinthe came to be considered dangerous to health because it appeared to cause convulsions, hallucinations, mental deterioration, and psychoses. These symptoms are evidently caused by thujone, a toxic chemical present in wormwood. Absinthe manufacture was prohibited in Switzerland in 1908, in France in 1915, and eventually in many other countries. In 1918 Pernod Fils established a factory in Tarragona, Spain, to manufacture both absinthe and a similar beverage, without wormwood, for export to those countries prohibiting true absinthe. Beverages developed as substitutes, similar in taste but lower in alcohol content and without wormwood, are known by such names as Pernod, anis (or anisette), pastis, ouzo, or raki.

Absinthe is usually served diluted with water and ice and may be used to flavour mixed drinks. The classic absinthe drink, the absinthe drip, is served in a special drip glass, allowing water to slowly drip through a sugar cube into the liquor. Pastis also turns cloudy white when mixed with water, and anis turns to a cloudy, greenish-tinged white.

Absolute Idealism, a philosophical theory chiefly associated with G.W.F. Hegel and Friedrich Schelling, both German idealist philosophers of the 19th century, Josiah Royce, an American philosopher, and others, but, in its essentials, the product of Hegel. Absolute Idealism can generally be characterized as including the following principles: (1) the common everyday world of things and embodied minds is not the world as it really is but merely as it appears in terms of uncrit-

icized categories; (2) the best reflection of the world is not found in physical and mathematical categories but in terms of a self-conscious mind; and (3) thought is the relation of each particular experience with the infinite whole of which it is an expression, rather than the imposition of ready-made forms upon given material.

Idealism for Hegel meant that the finite world is a reflection of mind, which alone is truly real. He held that limited being (that which comes to be and passes away) presupposes infinite unlimited being, within which the finite is a dependent element. In this view, truth becomes the relationship of harmony or coherence between thoughts, rather than a correspondence between thoughts and external realities. As one proceeds from the confusing world of sense experience to the more complex and coherent categories of science, the Absolute Idea, of which all other abstract ideas are merely a part, is approached. Hegel also held that this increasing clarity is evident in the fact that later philosophy presupposes and advances from earlier philosophy, ultimately approaching that to which all things are related and which is nevertheless self-contained—*i.e.*, the Absolute Idea.

Schelling, though similar to Hegel in that he also believed in the Absolute Idea, differed from him in identifying the Absolute as the undifferentiated, or featureless, unity of opposites. Thus, in the state of intellectual intuition, subject and object, being opposites, are lost in the anonymity of the Absolute. Hegel attacked this position in his *Phänomenologie des Geistes* (1807; *Phenomenology of Mind*).

Royce proposed that human minds are fragments of the Absolute, yet somehow remain separate selves and persons. He held that individual selves (as parts of the Absolute) are able, through the fundamental virtue of loyalty, to seek their ever increasing and ever widening meaning and identify with it, thus approaching the Absolute.

Hegel's Idealism formed the basis of the Absolute Idealism of many philosophers (including F.H. Bradley and Bernard Bosanquet), who made Absolute Idealism a dominant philosophy of the 19th century.

absolute reaction rates, theory of (chemistry): *see* transition-state theory.

absolute zero, temperature at which a thermodynamic system has the lowest energy. It corresponds to -273.15° on the Celsius scale and to -459.67° on the Fahrenheit scale.

The notion that there is an ultimately lowest temperature was suggested by the behaviour of gases at low pressures: it was noted that gases seem to contract indefinitely as the temperature is decreased. It appeared that an ideal gas at constant pressure would reach zero volume at what is now called the absolute zero of temperature. Any real gas actually condenses to a liquid or a solid at some temperature higher than absolute zero; therefore, the ideal gas law is only an approximation to real gas behaviour. As such, however, it is extremely useful.

The concept of absolute zero as a limiting temperature has many thermodynamic consequences. For example, all molecular motion does not necessarily cease at absolute zero, but none is available for transfer to other systems, and it is therefore correct to say that the energy at absolute zero is minimal.

Any temperature scale having absolute zero for its zero point is termed an absolute temperature scale. By international agreement, the Kelvin, or thermodynamic, scale is the standard for a scale of this type and is the basis for all scientific temperature measurements. Its fundamental unit, the kelvin (symbol K written without a degree sign [°]), is defined as $1/273.16$ of the triple point of pure water—*i.e.*, the temperature at which the liquid, solid, and gaseous forms of the substance can

be maintained simultaneously. In effect, the interval between this triple point and absolute zero comprises 273.16 kelvins.

Another absolute temperature scale used in the United States (primarily for engineering applications) is the Rankine scale. Although the zero point of the Rankine scale is also absolute zero, Rankine temperatures differ from Kelvin temperatures. This is because the basic unit of the scale, the degree Rankine ($^{\circ}R$), is $5/9$ of the kelvin (e.g., the freezing point of water is 273.15 K and $491.67^{\circ}R$). For coverage of empirical temperature scales, see Celsius temperature scale; Fahrenheit temperature scale.

absolution, in the Christian religion, a pronouncement of remission (forgiveness) of sins to the penitent. In Roman Catholicism, penance is a sacrament and the power to absolve lies with the priest, who can grant release from the guilt of sin to the sinner who is truly contrite, confesses his sin, and promises to perform satisfaction to God. In the New Testament the grace of forgiveness is seen as originating in Jesus Christ and being subsequently extended to sinners by members of the Christian priesthood. In the early Christian church, the priest publicly absolved repentant sinners after they had confessed and performed their penance in public. During the Middle Ages, however, private (auricular) confession became the usual procedure, and thus absolution followed in private. The priest absolved the penitent sinner using the formula, "I absolve thee from thy sins in the name of the Father and of the Son and of the Holy Spirit." In place of this Western formula, the Eastern Orthodox churches generally employ a formula such as "May God, through me, a sinner, forgive thee . . ."

In Protestant churches, absolution is usually a public rather than a private declaration. The Anglican and Lutheran churches use formulas ranging from the declaratory "I forgive you all your sins . . ." to "Almighty God have mercy upon you, and forgive you all your sins." In general, Protestant churches have tended to confine absolution to prayers for forgiveness and the announcement of God's willingness to forgive all those who truly repent of their sins. In these denominations, absolution is neither a judicial act nor a means by which the forgiveness of sins is conferred but is, instead, a statement of divine judgment and divine forgiveness. Nevertheless, a formula for the public confession of sins and the public pronouncement of forgiveness is included in most Christian liturgies.

absolutism, the political doctrine and practice of unlimited, centralized authority and absolute sovereignty, as vested especially in a monarch. The essence of such a system is that the ruling power is not subject to regularized challenge or check by any other agency, be it judicial, legislative, religious, economic, or electoral. Louis XIV, who ruled France during the late 17th and early 18th centuries, furnished the most familiar assertion of absolutism when he said, "*L'état, c'est moi*" ("I am the state").

A brief treatment of absolutism follows. For full treatment, see MACROPAEDIA: European History and Culture.

Varying in form, political absolutism has prevailed in much of the world over long periods of time. However, the form originating in early modern European history became the prototype. Its character was definitely monarchical, based on the strong individual leaders of new nation-states created at the breakup of the medieval order. The power of these states was closely associated with the power of their rulers; and, in order to strengthen both, it was necessary to curtail the restraints on centralized government that had been exercised by the church, feudal lords, and medieval customs generally. By claiming the absolute

authority of the state against such former restraints, the monarch as head of state claimed his own absolute authority as well.

By the 16th century, monarchical absolutism was coming to prevail in much of western Europe, and it was widespread in the 17th and 18th centuries. Besides France, whose absolutism was epitomized by Louis XIV, well-known illustrations may be drawn from Spain, Prussia, and Austria.

In defense of monarchical absolutism, the simplest argument was that kings derived their authority from God—"the divine right of kings." This view could justify even tyrannical rule as divinely ordained punishment, administered by rulers, for human sinfulness. In its origins, the divine-right theory may be traced to the medieval conception of God's award of temporal power to the political ruler, while spiritual power was given to the head of the Roman Catholic church. However, the new national monarchs asserted their authority in all matters and tended to become heads of church as well as state. Their power was absolute in a way that was impossible for medieval monarchs confronted by a church that was essentially a rival centre of authority.

More pragmatic arguments than that of divine right were also advanced in behalf of absolute monarchy. Complete obedience to a single will was said to be essential to order and security; the alternative was the chaos created by challenging or dividing political power. In so justifying submission by subjects on the ground of self-interest, the most elaborate statement was made in the 17th-century work *Leviathan* by Thomas Hobbes. The monopoly of power is also justified by a presumed knowledge of absolute truth. Neither the sharing of power nor limits on its exercise appear valid to those who believe that they know, and know absolutely, what is right.

absorption, in wave motion, the transfer of the energy of a wave to matter as the wave passes through it. The energy of an acoustic, electromagnetic, or other wave is proportional to the square of its amplitude—i.e., the maximum displacement or movement of a point on the wave; and, as the wave passes through a substance, its amplitude steadily decreases. If there is only a small fractional absorption of energy, the medium is said to be transparent to that particular radiation, but, if all the energy is lost, the medium is said to be opaque. All known transparent substances show absorption to some extent. For instance, the ocean appears to be transparent to sunlight near the surface, but it becomes opaque with depth.

Substances are selectively absorbing—that is, they absorb radiation of specific wavelengths. Green glass is transparent to green light but opaque to blue and red; hard rubber is transparent to infrared and X rays but opaque to visible light. Thus, radiation of an unwanted wavelength may be removed from a mixture of waves by letting them pass through an appropriate medium. Those substances that are designed to absorb a particular wavelength or band of wavelengths are called filters.

As radiation passes through matter, it is absorbed to an extent depending on the nature of the substance and its thickness. A homogeneous substance of a given thickness may be thought of as consisting of a number of

Absorption

equally thin layers. Each layer will absorb the same fraction of the energy that reaches it. The diagram shows a beam of waves passing from left to right through a series of layers (d_1, d_2, d_3, d_4) of a medium. If the fractional absorption is taken as 50 percent, or $1/2$, after the beam passes through the first layer d_1 , its initial energy (E_0) will be reduced to $E_0/2$. One-half the energy $E_0/2$ will be absorbed passing through layer d_2 , and the beam will enter layer d_3 with energy $1/2 (E_0/2)$, or $(E_0/4)$. Similarly, each successive layer absorbs one-half of the energy it receives. Thus for radiation of a given wavelength, an infinitesimally thin layer will reduce the energy of a wave by a fractional amount that is proportional to the thickness of the layer. The change in energy as the wave passes through a layer is a constant of the material for a given wavelength and is called its absorption coefficient.

Abstbessingen faience, tin-glazed earthenware produced in a factory in the village of Abstbessingen, in Thuringia, which flourished probably from the first half of the 18th century to about 1816. A hayfork factory mark indicates the patronage of the prince of Schwarzburg. Ordinary wares such as flower vases, tankards, and jugs are thick-bodied, with a creamy glaze; and decorations either in blue or polychrome are common. Abstbessingen remained a modest imitator of the more important German court factories.

abstract art, also called NONOBJECTIVE ART, or NONREPRESENTATIONAL ART, painting, sculpture, or graphic art in which the portrayal of things from the visible world plays no part. All art consists largely of elements that can be called abstract—elements of form, colour, line, tone, and texture. Prior to the 20th century these abstract elements were employed by artists to describe, illustrate, or reproduce the world of nature and of human civilization—and exposition dominated over expressive function.

Abstract art has its origins in the 19th century. The period characterized by so vast a body of elaborately representational art produced for the sake of illustrating anecdote also produced a number of painters who examined the mechanism of light and visual perception. The period of Romanticism had put forward ideas about art that denied classicism's emphasis on imitation and idealization and had instead stressed the role of imagination and of the unconscious as the essential creative factors. Gradually many painters of this period began to accept the new freedom and the new responsibilities implied in the coalescence of these attitudes. Maurice Denis's statement of 1890, "It should be remembered that a picture—before being a war-horse, a nude, or an anecdote of some sort—is essentially a flat surface covered with colours assembled in a certain order," summarizes the feeling among the Symbolist and Postimpressionist artists of his time.

All the major movements of the first two decades of the 20th century, including Fauvism, Expressionism, Cubism, and Futurism, in some way emphasized the gap between art and natural appearances.

There is, however, a deep distinction between abstracting from appearances, even if to the point of unrecognizability, and making works of art out of forms not drawn from the visible world. During the four or five years preceding World War I, such artists as Robert Delaunay, Wassily Kandinsky, Kazimir Malevich, and Vladimir Tatlin turned to fundamentally abstract art. (Kandinsky is generally regarded as having been the first modern artist to paint purely abstract pictures containing no recognizable objects, in 1910–11.) The majority of even the progressive artists regarded the aban-

donment of every degree of representation with disfavour, however. During World War I the emergence of the de Stijl group in The Netherlands and of the Dada group in Zürich further widened the spectrum of abstract art.

Abstract art did not flourish between World Wars I and II. Beset by totalitarian politics and by art movements placing renewed emphasis on imagery, such as Surrealism and socially critical Realism, it received little notice. But after World War II an energetic American school of abstract painting called Abstract Expressionism emerged and had wide influence. Since the 1950s abstract art has been an accepted and widely practiced approach within European and American painting and sculpture. Abstract art has puzzled and indeed confused many people, but for those who have accepted its nonreferential language there is no doubt as to its value and achievements. See also modern art.

Abstract Expressionism, broad movement in American painting that began in the late 1940s and became a dominant trend in Western painting during the 1950s. The most prominent American Abstract Expressionist painters were Jackson Pollock, Willem de Kooning, Franz Kline, and Mark Rothko. Others included Clyfford Still, Philip Guston, Helen Frankenthaler, Barnett Newman, Adolph Gottlieb, Robert Motherwell, Lee Krasner, Bradley Walker Tomlin, William Bazotes, Ad Reinhardt, Richard Pousette-Dart, Elaine de Kooning, and Jack Tworkov. Most of these artists worked, lived, or exhibited in New York City.

Although it is the accepted designation, Abstract Expressionism is not an accurate description of the body of work created by these artists. Indeed, the movement comprised many different painterly styles varying in both technique and quality of expression. Despite this variety, Abstract Expressionist paintings share several broad characteristics. They are basically abstract—*i.e.*, they depict forms not drawn from the visible world. They emphasize free, spontaneous, and personal emotional expression, and they exercise considerable freedom of technique and execution to attain this goal, with a particular emphasis laid on the exploitation of the variable physical character of paint to evoke expressive qualities (*e.g.*, sensuousness, dynamism, violence, mystery, lyricism). They show similar emphasis on the un-studied and intuitive application of that paint in a form of psychic improvisation akin to the automatism of the Surrealists, with a similar intent of expressing the force of the creative unconscious in art. They display the abandonment of conventionally structured composition built up out of discrete and segregable elements and their replacement with a single unified, undifferentiated field, network, or other image that exists in unstructured space. And finally, the paintings fill large canvases to give these aforementioned visual effects both monumentality and engrossing power.

The early Abstract Expressionists had two notable forerunners: Arshile Gorky, who painted suggestive biomorphic shapes using a free, delicately linear, and liquid paint application; and Hans Hofmann, who used dynamic and strongly textured brushwork in abstract but conventionally composed works. Another important influence on nascent Abstract Expressionism was the arrival on American shores in the late 1930s and early '40s of a host of Surrealists and other important European avant-garde artists who were fleeing Nazi-dominated Europe. Such artists greatly stimulated the native New York City painters and gave them a more intimate view of the vanguard of European painting. The Abstract Expressionist movement itself is generally regarded as hav-

"Composition," Abstract Expressionist painting by Willem de Kooning, oil on canvas, 1955; in the Solomon R. Guggenheim Museum, New York City

ing begun with the paintings done by Jackson Pollock and Willem de Kooning in the late 1940s and early '50s.

In spite of the diversity of the Abstract Expressionist movement, three general approaches can be distinguished. One, Action painting (*q.v.*), is characterized by a loose, rapid, dynamic, or forceful handling of paint in sweeping or slashing brushstrokes and in techniques partially dictated by chance, such as dripping or spilling the paint directly onto the canvas. Pollock first practiced Action painting by dripping commercial paints on raw canvas to build up complex and tangled skeins of paint into exciting and suggestive linear patterns. De Kooning used extremely vigorous and expressive brushstrokes to build up richly coloured and textured images. Kline used powerful, sweeping black strokes on a white canvas to create starkly monumental forms.

The middle ground within Abstract Expressionism is represented by several varied styles, ranging from the more lyrical, delicate imagery and fluid shapes in paintings by Guston and Frankenthaler to the more clearly structured, forceful, almost calligraphic pictures of Motherwell and Gottlieb.

The third and least emotionally expressive approach was that of Rothko, Newman, and Reinhardt. These painters used large areas, or fields, of flat colour and thin, diaphanous paint to achieve quiet, subtle, almost meditative effects. The outstanding colour-field painter was Rothko, most of whose works consist of large-scale combinations of soft-edged, solidly coloured rectangular areas that tend to shimmer and resonate.

Abstract Expressionism had a great impact on both the American and European art scenes during the 1950s. Indeed, the movement marked the shift of the creative centre of modern painting from Paris to New York City in the postwar decades. In the course of the 1950s, the movement's younger followers increasingly followed the lead of the colour-field painters and, by 1960, its participants had generally drifted away from the highly charged expressiveness of the Action painters.

Abstraction-Création, group composed predominantly of French painters led by Georges Vantongerloo and Auguste Herbin who promoted the principles of pure abstraction in art from 1931 to 1936. These abstractionists were devoted, in theory if not in practice, to the pure use of the basic formal elements of painting, colour and form, depicted pictorially as flat, brightly coloured geometric shapes.

The immediate predecessor of the Abstraction-Création group was the Cercle et Carré

("Circle and Square") group, founded by Michel Seuphor and Joaquin Torres-Garcia in 1930. In 1931 *Abstraction-Création*, a periodical published by Herbin and Jean Hélon, took over the Cercle et Carré's mailing list; and the new Abstraction-Création group, with as many as 400 members, carried on in the direction of geometric abstraction until 1936. It was located in Paris and hence received the active membership of Wassily Kandinsky and Naum Gabo, both of whom were living there at the time. It was succeeded after World War II by the Salon des Réalités Nouvelles ("Salon of New Realities").

Absurd, Theatre of the, dramatic works of certain European and American dramatists of the 1950s and early '60s who agreed with the Existentialist philosopher Albert Camus's assessment, in his essay "The Myth of Sisyphus" (1942), that the human situation is essentially absurd, devoid of purpose. The term is also loosely applied to those dramatists and the production of those works. Though no formal Absurdist movement existed as such, dramatists as diverse as Samuel Beckett, Eugène Ionesco, Jean Genet, Arthur Adamov, Harold Pinter, and a few others shared a pessimistic vision of humanity struggling vainly to find a purpose and to control its fate. Humankind in this view is left feeling hopeless, bewildered, and anxious.

The ideas that inform the plays also dictate their structure. Absurdist playwrights, therefore, did away with most of the logical structures of traditional theatre. There is little dramatic action as conventionally understood; however frantically the characters perform, their busyness serves to underscore the fact that nothing happens to change their existence. In Beckett's *Waiting for Godot* (1953), plot is eliminated, and a timeless, circular quality emerges as two lost creatures, usually played as tramps, spend their days waiting—but without any certainty of whom they are waiting for or of whether he, or it, will ever come. Language in an Absurdist play is often dislocated, full of clichés, puns, repetitions, and non sequiturs. The characters in Ionesco's *The Bald Soprano* (1950) sit and talk, repeating the obvious until it sounds like nonsense, thus revealing the inadequacies of verbal communication. The ridiculous, purposeless behaviour and talk give the plays a sometimes dazzling comic surface, but there is an underlying serious message of metaphysical distress. This reflects the influence of comic tradition drawn from such sources as commedia dell'arte, vaudeville, and music hall combined with such theatre arts as mime and acrobatics. At the same time, the impact of ideas as expressed by the Surrealist, Existentialist, and Expressionist schools and the writings of Franz Kafka is evident.

Originally shocking in its flouting of theatrical convention while popular for its apt expression of the preoccupations of the mid-20th century, the Theatre of the Absurd declined somewhat by the mid-1960s; some of its innovations had been absorbed into the mainstream of theatre even while serving to inspire further experiments. Some of the chief authors of the Absurd have sought new directions in their art, while others continue to work in the same vein.

Ābu, also called MOUNT ĀBU, city, southwestern Rājasthān state, northwestern India. It is situated on the slopes of Mount Ābu, an isolated feature of the Arāvāli Range. The city is a noted hill resort, and the Jaina temples at nearby Dilwara, built of white marble, are famous. Tejpāl temple, built about AD 1200, is known for the delicacy and richness of its carving, especially for that on the underside of its dome. The earlier Vimala Vasahī tem-

Abū al-‘Abbās ‘Abd Allāh al-Ma‘mūn ibn ar-Rashīd (caliph): see Ma‘mūn, al-.

Abū al-‘Abbās as-Saffāh (b. 722—d. 754, Al-Anbār [Iraq]), Islāmīc caliph (reigned 749–754), first of the ‘Abbāsīd dynasty, which was to rule over eastern Islām for approximately the next 500 years. The ‘Abbāsīds were descended from an uncle of Muḥammad and were cousins to the ruling Umayyad dynasty. The Umayyads were weakened by decadence and an unclear line of succession, and they enjoyed little popular support, prompting the ‘Abbāsīds to declare open revolt in 747. When Abū al-‘Abbās assumed the caliphate in 749, he began a campaign of extermination against the Umayyads, the ‘Alids, other ‘Abbāsīd leaders who had become too popular, and all other claimants to power. He named himself as-Saffāh, “the blood-shedder,” because of his savage attacks. He established a firm legal and dynastic base for the ‘Abbāsīds. His successor moved the caliphate to Baghdad.

Abū al-‘Atāhiyah, original name **ABŪ ISHĀQ ISMĀ‘ĪL IBN AL-QĀSIM IBN SUWAYD IBN KAYSĀN** (b. 748, Al-Kūfah or ‘Ayn at-Tamr, Iraq—d. 825/826, Baghdad), first Arab poet of note to break with the conventions established by the pre-Islāmīc poets of the desert and to adopt a simpler and freer language of the village.

Abū al-‘Atāhiyah (“Father of Crazyness”) came from a family of *mawlās*, poor non-Arabs who were clients of the ‘Anaza Arab tribe. The family’s poverty prevented Abū al-‘Atāhiyah from receiving a formal education,

which may account for his subsequently original and untraditional poetic style. He began to write *ghazals* (lyrics) in his early years in al-Kūfah; they later gained him notoriety as well as the favour of the ‘Abbāsīd caliph Hārūn ar-Rashīd. Abū al-‘Atāhiyah’s fame, however, rested on the ascetic poems of his later years, the *Zuhdiyyāt* (Ger. trans. by O. Rescher, 1928), collected in 1071 by the Spanish scholar Ibn ‘Abd al-Barr. The *Zuhdiyyāt* gave vent to his feelings of social resentment in verses depicting the leveling of the rich and powerful by the horrors of death. These found an enthusiastic following among the masses.

Despite suggestions of heresy in his verse, probably attributable to his lack of religious training and unfettered style, Abū al-‘Atāhiyah’s poetry enjoyed immense popularity and was frequently set to music.

Abū al-Faraj (medieval Syrian scholar): see Bar Hebraeus.

Abū al-Faraj al-Iṣbahānī, in full **ABŪ AL-FARAJ ‘ALĪ IBN AL-ḤUSAYN AL-QURASHĪ AL-IṢBAHĀNĪ**, also called **AL-IṢFAHĀNĪ** (b. 897, Isfahan, Iran—d. Nov. 20, 967, Baghdad), literary scholar who composed an encyclopaedic and fundamental work on Arabic song, composers, poets, and musicians.

Abū al-Faraj was a descendant of Marwān II, the last Umayyad caliph of Syria. Despite the enmity of this family and the ‘Alids, he was a Shi‘ite Muslim, upholding the rights of the descendants of the Prophet Muḥammad’s son-in-law ‘Alī to the caliphate. He spent most of his life in Baghdad where he enjoyed the patronage of the Būyid *amīrs*.

Kitāb al-aghānī (“The Book of Songs”), his major work, contains songs, biographical information, and much information concerning the life and customs of the early Arabs and of the Muslim Arabs of the Umayyad and ‘Abbāsīd periods.

Abū al-Faraj also wrote *Maqātil at-Ṭālibīyīn wa-akhbaruhum* (“The Slaying of the Ṭālibīs”), comprising biographies of the Shi‘ah martyrs descended from ‘Alī and his father, Abu Ṭālib.

Abū al-Fidā’, in full **ABŪ AL-FIDĀ’ ISMĀ‘ĪL IBN ‘ALĪ AL-MĀLIK AL-MU‘AYYAD ‘IMAD AD-DĪN**, also called **ABULFEDA** (b. Nov. 1273, Damascus—d. Oct. 27, 1331, Ḥamāh, Syria), Ayyūbid dynasty historian and geographer who became a local sultan under the Mamlūk empire.

Abū al-Fidā’ was a descendant of Ayyūb, the father of Saladin, founder of the Ayyūbid dynasty that had been supplanted by the Mamlūks in Egypt and elsewhere before his birth. In 1285 he accompanied his father and his cousin (prince of Ḥamāh and a Mamlūk client) to Mamlūk sieges of Crusader strongholds. Abū al-Fidā’ served the Mamlūk governor of Ḥamāh until he was made first governor of Ḥamāh (1310), then prince for life (1312). In 1320, after making a pilgrimage to Mecca with the Mamlūk sultan al-Nāṣir Muḥammad, he became al-Mālik al-Mu‘ayyad, with the rank of sultan; and he continued to rule Ḥamāh until his death. His son Muḥammad succeeded him.

Abū al-Fidā’ was a patron of scholars and a scholar himself. His two major works were a history, *Mukhtaṣar tārikh al-bashar* (“Brief History of Man”), spanning pre-Islāmīc and Islāmīc periods to 1329; and a geography, *Taqwīm al-buldān* (1321; “Locating the Lands”). Both works were compilations of other authors, arranged and added to by Abū al-Fidā’, rather than original treatises. Popular in their day in the Middle East, they were much used by 18th- and 19th-century European Orientalists before earlier sources became available.

Abū al-Ghāzī Bahādur, also spelled **ABULGHAZI BAHADUR** (b. Aug. 24, 1603, Urgench, khanate of Khiva [now in Uzbek-

istan]—d. 1663, Khiva), khan (ruler) of Khiva and one of the most prominent historians in Chagatai Turkish literature.

The son of ‘Arab Muḥammad Khan, Abū al-Ghāzī spent most of his early life in Urgench. When his father died and a dynastic struggle arose among Abū al-Ghāzī and his brothers for the succession to the throne, he was compelled to flee to the Ṣafavid court of Iran in the city of Isfahan, where he lived in exile from 1629 to 1639. While in exile he studied history, examining Persian and Arabic historical sources. In 1644/45, Abū al-Ghāzī finally succeeded to the throne of Khiva, reigning for about 20 years, carrying on intermittent wars with the Turkmen, the Uzbeks of Bukhara, the Kalmyks, Russia, and Iran.

The historical works for which he is most famous are *Shajare-i Tarākime*, or *Ṣecere-i Terakime* (1659; “The Genealogical Tree of the Turkmen”), written in Chagatai Turkish, mainly a compilation from the Persian historian Rashīd ad-Dīn (d. 1318) and the semi-legendary oral traditions of the Turks, and the *Shajare-i Turk* (“The Genealogical Tree of the Turks”), left incomplete and finished by his son, Abū al-Muzaffar Anūsha Muḥammad Bahādur, in 1665. This work is mainly a history of the Shaybānid dynasty (mid-15th century to 1665); it is not considered reliable because the author wrote from memory without using sources. The introduction is interesting for relating traditional material on Genghis Khan and his sons. The work became well known in Europe by the 18th century through German, French, Russian, Latin, and English translations.

Abū al-Ḥasan (fl. early 17th century, Delhi [India]), one of the leading Mughal painters of the emperor Jahāngīr’s atelier, honoured by the emperor with the title *Nādir-uz-Zamān* (“Wonder of the Age”).

Abū al-Ḥasan was the son of Āqā Rezā of Herāt, who took employment with Jahāngīr (reigned 1605–27) before his accession to the throne. Abū al-Ḥasan was trained in painting under the careful tutelage of the emperor, who praised him as having “no rival or equal” and took pride in having personally formed him at his court. Paintings of his that have survived include the famous chinar tree with squirrels in the India Office Library, and a large number of superb portraits. His study of European prints may have reinforced his naturalism and sympathy for his subjects. He is known to have worked early in the reign of Shāh Jahān (reigned 1628–57/58).

Abū al-Ḥasan ‘Alī (b. c. 1297—d. May 24, 1351, Hintato, Mor.), Marinid sultan of Morocco (reigned 1331–51) who increased the territories of his dynasty and, for a brief time, created a united North African empire.

In 1331 Abū al-Ḥasan succeeded his father, Abū Sa‘īd, to the throne. With the goals of expelling the Christians from Spain and uniting all the Islāmīc lands of North Africa, Abū al-Ḥasan attacked and captured Algeciras and Gibraltar in Spain (1333). He next attacked the Algerian territories of the ‘Abd al-Wādīd dynasty and after a three-year siege took the strategic town of Tlemcen (1337). Taking advantage of the internal weakness of Spain, he won a brilliant naval victory in the Strait of Gibraltar on April 5, 1340, but was defeated six months later at the Battle of Rio Salado and was forced to abandon his “holy war” against Spain.

Abū al-Ḥasan expanded his influence in Tunisia and married a daughter of Abū Bakr, the Ḥafṣīd ruler of Tunisia, which by 1342 had become a virtual vassal state. After Abū Bakr’s death Abū al-Ḥasan invaded Tunisia and captured Tunis (Sept. 15, 1347), but in the following April he was badly defeated by a

confederation of Tunisian tribes at Kairouan. Forced to flee Tunisia by sea during December 1349, he landed at Algeria in January and set out for Morocco to put down a rebellion led by his son Abū 'Inān. Deserted by his troops, he abdicated in favour of Abū 'Inān in 1351, and he died shortly afterward of an infected wound.

Abū al-Majd Majdūd ibn Ādam: *see* Sanā'i.

Abū al-Mundhir (Islāmic scholar): *see* Hishām ibn (Muḥammad) al-Kalbī.

Abū al-Qāsim, also spelled ABUL KASIM, in full ABU AL-QĀSIM KHALAF IBN 'ABBĀS AZ-ZAHRĀWĪ, Latin ALBUCASIS (b. c. 936, near Córdoba [Spain]—d. c. 1013), Islām's greatest medieval surgeon, whose comprehensive medical text, combining Middle Eastern and Greco-Roman classical teachings, shaped European surgical procedures until the Renaissance.

Abū al-Qāsim was court physician to the Spanish caliph 'Abd ar-Rahmān III an-Nāsir and wrote *At-Taṣrif liman 'ajaz'an at-Ta'ālīf*, or *At-Taṣrif* ("The Method"), a medical work in 30 parts. While much of the text was based on earlier authorities, especially the *Epitomae* of the 7th-century Byzantine physician Paul of Aegina, it contained many original observations, including the earliest known description of hemophilia. The last chapter, with its drawings of more than 200 instruments, constitutes the first illustrated, independent work on surgery.

Although *At-Taṣrif* was largely ignored by physicians of the eastern Caliphate, the surgical treatise had tremendous influence in Christian Europe. Translated into Latin in the 12th century by the scholar Gerard of Cremona, it stood for nearly 500 years as the leading textbook on surgery in Europe, preferred for its concise lucidity even to the works of the classic Greek medical authority Galen.

Abū al-Qāsim Muḥammad ibn 'Abd Al-lāh ibn 'Abd al-Muṭṭalib ibn Hāshim: *see* Muḥammad *under* Muḥammad (Arab Empire).

Abū al-Wafā', also spelled ABUL WEFĀ, in full ABU AL-WAFĀ' AL BŪZAJĀNĪ (b. 940, Buzjan, Iran—d. 998, Baghdad, Iraq), astronomer and one of the greatest of Muslim mathematicians, who made important contributions to the development of trigonometry.

Abū al-Wafā' worked in an observatory in Baghdad, where he built the first wall quadrant for observing the stars. He did not, as is sometimes claimed, discover the inequality in the Moon's motion, later called variation, but in his work on lunar theory he utilized the tangent and cotangent trigonometric functions and calculated tables for them. He also invented the secant and cosecant functions, proved the generality of the sine theorem for spherical triangles, and devised a new method of calculating sine tables.

He translated and wrote commentaries, since lost, on the works of the Greek mathematicians Euclid and Diophantus and of the Arabic mathematician al-Khwarizmi. Abū al-Wafā' also wrote *Kitāb fimā yahtāj ilayh al-kuttāb wa al-ummāl min 'ilm al-ḥisāb* ("Book on What Is Necessary from the Science of Arithmetic for Scribes and Businessmen") and *Kitāb fimā yahtāj ilayh al-sānī 'min al-a'māl al-Handasiyha* ("Book on What Is Necessary from Geometric Construction for the Artisan").

Abū 'Alī al-Ḥasan ibn al-Haytham (Islāmic scientist): *see* Alhazen.

Abū 'Alī Ḥasan ibn 'Alī (Persian vizier): *see* Nizām al-Mulk.

Abu Bakar (b. 1843?—d. June 4, 1895, London, Eng.), sultan of the Malay state of Johore (now part of Malaysia) from 1885 to 1895. He maintained independence from Britain and stimulated economic development in Johore at a time when most Southeast Asian states were being incorporated into European colonial empires.

Under an 1824 British treaty, supplemented by an agreement in 1855, the Malay state of Johore was ruled not by the sultan but by a lower-ranking official called a *temenggong*. These arrangements were in part an outgrowth of British machinations in acquiring Singapore in 1819. Abu Bakar, who became *temenggong* in 1862, was the third ruler under that agreement. He elevated his title to maharaja in 1868, and in 1885 he was acknowledged by Great Britain as sultan of Johore, disestablishing the former sultan's lineage. An able and clever ruler, he did much to promote trade, investment, and agriculture in his state. In particular he encouraged the development of gambier and pepper plantations.

Western in his interests, Abu Bakar lived in the British colony of Singapore, and, in his conduct of Johore's internal affairs (Britain had control of Johore's foreign affairs under terms of an 1861 agreement), he made use of Western advisers and methods. This practice stood him in good stead in persuading the British that the government of Johore was stable and just. He also elicited British positions on important issues and established his own policy accordingly, compromising when necessary. Thus, he not only maintained his independence but also strengthened his position vis-à-vis other Malay rulers.

Abū Bakr, also called AṢ-ṢĪDDĪQ (Arabic: "The Upright") (b. c. 573—d. Aug. 23, 634), Muḥammad's closest companion and adviser, who succeeded to the Prophet's political and administrative functions, thereby initiating the office of the caliphate.

Of a minor clan of the ruling merchant tribe of Quraysh at Mecca, Abū Bakr purportedly was the first male convert to Islām, but this view is doubted by a majority of Muslim historians. Abū Bakr's prominence in the early Muslim community was clearly marked by Muḥammad's marriage to his young daughter 'Ā'ishah and again by Muḥammad's choosing Abū Bakr as his companion on the journey

Abū Bakr (second figure on left), miniature from an illuminated manuscript; in the British Library (MS. Or. 371)

By courtesy of the trustees of the British Library

to Medina (the Hegira, 622). In Medina he was Muḥammad's chief adviser (622–632) but functioned mainly in conducting the pilgrimage to Mecca in 631 and leading the public prayers in Medina during Muḥammad's last illness.

On Muḥammad's death (June 8, 632), the Muslims of Medina resolved the crisis of succession by accepting Abū Bakr as the first

khalīfat rasūl Allāh ("deputy [or successor] of the Prophet of God," or caliph). In his rule (632–634), he suppressed the tribal political and religious uprisings known as the *riddah* ("apostasy"), thereby bringing central Arabia under Muslim control. Then by undertaking direct expansion from Arabia into Iraq and Syria, he began the Muslim conquests.

Abu Dhabi, Arabic ABU ZĀBY, constituent emirate of the United Arab Emirates (formerly Trucial States, or Trucial Oman). Though its international boundaries are disputed, it is unquestionably the largest of the country's seven constituent emirates with more than three-fourths of the area of the entire federation. Its rich oil fields, both onshore and in the Persian Gulf, make it, with neighbouring Dubayy, one of the nation's two most prosperous emirates.

Abu Dhabi fronts the Persian Gulf on the north for about 280 miles (450 km). The desolate coast has many areas of *sabkha* ("salt marsh") and numerous offshore islands. Abu Dhabi borders Qatar (west), Saudi Arabia (south), and Oman, formerly Muscat and Oman (east). Internally it half surrounds Dubayy and has a short frontier with ash-Shāriqah.

Since the 18th century the Āl bū Falāh clan of the Bani Yās has been in power; their earliest seat was in the Liwā (al-Jiwā') oasis district. In 1761 they found wells of potable water at the site of Abu Dhabi town on the coast and made their headquarters there from 1795. Because Abu Dhabi's traditional rivals were the Qawāsim pirates of Ra's al-Khaymah and ash-Shāriqah sheikhdoms and because the pirates were hostile to the sultanate of Muscat and Oman, Abu Dhabi's rulers at first allied themselves with the sultanate. In the 19th century, however, territorial conflicts developed between Abu Dhabi, Muscat and Oman, and the expanding power of the Wahhābi of Najd, ancestors of the present ruling dynasty of Saudi Arabia. These conflicts led to border disputes, most still unsettled.

Though not considered a pirate state, Abu Dhabi signed the British-sponsored General Treaty of Peace (1820), the maritime truce (1835), and the Perpetual Maritime Truce (1853). By the terms of the Exclusive Agreement of 1892, its foreign affairs were placed under British control. During the long rule of Sheikh Zayd ibn Khalifah (1855–1908), Abu Dhabi was the premier power of the Trucial Coast, but in the early 20th century it was outpaced by ash-Shāriqah and Dubayy. When Britain proposed withdrawal from the Persian Gulf (1968), Abu Dhabi, together with the other Trucial States, Bahrain, and Qatar, negotiated to form a nine-member federation. The latter two states, however, became separately independent (1971); Britain abrogated its earlier treaties with the Trucial States, and the new United Arab Emirates, of which Abu Dhabi is a leading member, came into being. Abu Dhabi town was made the provisional capital of the United Arab Emirates for five years; its status was extended several times until it was made the permanent national capital in the early 1990s.

Abu Dhabi's economic base rests almost entirely on crude-oil production. Petroleum was discovered in 1958 at the submarine field of Umm ash-Shayf, about 75 miles (125 km) offshore at a depth of almost 9,000 feet (2,750 m). This oil is pumped through a submarine pipeline to previously desolate Dās Island, about 20 miles (32 km) west, where the emirate's main offshore tanker terminal was built, with airstrip, gas-liquefaction plant, and ancillary facilities; exports began in 1962. Principal onshore production is from the Murbān and Bū Ḥaṣā fields, the centres of which are in the central part of the state, 25 to 40 miles (40 to 65 km) from the coast. Pipelines connect these with a coastal terminal to the northwest at Mount az-Zannah (Danna). Other offshore

fields are at the az-Zakum shoal, northwest of Abu Dhabi town and connected by submarine pipeline to Dās Island, and at Umm ad-Dalkh, north of Abu Dhabi town. The state's total oil reserves are estimated to be about one-tenth of the world's total reserves.

Abu Dhabi's revenues from oil royalties give it one of the world's highest per capita incomes. In addition to internal modernization, Abu Dhabi has lent some of its wealth to its less-prosperous sister states in the United Arab Emirates, to other countries in the Arab world, and to developing countries elsewhere. An Arid Lands Research Centre located at al-'Ayn in the interior seeks improved methods of vegetable growing. Area 28,210 square miles (73,060 square km). Pop. (2001 est.) 1,186,000.

Abu Dhabi, Arabic ABŪ ZĀBY, town, capital of Abu Dhabi emirate, one of the United Arab Emirates (formerly Trucial States, or Trucial Oman), and the national capital of that federation. The town occupies most of a small triangular island of the same name, just off the Persian Gulf coast and connected to the mainland by a short bridge. Abu Dhabi was formerly an undeveloped town of only local importance, but the emirate's oil revenues have enabled it to develop into a modern city with a fully developed infrastructure.

No settlement existed at Abu Dhabi town before 1761, when tribesmen of the Āl bū Falāh clan of the Banī Yās, rulers of Abu Dhabi then as now, settled there. They moved their headquarters to this coastal islet from the inland Liwā (al-Jiwā) oases in 1795. Through most of the 19th and early 20th centuries, the town, though capital of one of the chief sheikhdoms of the Trucial Coast, yielded pride of place in trade and economic importance to Dubayy town and ash-Shāriqah town, capitals of neighbouring Trucial sheikhdoms. At the beginning of the 20th century, Abu Dhabi town's population was estimated at 6,000; pearl diving from the rich offshore banks and some local trade (chiefly in the hands of Iranians and Hindus) sustained the economy. Pearl diving declined with the development of the Japanese cultured-pearl industry and the worldwide economic depression beginning in 1929.

The discovery (1958) and commercial production (since 1962) of the rich oil fields of Abu Dhabi emirate revolutionized the political and economic position of Abu Dhabi town. Great Britain, as the protecting power of the then Trucial States, established a separate Political Agency at the town in 1961, removing the sheikhdom from dependence on

the political agent at Dubayy town. As capital of the chief oil-producing state in the region, Abu Dhabi town had large sums available for urban development. The town modernized slowly, however, because of the extremely conservative policies of Sheikh Shakhbūt ibn Sulṭān (reigned 1928–66). In the latter year, he was deposed in favour of his younger brother Zayd ibn Sulṭān, former governor of the Abu Dhabi-controlled portion of al-Buraymī oasis. Sheikh Zayd began developing a road network radiating from Abu Dhabi town and had a seawall built along the northern end of the island containing the town. Under an ambitious five-year development plan, inaugurated in 1968, the town was thoroughly modernized. Electricity, running water, and a central sewage system were installed; modern government buildings, hotels, housing projects, and a new port extension were built. An oil refinery on nearby Umm an-Nār Island began production in 1976. Abu Dhabi's international airport is at the south end of the island. Light industry is concentrated at nearby Musafah. Motor roads link Abu Dhabi town with Dubayy town (northeast), al-'Ayn (al-Ain) oasis (east), and Qatar (west).

When Britain finally left the Persian Gulf and when the United Arab Emirates achieved political independence (December 1971), a compromise decision made Abu Dhabi town the provisional national capital. It was made the permanent capital of the United Arab Emirates in the early 1990s. Pop. (1995) 398,695.

Abū Ḥabbah (Iraq): see Sippar.

Abū Ḥanīfah, in full ABŪ ḤANĪFAH AN-NU'MĀN IBN THĀBIT (b. 699, Kūfah, Iraq—d. 767, Baghdad), Muslim jurist and theologian whose systematization of Islāmic legal doctrine was acknowledged as one of the four canonical schools of Islāmic law. The school of Abū Ḥanīfah acquired such prestige that its doctrines were applied by a majority of Muslim dynasties. Even today it is widely followed in India, Pakistan, Turkey, Central Asia, and Arab countries.

Abū Ḥanīfah was born in Kūfah, an intellectual centre of Iraq, and belonged to the *mawālī*, the non-Arab Muslims, who pioneered intellectual activity in Islāmic lands. The son of a merchant, young Abū Ḥanīfah took up the silk trade for a living and eventually became moderately wealthy. In early youth he was attracted to theological debates, but later, disenchanted with theology, he turned to law and for about 18 years was a disciple of Ḥammād (d. 738), then the most noted Iraqi jurist. After

Ḥammād's death, Abū Ḥanīfah became his successor. He also learned from several other scholars, notably the Meccan traditionist 'Aṭā' (d. c. 732) and the founder of the Shī'ite law, Ja'far aṣ-Ṣādiq (d. 765). Abū Ḥanīfah's mind was also matured by extensive travels and by exposure to the heterogeneous, advanced society of Iraq.

By Abū Ḥanīfah's time a vast body of legal doctrines had accumulated as a result of the endeavour to apply Islāmic norms to legal problems. The disagreements in these doctrines had rendered necessary the development of a uniform code. Abū Ḥanīfah responded by scrutinizing the current doctrines in collaboration with his students, several of them outstanding scholars. He had each legal problem discussed before formulating any doctrines. Before Abū Ḥanīfah's time, doctrines had been formulated mainly in response to actual problems, whereas he attempted to solve problems that might arise in the future. By the introduction of this method, the area of law was considerably enlarged. Because of this enlargement of the bounds of law and because of Abū Ḥanīfah's somewhat rationalist orientation and his reserve about traditions that were not highly authenticated, his school was sometimes erroneously denounced as the school of *ra'y* (independent opinion), as opposed to that of Ḥadīth (authoritative tradition).

Being a speculative jurist, Abū Ḥanīfah brought about systematic consistency in legal doctrines. In his doctrines, emphasis shifts from material to systematic considerations. Again and again he disregarded established practices and considerations of judicial and administrative convenience in favour of systematic and technical legal considerations. His legal acumen and juristic strictness were such that Abū Ḥanīfah reached the highest level of legal thought achieved up to his time. Compared with his contemporaries, the Kufan Ibn Abī Laylā (d. 765), the Syrian Awzā'ī (d. 774), and the Medinese Mālik (d. 795), his doctrines are more carefully formulated and consistent and his technical legal thought more highly developed and refined.

Although theology was not Abū Ḥanīfah's primary concern, he did take distinct positions on several theological questions, stimulating the development of the Māturīdiyāh school, a champion of orthodoxy.

Because of his temperament and academic preoccupation, Abū Ḥanīfah took no direct part in court politics or power struggles, despite his obvious antipathy toward the Umayyads and 'Abbāsids, the ruling dynasties of the time. His sympathies lay with the 'Alids (the successors of 'Alī, later revered by Shī'ites), whose revolts he openly supported with words and money. This fact partly explains why Abū Ḥanīfah steadfastly refused a judgeship and also why he suffered severe persecution under both dynasties. (Z.I.A.)

Discussions of his work in its larger context can be found in Joseph Schacht, *An Introduction to Islamic Law* (1964, reprinted 1998); and A.J. Wensinck, *The Muslim Creed: Its Genesis and Historical Development*, 2nd ed. (1979).

Abū Hudhayfah (Muslim theologian): see Waṣīl ibn 'Aṭā'.

Abū Jirāb, also spelled ABU GURAB, ancient Egyptian site, about 1 mile (1.6 km) north of Abū Ṣīr, between Ṣaqqārah and Giza; it is known as the location of two 5th-dynasty (c. 2465–c. 2325 BC) sun temples. The first part of the 5th dynasty is recognized as a period of unusually strong emphasis on the worship of the sun god Re, contemporary in-

Volcano Fountain on the corniche, Abu Dhabi

Jon Hicks—Corbis

scriptions recording that six sun temples were built. Only those of King Userkaf and King Neuserre, however, have been found and excavated, the latter one being better preserved because it was built entirely of stone. The temple of King Neuserre originally consisted

Reconstruction of the sun temple of King Neuserre

of a large unroofed platform surrounded by storerooms, cult chambers, and an altar. In the rear, resting on a rectangular podium, was a squat obelisk, about 56 feet (18 m) high and perhaps signifying radiating sunbeams. A long, covered passage approached the platform and was decorated with some of the most beautifully sculptured and painted scenes remaining from the Old Kingdom.

Abū Kālījār al-Marzubān ibn Sulṭān ad-Dawlah, also called MUḤYĪ'AD-DĪN (b. May/June 1009, Basra, Iraq—d. October 1048, Khannāb, near Kermān, Iran), ruler of the Būyid dynasty from 1024, who for a brief spell reunited the Būyid territories in Iraq and Iran.

When his father, Sulṭān ad-Dawlah, died in December 1023/January 1024, Abū Kālījār's succession to the sultan's Iranian possessions of Fārs and Khuzistan was challenged by his uncle Abū al-Fawāris, the ruler of Kerman, to the west. By 1028 Abū Kālījār was victorious and added Kerman to his domains. In the meantime (1027) he had attacked the Iraqi lands of another uncle, Jalāl ad-Dawlah, and had precipitated a civil war between the Iraqi and the Iranian branches of the Būyid family that lasted until 1037, when the two made peace. With the death of Jalāl ad-Dawlah in March 1044, Abū Kālījār was recognized as the Būyid ruler in Iraq.

In the face of the growing challenge of the Seljuq Turks, Abū Kālījār fortified his capital Shirāz, in Fārs (1044), and three years later entered into a marriage alliance with the Seljuq ruler Toghrīl Beg. In 1048, however, Toghrīl broke the alliance and attacked. Abū Kālījār died leading a force against the Seljuqs, who by 1062 completed their occupation of Būyid territories.

Abu 'l-Faḍl 'Allāmī, Abu 'l-Faḍl also spelled ABU-L-FAZL (b. Jan. 14, 1551, Āgra, India—d. Aug. 22, 1602), historian, military commander, secretary, and theologian to the Mughal emperor Akbar.

Abu 'l-Faḍl 'Allāmī studied with his father, Sheikh Mubārak Nāgawrī, a distinguished scholar, and after teaching in his father's school was presented to Akbar in 1574 by the poet Fayzī, Abu 'l-Faḍl's older brother. Through his criticism of the traditional Muslim religious leaders, he influenced the development of Akbar's religious synthesis. He opposed the narrow-mindedness of the religious leaders and their preoccupation with outward forms instead of the transcendent God. Abu 'l-Faḍl had immense influence at court. Appointed a military commander in the Deccan in 1599, he distinguished himself both as a soldier and as an administrator. He was called back to court during a rebellion of Akbar's son Salīm (afterward the emperor Jahāngīr) but, at the

instigation of Salīm, was stopped en route and assassinated.

Abu 'l-Faḍl's major literary achievement was a history of Akbar and his ancestors, *Akbar-nāmah* (Eng. trans. by H. Beveridge, *The Akbar-nāmah of Abu-l-Faḍl*, 1907–39), concluded by the *Āin-e Akbarī* (Eng. trans. by H.F. Blochmann and H.S. Jarrett, *Āin-i-Akbarī of Abul Fazl-i-'Allāmī*, 1927–49). *Āin-e Akbarī* is in three parts: (1) a manual of government operations ranging from the jewel office and elephant stables to the army and tax collection; (2) a description and short history of Akbar's 12 provinces; and (3) an account of Hindu culture and sciences. Abu 'l-Faḍl is said to have translated the Bible into Persian. Collections of his letters are also extant.

Abū Maḍī, Īliyā (b. c. 1890, al-Muḥaydithah, Lebanon—d. 1957), Arab poet and journalist who spent much of his life in the United States.

When he was 11 years old, Abū Maḍī moved with his family from their mountain village in Lebanon to Alexandria, Egypt. As a young man he earned money selling cigarettes. He published his first collection of poetry in Alexandria in 1911. The following year he migrated to the United States, settling in Cincinnati, where he worked with his brother. In 1916 he moved to New York City and began editing several Arabic newspapers and magazines, which were supported by New York City's Arab community. He worked for 10 years with the magazine *Mir'āt al-gharb* ("Mirror of the West") and married the owner's daughter. In 1929 he started his own bimonthly magazine, *As-Samīr* ("The Companion"), which he expanded into a daily newspaper in 1936 and continued to publish until his death.

Abū Maḍī published a collection of poetry in 1916 and a second, *Al-Jadāwīl* ("Streams"), in 1927. *Al-Khamā'il* (1946; "Thickets") was printed in Beirut, as was the posthumous *Tibr wa turāb* (1960; "Ore and Dust"). The popularity of his poetry was based on his expressive use of language, his mastery of the traditional patterns of Arabic poetry, and the relevance of his ideas to contemporary Arab readers.

Abū Ma'shar: see Albumazar.

Abū Muḥammad 'Alī ibn Aḥmad ibn Sa'īd ibn Ḥazm (Muslim historian): see Ibn Ḥazm.

Abū Muslim (d. February 755), leader of a revolutionary movement in Khorāsān who, while acting as an agent for the 'Abbāsīd family, was instrumental in the downfall of the Umayyad Caliphate and in placing the 'Abbāsīds on the throne.

There are numerous versions of Abū Muslim's background, but it seems most likely that he was descended from a slave of Persian origin and was therefore a *mawālī* (non-Arab Muslim, accorded lowly status under the Umayyads). The emissary of the 'Abbāsīd imam, who was briefly incarcerated, met Abū Muslim while in prison (741) and later arranged for his release. Abū Muslim was instructed by the imam and then sent to Khorāsān (745–46) to instigate a revolt.

Abū Muslim proved to be an energetic and capable leader. Overcoming the initial resentment caused by his obscure origin, he took advantage of the deep social divisions rife in Khorāsān, where the 'Abbāsīds had carefully intrigued and disseminated propaganda against the Umayyads for 20 years. Recruiting from various discontented or dispossessed social groups, Abū Muslim created a coalition of rebellious Arabs and Iranians; the distinctions between Arab and non-Arab were blurred as he managed to syncretize local tradition and Iranian culture with Islāmic religion.

On June 15, 747, Abū Muslim raised the banner of revolution, and the revolt quickly spread throughout Khorāsān and to other provinces, with Abū Muslim as the chief mili-

tary organizer. The revolt triumphed when the last Umayyad caliph, Marwān II, was defeated and killed (750) and Abū al-'Abbās (as-Saffāh) became the first 'Abbāsīd caliph (749). Abū Muslim was given the governorship of Khorāsān in reward for his services. The 'Abbāsīds still depended on him to keep order, and Abū Muslim served his patrons well by defeating both internal and external enemies.

Although the 'Abbāsīds were in large part enthroned owing to Abū Muslim's military victories and political prowess, they became leery of a vassal with so much power and popularity. With the accession of the second 'Abbāsīd caliph (754), the morbidly suspicious al-Manṣūr, Abū Muslim's downfall was certain. After having Abū Muslim quell an uprising led by a rebellious uncle, al-Manṣūr stripped away the governorship of Khorāsān from him. When Abū Muslim arrived at court, al-Manṣūr had him put to death, thus eliminating a potential rival for the throne. The death of Abū Muslim, already a legendary hero, inspired many later uprisings and revolts.

Abū Naṣr, Aḥmad Shāh Bahādur Mu-jāhid-ud-Dīn: see Aḥmad Shāh.

Abū Niḍāl, byname of SABRĪ KHALĪL AL-'BANNĀ' (b. May 1937, Jaffa, Palestine [now Tel Aviv-Yafo, Israel]—d. Aug. 16?, 2002, Baghdad, Iraq), leader of the Fatah Revolutionary Council, more commonly known as the Abū Niḍāl Organization (ANO), or Abū Niḍāl Group, a Palestinian organization that engaged in terrorist acts beginning in the mid-1970s.

He and his family fled Palestine after the 1948 war that created the State of Israel, and for the next 20 years he lived in Jordan and Saudi Arabia. In the late 1960s he joined Yāsir 'Arafāt's guerrilla group, Fatah, a component of the Palestine Liberation Organization (PLO), which fought to wrest Palestine from Israeli control, but left the group in 1973 because of his dissatisfaction with moderates within Fatah who were willing to pursue diplomatic solutions. His new organization, no longer associated with Fatah, operated out of Iraq, then Syria, and finally Libya, usually with the support of those governments. Many of his targets were Palestinians whose political views were at odds with his own, and in 1974 the PLO condemned him to death in absentia.

The ANO was held responsible for terrorist attacks against both Arab and Israeli diplomats and government representatives. It also was alleged to have carried out hijackings, bombings, and commando raids. Among its most infamous acts were the simultaneous attacks at the international airports in Rome and Vienna in December 1985, in which 18 people were killed, and the shooting of 21 worshipers in an Istanbul synagogue in 1986. In January 1991 Abū Niḍāl's agents were thought to have been responsible for the assassination of Abū 'Iyād (nom de guerre of Ṣalāḥ Khalaf), the PLO's intelligence chief and one of 'Arafāt's closest associates. In 2001 he was condemned to death, again in absentia, by a court in Jordan for the murder of a Jordanian diplomat. The following year he was killed while in the custody of Iraqi security personnel.

Abū Nuwās, also spelled ABŪ NU'ĀS, in full ABŪ NUWĀS AL-ḤASAN IBN ḤĀNĪ' AL-ḤAKAMĪ (b. c. 747–762, Ahvāz, Iran—d. c. 813–815, Baghdad), important poet of the early 'Abbāsīd period (750–835).

Abū Nuwās, of mixed Arab and Persian heritage, studied in Basra and al-Kūfah, first under the poet Wālibah ibn al-Ḥubāb, later under Khalaf al-Aḥmar. He also studied the Qur'ān (Islāmic sacred scripture), Ḥadīth (traditions relating to the life and utterances of the Prophet), and grammar and is said to have spent a year with the Bedouins in the desert to acquire their traditional purity of language.

Abū Nuwās' initial appearance at the 'Abbāsīd court in Baghdad met with little success;

his alliance with the Barmakids, the 'Abbāsīd viziers, forced him to seek refuge in Egypt when the Barmakid dynasty collapsed. On his return to Baghdad, however, his panegyrics earned the favour of the caliphs Hārūn ar-Rashīd and al-Amīn, and he enjoyed great success in the 'Abbāsīd court until his death.

The language of Abū Nuwās' formal odes (*qasidas*) is grammatically sound and based on the old Arab traditions; his themes, however, are drawn from urban life, not the desert. He is particularly renowned for his poems on wine and pederasty. His verse is laced with humour and irony, reflecting the genial yet cynical outlook of the poet, who spent much of his life in pursuit of pleasure.

Abū ol-Qasem Maṣṣūr (Persian poet): *see* Ferdowsi.

Abū Qīr Bay, also called **ABUKIR BAY**, or **ABOUKIR BAY**, semicircular inlet of the Mediterranean Sea, lying between Abū Qīr Point (southwest) and the mouth of the Rosetta Branch (northeast) of the Nile River delta, in Lower Egypt. The bay was the scene of the Battle of the Nile (1798), in which an English fleet under Rear Admiral Sir Horatio Nelson defeated the Napoleonic fleet. A natural-gas field, developed offshore in the late 1970s, provides energy for industries around Alexandria.

Abū Ruwaysh, also spelled **ABU ROASH**, ancient Egyptian site of a 4th-dynasty (c. 2575–c. 2465 BC) pyramid built by Redjedef, usually considered the third of the seven kings of that dynasty. The site is about 5 miles (8 km) northwest of Giza (Al-Jīzah) on the west bank of the Nile. Of the pyramid superstructure very little remains, and some scholars believe that it was never finished—a theory reinforced by evidence that the walls of the mortuary temple next to the pyramid were hastily made of mud brick instead of the usual cut stone; the complex was also deliberately ransacked, as Redjedef was involved in a dynastic struggle. Nothing remains of the pyramid's valley temple, but the causeway from it to the mortuary temple can still be traced.

An Early Dynastic (c. 2925–c. 2575 BC) private cemetery has also been found at Abū Ruwaysh.

Abū Sa'īd 'Abd al-Malik ibn Qurayb al-Aṣma'i: *see* Aṣma'i, al-.

Abū Sa'īd ibn Abī al-Ḥasan Yasār al-Baṣrī: *see* Ḥasan al-Baṣrī, al-.

Abū Shahrāyn, mound in southern Iraq, site of the ancient Sumerian city of Eridu (*q.v.*).

Abu Simbel, also spelled **ABU SUNBUL**, site of two temples built by the Egyptian king Ramses II (reigned 1279–13 BC), now located in Aswān *muḥāfazah* (governorate), Egypt. The area was anciently at the southern fron-

tier of pharaonic Egypt, facing Nubia. The four colossal statues of Ramses in front of the main temple are spectacular examples of ancient Egyptian art. By means of a complex engineering feat in the 1960s, the temples were salvaged from the rising waters of the Nile River caused by erection of the Aswān High Dam.

Carved out of a sandstone cliff on the west bank of the Nile, south of Korosko (modern Kuruskū) in the Aswān governorate, near the Sudanese frontier, the temples were unknown to the outside world until their rediscovery in 1813. They were first explored in 1817 by the early Egyptologist Giovanni Battista Belzoni.

The 67-foot (20-metre) seated figures of Ramses were set against the recessed face of the cliff, two on either side of the entrance to the main temple. Carved around their feet were small figures representing Ramses' queen, Nefertari, and their children. Graffiti inscribed on the southern pair by Greek mercenaries serving Egypt in the 6th century BC have provided important evidence of the early history of that alphabet. The temple itself, dedicated to the sun gods Amon-Re and Re-Horakhte, consisted of three consecutive halls extending 185 feet (56 m) into the cliff, decorated with more figures of the king and with painted reliefs showing his life and achievements. It was built so that, on certain days of the year, the first rays of the morning sun would penetrate its whole length and even illuminate the shrine in its innermost sanctuary.

Just to the north of the main temple was a smaller one, dedicated to Nefertari for the worship of the goddess Hathor and adorned with 35-foot (10.5-metre) statues of the king and queen.

When the reservoir that was created by the construction of the nearby Aswān High Dam threatened to submerge Abu Simbel in the early 1960s, the United Nations Educational, Scientific and Cultural Organization (UNESCO) and the Egyptian government sponsored a project to save the site. Between 1964 and 1966 a work force and an international team of engineers and scientists, supported by funds from more than 50 countries, dug away the top of the cliff and completely disassembled both temples, reconstructing them on high ground 200 feet (60 m) above the riverbed.

Abū Ṣīr, in Egypt, ancient site between Giza (Al-Jīzah) and Saqqārah where several 5th-dynasty (c. 2465–c. 2325 BC) kings built their pyramids. The pyramids were poorly constructed and are now in a state of disrepair. The adjoining mortuary temples are notable for their elaborate sculptured wall reliefs and columns in the forms of palm, lotus, and papyrus plants. Near their pyramids a number of the kings built sanctuaries with obelisks dedicated to Re, the sun god; only those of King Userkaf and King Neuserre have been excavated.

Abū Tammām, in full **ABU TAMMĀM ḤABĪB IBN AWS** (b. 804, near Damascus [now in Syria]—d. c. 845, Mosul, Iraq), poet and editor of an anthology of early Arabic poems known as the *Ḥamāsah*.

Abū Tammām changed his Christian father's name of Thādhūs to Aws and invented for himself an Arab genealogy. In his youth he worked in Damascus as a weaver's assistant but on going to Egypt began to study poetry. It is not certain when he began to write verse, but by the time of the caliph al-Mu'taṣim (reigned 833–842) he had established a small reputation. This was greatly enlarged through

his association with al-Mu'taṣim's court, where he became the most acclaimed panegyrist of his day. He traveled to Armenia and Nishāpūr, Iran, and on his return from Iran stopped in Hamadan, where he began compiling his *Ḥamāsah*.

Abū Tammām's *divan*, or collection of poems, generally deals with contemporary events of historical significance. In his own day it was variously judged by the Arab critics; while his command and purity of language were generally recognized, many deprecated his excessive use of tortuous poetical devices.

Abuja (town and emirate, Nigeria): *see* Suleja.

Abuja, capital territory, central Nigeria, created in 1976 from a northwestern part of former Benue-Plateau state, a southeastern part of former North-Western state, and a northeastern part of former Western state. The territory is located north of the confluence of the Niger and Benue rivers. It is bordered by the states of Niger to the west and northwest, Kaduna to the northeast, Plateau to the east and south, and Kwara to the southwest. Abuja, the federal capital and a planned modern city, is located near the centre of the territory.

The region is underlain by crystalline rocks consisting of granites and gneisses. The vegetation is mainly savanna with limited forest areas. Agriculture, the economic mainstay, produces yams, millet, corn (maize), sorghum, and beans. The population comprises the Gwari, Koro, Ganagana, Gwandara, Afo, and Bassa ethnic groups, predominantly dairy farmers. Hausa and Fulani also live in the territory. Mineral resources include clay, tin, feldspar, gold, iron ore, lead, marble, and talc. Abuja city has an airport and major road connections. Area 2,824 square miles (7,315 square km). Pop. (1995 est.) capital territory, 423,391.

Abuja, city, federal capital of Nigeria, in the central part of the Abuja capital territory (created 1976), located approximately 300 miles (480 km) northeast of Lagos, the former capital (until Dec. 12, 1991). During the 1980s, the new capital city (designed by the Department of Architecture, Ahmadu Bello University in Zaria) was built and developed in the grass-covered Chukuku Hills.

The site was chosen because of its central location, easy accessibility, salubrious climate, low population density, and the availability of land for future expansion. It was the first planned city to be built in Nigeria. Abuja lies at 1,180 feet (360 m) above sea level and has a cooler climate and less humidity than is found in Lagos. The city was planned with a projected population of about 25,000 in the early stages of occupation and is divided into two zones. The central area contains the National Assembly, the city hall, national cultural institutes, and other government-related offices. The other zone provides housing, shopping facilities, and other urban amenities. Abuja has an airport, and expressways connect the federal capital with other state capitals. High-tension power lines conduct electricity to the city from Shiroro Dam, on the Niger River. Pop. (1991) 107,069.

Abukuma-sammyaku (Japanese: Abukuma Mountains), range in northern Honshu, Japan, extending for 106 miles (170 km) north to south and paralleling the Pacific coast of Fukushima Prefecture (*ken*), Tōhoku Region (*chihō*). Its southern end extends into Ibaraki Prefecture of Kantō Region. The mountain range is 30 miles wide, and the individual peaks are sphenoidal, or wedge shaped. They consist of schistose granite and granodiorite, occasionally accompanied by slate, sandstone, and limestone.

The mountains are also referred to as the Abukuma-kōgen (Abukuma Plateau) because much of the original surface in the south has been obliterated by erosion and broken by several parallel fault valleys that run from north-northwest to south-southeast. Ōtakine-san (Mt. Ōtakine) is the highest point in the range; it rises to 3,914 feet (1,193 m) above the surrounding eroded surfaces, which average 2,950 feet (900 m) in elevation. Since ancient times a main highway has followed the pass between these mountains and the Mikuni-sammyaku from the Kantō Plain to Tōhoku Region. The eastern piedmont hills contain the Jōban coalfields, which are developing as a new industrial district.

Abuná River, Spanish RÍO ABUNÁ, Portuguese RIO ABUNÁ, headwater of the Amazon, rising in several streams, east of the Cordillera Oriental of the Andes. The navigable river flows for about 200 miles (320 km) northeast through rain forests, forming Bolivia's northern border with Brazil. It joins the Rio Madeira, a tributary of the Amazon, at Manoa, Bolivia. Rubber, Brazil nuts, quinine, and other forest products are the principal items of commerce in the sparsely inhabited Abuná region.

Abung (people): *see* Lampong.

Abutilon, genus of about 100 species of herbaceous plants and partly woody shrubs, of the mallow family (Malvaceae), native to tropical and warm temperate areas. It includes several species used as houseplants and in gardens for their white to deep-orange, usually nodding, five-petaled blossoms.

A. hybridum, sometimes called Chinese lantern, is planted outdoors in warm regions and grown in greenhouses elsewhere. The trailing abutilon (*A. megapotamicum*), often grown as a hanging plant, is noted for its nodding, yellowish-orange, closed flowers; it has a handsome variegated-leaved variety. *A. pictum*, a shrub reaching a height of 4.5 m (15 feet), often called parlor, or flowering, maple, is grown as a houseplant. An important fibre plant in China is *A. theophrastii*, called China jute; it is a field weed in the United States, where it is called velvet leaf (*q.v.*), or Indian mallow.

Abydos, Egyptian ABDU, Coptic EBOT, modern AL-ʿARABAT AL-MADFUNA, prominent sacred city and one of the most important archaeological sites of ancient Egypt. The site, located in the low desert west of the Nile near al-Balyanā, was a royal necropolis of the first two dynasties and later a pilgrimage centre for the worship of Osiris.

The history of Abydos is intimately associated with the political and religious development of Egypt itself and dates to the beginnings of Egyptian history. Excavations there at the end of the 19th century by Emile-Clément Amélineau and Sir Flinders Petrie uncovered a series of pit tombs, the stelae (standing stone slabs) of which marked them as apparently belong-

ing to the kings of the first two dynasties of Egypt. Doubt has subsequently been raised as to whether these tombs were the actual burial places of the pharaohs whose names they bore: in Saqqārah, a series of mastaba tombs were found that contained objects bearing the same royal names, and the far greater size of these tombs and the richness of their contents and decoration have led many scholars to suppose that these are the real resting places of the early kings and that the custom of constructing a sham burial, or cenotaph, at Abydos was practiced as early as the Archaic period. Some of the 2nd-dynasty pharaohs, however, may in fact have been buried at Abydos, where imposing brick funerary enclosures were built at the northwestern end of the necropolis area; one of these structures covers nearly 2 acres (0.8 hectare).

The tutelary deity of the necropolis city was the jackal god, called Khenti-amentiu in the Old Kingdom; in the 5th dynasty, his cult was gradually absorbed by that of the god Osiris, and the city soon became the focal point of the cult of Osiris. Abydos became a place of pilgrimage for pious Egyptians, who desired above all else to be buried as close as possible to the recognized tomb of Osiris, which was located at Abydos. For those who could not afford the expense of being buried there, stelae were set up, inscribed with the dead man's name and titles and a prayer to the god. Thousands of these stelae have been found in the city's cemeteries.

The pharaohs, though they were now buried near their city of residence rather than at Abydos, encouraged the cult of the deified king at Abydos, and they took special care to embellish and enlarge the temple of Osiris there. Over the centuries the temple of Osiris was successively rebuilt or enlarged by Pepi I, Ahmose I, Thutmose III, Ramses III, and Ahmose II. Some pharaohs had a cenotaph or a mortuary temple at Abydos. The temple of Seti I was one of the most beautiful of all such temples. Its plan is unique, for it has no fewer than seven sanctuaries, approached through two broad hypostyle halls. The sanctuaries are dedicated to the pharaoh and the principal gods of Egypt. In a long gallery leading to other rooms is a relief showing Seti and his son Ramses making offerings to the cartouches of 76 of their dead predecessors beginning with Menes. This is the so-called Abydos list of kings. The reliefs decorating the walls of this temple are of particular delicacy and beauty. Only 26 feet (8 m) behind the temple of Seti I is a remarkable structure known as the Osireion, but probably in reality Seti's cenotaph. This curious monument is an underground vaulted hall containing a central platform with 10 monolithic pillars surrounded by a channel of water.

Around and between the various temples of Abydos is a vast complex of cemeteries used in every period of early Egyptian history, from the prehistoric age to Roman times.

Abydos, ancient Anatolian town located just northeast of the modern Turkish town of Çanakkale on the east side of the Dardanelles (Hellespont). Probably originally a Thracian town, it was colonized about 670 BC by the Milesians. There Xerxes crossed the strait on his bridge of boats to invade Greece in 480 BC. Abydos is celebrated for its vigorous resistance to Philip V of Macedonia (200 BC) and for the legend of Hero and Leander. It survived until late Byzantine times as the toll station of the Hellespont.

abyssal gap: *see* submarine gap.

abyssal hill, small, topographically well-defined submarine hill that may rise from several metres to several hundred metres above the abyssal seafloor, in water 3,000 to 6,000 m (10,000 to 20,000 feet) deep. Typical hills have diameters of several to several hundred

metres. Abyssal-hill provinces, areas of abyssal seafloor occupied exclusively by such hills, characteristically occur seaward of the smooth abyssal plains at the bases of continental rises. Isolated hills and groups of hills also protrude from abyssal-plain surfaces, and the base of an abyssal-plain accumulation of sediment, as revealed by sub-bottom seismic profiling, generally matches the undulating topography and relief of abyssal-hill provinces.

Abyssal hills, although generally covered with marine sediments, probably are identical in composition and origin to the extrusive basaltic prominences on the upper flanks of mid-oceanic ridges and rises. Thus, it is believed that abyssal hills underlie most of the ocean floor, locally buried by accumulations of abyssal sediment. In the Atlantic Ocean, long abyssal-hill provinces parallel both flanks of the Mid-Atlantic Ridge along most of its length. The Pacific Ocean has a smaller supply of continental sediment than the Atlantic Ocean, and numerous trenches and local rises separate the main ocean floor from the continents, preventing the seaward transport of sediment; consequently, between 80 and 85 percent of the Pacific abyssal floor is occupied by abyssal hills.

abyssal plain, flat seafloor area at an abyssal depth (3,000 to 6,000 m [10,000 to 20,000 feet]), generally adjacent to a continent. These submarine surfaces vary in depth only from 10 to 100 cm per kilometre of horizontal distance. Irregular in outline but generally elongate along continental margins, the larger plains are hundreds of kilometres wide and thousands of kilometres long. In the North Atlantic the Sohms Plain alone has an area of approximately 900,000 square km (350,000 square miles). The plains are largest and most common in the Atlantic Ocean, less common in the Indian Ocean, and even rarer in the Pacific, where they occur mainly as the small, flat floors of marginal seas or as the narrow, elongate bottoms of trenches.

The plains are thought to be the upper surfaces of land-derived sediment that accumulates in abyssal depressions, thus smoothing out a preexisting hilly or otherwise irregular topography. Seismic profiles (cross sections) of abyssal plains reveal accumulations of sediment averaging one kilometre in thickness, deposited on undulating topography. Incomplete burial of preexisting relief may result in the presence of isolated volcanic hills or hill groups that rise abruptly out of some abyssal plains. Sediment from the continental margins accretes at steep continental slopes, and occasional submarine slumping of this coarse material creates dense, sediment-laden slurries, called turbidity currents, that flow down the slopes in obedience to gravity. Part of the turbidity-current sediment settles out at the bases of the continental slopes, creating continental rises of lesser gradient, but some of the coarse sediment reaches the abyssal depressions. Horizontal silty, sandy, and even gravelly beds that are fractions of a centimetre to several metres thick comprise 2 to 90 percent of abyssal-plain sediment. Many such layers demonstrably are of shallow-water organisms—*e.g.*, the microscopic protozoan Foraminifera. An individual layer may be progressively finer grained from bottom to top; this grading reflects the bed's origin as the deposit of a single turbidity current.

The coarse layers are interbedded with homogeneous deposits of fine-grained clay and the microscopic remains of organisms that inhabit the waters overlying the abyssal plains. Between turbidity-current episodes these fine-grained sediments are believed to fall through the water column particle by particle, accumulating at exceedingly slow rates (a millimetre to several centimetres per 1,000 years). Alternatively, it has been proposed that deep-sea clay deposits may be brought to

abyssal plains continuously by slowly flowing, diffusely turbid bottom waters that originate in turbulent, shallow nearshore areas.

abyssal zone, portion of the ocean deeper than about 2,000 m (6,600 feet) and shallower than about 6,000 m (20,000 feet). The zone is defined mainly by its extremely uniform environmental conditions, as reflected in the distinct life forms inhabiting it. The upper boundary between the abyssal zone and the overlying bathyal zone is conveniently defined as the depth at which the water temperature is 4° C (39° F); this depth varies between 1,000 and 3,000 m. Waters deeper than 6,000 m are treated separately as the hadal realm by ecologists.

The abyssal realm is the largest environment for Earth life, covering 300,000,000 square km (115,000,000 square miles), about 60 percent of the global surface and 83 percent of the area of oceans and seas.

Abyssal waters originate at the air-sea interface in polar regions, principally the Antarctic. There, the cold climate produces sea ice and residual cold brine. Because of its high density, the brine sinks and slowly flows along the bottom toward the Equator. Abyssal salinities range narrowly between 34.6 and 35.0 parts per thousand, and temperatures are mostly between 0° and 4° C (32° and 39° F). Pressure increases by about one atmosphere (approximately 14.7 pounds per square inch at sea level) with each 10-metre increment in depth; thus, abyssal pressures range between 200 and 600 atmospheres. Pressure presents few problems for abyssal animals, however, because the pressures within their bodies are the same as those outside them.

The concentrations of nutrient salts of nitrogen, phosphorus, and silica are very uniform in abyssal waters and are much higher than in overlying waters. This is because abyssal and hadal waters are the reservoir for the salts from decomposed biological materials that settle downward from upper zones, and the lack of sunlight prevents their uptake by photosynthesis.

The oxygen content of abyssal water depends entirely upon the amounts dissolved into it at its polar site of origin and the absence of photosynthesis, which precludes the introduction of new oxygen at depth. Abyssal waters retain several cubic centimetres of dissolved oxygen per litre, because the sparse animal populations do not consume oxygen faster than it is introduced into the abyssal zone. Abyssal life is concentrated at the seafloor, however, and the water nearest the floor may be essentially depleted in oxygen.

The abyssal realm is very calm, being far removed from storms that agitate the ocean at the air-sea interface. These low energies are reflected in the character of abyssal sediments. The abyssal realm is usually far enough from land that the sediment is composed predominantly of microscopic plankton remains produced in the food chain in the overlying waters, from which they settle. Abyssal sediment in waters shallower than 4,000 m in equatorial to temperate regions is composed primarily of the calcareous shells of foraminiferan zooplankton and of phytoplankton such as coccolithophores. Below 4,000 m, calcium carbonate tends to dissolve, and the principal sediment constituents are brown clays and the siliceous remains of radiolarian zooplankton and such phytoplankton as diatoms.

Abyssal fauna, though very sparse and embracing relatively few species, include representatives of all major marine invertebrate phyla and several kinds of fish, all adapted to an environment marked by no diurnal or seasonal changes, high pressures, darkness, calm water, and soft sediment bottoms. These animals tend to be gray or black, delicately structured, and unstreamlined. Mobile forms have long legs; and animals attached to the bottom

have stalks, enabling them to rise above the water layer nearest the bottom, where oxygen is scarce. Abyssal crustaceans and fish may be blind. With increasing depth, carnivores and scavengers become less abundant than animals that feed on mud and suspended matter. Abyssal animals are believed to reproduce very slowly.

Abyssinia: see Ethiopia.

Abyssinian, breed of domestic cat, probably of Egyptian origin, that has been considered to approximate the sacred cat of ancient Egypt more closely than any other living cat. The Abyssinian is a lithe cat with relatively slender legs and a long, tapering tail. The short, finely textured coat is ruddy reddish brown, with individual hairs of the back, sides, chest, and tail distinctively ticked, or tipped, with bands of black or brown. The nose is red,

Juvenile ruddy Abyssinian
Animals Unlimited/Paddy Cutts

the eyes are hazel, green, or gold, and the tail tip and backs of the hindlegs are black. The Abyssinian is noted for being affectionate and quiet, though generally shy with strangers.

ac: see alternating current.

acacia, any of about 800 species of trees and shrubs comprising a genus (*Acacia*) in the mimosa family (Mimosaceae) and native to tropical and subtropical regions of the world, particularly Australia (there called wattles) and Africa. Acacias' distinctive leaves take the form of small, finely divided leaflets that give the leafstalk a feathery or fernlike (*i.e.*, pinnate) appearance. In many Australian and Pacific species, the leaflets are suppressed or absent altogether, and the leafstalks (petioles) are flattened and perform the physiological functions of leaves. The leafstalks may be vertically arranged and bear thorns or sharp spines at their base. Acacias are also distinguished by their small, often fragrant flowers, which are arranged in compact globular or cylindrical clusters. The flowers are usually yellow but occasionally white and have many stamens apiece, giving each one a fuzzy appearance.

About 600 species are native to Australia and various Pacific Ocean islands, with the rest native to either Africa or the Americas. Acacias are especially numerous on the plains of southern and eastern Africa, where they are well-known landmarks on the veld and savanna.

Several acacia species are important economically. *A. senegal*, native to the Sudan region in Africa, yields true gum arabic, a substance used in adhesives, pharmaceuticals, inks, confections, and other products. The bark of most acacias is rich in tannin, which is used in tanning and in dyes, inks, pharmaceuticals, and other products. The babul tree (*A. arabica*),

of tropical Africa and across Asia, yields both an inferior type of gum arabic and a tannin that is extensively used in India. Several Australian acacias are valuable sources of tannin,

Spreading wattle (*Acacia genistifolia*), an Australian acacia in which the leafstalks are flattened and function as leaves

© Ralph and Daphne Keller/Australasian Nature Transparencies

among them the golden wattle (*A. pycnantha*), the green wattle (*A. decurrens*), and the silver wattle (*A. dealbata*).

A few acacias produce valuable timber, among them the Australian blackwood (*A. melanoxylon*); the yarran (*A. homalophylla*), also of Australia; and *A. koa* of Hawaii. Sweet acacia (*A. farnesiana*) is native to the southwestern United States. Many of the Australian species have been widely introduced elsewhere as cultivated small trees valued for their spectacular floral displays.

Acacian Schism (484–519), in Christian history, split between the patriarchate of Constantinople and the Roman See, caused by an edict by Byzantine patriarch Acacius that was deemed inadmissible by Pope Felix III.

With the support of the Byzantine emperor Zeno, Acacius in 482 drew up an edict, the *Henotikon* (Greek: "Edict of Union"), by which he attempted to secure unity between orthodox Christians and monophysites. The *Henotikon's* theological formula incorporated the decisions of the general Councils of Nicaea (325) and Constantinople (381) and recognized Christ's divinity, but it omitted any reference to the orthodox distinction of Christ's human and divine essences, as enunciated by the Council of Chalcedon (451), and in so doing made important concessions to the monophysites. The *Henotikon* was widely accepted in the East but proved unacceptable to Rome and the Western church. Consequently, Acacius was deposed (484) by Pope Felix III in an excommunication that was reaffirmed and broadened in 485 to embrace all of Acacius' accomplices, including a substantial part of the Byzantine hierarchy. The condemnation by Pope Felix precipitated the Acacian Schism, which was not resolved until 519.

Academia, Bahia de la: see Academy Bay.

academic freedom, the freedom of teachers and students to teach, study, and pursue knowledge and research without unreasonable interference or restriction from law, institutional regulations, or public pressure. Its basic elements include the freedom of teachers to inquire into any subject that evokes their intellectual concern; to present their findings to their students, colleagues, and others; to publish their data and conclusions without control or censorship; and to teach in the manner

they consider professionally appropriate. For students, the basic elements include the freedom to study subjects that concern them, to form conclusions for themselves, and to express their opinions.

According to its proponents, the justification for academic freedom thus defined lies not in the comfort or convenience of teachers and students but in the benefits to society. The long-term interests of a society, they argue, are best served when the educational process leads to the advancement of knowledge, and knowledge is best advanced when inquiry is free from restraints by the state, by the church or other institutions, or by special-interest groups.

The foundation for academic freedom was laid by the medieval European universities, even though their faculties met periodically to condemn on religious grounds the writings of individual faculty members. Protected by papal bulls and royal charters, the universities became legally self-governing corporations with the freedom to organize their own faculties, to control admissions, and to establish standards for graduation.

Until the 18th century, the Roman Catholic church and, in some areas, its Protestant successors exerted censorship over universities or certain members of their faculties. Similarly, in the 18th and 19th centuries, the newly emerged nation-states of Europe constituted the chief threat to the autonomy of the universities. Professors were subject to governmental authority and were liable to be forbidden to teach anything that was unacceptable to the government in power. Thus began a tension that has continued to the present.

Some states permitted or encouraged academic freedom and set an example for subsequent emulation. The University of Leiden in The Netherlands (founded in 1575) provided great freedom from religious and political restraints for its teachers and students. The University of Göttingen in Germany became a beacon of academic freedom in the 18th century, and, with the founding of the University of Berlin in 1811, the basic principles of *Lehrfreiheit* ("freedom to teach") and *Lernfreiheit* ("freedom to learn") were firmly established. These principles later inspired universities throughout Europe and the Americas.

Academic freedom is never unlimited. The general laws of society, including those concerning obscenity, pornography, and libel, apply also to academic discourse and publication. Teachers are freer within than outside their disciplines. The more highly trained teachers are, the more freedom they are likely to be afforded: university professors tend to be less restricted than elementary-school teachers. Similarly, students usually gain greater freedom as they move through the academic system. Academic freedom is liable to contract in times of war, economic depression, or political instability.

In countries without democratic traditions, academic freedom may be unreliably granted and unevenly distributed. Academic freedom at the university level existed in some communist countries, but usually only in fields such as mathematics, the physical and biological sciences, linguistics, and archaeology; it was largely absent in the social sciences, the arts, and the humanities. The collapse of communist rule in eastern Europe and the breakup of the Soviet Union in 1989–91 allowed the tentative reappearance of academic freedom in many formerly communist countries. Despite its strong tradition of academic freedom, Germany experienced a virtually complete eclipse of such freedom during the period of Nazi rule (1933–45). At the end of the 20th

century, academic freedom seemed most firmly established in Europe and North America and most precarious under various dictatorial regimes in Africa, Asia, and the Middle East.

Although the United States generally has been a bastion of academic freedom, this tradition occasionally has been marred. From the 1930s, for example, state legislatures sometimes required teachers to take "loyalty" oaths in order to prevent them from engaging in left-wing (and particularly communist) political activities. During the anticommunist hysteria of the 1950s, the use of loyalty oaths became widespread, and many teachers who refused to take them were dismissed without due process.

In the 1980s and '90s, many universities in the United States adopted regulations aimed at proscribing speech and writing that were deemed discriminatory against, or injurious or offensive to, individuals or groups on the basis of their race, ethnicity, gender, religion, sexual orientation, or physical disability. Whereas supporters of the measures, known as "speech codes," defended them as necessary to protect minorities and women against discrimination and harassment, opponents contended that they unconstitutionally infringed the free-speech rights of students and teachers and effectively undermined academic freedom. Many of these critics charged that the codes amounted to the legal enforcement of a narrow range of "politically correct" ideas and expressions.

Académie des Sciences (France): *see* Sciences, Academy of.

Académie Française: *see* French Academy.

Académie Nationale de Musique: *see* Paris Opéra.

academy, society of learned persons organized to advance science, art, literature, music, or some other cultural or intellectual area of endeavour. The word academy is derived from the name of an olive grove outside ancient Athens where Plato taught philosophy. Gradually the term acquired the general meaning of a higher school, and in that sense it was used by the pharaoh Ptolemy I in Alexandria and by Spanish Muslim caliphs, the emperor Charlemagne, England's Alfred the Great, and others.

At the close of the European Middle Ages, learned societies called academies began to be formed in Italy, first for the study of classical and then of Italian literature. One of the earliest was the Platonic Academy, founded in Florence in 1442 by two Greek scholars under the encouragement of Cosimo de' Medici. Literary academies sprang up all over Italy in the 16th and 17th centuries; the most famous of these was the Crusca Academy (*Accademia della Crusca*), which was founded in Florence by A.F. Grazzini in 1582. Its dictionary, *Vocabolario della Crusca*, first published in 1612, stabilized the Italian literary language on the basis of Tuscan speech.

The first scientific academies began in the 16th century in Italy, the Lincei Academy (1603) in Rome being the most famous. In the 17th century Europe's two preeminent scientific academies were founded: the Royal Society (*q.v.*) of England in 1662 and the Academy of Sciences of France in 1666. The French Academy (*q.v.*; *Académie Française*), which would become Europe's best-known literary academy, began in 1635. France's third great academy, the Royal Academy of Painting and Sculpture, was founded under similar state patronage in 1648 and is now called the Academy of Fine Arts (*Académie des Beaux-Arts*). These three French academies, together with two others, now make up the Institut de France. The Royal Spanish Academy (*Real Academia Española*) was founded in 1713 to preserve the Spanish language and published a landmark Spanish dictionary to that effect.

By the start of the 18th century most Euro-

pean countries had scientific and literary academies, and these were followed by fine-arts academies. One of the most prominent was England's Royal Academy of Arts, founded in London in 1768 by Sir Joshua Reynolds. France's even better-known art academy has already been mentioned. Most fine-arts academies were closely connected with teaching functions and thus differed from earlier academies. (*See* art, academy of.)

Academies of music, social sciences, medicine, mining, and agriculture also began to appear from the 18th century on. The foundation of academies continued throughout the 19th and 20th centuries, and most European countries now have at least one academy or learned society that is sponsored by or otherwise connected with the state. The academies' influence was greatest during the 17th and 18th centuries but declined during the 19th because of their tendency to resist new and unorthodox developments in science and culture.

The United States, like Great Britain, Canada, and other English-speaking countries, has no state-established academies of science or literature, a fact reflective of English beliefs that culture should basically be a matter for private initiative. The first learned society in what would become the United States was founded by Benjamin Franklin in 1743 and called the American Philosophical Society. The rival American Academy of Arts and Sciences was founded in 1779, and the National Academy of Sciences was founded in Washington, D.C., in 1863. Russia's Imperial Academy of Sciences was founded by Peter the Great in St. Petersburg in 1724 and later came to serve as the Soviet Union's principal coordinating body for scientific research. (*See* Sciences, Academy of.)

The term academy is also often used to designate a secondary school or college in which special subjects are taught—*e.g.*, military or naval affairs, agriculture, fine arts, music, or business.

Academy, Greek *ACADEMEIA*, Latin *ACADEMIA*, in ancient Greece, the academy, or college, of philosophy in the northwestern outskirts of Athens, where Plato acquired property about 387 BC and used to teach. At the site there had been an olive grove, park, and gymnasium sacred to the legendary Attic hero *Academos* (or *Hecademos*).

The designation academy, as a school of philosophy, is usually applied not to Plato's immediate circle but to his successors down to the Roman Cicero's time (106–43 BC). Legally, the school was a corporate body organized for worship of the Muses, the scholar (or headmaster) being elected for life by a majority vote of the members. Most scholars infer, mainly from Plato's writings, that instruction originally included mathematics, dialectics, natural science, and preparation for statesmanship. The Academy continued until AD 529, when the emperor Justinian closed it, together with the other pagan schools.

The Academy philosophically underwent various phases, arbitrarily classified as follows: (1) the Old Academy, under Plato and his immediate successors as scholars, when the philosophic thought there was moral, speculative, and dogmatic, (2) the Middle Academy, begun by Arcesilaus (316/315–c. 241 BC), who introduced a nondogmatic skepticism, and (3) the New Academy, founded by Carneades (2nd century BC), which ended with the scholar Antiochus of Ascalon (d. 68 BC), who effected a return to the dogmatism of the Old Academy. Thereafter, the Academy was a centre of Middle Platonism and Neoplatonism until it was closed in the 6th century AD.

Academy Bay, Spanish *BAHIA DE LA ACADEMIA*, bay at the south end of Santa Cruz (Indefatigable) Island (one of the Galapagos Islands), about 600 miles (965 km) west of

Small craft in the harbour at Academy Bay, Santa Cruz Island, Galapagos Islands

Ecuador, in the eastern Pacific Ocean. Named in 1905 by the California Academy of Sciences Expedition, it is the site of the Charles Darwin Research Station, which was established in 1959 to study and preserve the Galapagos Islands' flora and fauna. The bay also serves as a harbour for small craft. It was from Academy Bay that the stranded Norwegian crew of the abandoned ship *Alexandra* was rescued in 1906.

Academy of — : see under substantive word (e.g., Sciences, Academy of), except as below.

Academy of Venice, Galleries of the, Italian GALLERIE DELL'ACCADEMIA DI VENEZIA, museum of art in Venice housing an unrivaled collection of paintings from the Venetian masters of the 13th through the 18th century. There are outstanding works by Giovanni Bellini, Giorgione, Titian, Tintoretto, Giovanni Battista Tiepolo, and Canaletto.

The galleries occupy the former monastery, church, and school of Santa Maria della Carità. The core of the collection was assembled in 1756.

Acadia, French ACADIE, North American Atlantic seaboard possessions of France in the 17th and 18th centuries. Centred in what is now Nova Scotia, Acadia was probably intended to include the other present Maritime Provinces of Canada as well as parts of Maine [U.S.] and Quebec.

The first organized French settlement in Acadia was founded in 1604 on an island in Passamaquoddy Bay, on the present U.S.-Canadian border, by Pierre de Monts and Samuel de Champlain. In 1605 the colony was moved to Port Royal (now Annapolis Royal, Nova Scotia), and that settlement became the centre of Acadia's future. Because the French claimed for Acadia lands that had also been claimed by England, the colony was continually contested by both nations. In 1613 Port Royal was destroyed, and its inhabitants were dispersed by an English military expedition from Virginia.

In 1621 King James I of England (VI of Scotland) awarded the lands of Acadia to Sir William Alexander for the purpose of founding the colony of Nova Scotia. In 1632 his son King Charles I ceded Acadia back to France, and, under the Company of New France, a renewed period of French colonization followed. A bitter struggle for power broke out in 1636 between two of the leading French officials of the colony—a struggle that eventually resulted in a local civil war. Acadia was under English rule from 1654 to 1670 and then reverted again to French rule and remained under French control for the next 40 years.

On Oct. 16, 1710, Port Royal was captured by the British. The Treaty of Utrecht (1713) gave Nova Scotia to Great Britain but left Cape Breton Island and Ile St. Jean (from 1799 Prince Edward Island) with France. In

1755 many French-speaking Acadians were deported by the British because of the imminence of war with France, the question of Acadian neutrality, and the possibility of revolt. Several thousand of them eventually settled in French-ruled Louisiana, where their descendants became known as Cajuns.

At the conclusion of the French and Indian Wars in 1763, Ile St. Jean and Cape Breton Island also formally came under British rule; the province of New Brunswick was separated from Nova Scotia in 1784. See also Cajun.

Acadia National Park, national park on the Atlantic coast of Maine, U.S., astride Frenchman Bay. It has an area of 65 square miles (168 square km) and was originally established as Sieur de Monts National Monument (1916). It became the first national park in the eastern United States, as Lafayette National

Great Head from Mount Desert Island, Acadia National Park, Maine

Josef Muench

Park in 1919, and was renamed Acadia in 1929 to preserve the historic name given to the region by the De Monts Commission in 1604.

Acadia National Park mainly comprises a rugged forested area on Mount Desert Island, dominated by Cadillac Mountain and including Anemone Cave and Sieur de Monts Spring (site of the Nature Center and Abbe Museum, which displays Indian relics). Other segments include half of Isle au Haut, with its spectacular cliffs, and the Schoodic Peninsula on the mainland. Situated at the crossroads of the northern and temperate zones, Acadia's cold, shallow gulf environment has an abundance of marine life.

Acadian orogeny, a mountain-building event that affected the northern portion of the Appalachian Geosyncline from present-day New York to Newfoundland during the Devonian Period (408 to 360 million years ago). Orogenic activity began during the Early Devonian in Gaspé, spread westward throughout Devonian time, and affected the western margins of the geosyncline in Late Devonian time. The orogeny was most intense in the Merrimac area in southern New England and in Maine and extended northward to the Central Volcanic Belt of Newfoundland. Evidence for the Acadian orogeny consists of abundant angular unconformities (nonparallel strata) and igneous intrusions, regional metamorphism, and deformation of pre-Devonian and Devonian rocks. Additionally, the westward spread of clastic sedimentary wedges and red beds probably resulted from Acadian uplift in the interior portions of the geosyncline. The Catskill Delta in New York and eastern Pennsylvania represents the westernmost of these clastic wedges.

The cause of the Acadian orogeny has been ascribed to the collision of the northeastern portion of the North American Plate with western Europe.

Acajutla, Pacific seaport, southwestern El Salvador. Spanish conquistadores defeated the Indians there in 1524, and it subsequently

flourished as a colonial port. The old town has been rebuilt inland in order to make room for new port facilities. Acajutla is El Salvador's principal port and handles a large portion of its coffee exports and shipments of sugar and balsam. There are also a petroleum refinery and a fertilizer plant in the city. Fish- and shell-processing industries and summer beach-resort facilities are also important. Pop. (1992) town, 18,008; mun., 47,678.

Acámbaro, city, southeastern Guanajuato estado ("state"), central Mexico. Acámbaro lies along the Lerma River, in the central plateau, at 6,388 feet (1,947 m) above sea level. A Spanish settlement was founded there in 1526 on the site of a small Tarascan Indian village. With the construction of the Solís Reservoir, irrigation water became available to bring land under cultivation. Corn (maize), beans, wheat, and chick-peas are the principal crops. Cattle, sheep, and pig raising are also important. Much of Acámbaro's importance derives from its function as a rail and highway junction 45 miles (70 km) south of Celaya and 172 miles (277 km) west-northwest of Mexico City. Pop. (2000 est.) city 53,000.

Acanthaceae, one of 18 families in the figwort order of flowering plants (Scrophulariales), containing approximately 250 genera and at least 2,500 species distributed predominantly in tropical and subtropical regions of

Acanthaceae: (top) *Jacobinia magnifica* and (bottom) zebra plant (*Aphelandra squarrosa*)

(Top) Sven Samelius (bottom) Kitty Kohout from Root Resources

the world. The greater part of the Acanthaceae family are herbs or shrubs, but climbers (vines) and trees occur as well. The range of habitats extends from marshes to extremely dry situations, but most of these plants are found in damp tropical forests.

The family is characterized by simple leaves arranged in opposite pairs on the twigs, cystoliths (enlarged cells containing crystals of calcium carbonate) in streaks or protuberances in the vegetative parts, and bilaterally

The harbour at Acapulco, Mex.
Victor Englebert

symmetrical, bisexual flowers that are usually crowded together in clusters and individually enclosed by leaflike bracts, often coloured and large. Sepals and petals number five or four each and are fused into tubular structures called the calyx and corolla. There are usually four or two stamens that arise from the corolla tissues and extend beyond the mouth of the flower; often there are one to three sterile stamens (staminodes). The pistil is superior (*i.e.*, positioned above the attachment point of the other flower parts) and consists of two fused ovule-bearing segments (carpels) enclosing two chambers (locules), each of which has two to many ovules in two rows along the central axis of the ovary. Seeds are borne on hooks on the placenta.

The group is mainly of horticultural interest and includes such ornamentals as bear's-breech (*Acanthus mollis*), clock vine (*Thunbergia*), shrimp plant (*Beloperone guttata*), and caricature plant (*Graptophyllum pictum*). The largest genera include *Jacobinia* (about 300 species), *Stobilanthes* (250), *Barleria* (230), *Aphelandra* (200), *Thunbergia* (200), *Dicliptera* (150), *Hypoestes* (150), *Blepharis* (100), *Dyschoriste* (100), *Lepidagathis* (100), and *Hygrophila* (80).

Acanthisittidae (bird family): *see* Xenicidae.

acanthocephalan: *see* spiny-headed worm.

acanthus, in architecture and decorative arts, a stylized ornamental motif based on a characteristic Mediterranean plant with jagged leaves, *Acanthus spinosus* (for illustration, *see* Acanthaceae). It was first used by the Greeks in the 5th century BC on temple roof ornaments, on wall friezes, and on the capital of the Corinthian column. One of the best examples of its use in the Corinthian order is the Erechtheum on the Athenian Acropolis. Later, the Romans used the motif in their Composite order, in which the capital of the column is a three-dimensional combination of spirals resembling rams' horns and full-bodied acanthus leaves. The acanthus leaf has been a popular motif in carved furniture decoration since the Renaissance.

Acapulco, in full ACAPULCO DE JUÁREZ, resort and port, Guerrero *estado* ("state"), southwestern Mexico. Situated on a deep, semicircular bay, Acapulco has the best harbour on the Pacific coast of Mexico and one of the finest natural anchorages in the world. The town lies on a narrow strip of land between the bay and the steeply rising mountains that encircle it. From May to November the climate is hot, humid, and frequently rainy, but from December through April it is warm, dry, and pleasant. The harbour was discovered by Hernán Cortés in 1531, and a settlement was founded in 1550. It was designated a city in

1599. Acapulco was a main depot for Spanish colonial fleets plying between Mexico and the Orient, especially Manila, and continued to be a port of call for steamship lines between Panama and San Francisco and a major export point for coffee, sugar, and other products of the interior.

Acapulco has become the "Riviera of Mexico" for tourists attracted by the climate, the many luxurious hotels, excellent beaches, and deep-sea fishing. More than 300,000 visitors go there annually. No railroads connect to Acapulco, but the paving in 1940 of the Taxco-Acapulco link of the highway from Cuernavaca and Mexico City (288 miles [463 km] to the north-northeast) and frequent air service make it easily accessible. A summer school for foreigners, founded in 1955, provides tourists with courses on Mexican arts and archaeology.

Local industry is limited to the manufacture of woven sombreros, shellwork, confectionery, and other tourist-based products. Historical attractions include the 18th-century Fort of San Diego, which houses a museum. Pop. (2000 prelim.) city, 619,253; urban agglom. 712,011.

Acarai Mountains, also spelled ACARAHY, or AKARAI, Portuguese SERRA ACARAI, low range on the border of Brazil (Pará state) and southern Guyana. The mountains, which rise to about 2,000 feet (600 m) above sea level, run in an east-west direction for about 80 miles (130 km) and form part of the northern watershed of the Amazon Basin. The whole area is covered with dense tropical rain forest and was mapped by satellite in the late 1970s.

acaricide: *see* miticide.

Acarie, Barbe-Jeanne Avrillot, Mme (French mystic): *see* Mary of the Incarnation.

Acarigua, city, northern Portuguesa *estado* ("state"), northwestern Venezuela. Formerly the state capital, Acarigua is a principal commercial centre of the northern portion of the Llanos (plains), in which cattle, sugarcane, cotton, corn (maize), and rice are the principal products. Industries in the city include sawmilling and dairying. Acarigua is accessi-

ble by air and by highway from Guanare, the state capital, 50 miles (80 km) to the southwest, and from Barquisimeto, capital of Lara *estado*, 50 miles (80 km) north-northwest. The city has been designated a rail centre under Venezuela's railway-expansion plan. Pop. (1990) 116,551.

Acarina, subclass of the arthropod class Arachnida that includes the mite and tick (*qq.v.*).

Acarmania, district of ancient Greece bounded by the Ionian Sea, the Ambracian Gulf, Mount Thyamus, and the Achelous River. Corinth founded several colonies on the coast of Acarnania in the 7th and 6th centuries BC. Originally a tribal unit, Acarnania developed into a federal state with generals and other magistrates, a council, and an assembly by the late 5th century; its capital was at the city of Stratus. With Athenian help, in the early years of the Peloponnesian War it repulsed Corinthian and Spartan attacks and enlarged its territory. In 388 it was compelled by Sparta to give up the Athenian alliance. It later came under Athenian, Theban, and Macedonian rule. In 314 the Acarnanians established a confederation of newly founded cities; but frontier disputes with Aetolia culminated in the partition of their country between Aetolia and Epirus (c. 243). The Epirote part of Acarnania recovered its independence in 231 and set up a new confederacy. By allying with Philip V of Macedon, it succeeded in recovering some of its former territory. When Rome overthrew the Macedonian dynasty (167 BC), it deprived Acarnania of Leucas, the capital of the revived confederacy, and compelled it to send hostages to Rome; but the confederacy, with its capital at Thyrrheum, survived until the Roman emperor Augustus incorporated many Acarnanians into his new city, Nicopolis Actia; the rest were included in the province of Achaëa.

In modern Greece, Acarnania is linked with Aetolia in the *nomós* (department) Aitolía kai Akarnania.

first*

acatalasia, rare hereditary metabolic disorder caused by lack of the organic catalyst or enzyme called catalase. Although a deficiency of catalase activity is noted in many tissues of the body, including the red blood cells, bone marrow, liver, and skin, only about half of the affected persons have symptoms, which consist of recurrent infections of the gums and associated oral structures that may lead to gangrenous lesions. Such lesions are rare after puberty. The disorder has been most frequently reported in Japanese and Korean populations; its estimated frequency in Japan is approximately 2 in 100,000.

Treatment includes surgery, tooth extraction, and antimicrobial therapy.

acceleration, time rate at which a velocity is changing. Because velocity has both magnitude and direction, it is called a vector quantity; acceleration is also a vector quantity and must account for changes in both the magnitude and direction of a velocity. The

velocity of a point or an object moving on a straight path can change in magnitude only; on a curved path, it may or may not change in magnitude, but it will always change in direction. This condition means that the acceleration of a point moving on a curved path can never be zero.

If the velocity of a point moving on a straight path is increasing (*i.e.*, if the speed, which is the magnitude of the velocity, is increasing), the acceleration vector will have the same direction as the velocity vector. If the velocity is decreasing (that is, the point or object is decelerating), the acceleration vector will point in the opposite direction. The average acceleration during a time interval is equal to the total change in the velocity during the interval divided by the time interval. The acceleration at any instant is equal to the limit of the ratio of the velocity change to the length of the time interval, as the time interval approaches zero.

When a point moves on a curved path, the component of the acceleration that results from the change in the direction of the velocity vector is perpendicular to the velocity vector and is directed inward, to the concave side of the path; its magnitude is given by the square of the velocity divided by the radius of curvature r of the path: v^2/r . The change in the magnitude of v may be represented by another vector (that is, a second component of the acceleration) collinear with v and in the same direction if v is increasing and the opposite direction if v is decreasing. If velocity is stated in metres per second, acceleration will be stated in metres per second per second.

acceleration stress, physiological changes that occur in the human body in motion as a result of rapid increase of speed. Rapid acceleration and surges in acceleration are felt more critically than are gradual shifts. Pilots are especially subject to the effects of acceleration because of the high speeds at which they travel. Acceleration forces are measured in units of gravitational acceleration, or g . A force of three g , for example, is equivalent to an acceleration three times that of a body falling near the Earth.

Three kinds of acceleration stress are distinguished—positive, negative, and transverse—according to the position of the body with relation to the direction of acceleration.

Positive acceleration stress. Positive acceleration stress occurs when the direction of acceleration is along the long axis of the body from head to foot. As acceleration increases the force exerted on the pilot from one g to two g , there is an awareness of increased pressure and a general feeling of heaviness in the seat, hands, and feet. Three and four g further increase this sensation, and movement of the extremities becomes difficult; unless the trunk and head are supported, it may be difficult to keep them erect. The internal organs are pulled down in the body cavity and blood pressure falls. Eyesight may become limited, or there may be total blackout. The legs may feel congested and may have muscle cramps. Breathing may become difficult. If the acceleration is uneven or if the pilot is inexperienced, there may be mental confusion and disorientation. Unconsciousness can occur when the force exerted is from three to five g .

When acceleration is in the direction from head to feet, the blood is forced to the lower part of the body, and unconsciousness occurs when the brain fails to receive enough oxygen. Increased pressure in the extremities can cause rupture of the small blood vessels of the skin. The more gradual the acceleration, the less will be the fall in blood pressure, since the circulatory system is capable of making adjustments; but it takes about five seconds before this mechanism becomes fully activated.

There are seldom any aftereffects of acceleration in the direction from head to feet ex-

cept for a few moments of mental confusion. There is usually no pain, though there may be some discomfort. Repeated exposures to such acceleration do not usually have permanent effects.

Negative acceleration stress. Negative acceleration stress occurs when the direction of acceleration is from feet to head. This causes a slight displacement of the internal organs in the abdomen and chest and a rush of blood to the face accompanied by the feeling of congestion. As the acceleration increases the congestion increases and throbbing pains are felt throughout the head. When the force is from 3 to 4.5 g , the eyes feel as though they are protruding, and there is a gritty feeling under the eyelids because of swelling in the small blood vessels. There may be temporary loss of vision or all objects may appear red; this latter condition is known as "red-out." The mental confusion that develops at high accelerations may lead to unconsciousness.

In acceleration in the direction from feet to head the blood pressure in the skull rises. In order to relieve the pressure in the skull the velocity of the blood flow to the rest of the body must be increased. Temporary cardiac arrest may occur at around 5 g . Respiration is also impaired because of the pressure upon the lungs from the abdominal contents and the muscular diaphragm (the wall between the chest and the abdomen). Bleeding can occur under the skin of the face; weak arteries or veins in the head region can rupture while under such stress. The average endurable times for negative stress are a few seconds at 5 g , 15 seconds for 4.5 g , and around 30 seconds for 3 g . Stunt fliers and pilots experienced with accelerations in the direction from feet to head seem to tolerate its effects better than new or inexperienced fliers.

Transverse acceleration stress. Transverse acceleration stress occurs when the direction of acceleration is sideways with relation to the long axis of the body. The effects of transverse acceleration are not as great as those of equivalent forces in the previous two cases. Thus, the position in which a pilot lies on his back at right angles to the direction of flight seems to be best for the high accelerations required to reach orbital velocity and reentry decelerations in manned space flight. Accelerations up to 6 g directed across the body produce only the sensations of increased pressure on that part of the body that supports the weight. As the force increases toward 8 g , breathing may become difficult because of the compression of the abdomen and chest. Accelerations of up to 12 g can be tolerated in transverse acceleration without undue discomfort or visual disorders. There may, however, be a slight increase in heart rate and blood pressure, and the blood oxygenation level seems to decrease with pressure.

It is speculated that future space flights may have acceleration forces of 15–20 g for one to two minutes and that additional protective measures may prove to be necessary. Breathing pure oxygen increases the blood's oxygen saturation level, and it is thought that certain heart stimulants may help to increase the heart output without affecting blood pressure, so that the circulatory system's capacity under stress is increased.

accelerator, in the rubber industry, any of numerous chemical substances that cause vulcanization (*q.v.*) of rubber to occur more rapidly or at lower temperatures. Many classes of compounds act as accelerators, the most important being organic materials containing sulfur and nitrogen, especially derivatives of benzothiazole.

The use of alkaline compounds of metals as vulcanization accelerators was cited in the original patent of the vulcanization process, granted to Charles Goodyear in 1844; magnesium oxide, zinc oxide, and basic lead

carbonate were used until early in the 20th century, when the superiority of aniline, an organic compound, was discovered. Despite its toxicity, aniline was used as an accelerator for several years. Thiocarbonyl, less poisonous than aniline, succeeded it as the most important accelerator until it was displaced by mercaptobenzothiazole (MBT) about 1925. Compounds related to MBT have proved especially useful in vulcanizing synthetic rubbers.

During vulcanization the accelerator apparently converts the sulfur into a compound that reacts more rapidly with rubber than does sulfur itself. An alternative possibility is that the accelerator reacts first with the rubber, changing it into a form that combines rapidly with sulfur.

accelerator, particle: *see* particle accelerator.

accelerometer, instrument that measures the rate at which the velocity of an object is changing (*i.e.*, its acceleration). Acceleration cannot be measured directly. An accelerometer, therefore, measures the force exerted by restraints that are placed on a reference mass to hold its position fixed in an accelerating body. Acceleration is computed using the relationship between restraint force and acceleration given by Newton's second law: force = mass x acceleration.

Accelerometer

The output of an accelerometer is usually in the form of either a varying electrical voltage or a displacement of a moving pointer over a fixed scale. The figure shows an accelerometer of the former type, called a spring-mass accelerometer. This device incorporates a mass suspended by four precisely designed and matched springs; movement of the mass is restrained by a damper. The accelerometer housing is solidly attached to the moving object.

As the object accelerates, inertia causes the suspended mass to lag behind as its housing moves ahead (accelerates with the object). The displacement of the suspended mass within its housing is proportional to the acceleration of the object. This displacement is converted to an electrical output by a pointer fixed to the mass moving over the surface of a potentiometer attached to the housing. Since the current supplied to the potentiometer remains constant, the movement of the pointer causes the output voltage to vary directly with the acceleration.

Specially designed accelerometers are used in applications as varied as control of industrial vibration test equipment, detection of earthquakes (seismographs), and input to navigational and inertial guidance systems. The design differences are primarily concerned with the method used to convert acceleration to a proportional electrical voltage. These methods include the direct pressure of a mass on a piezoelectric crystal and the electrically sensed displacement of a damped pendulum.

accent, also called **STRESS**, in music, momentary emphasis on a particular rhythmic

or melodic detail; accent may be implied or specifically indicated, either graphically (for example, >, —) or verbally (*sforzato*, abbreviated *sfz*). In metrically organized music, accents serve to articulate rhythmic groupings, especially in dances where regular accentuation facilitates the patterning of steps. As a rule, the heaviest accent falls on the first beat of the measure (actually it is the accent that determines where the measure begins). In compound metres a lesser accent marks the beginning of the second half of the measure (e.g., the third beat in $\frac{3}{4}$ or the fourth in $\frac{3}{8}$).

Entire measures, also, may be subject to greater or lesser accentuation, which contributes vitally to meaningful phrasing, especially in periodically structured music. Dynamic accents, realized through a temporary increase in sonorous volume, are to be distinguished from agogic accents, produced by slight durational extensions. Regular implied accents may be temporarily displaced through the process known as syncopation (*q.v.*). In a typical instance, the accent on the first beat will be suppressed by a quarter rest followed by a half note (in $\frac{4}{4}$). Or, instead of being replaced by a rest, the first beat may be tied across the bar line to the last note of the preceding measure.

accent, in phonetics, that property of a syllable which makes it stand out in an utterance relative to its neighbouring syllables. The emphasis on the accented syllable relative to the unaccented syllables may be realized through greater length, higher or lower pitch, a changing pitch contour, greater loudness, or a combination of these characteristics.

Accent has various domains: the word, the phrase, and the sentence. Word accent (also called word stress, or lexical stress) is part of the characteristic way in which a language is pronounced. Given a particular language system, word accent may be fixed, or predictable (e.g., in French, where it occurs regularly at the end of words, or in Czech, where it occurs initially), or it may be movable, as in English, which then leaves accent free to function to distinguish one word from another that is identical segmentally (e.g., the noun permit versus the verb permit). Similarly, accent can be used at the phrasal level to distinguish sequences identical at the segmental level (e.g., "light housekeeping" versus "lighthouse keeping," or "blackboard" versus "black board"). Finally, accent may be used at the sentence level to draw attention to one part of the sentence rather than another (e.g., "What did you sign?" "I signed a contract to do some light housekeeping." versus "Who signed a contract?" "I signed a contract to do some light housekeeping.").

accantor, any of the 12 species of the bird genus *Prunella*, constituting the Old World family Prunellidae (order Passeriformes). They have thrushlike bills and rounded wings, and they frequently hop or move with a peculiar motion that has given them another name, shufflingwing.

Accantors breed chiefly in mountains but winter at lower elevations. A widespread lowland species is the dunnock, or hedge sparrow (*P. modularis*), which nests in hedges and shrubby evergreens. A typical member is the alpine accantor (*P. collaris*), of northwestern Africa and from Spain to Japan; 18 centimetres (7 inches) long and mostly brown, it has reddish-spotted flanks and a heavily stippled throat (sexes alike). In courtship the male warbles from a station near the ground or may ascend, larklike.

acceptance, short-term credit instrument consisting of a written order requiring a buyer to pay a specified sum at a given date to the

seller, signed by the buyer as an indication of his intention to honour his obligation. Acceptances are used in financing export and import operations and in some domestic transactions involving staple commodities.

An exporter of goods, for example, may send such an order to pay to the buyer, who signs it to indicate his acceptance of the obligation and returns it to the exporter. The exporter can then obtain his payment promptly by selling the bill (or acceptance) to his bank at a discount. The buyer has obtained time (until the bill's maturity date) to dispose of the goods and obtain the funds to meet his obligation.

This is known as a self-liquidating transaction, and this characteristic has given trade acceptances excellent credit standing (with consequent widespread use) in many countries. The acceptance market therefore provides investors with a means of employing temporarily excess funds for short periods of time with a minimum of risk.

If a bill of exchange is accepted by the buyer of the goods, it is known as a trade acceptance. If the bill is drawn against and accepted by a bank (commonly done when the buyer is not a widely known firm), it is called a banker's acceptance.

Accesi, Compagnia degli, company that performed commedia dell'arte (improved popular Italian comedy) in the early 1600s. The name means "the stimulated." Leadership was provided by Tristano Martinelli (famous for his portrayal of Arlecchino, the mischievous servant) and Pier Maria Cecchini (known as the leading interpreter of the character Fritellino, as well as the author of valuable texts on the proper performance of commedia dell'arte).

The Accesi joined for a time with the Fedeli, another great Italian company under the direction of Giovambattista Andreini, but the wives of Cecchini and Andreini quarrelled, and the companies separated. The Accesi was one of the commedia troupes that became popular with European royalty and was known as the troupe of the duke of Mantua. The company was well received in the Habsburg empire at both Linz and Vienna and appeared several times in France, playing in Fontainebleau and such locations as the Hôtel de Bourgogne.

accessory, in law, a person who becomes equally guilty in the crime of another by knowingly and voluntarily aiding the criminal prior to or after the crime. An accessory is one kind of accomplice (*q.v.*), the other being an abettor, who aids the criminal during the act itself.

accessory mineral, any mineral in an igneous rock not essential to the naming of the rock. When it is present in small amounts, as is common, it is called a minor accessory. If the amount is greater or is of special significance, the mineral is called a varietal, or characterizing, accessory and may give a varietal name to the rock (e.g., the mineral biotite in biotite granite). Accessory minerals characteristically are formed during the solidification of the rocks from the magma; in contrast are secondary minerals, which form at a later time through processes such as weathering by hydrothermal alteration. Common minor accessory minerals include topaz, zircon, corundum, fluorite, garnet, monazite, rutile, magnetite, ilmenite, allanite, and tourmaline. Typical varietal accessories include biotite, muscovite, amphibole, pyroxene, and olivine.

acciaccatura, in music, ornamental note sometimes confused with appoggiatura (*q.v.*).

Acciaiuoli, Niccolò (b. Sept. 12, 1310, Montegufoni, near Florence—d. Nov. 8, 1365, Naples), statesman, soldier, and grand seneschal of Naples who enjoyed a predominant position in the Neapolitan court.

Of a prominent and wealthy Florentine family, Acciaiuoli went to Naples in 1331 to direct the family's banking interests. In 1335 King Robert made him a knight, entrusted him with the care of his nephew Louis of Taranto, and bestowed upon him a series of fiefs in Apulia and in Greece.

After playing a major role in arranging the marriage between Louis of Taranto and Queen Joan I of Naples in 1347, Acciaiuoli became one of the most powerful men in the kingdom, being named grand seneschal in 1348. He defended Louis and Joan against the attack of Louis I of Hungary, who was seeking revenge for the assassination of his brother Andrew, Joan's first husband. Acciaiuoli finally regained the kingdom, having Louis of Taranto crowned king (May 27, 1352).

Acciaiuoli then led the conquest of almost all of Sicily (1356–57), put down a barons' revolt, and conquered Messina, for which he was created count of Malta and Gozo. In 1358 he defended Achaia, which was menaced by the Turks and the Catalans, and for this he was created lord of Corinth. He later consolidated his power in Messina, but following Louis of Taranto's death (1362), he returned to Naples in 1364 to defend Joan against another baronial revolt.

accidence: see inflection.

accidental, in music, sign placed immediately to the left of a note to show that the note must be changed in pitch. A sharp (#) raises a note by a semitone; a flat (b) lowers it by a semitone; a natural (♮) restores it to the original pitch. Double sharps (×) and double flats (bb) indicate that the note is raised or lowered by two semitones. A single natural cancels a double sharp or flat; a natural next to a sharp or flat (as ♮#) cancels half of a double sharp or flat. Sharps or flats that are placed at the beginning of a musical staff indicate the tonality, or key, of the music and are not considered accidentals.

Accidentals were first applied to the note B, by about the 10th century. To fulfill certain theoretical and aesthetic rules, B was sometimes flattened and, later, F was sometimes sharpened. At first there was no sign for a natural; a sharp (written # or ♯) cancelled a flat, a flat cancelled a sharp. By the late Renaissance, Eb, Ab, and C# were fairly common. Accidentals applied to all notes became increasingly common in music of subsequent periods.

accipiter, any bird of the genus *Accipiter*, largest genus of the birds of prey, consisting of about 50 species of falconiform birds, or "bird" hawks, of the family Accipitridae. Sometimes accipiters are referred to as the "true" hawks. They have broad, short wings and comparatively long legs and tail. They range in size from the little sparrowhawk

Sharp-shinned hawk (*Accipiter striatus*)
Albert E. Gilbert

(*A. minullus*) of Africa, slightly larger than a thrush, to the northern goshawk (*A. gentilis*), about 60 centimetres (2 feet) long.

Accipiters occur in forested areas throughout the world. They build soft-lined nests of sticks in tall trees. The three to five brown-blotched white eggs are incubated for four to five weeks by the female. The young fledge after five or six weeks. See also hawk; goshawk; sparrowhawk.

Accius, Lucius, Accius also spelled **ATTIUS** (b. 170 BC, Pisaurum, Umbria, Italy?—d. c. 86 BC), one of the greatest of the Roman tragic poets, in the view of his contemporaries. His plays (more than 40 titles are known, and about 700 lines survive) were mostly free translations from Greek tragedy, many from Euripides, with violent plots, flamboyant characterizations, and forceful rhetoric. His tragedies were performed until the end of the republic (c. 30 BC). Their themes were those of classical legend, particularly the Troy cycle, but Accius also composed two historical plays, *Decius* and *Brutus*, based on Roman history.

He also wrote several treatises: the *Didascalica*, a work on the history of Greek and Latin poetry; and *Annales*, which seems to deal with the calendar. Gellius, Varro, and other later grammarians refer to his observations on grammar and orthography. Cicero records having met Accius in his youth and having seen his plays. He quoted with admiration the famous line from Accius' *Atreus*, "*Oderint, dum metuant!*" ("Let them hate so long as they fear"), a motto that is said to have appealed to the tyrant Caligula.

acclimatization, any of the numerous gradual, long-term responses of an organism to changes in its environment. Such responses are more or less habitual and reversible should environmental conditions revert to an earlier state.

The numerous sudden changes that evoke rapid and short-term responses via the nervous and hormonal systems are not examples of acclimatization. An individual organism can regulate its internal processes rapidly to sustain itself within the usual range of environmental changes that it encounters hourly or daily. But this rapid regulation, or homeostasis, is limited in its operation to a small range of environmental variations. Homeostatic regulation usually cannot meet effectively large environmental changes such as those that would allow a plant or animal living in the warmth of summer to function in the cold of winter. As summer wanes, organisms change their substance and their habits in seeming anticipation of the coming winter. This gradual adjustment to conditions is acclimatization.

In contrast to changes that occur during growth and development, acclimatization, as defined above, refers to an adaptive change that is reversible when conditions return to their former condition. Acclimatization does not leave a lasting impression upon the genetic mechanisms of the acclimatized organism. The adaptation of populations to change that effects evolution by the selection of genetic capability is a different process from the acclimatization of an individual.

In dealing with acclimatization, the influence of climate upon life can be treated under headings of adjustments to temperature, humidity, salinity, light, pressure, and certain chemical substances in the environment. Because organisms do not have unlimited combinations of adaptations, they may use a similar process to adapt to changes of different origins. For example, in acclimatization to the low pressure of oxygen (hypoxia) in high mountains, animals, including man, improve the capacity of blood to transport oxygen by increasing the number of red blood cells (polycythemia); in the chronic disease emphysema, the inadequate supply of oxygen to the lungs is to

some degree compensated for by a similar polycythemia.

Because animals and plants can be successfully introduced to new regions, it can be said that species do not necessarily thrive at their best potential in their native regions. Thus acclimatization does not invariably mean that a plant or animal is adapted to function at its maximum rate. In the hot summer, acclimatized birds and mammals often rest in the shade, and in winter cold some animals and all plants become dormant. At extreme limits an organism may suffer some impairment of vigour, but it survives; if the impairment is overt, acclimatization is considered inadequate.

Although acclimatization commonly requires modification of activity, the adaptive changes permit an organism to exploit regions of great seasonal variation and, on occasion, to move in wholly new environments. Only the individuals that acclimatize can survive to produce progeny from which a new population may become established. Ability to become acclimatized differs greatly among species of plants and animals. Some breeds of domesticated animals and cultivated plants are quite versatile in this ability, whereas others are narrowly restricted.

An interesting characteristic of seasonal acclimatization appears in animals and plants that become adjusted to cold beyond that which they are likely to encounter. Not only does acclimatization prepare them with a margin of safety but some microorganisms, insects, and plants tolerate experimental exposure at temperatures far colder or warmer than ever occur in nature. It seems strange that adaptability enables these organisms to be prepared to encounter conditions beyond their natural experience.

Another surprising characteristic of acclimatization is its anticipatory nature—it can develop before the change occurs. It would seem that anticipation of the need for change would be required in order to make the slow physiological preparations for climatic changes that often set in very suddenly. Anticipation of acclimatization seems to require a sense of time by which the coming environmental conditions can be predicted. Length of day is one external signal, but it seems to impinge upon intrinsic rhythms that provide clues from within as to the passage of time.

Although acclimatization refers basically to adaptation to climate, the term can also be used to describe the adjustments that a person makes to urban, social, or political conditions or the adaptation of a population of plants to conditions of cultivation or of an animal to the unnatural conditions of captivity. Adaptations to strange or artificial conditions, however, are often difficult to describe, and only in a few cases can such adaptations be compared with acclimatization.

accompaniment, in music, auxiliary part or parts of a composition designed to support the principal part or to throw it into relief. In secular medieval music and in much folk and non-European music, instrumental accompaniments for singers consist of unison or octave duplications of the melody (sometimes with slight differences, creating heterophony, the simultaneous performance of variant versions of the same melody), of novel rhythmic features, or of a drone (sustained note or notes) played on wind or stringed instruments. In 16th-century European music, solo songs were sung with simple lute accompaniments, both chordal and contrapuntal (using interwoven melodic lines); notable examples include the songs of the English composer John Dowland and the French *airs de cour* (courtly songs or airs).

The beginning of the 17th century saw the introduction of the thorough bass, or basso continuo, a type of harmonic accompaniment

improvised at the harpsichord or organ and based on chords that the composer indicated by figures. By the 18th century, thorough bass accompaniments designed to support either a soloist, as in the sonatas and solo cantatas of J.S. Bach, or an instrumental ensemble, as in the operas of the Italian composer Alessandro Scarlatti, demanded from the performer a high degree of ornamental and contrapuntal invention. The accompaniment thus assumed a role as important as that of the soloist.

The term obligato accompaniment came to be applied to accompaniments of this type, as opposed to ad libitum accompaniment, the unessential ornamentation or the optional reduplication of a part, performed on a secondary instrument. Obligato accompaniments were sometimes written out, among them one originally improvised by Bach for a movement of his *Sonata in B Minor* for flute and harpsichord. In the second half of the 18th century the obligato accompaniment assumed a primary role, gaining increased complexity and musical substance while the solo instrument was reduced to the role of an ad libitum accompaniment. Thus, Mozart followed the example of a contemporary composer, Johann Schobert, in writing four sonatas for harpsichord accompanied by the violin.

The influence of the obligato style of the late 18th century is suggested in Beethoven's statement "I came into the world with obligato accompaniment." Obligato style persisted into the 19th century in both solo and concerted works of the Romantic composers, in which accompaniments became even more elaborate and expressive. The expressive resources of the piano allowed the accompaniments of Schubert to illustrate pictorial or psychological aspects of the texts of his lieder ("songs"). His example was followed in the lieder of Schumann, Brahms, and Hugo Wolf. Piano accompaniments in works for string or wind instruments acquired the status of a concerted part. Orchestral accompaniment was greatly developed in the Romantic concerto and in songs and song cycles with orchestra by numerous composers from Hector Berlioz (1803–69) to Alban Berg (1885–1935) and Benjamin Britten (1913–76).

The art of piano accompaniment flourished chiefly in response to the demands in the 19th century of the German lied and the French *mélodie*. Qualities of poetic and musical insight and also of ensemble playing distinguish the piano accompanist's art, which resembles the art of performance in chamber music. In the 20th century, accompanists such as the English pianist Gerald Moore and the Dutch pianist Coenraad Valentyn Bos developed the art by their sensitive attitude to the soloist and by their power to interpret the composer's intention. Both Moore and Bos have written valuable books on the art of accompaniment.

accomplice, in law, a person who becomes equally guilty in the crime of another by knowingly and voluntarily aiding the other to commit the offense. An accomplice is either an accessory or an abettor. The accessory aids a criminal prior to his crime, whereas the abettor aids him during the act itself.

An abettor is one who is present actually or constructively at the commission of a crime and incites, encourages, or assists the offender in his act. One may assist the offender by failing to try to prevent the offense, when a duty to act is imposed by law.

An accessory is one who is not present during the commission of the offense but who assists, procures, encourages, or counsels the offender prior to the crime. In most jurisdictions the accessory must perform an act of assistance, and there must be evidence that he intended

to facilitate the crime. Thus, the owner of a sporting-goods store will not be guilty of murder if he sells a rifle to one who subsequently commits murder with it.

The terms accessory and abettor derive from the English common law, which distinguished between accomplices and principals in assessing guilt for crime. Modern statutes abolish these differences and consider all accomplices as principals. It is no longer necessary to prove which kind of an accomplice a person is or to find the principal guilty before the accomplice can be convicted. Once a crime has been committed and a party is shown to have contributed to its commission, he may be punished as a principal.

An accessory after the fact is often not considered an accomplice but is treated as a separate offender. Such an offender is one who harbours, protects, or assists a person who has already committed an offense or is charged with committing an offense. Usually the offense must be a felony. Punishment for an accessory after the fact is universally less than that for the principal offender, except in cases of sedition or treason. *See also* solicitation.

accordion, free-reed portable musical instrument, consisting of a treble casing with external piano-style keys or buttons and a bass casing (usually with buttons) attached to opposite sides of a hand-operated bellows.

The advent of the accordion is the subject of debate among researchers. Many credit C. Friedrich L. Buschmann, whose *Handäoline* was patented in Berlin in 1822, as the inventor of the accordion, while others give the distinction to Cyril Demian of Vienna, who patented

Italian accordion, 19th century
Richard Saunders—Scope Associates, Inc.

his *Accordion* in 1829, thus coining the name. A modification of the *Handäoline*, Demian's invention comprised a small manual bellows and five keys, although, as Demian noted in a description of the instrument, extra keys could be incorporated into the design. Numerous variations of the device soon followed.

Within the treble and bass casings of an accordion are the free reeds, small metal tongues arranged in rows alongside pallets (valves) that are cut into metal frames. When air flows around a reed from one side, it vibrates above its frame; airflow in the opposite direction does not cause vibration. Wind is admitted to the reeds selectively through pallets controlled by a keyboard or set of finger buttons. Each pallet admits wind to a pair of reeds, one of which is mounted to sound on the press of the bellows, the other, on the draw.

Some accordions, including the earliest ones, are "single-action," in which the paired reeds sound adjacent notes of the diatonic (seven-note) scale, so that a button will give, for instance, G on the press and A on the draw. With a single-action accordion, 10 buttons suffice for a range of more than two octaves. For the left hand there are typically two keys, or basses, one providing a bass note, the other a major chord. The single action was early developed, chiefly in Austria and Switzerland, by adding a second row of treble buttons giving the F scale (the first-row scale being C).

Various models add rows of buttons for the playing of semitones and additional bass notes and chords.

In "double-action" accordions, the two reeds of each pair are tuned to the same note, thus making each treble or bass note available from the same key or button with both directions of bellows movement. Among these instruments is the piano accordion, with a piano-style keyboard for the right hand. Its invention in the mid-19th century is credited either to the manufacturer Busson or to M. Bouton, both of France.

Couplers, or "registers," in some double-action instruments activate extra sets of reeds, one pitched an octave below the main set and another off-tuned from the main set to give a tremulant through "beating" (sound-wave interference). Other registers may include a high-octave set of reeds and a second tremulant. Accordions often encompass ranges of seven or eight octaves.

The left-hand provision may also be extended, with more than 120 basses actuated by six or seven rows of buttons. Most of the rows in traditional "fixed-bass," or Stradella, models give three-note chords—major and minor triads and dominant and diminished sevenths—while "free-bass" accordions overcome melodic restrictions by providing extra buttons or a converter switch for bass melodies and counterpoint. Many accordions include up to five registers for the basses, allowing each bass note to sound over as many as five octaves and each chord to sound in three.

Accordions are played both as concert and folk instruments. A variant of both the accordion and the concertina is the bandonion, a single- or double-action instrument with square shape and finger buttons, invented by Heinrich Band of Krefeld, Ger., in the mid-1840s. Along with the piano accordion, it is a leading solo instrument in Argentine tango orchestras. For precursors of the free-reed instruments, *see* sheng; for other types, *see* concertina; harmonica; harmonium.

Accorso, Francisco (legal scholar): *see* Accursius, Franciscus.

account payable, any amount owed by a company as the result of a purchase of goods or services from another company on a credit basis. Under a trade-credit arrangement, the purchasing company, after placing its order with the seller, receives the goods and an invoice denoting the price of the goods and the terms for payment. The purchasing firm does not send a trade acceptance or promissory note for payment but enters the amount owed as a current liability in its accounts.

Companies incur this type of short-term debt primarily to finance their inventories; if inventory turnover is rapid within an industry, a company may be expected to have large accounts payable. Within any given industry, smaller companies are more likely to make use of this type of trade credit because they are less able to pay cash and take advantage of discounts than larger companies and have fewer sources of credit open to them.

Accounts payable are a customary means of conducting domestic trade in the United States. In international trade and in the domestic trade of many European countries, the use of the acceptance and promissory note is common. *Compare* account receivable.

account receivable, any amount owed to a business by a customer as a result of a purchase of goods or services from it on a credit basis. The company making the sale does not receive an acceptance or promissory note (*i.e.*, written orders or promises to pay) from the purchaser but merely enters the amount due as a current asset in its books. Accounts receivable constitute a major portion of the assets of many companies and tend to vary directly with sales.

Accounts receivable may be sold to finance companies or pledged as collateral to obtain loans from commercial banks or finance companies. This kind of financing differs from factoring (*q.v.*) in that the company's customers are not notified that their accounts have been sold or pledged as collateral, and the company remains responsible for credit losses. This type of financing is frequently employed by smaller companies that cannot obtain additional credit from commercial banks and have no other highly liquid assets to offer as security.

Although it offers a flexible source of credit, varying with the volume of sales, accounts-receivable financing is considered a relatively expensive form of borrowing. *Compare* account payable.

accounting, the systematic development and analysis of information about the economic affairs of an organization. Every business and many organizations that are not businesses, up to and including nations, are continually engaged in transactions involving money or goods or both. Interested and responsible parties must have access to the information necessary for assessing the organization's economic status and performance.

A brief treatment of accounting follows. For full treatment, *see* MACROPAEDIA: Accounting.

The actual recording and summarizing of financial transactions in accordance with well-established procedures is known as bookkeeping (*q.v.*). When the data thus produced are abstracted in reports (typically produced on a quarterly or an annual basis) published for the use of persons outside the organization—stockholders, creditors, brokers, government officials, and others—the process is called financial accounting. The process of producing reports (typically on a monthly basis) for the use of the management of the organization in planning and monitoring activities is called managerial accounting. Accounting systems also serve to produce the internal financial documents needed in the ordinary course of operations, to institute systems of internal controls for the protection of the organization's assets, and to provide data needed for tax returns and other legally required reporting.

Three periodic reports are typically generated in financial accounting: (1) the balance sheet, which summarizes, as of a specified date, the assets or resources controlled by the firm, the liabilities of the firm to creditors, and the owners' equity, that is, the funds provided by the owners (usually in exchange for shares of capital stock) plus the sum of earnings retained by the organization, (2) the income statement, which reports the gross proceeds of the organization's operations for a specified period, the expenses incurred in those operations, and the net proceeds, and (3) the statement of cash flow, which analyzes the flow of cash into and out of the organization during the period.

Many conventions and practical guidelines govern the difficult questions of measuring assets, distributing the costs of assets over time (a process known as amortization, or depreciation), measuring income, matching expenses to corresponding revenues, and adjusting costs for changes in the purchasing power of money. The reports prepared for an organization by its accountant ordinarily are reviewed by outside auditors for completeness, accuracy, and adherence to conventional practices; these auditors are independent accountants who in the United States bear the title of certified public accountant (CPA) and in Great Britain are known as chartered accountants.

Managerial accounting aims to provide management with reliable and timely information on the various costs of operations and on standards with which those costs can be compared, to assist in the development of

budgetary plans and in the measurement of performance against those plans, and to analyze the results of operations (in businesses, profits). The forecasts of cash requirements for given kinds and levels of operations that are provided by accountants to managers are essential to assure that the organization will remain liquid—able to meet its obligations as they fall due—while quantified profit plans form an integral part of any rational business strategy.

accounting machine, also called **BOOKKEEPING MACHINE**, office machine capable of performing normal bookkeeping functions, such as tabulating in vertical columns, performing arithmetic functions, and typing horizontal rows. The billing machine is a class of accounting machine designed to typewrite names, addresses, and descriptions, to multiply and extend, to compute discounts, and to add net total, posting the requisite data to the proper accounts, and so to prepare a customer's bill automatically once the operator has entered the necessary information.

Early accounting machines were marvels of mechanical complexity, often combining a typewriter and various kinds of calculator elements. The refinements in speed and capacity made possible by advances in electronics technology quickly reduced the size, noise, and operating complexity of these machines. Many of the newer "generations" of accounting machines are operated by a computer to which they are permanently connected.

Accra, capital and largest city of Ghana, on the Gulf of Guinea (Atlantic Ocean). The city lies partly on a cliff, 25 to 40 feet (8 to 12 m) high, and spreads northward over the undulating Accra plains. The area's susceptibility to faulting is the cause of occasional earthquakes.

When the Portuguese first settled on the coast of what is now Ghana in 1482, the present site of Accra was occupied by several villages of the Ga tribe, ruled from a parent settlement, Ayaso (Ayawaso), located about 15 miles (24 km) north. Between 1650 and 1680 the Europeans built three fortified trading posts—Fort James (English), Fort Crevecoeur (Dutch), and Christiansborg Castle (Danish)—along the coast in the locality. While these European posts were being constructed, Ayaso was destroyed in a tribal war, and its population, together with that of the other major Ga towns on the Accra plains, was drawn to the coast by the prospect of profitable trade with the Europeans. As a result, three coastal villages—Osua (Christiansborg), Dutch Accra (later called Ussher Town), and James Town—sprang up, becoming the nuclei of what was to be Accra. The name Accra itself is a corruption of the Akan word *nkran*. It refers to the black ants that abound in the vicinity. It came to be applied to the inhabitants of this part of the Accra plains.

Accra grew into a prosperous trading centre. The Danes and the Dutch left the region in 1850 and 1872, respectively, and in 1877 Accra became the capital of the British Gold Coast colony. In 1898 a municipal council was formed to improve the town. By the 1930s Accra was systematically laid out.

Accra is the administrative, economic, and educational centre of Ghana. The city contains the head offices of all of the large banks and trading firms, the insurance agencies, the electricity corporation, the general post office, the large open markets to which most of the food supply comes, and the Accra Central Library.

In addition to the forts, important buildings include the Korle Bu General Hospital, which also houses the Ghana Medical School; the Holy Spirit (Roman Catholic), Holy Trinity (Anglican), and Methodist cathedrals; the national archives; and the national museum. Also located in the city are the offices of the

Council for Scientific and Industrial Research and the Ghana Academy of Arts and Sciences. The University of Ghana (1948) is located at Legon, to the north. In addition, there is a football stadium and a race course in the city. Independence Arch, in Black Star Square, is used for ceremonial parades.

Accra has well-paved roads and a good municipal bus service. A transportation hub, the city is also connected by rail to Kumasi, in the interior, and to the port city of Tema, 17 miles (27 km) to the east, which has taken over Accra's port function. Accra is the site of Kotoka International Airport. The city's chief manufactures are processed food, lumber, and textiles. Pop. (2003 est.) 1,847,432.

acculturation, the processes of change in artifacts, customs, and beliefs that result from the contact of societies with different cultural traditions. The term is also used to refer to the results of such changes.

Two major types of acculturation may be distinguished based on two classes of conditions under which changes take place. A free "borrowing" and modification of cultural elements may occur when people of different cultures maintain an interchange without the exercise of military or political domination of one group by another. These new elements may be integrated into the existing culture in a process called incorporation. The unconquered Navajo Indians, in frequent and varied contact with Spanish colonists in the 18th century, selected elements of Spanish culture such as clothing and metalworking techniques that were integrated into their own culture in their own way.

Directed change, the second type of acculturation, takes place when one people establishes dominance over another through military conquest or political control. Directed change characterized the Roman conquest of the Mediterranean region and western Europe, the American conquest of the North American Indians, the European domination of Africa, and many other political expansions.

Directed culture change, like incorporation, involves selection and modification, but the processes are more varied and the results more complex because they result from the interference in one cultural system by members of another. The processes that operate under conditions of directed change include assimilation, the almost complete replacement of one culture by another; cultural fusion, a new synthesis of cultural elements differing from both precontact cultures; and reaction against aspects of the dominant culture.

Accursius, Franciscus (Latin), Italian FRANCESCO ACCORSO (b. c. 1182, Bagnolo, Tuscany [Italy]—d. c. 1260, Bologna), Italian legal scholar and leading jurist of the 13th century who was responsible for the renovation of Roman law. He was the last of a series of legal glossators (annotators) of Justinian's compilation of Roman law.

A professor at the University of Bologna, Accursius had access to the many legal works of the Romans that had been brought from Ravenna in the 11th century, when the institution at Bologna was first established as a law school. This circumstance enabled Accursius to compile the authoritative *Glossa ordinaria*, also called the *Glossa magna* (the "Great Gloss"; 1220–50), which so far surpassed the glosses of earlier scholars that those works were rendered obsolete. For the next 500 years the *Glossa* of Accursius remained an indispensable complement to the texts of Roman law. His work made Roman law a popular course of study during the Renaissance period. Accursius' interpretations of Roman law also influenced the development of later European legal codes, among them the Code Napoléon, or French Civil Code, enacted in the early 19th century.

accused, rights of, in law, the rights and privileges of a person accused of a crime, guaranteeing him a fair trial. These rights were initially (generally from the 18th century on) confined primarily to the actual trial itself, but in the second half of the 20th century many countries began to extend them to the periods before and after the trial.

All legal systems provide, at least on paper, guarantees that insure certain basic rights of the accused. These include right to trial by jury (unless jury trial is waived), to representation by counsel (at least when he is accused of a serious crime), to present witnesses and evidence that will enable him to prove his innocence, and to confront (*i.e.*, cross-examine) his accusers, as well as freedom from unreasonable searches and seizures and freedom from double jeopardy.

Certain very general rights are attached to the process. An accused person must not be allowed to languish indefinitely in jail but must be given a speedy trial. Involved with this issue are the rights to a reasonable bail and prohibitions against being detained for more than a specified time without bail.

The most important right has been the right to be represented by counsel. During the second half of the 20th century this right was extended to cover the time when a person is arrested until final appeal. Different countries set different times at which an accused must be provided with counsel as well as different types of crimes for which counsel must be provided if the accused is indigent. The United States has made the most far-reaching changes in this area and has set a pattern that other nations have begun to emulate. Essentially, the U.S. system stipulates that the accused has the right to counsel from the time that he is taken into custody until all appeal is exhausted. The Supreme Court has ruled, moreover, that where the accused is indigent, the right to counsel must be implemented by the provision of a court-appointed lawyer in the case of all crimes for which punishment may be imprisonment. The Court established an indigent defendant's right to counsel in the cases *Powell v. Alabama* (1932) and *Gideon v. Wainwright* (1963). The Supreme Court also decided that at the time of his arrest the accused must be notified of both this right to counsel and the right not to answer any questions that might produce evidence against him (*see* *Miranda v. Arizona*). Both rights were introduced to prevent the police from extracting involuntary confessions to be used as evidence in court.

In civil-law countries such as France and Germany, there is less emphasis on the importance of the confession as evidence. It is considered merely as one piece of evidence. Because confessions are not as important, rights to counsel and to remain silent are less clearly defined. As a result, particularly in France, certain abuses have existed during the period of interrogation.

Other important rights guaranteed to the accused are those that protect him from illegally gathered evidence, be it from search and seizure or electronic eavesdropping (*qq.v.*). Also important are the rights to appeal, which vary from country to country (*see* appeal).

Aceh, also spelled **ACHEH**, **ACHIN**, or **ATJEHIN**, in full **NANGGROE ACEH DARUSSALAM**, English **STATE OF ACEH**, **ABODE OF PEACE**, semi-autonomous province of Indonesia, forming the northern extremity of the island of Sumatra. Aceh is bounded by the Indian Ocean (west and north), the Strait of Malacca (east), and Sumatera Utara (North Sumatra) province (southeast). The capital is Banda Aceh.

Pole, a Buddhist state (fl. c. AD 500) in northern Sumatra, was visited by Arab, Indian, and Chinese merchants and pilgrims. In the 13th

century Aceh became the first Muslim stronghold in the Indonesian archipelago. It was later visited by English explorers (1591) and by the Dutch. Its power reached its height in the time of Sultan Iskandar Muda (1607–36), when there were frequent wars with the Portuguese at Malacca; a Portuguese fleet was defeated at Bintan in 1614. The Dutch (1599) and the English (1602) tried unsuccessfully to establish trading settlements in Aceh. After a short-lived alliance (1641) with the Dutch, the sultanate of Aceh declined in influence.

From 1815 the British tried to keep Dutch influence out of Aceh, and an 1824 treaty stipulated that no hostile actions be undertaken. That reservation was withdrawn in 1873, upon which the Dutch tried to conquer Aceh. More than 25 years of open warfare (the Achinese War) ensued between the Achinese and the Dutch. The Achinese finally surrendered to the Dutch in 1903, but the area was never fully pacified during Dutch colonial rule.

Aceh became an autonomous province in 1949 and amalgamated with Sumatera Utara province in 1950. Under the Indonesian republic the Achinese broke in open rebellion in 1953; the creation of Aceh as a special district, administratively equal with the country's other provinces, in 1956, did not solve the problem. Resistance arose again in the 1970s, which from 1990 led to periods of armed conflict between separatists and Indonesian forces. The Indonesian government granted greater autonomy in 2002, when the present name of the district was adopted. In 2004 a severe earthquake in the Indian Ocean off Aceh triggered a large tsunami that devastated much of the province's western coast and killed tens of thousands of people.

Aceh is largely mountainous; Mount Leuser rises to 11,092 feet (3,381 m) and is the focus of Mount Leuser National Park. Except in the extreme north, there is a fairly wide coastal plain, and the rivers are short and have little value for shipping. The southwestern coast is dotted with swamps. The interior volcanic mountains are covered by temperate and tropical rainforests composed of stemless palm, oak, conifers, and laurel. Mosses and herbaceous plants carpet the ground and the lower trunks of trees.

The Achinese, a Malay people who are devout Muslims, occupy the lowlands and adjoining hills and constitute the great bulk of the population. In the highlands live the Gajo, also Muslims but related to the Batak. Rice is the food staple together with corn (maize), sweet potatoes, yams, and pulses (legumes). Pepper, copra, areca nuts, and rubber are the chief exports. Bauxite and coal are mined. There are some oil fields and increasingly important natural-gas fields on the eastern coast; Lhokseumawe is being developed as a petroleum and liquefied-natural-gas terminal. Industries and crafts produce processed foods, textiles, metalware, gold jewelry and filigree work, wood carvings, and engraved metal products. Principal ports are Uleelheue and Lhokseumawe, but large vessels can use the free port of Sabang on We Island, 50 miles (80 km) north of Uleelheue; all three were heavily damaged by the 2004 tsunami. Banda Aceh, the region's largest city, is on the Aceh River 3 miles (5 km) from the sea and is connected by road with Medan, the capital of Sumatera Utara. Area 20,053 square miles (51,937 square km). Pop. (2000) 3,930,905.

Aceraceae, the maple family of flowering plants, in the order Sapindales, comprising about 200 species of trees and shrubs in two genera, *Dipteronia* (two species) of central and southern China, and *Acer*, the maples, widely distributed in the Northern Hemisphere, crossing the Equator only in Malaysia.

Hedge maple (*Acer campestre*)

A to Z Botanical Collection—EB Inc

In *Dipteronia* the seed is surrounded by a wing; in *Acer* it is winged only on the back. Leaves of maples are opposite, simple, or compound (divided into separate leaflets) and usually toothed or lobed. The small, clustered flowers are mostly unisexual and are sometimes without petals. The fruit, a samara (a winged nutlet), splits into two (rarely three) winged, one-seeded parts. Many maples are cultivated for ornament and shade. Maples have a watery, sweet sap that in some species, especially sugar maple (*A. saccharum*), is used

Bigleaf maple (*Acer macrophyllum*)

R.F. Thorne

to make syrup and sugar. Certain species of *Acer* are also important timber trees. *See also* box elder; maple.

Acernus (poet): *see* Klonowic, Sebastian (Fabian).

acerola: *see* Barbados cherry.

acervulus, an open, saucer-shaped asexual fruiting body found in fungi (division Mycota). Always developed below the epidermis of the host tissue, it bears conidiophores (specialized filaments, or hyphae) that form conidia (spores).

Acestes, in Greek mythology, legendary king of Segesta (Greek Egesta) in Sicily. His mother, Egesta, had been sent from Troy by her parents to save her from being devoured by a sea serpent. Going to Sicily she met the river god Crimisus, by whom she became the mother of Acestes.

Acestes appears notably in the *Aeneid*, offering hospitality to Aeneas when he lands in Sicily. Acestes' function is to emphasize the mythological connection of Sicily with Troy; in Greek legend Aeneas, whose descendants founded Rome, traveled no farther than Sicily. In the *Aeneid* Acestes brings the funeral games of Anchises, Aeneas' father, to a climax by shooting into the air an arrow that becomes a comet, a sign of Anchises' eternal life.

Acetabularia, genus of one-celled, umbrella-like green algae found in subtropical seas and sometimes called the "mermaid's wine glass." At the top of the tall, slender stalk, 0.5 to

10 cm (0.2 to 3.9 inches) long, is a ring of branches that may fuse to form a cap. Near the base of its stalk, *Acetabularia* has a large nucleus that divides many times when the alga

Acetabularia from Cholla Bay, Mex.

Robert W. Hoshaw—EB Inc

matures and reproductive structures form; streaming cytoplasm carries the daughter nuclei to the saclike sporangium or umbrella lobe. Because part of one species can be grafted onto another, *Acetabularia* has been used to study the genetic control of growth and development.

acetaldehyde, also called ETHANAL (CH_3CHO), an aldehyde used as a starting material in the synthesis of acetic acid, *n*-butyl alcohol, ethyl acetate, and other chemical compounds. It is manufactured by the oxidation of ethyl alcohol and by the hydration of acetylene. Pure acetaldehyde is a colourless, flammable liquid with pungent, fruity odour; it boils at 20.8° C.

acetaminophen, drug used in the treatment of mild pain, such as headache and pain in joints and muscles, and to reduce fever. It is formed in the body as a metabolite of acetanilid or phenacetin (once commonly used drugs) and is responsible for their analgesic effects. Acetaminophen relieves pain by raising the body's pain threshold, and it reduces fever by its action on the temperature-regulating centre of the brain. The drug inhibits prostaglandin synthesis in the central nervous system, but it lacks an anti-inflammatory effect in peripheral nerves. Acetaminophen is much less likely to cause gastrointestinal side effects than aspirin, but overdoses of it can cause fatal liver damage. For prolonged use, aspirin is considered safer. The drug is marketed under several trade names, including Tylenol and Tempra.

acetanilide, synthetic organic compound introduced in therapy in 1886 as a fever-reducing drug. Its effectiveness in relieving pain was discovered soon thereafter, and it was used as an alternative to aspirin for many years in treating such common complaints as headache, menstrual cramps, and rheumatism. Excessive or prolonged use engenders toxic side effects: it interferes with the function of hemoglobin, the oxygen-carrying pigment of the blood. In the body acetanilide is mostly converted to acetaminophen, which has replaced acetanilide in therapy because it is less likely to induce blood disorders.

acetate (textile): *see* cellulose acetate.

acetic acid, also called ETHANOIC ACID (CH_3COOH), the most important of the carboxylic acids. A dilute solution of acetic acid produced by fermentation and oxidation of natural carbohydrates is called vinegar (*q.v.*); a salt, ester, or acylal of acetic acid is called acetate. Industrially, acetic acid is used in the preparation of metal acetates, used in some printing processes; vinyl acetate, employed in the production of plastics; cellulose acetate, a major ingredient in photographic films and textiles; and volatile organic esters (such as ethyl and butyl acetates), which are widely used as solvents for resins, paints, and lacquers. Biologically, acetic acid is an important metabolic intermediate, and it occurs naturally in body fluids and plant juices.

Besides that produced as vinegar, vast amounts of acetic acid are prepared synthetically. In one common process acetylene is hydrated to acetaldehyde, which is then oxidized to acetic acid. Ethyl alcohol also is converted industrially to acetic acid by oxidation.

Pure acetic acid, often called glacial acetic acid, is a corrosive, colourless liquid (boiling point 117.9° C; melting point 16.6° C), completely miscible with water.

acetoacetic ester: *see* ethyl acetoacetate.

acetone, also called 2-PROPANONE, or DIMETHYL KETONE (CH₃COCH₃), organic solvent of industrial and chemical significance, the simplest and most important of the aliphatic (fat-derived) ketones. Pure acetone is a colourless, somewhat aromatic, flammable, mobile liquid that boils at 56.2° C (133° F).

Acetone is capable of dissolving many fats and resins as well as cellulose ethers, cellulose acetate, nitrocellulose, and other cellulose esters. Because of the latter quality, acetone is used extensively in the manufacture of artificial fibres (such as some rayons) and explosives. It is used as a chemical intermediate in pharmaceuticals and as a solvent for vinyl and acrylic resins, lacquers, alkyd paints, inks, cosmetics (such as nail polish remover), and varnishes. It is used in the preparation of paper coatings, adhesives, and heat-seal coatings and is also employed as a starting material in the synthesis of many compounds.

In the United States, which is the largest producer of industrial acetone, the cumene hydroperoxide process and the dehydrogenation of isopropyl alcohol are the chief processes used in commercial production.

acetophenetidin, also called PHENACETIN, white crystalline compound, an aniline derivative that is used as a mild analgesic. This drug, which has antipyretic (fever-reducing) as well as analgesic (pain-reducing) effects, may be used alone or in combination with aspirin and either caffeine or codeine; such combinations are called APC mixtures. Because of the possible kidney damage that may be caused by high doses and prolonged use of acetophenetidin, aspirin is sometimes used as a substitute, even though the latter may cause some gastrointestinal irritation.

acetophenone (C₆H₅COCH₃), an organic compound used as an ingredient in perfumes and as a chemical intermediate in the manufacture of pharmaceuticals, resins, flavouring agents, and a form of tear gas. It also has been used as a drug to induce sleep.

The compound can be synthesized from benzene and acetyl chloride, but it is prepared commercially by the air oxidation of ethylbenzene.

acetylcholine (ACh), an ester of choline and acetic acid that is the transmitter substance at many neural, or nerve, synapses and at the motor end plate of vertebrate muscles (*see* end-plate potential). When a nerve impulse arrives at the nerve ending, ACh, which is stored there in vesicles, is released and combines with a receptor molecule in the postsynaptic membrane or the end-plate membrane of a muscle fibre. This bonding changes the permeability of the membrane, and a change in the nature of a generator potential results. The effects of successive nerve impulses accumulate if they arrive at a sufficiently high frequency. The ACh is destroyed by an enzyme, acetylcholinesterase, and thus is effective only briefly. Inhibitors of the enzyme, however, prolong the lifetime of ACh itself.

ACh affects a number of body systems including the cardiovascular system by acting as a vasodilator, by decreasing cardiac rate, and by decreasing cardiac contraction; the gastrointestinal system by such activities as increasing peristalsis in the stomach and by increasing the amplitude of digestive contractions; and

the urinary tract by such actions as decreasing the capacity of the bladder and increasing the voluntary voiding pressure. It also affects the respiratory system and stimulates secretion by all glands that receive parasympathetic nerve impulses.

ACh was first isolated around 1914; its functional significance was first established in about 1921 by Otto Loewi, a German physiologist and later (1936) Nobel laureate. Loewi demonstrated that ACh is the substance liberated when the vagus nerve is stimulated, causing slowing of the heartbeat. Subsequently he and others showed that ACh is also liberated as transmitter at the motor end plate of striated (voluntary) muscles of vertebrates, and it has since been identified as transmitter at many neural synapses and in many invertebrate systems as well.

ACh is also known to play an important role in memory and learning and is in abnormally short supply in the brains of those with Alzheimer's disease.

acetylene, also called ETHYNE, the simplest and best-known member of the hydrocarbon series containing one or more pairs of carbon atoms linked by triple bonds, called the acetylenic series, or alkynes. It is a colourless, inflammable gas widely used as a fuel in oxyacetylene welding and cutting of metals and as raw material in the synthesis of many organic chemicals and plastics.

Pure acetylene is a colourless gas with a pleasant odour; as prepared from calcium carbide it usually contains traces of phosphine that cause an unpleasant garliclike odour. Acetylene can be decomposed to its elements with the liberation of heat. The decomposition may or may not give rise to explosions, depending on conditions. Pure acetylene under pressure in excess of about 15 pounds per square inch or in liquid or solid form explodes with extreme violence.

Mixtures of air and acetylene are explosive over a wide range, from about 2.5 percent air in acetylene to about 12.5 percent acetylene in air. When burned with the correct amount of air, acetylene gives a pure, white light, and for this reason it was at one time used for illumination in locations where electric power was not available, *e.g.*, buoys, miners' lamps, and road signals. The combustion of acetylene produces a large amount of heat, and, in a properly designed torch, the oxyacetylene flame attains the highest flame temperature (about 6,000° F, or 3,300° C) of any known mixture of combustible gases.

The hydrogen atoms in acetylene can be replaced by metallic elements to form acetylides—*e.g.*, acetylides of silver, copper, or sodium. The acetylides of silver, copper, mercury, and gold are detonated by heat, friction, or shock. In addition to its reactive hydrogen atom, the carbon-carbon triple bond can readily add halogens, halogen acids, hydrogen cyanide, alcohols, amines, and amides. Acetylene can also add to itself or to aldehydes and ketones. Many of the reactions mentioned here are used for the commercial manufacture of various industrial and consumer products, such as acetaldehyde, the synthetic rubber neoprene, water-base paints, vinyl fabric and floor coverings, dry-cleaning solvents, and aerosol insecticide sprays. Acetylene is produced by any of three methods: by reaction of water with calcium carbide, by passage of a hydrocarbon through an electric arc, or by partial combustion of methane with air or oxygen.

acetylsalicylic acid: *see* aspirin.

Acevedo Díaz, Eduardo (b. April 20, 1851, Villa de la Unión, Uruguay—d. June 18, 1924, Buenos Aires), writer and politician, considered to be Uruguay's first novelist.

Acevedo Díaz attended the University of Montevideo, where he first became active in politics. He took part in the Revolución

Blanca (1870–72) and the Revolución Tricolor (1885), supporting the cause of the Blancos, a nationalist, ruraly oriented political party. Often depicted as the founder of *gauchismo*, a literary movement that emphasized the role of the gaucho in Spanish-American history and often romanticized his personality, Acevedo Díaz did most of his writing while in exile in Argentina. The traditionalist sensibilities put forth in his novels reflect his mistrust and resentment of the incomprehension and arrogance of his urban contemporaries in Argentina. His first novel, *Brenda*, was published in 1886. His best-known works include a trilogy of historical novels concerned with the Uruguayan wars for independence (from about 1808 to the late 1820s): *Ismael* (1888), *Nativa* (1890), and *Grito de gloria* (1893; "The Battle Cry of Glory"). *Soledad* (1894; "Solitude"), his masterpiece, had a continuing influence on gaucho novelists in Uruguay and Argentina.

His son, also named Eduardo Acevedo Díaz, was an Argentine novelist.

Achab: *see* Ahab.

Achaea, Modern Greek ΑΧΑΪΑ, *nomós* (department) and historic region of Greece on the north coast of the Peloponnese, south of the Gulf of Corinth. In ancient times it was bounded on the west by Elis (modern Ilía), on the south by Mount Erymanthus and Arcadia, and on the east by Sicyon (modern Sikión). The hilly coastal region almost corresponds to the modern *nomós* of Akhaía, whose administrative capital is Pátrai, although the eastern boundary now falls west of Mount Kyllene (Killíni Óros). The highway and railway from Athens to Pátrai follow the north coast of the Peloponnese.

Early in the 4th century BC the 12 cities of Achaea formed the Achaean League, a military alliance. In Hellenistic times, the League admitted non-Achaean allies and became the chief political power in Greece. It went over to Rome in 198 BC but was dissolved by the

Dimitri Papadimos

Romans in 146 BC, after which it was annexed to the Roman province of Macedonia. In 27 BC it became the centre of the Roman senatorial province of Achaea, which included all of Greece south of Thessaly. After various invasions and dismemberments in the Middle Ages, Achaea was conquered by the Turks in 1460. It was in the monastery of Ayía Lavra near Kalávrita in this province that the standard of the Greek Revolution was raised in 1821. Achaea was liberated from the Turks in 1828.

The name Achaea was also applied in antiquity to a region west of the Gulf of Pagasae (Pagasitikós Kólpos) in southern Thessaly, which was known as Achaea Phthiotis. Also in Mycenaean times the name referred to the whole Peloponnese. Pop. (1991) *nomós*, 300,078.

Achaean, Greek ΑΧΑΪΟΣ, any of the ancient Greek people, identified in Homer, along with the Danaoi and the Argeioi, as the Greeks who besieged Troy. Their area as described by Homer—the mainland and western isles of Greece, Crete, Rhodes, and adjacent isles, except the Cyclades—is precisely that covered by the activities of the Mycenaeans in the 14th–13th century BC, as revealed by archaeology. From this and other evidence, some authorities have identified the Achaeans with the Mycenaeans. Other evidence suggests that the Achaeans did not enter Greece until the so-called Dorian invasions of the 12th century BC. It seems at least possible that Homer's Achaean chiefs, with their short genealogies and their renown for infiltrating into Mycenaean kingships by way of military service and dynastic marriages, held power in the Mycenaean world only for a few generations in its last, warlike, and semibarbarous phase, until replaced by the Dorians, their relatively close kindred. The Achaeans of the northern Peloponnese in historic times were reckoned by Herodotus to be descendants of these earlier Achaeans. The name Ahhiyawā, occurring in Hittite documents of the 14th and 13th centuries BC, has sometimes been identified with the Achaeans, but this is disputed.

Achaean League, 3rd-century-BC confederation of the towns of Achaea in ancient Greece. The 12 Achaean cities of the northern Peloponnese had organized a league by the 4th century BC to protect themselves against piratical raids from across the Corinthian Gulf, but this league fell apart after the death of Alexander the Great. The 10 surviving cities renewed their alliance in 280 BC, and under the leadership of Aratus of Sicyon, the league gained strength by the inclusion of his city, and later other non-Achaean cities, on equal terms.

The league's activity initially centred on the expulsion of the Macedonians and the restoration of Greek rule in the Peloponnese. After this was successfully accomplished in about 228 BC, Achaea faced the danger of complete disintegration before the assaults of the Spartan king Cleomenes III, who also aimed at control of the Peloponnese. To counteract the Spartan threat, Aratus allied the league with Macedon, and Antigonos III Doson of Macedon and his troops subdued Sparta, making it a Macedonian ally and renewing the Macedonian hold over Greece (224–221). In the Second Macedonian War, Achaea joined Rome (198) in an alliance against Macedon, and this new policy led to the incorporation of nearly the whole Peloponnese into the Achaean League. But the league's success eventually resulted in friction with both Sparta (which had been drafted into the league in 192) and with expansionist Rome, and war broke out between the league and Rome in 146 BC. Rome was soon victorious, and it dissolved the Achaean League in 146. A smaller league, however, was set up soon afterward and continued into the Roman imperial age.

At the head of the Achaean League were two generals (*stratēgoi*) until a single general was substituted in 255 BC. The general was the annually elected head of the league's army, and a particular general could not be immediately reelected. The general headed the league's administrative board, whose 10 members in turn presided over the various city-states' representative councils and assemblies. These bodies of citizenry could vote on matters submitted to them by the general. The minimum voting age in the assemblies was 30 years of age.

Under the Achaean League's federal constitution, its city-state members had almost complete autonomy within the framework of the league's central administration; only mat-

ters of foreign policy, war, and federal taxes were referred to the general and the board for decision making.

Achaemenes, Old Persian HAKHAMANISH (fl. early 7th century BC), eponymous ancestor of the Persian Achaemenid dynasty; he was the father of Teispes (Chishpish) and an ancestor of Cyrus II the Great and Darius I the Great. Although Achaemenes probably ruled only Parsumash, a vassal state of the kingdom of Media, many scholars believe that he led armies from Parsumash and Anshan (Anzan, northwest of Susa in Elam) against the Assyrian king Sennacherib in 681.

Achaemenes, Old Persian HAKHAMANISH (d. c. 460 BC, Papremis, Egypt), son of the Achaemenid king Darius I of Persia.

After the first rebellion of Egypt (484), Achaemenes was appointed satrap (governor) of Egypt by his brother Xerxes I; he also commanded the Egyptian contingent of the Achaemenid fleet defeated by the Greeks at the Battle of Salamis (480). Little more is known of Achaemenes' career until he was defeated and slain in battle by Inaros, the leader of the second rebellion of Egypt against Achaemenid rule.

Achaemenian DYNASTY, also called ACHAEMENID, Persian HAKHAMANISHIYA (559–330 BC), ancient Iranian dynasty whose kings founded and ruled the Achaemenian Empire. Achaemenes (Persian Hakhmanish), the Achaemenians' eponymous ancestor, is presumed to have lived early in the 7th century BC, but little is known of his life. From his son Teispes two lines of kings descended. The kings of the older line were Cyrus I, Cambyses I, Cyrus II the Great, and Cambyses II. After the death of Cambyses II (522 BC) the junior line came to the throne with Darius I.

Achaemenian gold dagger, 5th century BC; in the Metropolitan Museum of Art, New York City

By courtesy of the Metropolitan Museum of Art, New York City, Dick Fund, 1954

The dynasty became extinct with the death of Darius III, following his defeat (330 BC) by Alexander the Great.

Probably the greatest of the Achaemenian rulers were Cyrus II (reigned 559–c. 529 BC), who actually established the empire and from whose reign it is dated; Darius I (521–486), who excelled as an administrator and secured the borders from external threats; and Xerxes I (486–466), who completed many of the buildings begun by Darius. During the time of Darius I and Xerxes I, the empire extended as far west as Macedonia and Libya and as far east as the Hyphasis (Beās) River; it stretched to the Caucasus Mountains and the Aral Sea in the north and to the Persian Gulf and the Arabian Desert in the south.

The Achaemenian rule of conquered peoples was generally liberal; the empire itself was divided into provinces (satrapies), each administered by a satrap who underwent frequent inspections by officials reporting directly to the king.

Royal inscriptions were usually trilingual, in Old Persian, Elamite, and Akkadian; Aramaic, however, was employed for imperial administration and diplomatic correspondence.

Building activity was extensive during the height of the empire, and of the several Achaemenian capitals, the ruins at Pasargadae and at Persepolis (*qq.v.*) are probably the most outstanding. Achaemenian sculptured reliefs and a great number of smaller art objects present a remarkably unified style for the period. Metalwork, especially in gold, was highly developed, and a variety of carefully executed examples survive.

Achaemenid DYNASTY, the Persian 27th dynasty of Egypt (525–404 BC), founded by Cambyses II of Persia and named after his family of the Achaemenids.

The policy of the Achaemenid kings seems to have been conciliatory to national beliefs and sentiments. There are conflicting views of Cambyses II's reign. The Egyptian courtier Udjahorresne depicts an ideal ruler in the pharaonic tradition, while Herodotus draws a portrait of a savage tyrant. Cambyses II apparently reduced the revenues given the Egyptian priesthood by more than half. Certainly Darius (reigned 521–486 BC) proved himself a more beneficent ruler and, in a visit to Egypt, displayed his consideration for the religion of the country. He restored the priests' privileges, ordered a written codification of Egyptian law, and completed or repaired the canal from the Nile to the Red Sea. At the very end of his reign, however, several years after the Achaemenid defeat at Marathon, Egypt rebelled. Xerxes (reigned 486–466 BC) put down the revolt with severity.

The disorders that marked the accession of his successor, Artaxerxes (reigned 466–424 BC), gave Egypt another opportunity to rebel, aided by an Athenian force. In 455 BC, however, the Achaemenids captured and destroyed two Athenian fleets and quickly ended the rebellion. The reigns of Xerxes II and Darius II were uneventful until 404 BC, when Egypt regained its independence under Amyrtaeus of Sais. The Persians briefly reconquered Egypt under Artaxerxes III between 343 and 341 BC, and it remained under Achaemenid rule until 332, when the satrap surrendered to Alexander the Great.

Achagua, South American Indian people of Venezuela and eastern Colombia. They speak a language of the Maipurean Arawakan group. Traditionally, the Achagua had typical tropical-forest economies, living in large villages and growing bitter cassava and other crops. The Achagua were warlike; they were one of the few native South American people to use arrows poisoned with curare.

Achagua social organization was distinguished by numerous lineages named for animals such as the serpent, bat, jaguar, and fox.

Each such unit occupied one communal house in the village. The Achagua were polygynous, each man aiming to have three or four wives. The chiefs also maintained concubines. The wives were legally equal, and each cultivated her own separate field. Women were excluded from the men's house and from a number of religious ceremonies. The Achagua believed in a supreme being, in a god of the fields, a god of riches, and gods of earthquakes, of madness, and of fire. They also worshipped lakes.

Acheampong, Ignatius Kutu (b. Sept. 23, 1931, Kumasi, Gold Coast—d. June 16, 1979, Accra, Ghana), Ghanaian army officer, who, after leading a military revolt that overthrew the government of Kofi Busia, became Ghana's chief of state in 1972. In July 1978 he was forced to resign, and the following June he and his successor, Lieut. Gen. F.W.K. Akuffo, were executed after a coup led by young officers, whose Armed Forces Revolutionary Council returned Ghana to civilian rule in September 1979.

Achebe, Chinua (b. Nov. 16, 1930, Ogidi, Nigeria), prominent Ibo novelist acclaimed for his unsentimental depictions of the social and psychological disorientation accompanying the imposition of Western customs and values upon traditional African society. His concern was with emergent Africa at its moments of crisis, his novels ranging in subject matter from the first contact of an African village with the white man to the educated African's attempt to create a firm moral order out of the changing values in a large city.

Educated in English at the University of Ibadan, Achebe taught for a short time before joining the staff of the Nigerian Broadcasting Corporation in Lagos, where he served as director of external broadcasting during 1961–66. In 1967 he launched a publishing company at Enugu with the poet Christopher Okigbo, who died shortly thereafter in the Nigerian civil war. In 1969 Achebe toured the United States with his fellow writers Gabriel Okara and Cyprian Ekwensi, lecturing at universities. Upon his return to Nigeria he was appointed research fellow at the University of Nigeria and became professor of English there in 1973. He was director (from 1970) of two Nigerian publishers, Heinemann Educational Books Ltd. and Nwankwo-Ifejika Ltd.

Things Fall Apart (1958), Achebe's first novel, concerns traditional Ibo life at the time of the advent of missionaries and colonial government in his homeland. His principal character cannot accept the new order, even though the old has already collapsed. In *No Longer at Ease* (1960) he portrayed newly appointed civil servant, recently returned from university study in England, who is unable to sustain the moral values he believes to be correct in the face of the obligations and temptations of his new position.

In *Arrow of God* (1964), set in the 1920s in a village under British administration, the principal character, the chief priest of the village, whose son becomes a zealous Christian, turns his resentment at the position he is placed in by the white man against his own people. Achebe's fourth novel, *A Man of the People* (1966), attacks injustice in a satirical exposé of corrupt government practices and politicians in newly independent Africa.

Achebe also published several collections of short stories; a children's book called *How the Leopard Got His Claws* (1973); with John Iroaganachi; two books of poems, *Beware, Soul-Brother* (1971) and *Christmas in Biafra* (1973); and a book of essays, *Morning Yet on*

Creation Day (1975). His novels have been translated into many languages.

Achelous River, Modern Greek AKHELÓOS POTAMÓS, also called ASPROPÓTAMOS, one of the longest rivers in Greece, rising in the Pinus Mountains of central Epirus (Ipiros) and dividing Aetolia from Acarnania. It debouches into the Ionian Sea after a course of 140 mi (220 km), mostly through gorges. Well above Agrinion two hydroelectric dams were built to harness the waters of the river and its tributaries. One is at Kastraki; the other, at Kremasta, is the highest (490 ft [150 m]) earth-fill dam in Europe. At the mouth of the river, where it is less than 2 ft deep, a number of small islands, the Ekhinádhes, have been enveloped by the silt. The name Aspropótamos (White River) is given to several other rivers in Greece, and the name Achelous appears in cult and in Greek mythology as that of the typical river god.

Achenbach, Andreas (b. Sept. 29, 1815, Kassel, Hesse—d. April 1, 1910, Düsseldorf, Ger.), landscape painter, a pioneer of the German realist school. He studied at the Düsseldorf academy under Johann Wilhelm Schirmer, but emancipated himself from the contemporary school of landscapists that delighted in the representation of romantic scenery. He was the first artist of the Düsseldorf school to paint nature for its own sake. His pictures of the stormy North Sea, of Dutch canal scenes, and of Rhineland villages contrasted favourably with the sentimental landscapes of his contemporaries. His brother Oswald was also a painter.

Achenbach, Oswald (b. Feb. 2, 1827, Düsseldorf, Prussia—d. Feb. 1, 1905, Düsseldorf, Ger.), landscape painter of the Düsseldorf school who is distinguished for his colourful renderings of the Bay of Naples, of Rome, and of Venice. He broke away from the traditional classicist interpretation of these scenes and revelled in strong and glowing colour effects. His more famous brother, Andreas, influenced his work.

achene, dry, one-seeded fruit lacking special seams that split to release the seed. The seed coat is attached to the thin, dry ovary wall (husk) by a short stalk, so that the seed is easily freed from the husk, as in buckwheat. The fruits of many plants in the buttercup family and the rose family are achenes.

Achernar, also called ALPHA ERIDANI, brightest star in the southern constellation Eridanus and one of the 10 brightest stars in the sky, with an apparent visual magnitude of 0.47. It lies about 60 or 70 light-years from the Earth. The name probably derives from an Arabic phrase meaning "the end of the river," in which the river referred to is the constellation.

Acheron, river in Thesprotia in Epirus, Greece, that was thought in ancient times to go to Hades because it flowed through dark gorges and went underground in several places; an oracle of the dead was located on its bank. In Greek mythology it is a river in Hades, and the name sometimes refers to the lower world generally. Several other rivers in Greece are also called Acheron, which traditionally means River of Woe.

Acheson, Archibald: *see* Gosford, Archibald Acheson, 2nd earl of.

Acheson, Dean (Gooderham) (b. April 11, 1893, Middletown, Conn., U.S.—d. Oct. 12, 1971, Sandy Spring, Md.), U.S. secretary of state (1949–53) and adviser to four presidents, who became the principal creator of U.S. foreign policy in the Cold War period following World War II, during which he helped to create the Western alliance in opposition to the Soviet Union and other Communist nations.

A graduate of Yale and of Harvard Law School, Acheson served for two years as pri-

vate secretary to Supreme Court Justice Louis Brandeis. In 1921 he joined a law firm in Washington, D.C. His first government post was under Roosevelt as undersecretary of the Treasury in 1933; he entered the Department of State in 1941 as an assistant secretary and was undersecretary from 1945 to 1947.

Dean Acheson

By courtesy of the National Archives, Washington, D.C.

One of Acheson's first responsibilities in 1945 was to secure Senate approval for U.S. membership in the United Nations. After 1945 he became a convinced anti-Communist, a position that was the dominant influence on his later conduct of foreign policy. Believing that the Soviet Union sought expansion in the Middle East, he shaped what came to be known as the Truman Doctrine (1947), pledging immediate military and economic aid to the governments of Greece and Turkey. In the same year he outlined the main points of what became known as the Marshall Plan.

Appointed secretary of state by Pres. Harry S. Truman in January 1949, Acheson promoted the formation of the North Atlantic Treaty Organization (NATO), the first peacetime defensive alliance ever entered into by the U.S.

Despite his strong stance in what he conceived to be a global confrontation with Communism, Acheson—because he had been associated with high government circles during the period when Communist parties were taking over many European countries—was the target of attack by foreign-policy critics within both political parties. His enemies were particularly inflamed when, during the congressional hearings of Sen. Joseph R. McCarthy on subversive activities (1949–50), Acheson refused to fire any of his State Department subordinates. His most widely publicized remark was, "I will not turn my back on Alger Hiss"—a former State Department officer later convicted of perjury in denying that he had engaged in espionage in the 1930s.

Demands for Acheson's resignation increased after the entry of Communist China into the Korean War (1950–53). The storm of public controversy erupted more violently after the President removed Gen. Douglas MacArthur as commander of forces in Korea. Acheson subsequently established the policies of non-recognition of China and aid to the Nationalist regime of Gen. Chiang Kai-shek on Taiwan; later he also supported U.S. aid to the French colonial regime in Indochina.

After leaving office he returned to private law practice but continued to serve as foreign-policy adviser to successive presidents. His account of his years in the Department of State, *Present at the Creation*, won the Pulitzer Prize in history in 1970. Other works include *Power and Diplomacy* (1958), *Morning and Noon* (1965), *The Korean War* (1971), and *Grapes from Thorns* (posthumous, 1972).

Acheson, Edward Goodrich (b. March 9, 1856, Washington, Pa., U.S.—d. July 6, 1931,

New York, N.Y.), American inventor who discovered the abrasive Carborundum and perfected a method for making graphite.

Acheson joined inventor Thomas A. Edison's staff in 1880 and helped to develop the incandescent lamp at Edison's laboratories at Menlo Park, N.J. In 1881 he installed the first electric lights for Edison in Italy, Belgium, and France. Upon returning to the United States, Acheson quit Edison and in 1884 began his own experiments on methods for producing artificial diamonds in an electric furnace. He heated a mixture of clay and coke in an iron bowl with a carbon arc light and found some shiny, hexagonal crystals (silicon carbide) attached to the carbon electrode. Because he at first mistakenly thought the crystals were a compound of carbon and alumina from the clay, he devised the trademark Carborundum, after corundum, the mineral composed of fused alumina. In 1893 he received a patent on this highly effective abrasive.

Later, while studying the effects of high temperature on Carborundum, he found that the silicon vaporizes at about 4,150° C (7,500° F), leaving behind graphitic carbon. He was granted a patent for this process in 1896. In all, he received 69 patents and organized several firms to commercialize his inventions, including The Carborundum Company, Niagara Falls, N.Y.

Acheulean industry, Acheulean also spelled ACHEULIAN, first standardized tradition of toolmaking of *Homo erectus* and early *Homo sapiens*. Named for the type site, Saint-Acheul, in Somme département, in northern France, Acheulean tools were made of stone with good fracture characteristics, including chalcedony, jasper, and flint; in regions lacking these, quartzite might be used. During the Acheulean period, which lasted from 1.5 million to 200,000 years ago, the presence of good tool stone was probably an important determining factor in the distribution of early humans. In the later stages they learned to bring stone from distant areas and thus became freer in their choice of homesites. "Tool kits" that differ in tool types reflect the varying adaptations made by early Stone Age humans to different environments.

The most characteristic Acheulean tools are termed hand axes and cleavers. Considerable improvement in the technique of producing hand axes occurred over the long period; anthropologists sometimes distinguish each major advance in method by a separate number or name. Early Acheulean tool types are called Abbevillian (especially in Europe); the last Acheulean stage is sometimes called Micoquian. Industries that existed at the same time and overlapped in geographic range, but specialized in flake tools and lacked hand axes, are known as Clactonian (England) and Tayacian (western and central Europe). Acheulean industries are found in Africa, Europe, the Middle East, and Asia as far east as Calcutta (East Asia was characterized by a tool tradition called the chopper chopping-tool industry).

The earliest hand axes, such as those found with *Homo erectus* in Bed II at Olduvai Gorge in Tanzania, were crude pointed bifaces: chips were removed from both sides of a core by rapping it against a set "anvil" stone to form a sinuous cutting edge all around. In the next step a hammerstone replaced the "anvil," and the whole surface of the core was flaked away to form an oval implement with relatively straight edges. Small flakes were sometimes removed from the edges to further straighten them. Later still, the hammerstone was replaced by bone or wood "hammers," which removed smaller, flatter flakes and resulted in a smoother tool with a sharp, straight edge. A sinuous edge could be produced purposefully,

resulting in a "saw." In the late Acheulean, hand axes were pointed, and the butt end was often only roughly finished. Cleavers were large tools with one end squared off to form an axlike cutting edge.

In addition to hand axes and cleavers, the Acheulean industry included choppers and flakes. The latter were produced from a prepared core and could be used as knives without further change or could be chipped to make side-scrapers, burins, and other implements. Though bone and wood were probably also used as tools, little evidence of them remains, and no discussion of style can be attempted. At the beginning of the Fourth (Würm) Glacial Period, Acheulean industries were gradually replaced by (graded into) the Levalloisian stone-flaking technique and the Mousterian industry in Europe and the Fauresmith and Sangoan industries in Africa.

Achill, mountainous island off the west coast of Ireland, joined to the mainland by a bridge across Achill Sound. A part of County Mayo, the island has an area of 56 square miles (145 square km), and its highest points are the quartzite peaks of Slieve Croaghaun (2,182 feet [665 m]) and Slieve More (2,201 feet [671 m]). The landscape is dominated by wild moorlands and spectacular coastal scenery. Farming and fishing provide some livelihood; supplementary income is obtained from tourism and by the migration of agricultural labourers to England and Scotland in summer. In the south, at Kildavnet, there are ruins of a 12th-century church and a 15th-century castle. Pop. (1991) 2,853.

Achilles, in Greek mythology, son of the mortal Peleus, king of the Myrmidons, and the Nereid, or sea nymph, Thetis. He was the bravest, handsomest, and greatest warrior of the army of Agamemnon in the Trojan War. According to Homer, Achilles was brought up by his mother at Phthia with his cousin and inseparable companion Patroclus. One of the non-Homeric tales of his childhood relates that Thetis dipped Achilles in the waters of the River Styx, by which he became invulnerable, except for the part of his heel by which she held him—the proverbial "Achilles' heel."

The later mythographers related that Peleus, having received an oracle that his son would die fighting at Troy, sent Achilles to the court of Lycomedes on Scyros, where he was dressed as a girl and kept among the king's daughters (one of whom, Deidamia, bore him Neoptolemus). Hearing from the soothsayer Calchas that Troy could not be taken without Achilles, the Greeks searched for and found him.

During the first nine years of the war, Achilles ravaged the country around Troy and took 12 cities. In the 10th year a quarrel with Agamemnon occurred when Achilles insisted

Achilles killing Penthesilea during the Trojan War, interior of an Attic cup, c. 460 BC; in the Antikensammlungen, Munich
The Mansell Collection

that Agamemnon restore Chryseis, his prize of war, to her father, a priest of Apollo, so as to appease the wrath of Apollo, who had decimated the camp with a pestilence. An irate Agamemnon recouped his loss by depriving Achilles of his favourite slave, Briseis.

Achilles refused further service, and consequently the Greeks floundered so badly that at last Achilles allowed Patroclus to impersonate him, lending him his chariot and armour. Hector (the eldest son of King Priam of Troy) slew Patroclus, and Achilles, having finally reconciled with Agamemnon, obtained new armour from the god Hephaestus and slew Hector. After dragging Hector's body behind his chariot, Achilles gave it to Priam at his earnest entreaty. The *Iliad* concludes with the funeral rites of Hector. It makes no mention of the death of Achilles, though the *Odyssey* mentions his funeral. The poet Arctinus in his *Aethiopis* took up the story of the *Iliad* and related that Achilles, having slain the Ethiopian king Memnon and the Amazon Penthesilea, was himself slain in battle by Priam's son Paris, whose arrow was guided by Apollo.

Achilles Painter (fl. 5th century BC), Athenian vase painter known by and named for an amphora attributed to him with a painting of

Achilles holding a spear, front of the "Achilles and Briseis" red-figure amphora by the Achilles Painter, c. 450 BC; in the Vatican Museums

Photograph by the Vatican Museums

"Achilles and Briseis." The amphora is now in the Vatican Museums. His period of activity coincides with the Parthenon sculptures and with the administration of Pericles.

The "Achilles and Briseis" amphora is a red-figure vase (that is, the figures are painted in red against a glazed black background). The vase dates from about 450 BC and is among the finest surviving examples of vase painting from the Classical period.

The Achilles Painter also is praised for his white-ground lekythoi (funerary vases with the figures painted in colour against a white background). The white-ground lekythoi are believed to be the most reliable source information about monumental Greek paintings of the Classical period. The original monumental paintings do not survive and are known only through the writings of the ancients.

More than 200 vase paintings have been attributed to the Achilles Painter on the basis of the style of the "Achilles and Briseis." Among them are: lekythoi of "Girl Bringing a Casket to Her Mistress" (Boston Museum of Fine Arts); "Youth Bidding Farewell to Wife" (Athens); and "Warrior Arming" (British Museum). The Achilles Painter is cited

for his delicately drawn, gentle, pensive, almost melancholy figures.

Achilles paradox, in logic, an argument attributed to the 5th-century BC Greek philosopher Zeno, and one of his four paradoxes described by Aristotle in the treatise *Physics*. The paradox concerns a race between the fleet-footed Achilles and a slow-moving tortoise. The two start moving at the same moment, but if the tortoise is initially given a head start and continues to move ahead, Achilles can run at any speed and will never catch up with it. Zeno's argument rests on the presumption that Achilles must first reach the point where the tortoise started, by which time the tortoise will have moved ahead, even if but a small distance, to another point; by the time Achilles traverses the distance to this latter point, the tortoise will have moved ahead to another, and so on.

The Achilles paradox cuts to the root of the problem of the continuum. Aristotle's solution to it involved treating the segments of Achilles' motion as only potential and not actual, since he never actualizes them by stopping. In an anticipation of modern measure theory, Aristotle argued that an infinity of subdivisions of a distance that is finite does not preclude the possibility of traversing that distance, since the subdivisions do not have actual existence unless something is done to them, in this case stopping at them. *See also* paradoxes of Zeno.

Achilles Tatius (fl. 2nd century AD, Alexandria), teacher of rhetoric and author of *Leucippe and Cleitophon*, one of the Greek prose romances that influenced the development of the novel centuries later.

Nothing certain is known of Achilles' life. The romance, a typical adventure story of love triumphant over innumerable obstacles—shipwrecks, tortures, abductions and attacks by pirates—is related in the first person by Cleitophon himself, whom Achilles claims to have met in Sidon. The work's style is typical of Atticism, with its purity of diction, short unconnected sentences, parallel clauses, detailed descriptions, and frequent declamations and disquisitions, often in antithetical form (e.g., on love for women and pederasty). Achilles shows great ingenuity in inventing coups de theatre (Leucippe apparently dies three times but always reappears), but his characterization is poor, and plot is relegated to the background by irrelevant interruptions. The romance was admired by Byzantine critics and was widely translated in the Renaissance.

Achilles tendon, also called **CALCANEAL TENDON**, strong tendon at the back of the heel that connects the calf muscles to the heel. The tendon is formed from the gastrocnemius and soleus muscles (the calf muscles) and is inserted into the heel bone. The contracting calf muscles lift the heel by this tendon, thus producing a foot action that is basic to walking, running, and jumping. The Achilles tendon is the thickest and most powerful tendon in the body. If the tendon is cut, use of the leg for running or jumping is lost. The tendon is named after the ancient Greek mythological figure Achilles because it lies at the only part of his body that was still vulnerable after his mother had dipped him (holding him by the heel) into the River Styx.

Achin (Indonesia): *see* Aceh.

Achinese, also spelled **ATJEHNESE**, one of the main ethnic groups on the island of Sumatra, Indonesia. They were estimated to number roughly 2,100,000 in the late 20th century. They speak a language of the Austronesian (Malayo-Polynesian) family.

The Achinese were ruled by Indian princes prior to AD 500, and in the 13th century they became the first people in the archipelago to adopt Islam. After expelling the Portuguese in

the 17th century, the sultanate of Achch (now Aceh) was dominant in northern Sumatra until 1904, when the sultanate was conquered by the Dutch. The Achinese, however, were never fully subdued. Although they are now part of the Indonesian republic, they remain restive and are administered within a special district.

Western influence is evident in the Achinese's public buildings and in the homes of the well-to-do. Otherwise the native type of dwelling prevails, consisting of a three-room structure of wood raised high above the ground on pilings.

Descent is traced through both the maternal and paternal lines. A married couple goes to live with the bride's family. The position of women is high, and they do not wear veils. Their dress consists of a skirt over trousers, a jacket and scarf, and many ornaments. The man wears a jacket or shoulder cloth and trousers of great width.

Achinese War (1873–1904), an armed conflict between The Netherlands and the Muslim sultanate of Aceh (now Aceh) in northern Sumatra that resulted in Dutch conquest of the Achinese and, ultimately, in Dutch domination of the entire region. In 1871 The Netherlands and Britain had signed a treaty that recognized Dutch influence in northern Sumatra in return for Dutch confirmation of Britain's right of equal trade in the Indies.

The Dutch, considering Aceh as within their sphere of influence, decided to conquer the area and sent two expeditions to Aceh in 1873. The palace was seized and shortly afterward the Achinese sultan died. The Dutch suspended military operations and concluded a treaty with the new sultan, who recognized Dutch sovereignty over the area. He was unable to control his subjects, however, and Dutch forces became involved in a prolonged guerrilla war in the countryside. This war, however, drained the colonial treasury, and public opinion in The Netherlands became increasingly critical of the colonial administration.

The administration later realized that their ignorance of the region had led them to commit serious errors. C. Snouck Hurgronje, professor of Islamic studies at the University of Leyden, was invited to undertake a thorough study of Aceh and published a book in 1893–94 on the Achinese. A "castle strategy," which provided fortified bases for the Dutch troops, was then introduced. Under the leadership of J.B. van Heutsz, who was appointed military and civil governor of Aceh in 1899, the kingdom was quickly subdued. The conquest of the entire region was accomplished by van Heutsz in 1904.

Achinsk, also spelled **AČINSK**, city, Krasnoyarsk kray (region), south-central Russia. It lies along the Chulym River, which is a tributary of the Ob. It was founded in 1621 and chartered in 1782. Important as a river-road transfer point until rail lines were constructed, it gained economic importance when an alumina plant was put into production in 1969 and when a petroleum refinery began operation at Kritovo, 15 miles (24 km) west of Achinsk, in the late 1970s. The nearby Kansk-Achinsk coal basin has also been developed. The city has clothing, furniture, and brick factories. Pop. (1993 est.) 121,700.

Achitophel (Old Testament): *see* Ahithophel.

Achmed, also spelled **ACHMET** (Arabic personal name): *see under* Ahmed, or Ahmad.

Acholi, also spelled **ACOLI**, also called **GANG**, or **SHULI**, ethnolinguistic group of northern Uganda and southernmost Sudan. Numbering about 820,000 in the late 20th century, they speak a Western Nilotic language of the Eastern Sudanic subbranch of the Chari-Nile branch of the Nilo-Saharan family and

are culturally and historically related to their traditional enemies, the neighbouring Lango. The Acholi are the descendants of a variety of Luo-speaking peoples who are believed to have migrated from adjacent areas of the southern Sudan into what is now the Acholi district of Uganda three or four centuries ago.

The Acholi have small chiefdoms of one or more villages, each with several patrilineal clans. Chiefs are chosen from one lineage. The Acholi live in small hamlets of patrilineal kin. They keep sheep and cattle but are not as committed to pastoralism as some Nilotic peoples are. Millet is the staple food of the Acholi, and tobacco is grown for trade. Corn (maize), sorghum, beans, squash, peanuts (groundnuts), and other savanna crops are also grown. Hunting tracts are owned by clans. Stream and swamp fishing are also important.

Acholi were considered a martial people by the British, and many joined the military. Under the Ugandan president Idi Amin (1971–79), the Acholi were severely persecuted and their men systematically executed for their past association with the colonial army and for their support of President Milton Obote (1962–71, 1980–85), who was a Lango.

achondrite, any stony meteorite containing no chondrules (rounded granules of cosmic origin). Achondrites, constituting about 4 percent of the known meteorites, are similar in appearance to terrestrial igneous rocks low in silica content, such as basalts, peridotites, and pyroxenites. They may have crystallized from a melt similar to the terrestrial magma that formed basic and ultrabasic igneous rocks; it is possible that they were derived from the melting and fractional crystallization of parent bodies having the overall composition of chondrites. Achondrites are classified into the following groups according to their mineralogy: angrites, aubrites, chassignites, diogenites, eucrites, howardites, nakhlites, shergottites, and ureilites. *See also* chondrite.

achondroplasia, also called **CHONDRODYS-TROPHIA FETALIS**, genetic disorder characterized by a lack of cartilage cells. As a consequence, bones that depend on cartilage models for development cannot grow. Achondroplasia is the most common cause of dwarfism. In those afflicted with the disorder, the limbs are very short (fingers reach only to the hips), but the trunk is almost normal in size. The head is enlarged because of some overgrowth of the vault bones following premature closure of sutures at the base of the skull. There is usually a bulging forehead, saddle nose, protruding full-sized jaw, deeply incurved lower back with prominent buttocks, and a narrow chest; women may have narrow pelvises and, subsequently, difficulty in childbirth. The disorder is inherited as an autosomal dominant trait. About 80 percent of cases of achondroplasia result from new genetic mutations, however, rather than from the parental transmission of defective genes.

Achondroplastic dwarfs are of normal intelligence and have otherwise normal health. This disorder has been known since antiquity—in Egypt the god Ptah was depicted as an achondroplastic dwarf; in the past, affected individuals were in demand as court jesters and soothsayers.

acid, any substance that in water solution tastes sour, changes the colour of certain indicators (e.g., reddens blue litmus paper), reacts with some metals (e.g., iron) to liberate hydrogen, reacts with bases to form salts, and promotes certain chemical reactions (acid catalysis). Examples of acids include the inorganic substances known as the mineral acids—sulfuric, nitric, hydrochloric, and phosphoric acids—and the organic compounds belonging

to the carboxylic acid, sulfonic acid, and phenol groups. Such substances contain one or more hydrogen atoms that, in solution, are released as positively charged hydrogen ions (see Arrhenius theory).

Broader definitions of an acid, to include substances that exhibit typical acidic behaviour as pure compounds or when dissolved in solvents other than water, are given by the Brønsted-Lowry theory (*q.v.*) and the Lewis theory (*q.v.*). Examples of nonaqueous acids are sulfur trioxide, aluminum chloride, and boron trifluoride. Compare base.

acid and basic rocks, division of igneous rocks on the basis of their silica content. Chemical analyses of the most abundant components in rocks usually are presented as oxides of the elements; igneous rocks typically consist of approximately 12 major oxides totaling over 99 percent of the rock. Of the oxides, silica (SiO₂) is usually the most abundant. Because of this abundance and because most igneous minerals are silicates, silica content was used as a basis of early classifications; it remains widely accepted today. Within this scheme, rocks are described as acid, intermediate, basic, and ultrabasic (in order of decreasing silica content), because it was originally thought by some that silica was present in rock magmas in the form of silicic acid. In modern usage the terms should not be construed to indicate acidity in the old sense, nor do they indicate hydrogen ion concentration (as typically used in chemistry). The terms are well established, however, and can be useful in describing the silica content of rocks.

In a widely accepted silica-content classification scheme, rocks with more than 66 percent silica are called acid; those with between 52 and 66 percent silica are intermediate; those with between 45 and 52 percent silica are basic; and those with less than 45 percent are ultrabasic. Compilations of many rock analyses show that rhyolite and granite are acid, with an average silica content of about 72 percent; syenite, diorite, and monzonite are intermediate, with an average silica content of 59 percent; gabbro and basalt are basic, with an average silica content of 48 percent; and peridotite is an ultrabasic rock, with an average of 41 percent silica. Although there are complete gradations between the averages, rocks tend to cluster about the averages. In general, the gradation from acid to basic corresponds to an increase in colour index (dark-mineral percentage), which has led to the development of a parallel, but not equivalent, classification system from felsic to mafic (*i.e.*, light to dark).

The fine-grained or glassy nature of many volcanic rocks makes a chemical classification such as acid-basic very useful in distinguishing the different types. Silica content is especially useful because the density and refractive index of natural glasses have been correlated with silica percentage; this makes identification possible in the absence of chemical data. For similar determinations, glasses can also be prepared in the laboratory from crystalline rocks.

The influence of silica content on the particular minerals that crystallize from a rock magma is a complex interaction of several parameters, and it cannot be assumed that rocks with the same silica content will have the same mineralogy. Silica saturation is a classification of minerals and rocks as oversaturated, saturated, or undersaturated with respect to silica. Acidic rocks are commonly oversaturated and contain free quartz (SiO₂), intermediate rocks contain little or no quartz or feldspathoids (undersaturated minerals), and basic rocks may contain abundant feldspathoids. This broad grouping on the basis of mineralogy related to

silica content is used in many modern classification schemes.

acid-base catalysis, acceleration of a chemical reaction by the addition of an acid or a base, the acid or base itself not being consumed in the reaction. The catalytic reaction may be acid-specific (acid catalysis), as in the case of decomposition of the sugar sucrose into glucose and fructose in sulfuric acid; or base-specific (base catalysis), as in the addition of hydrogen cyanide to aldehydes and ketones in the presence of sodium hydroxide. Many reactions are catalyzed by both acids and bases.

The mechanism of acid- and base-catalyzed reactions is explained in terms of the Brønsted-Lowry concept of acids and bases as one in which there is an initial transfer of protons from an acidic catalyst to the reactant or from the reactant to a basic catalyst. In terms of the Lewis theory of acids and bases, the reaction entails sharing of an electron pair donated by a base catalyst or accepted by an acid catalyst.

Acid catalysis is employed in a large number of industrial reactions, among them the conversion of petroleum hydrocarbons to gasoline and related products. Such reactions include decomposition of high-molecular-weight hydrocarbons (cracking) using alumina-silica catalysts (Brønsted-Lowry acids), polymerization of unsaturated hydrocarbons using sulfuric acid or hydrogen fluoride (Brønsted-Lowry acids), and isomerization of aliphatic hydrocarbons using aluminum chloride (a Lewis acid).

Among industrial applications of base-catalyzed reactions is the reaction of diisocyanates with polyfunctional alcohols in the presence of amines, used in the manufacture of polyurethane foams.

acid-base reaction, a type of chemical process typified by the exchange of one or more hydrogen ions, H⁺, between species that may be neutral (molecules, such as water, H₂O; or acetic acid, CH₃CO₂H) or electrically charged (ions, such as ammonium, NH₄⁺; hydroxide, OH⁻; or carbonate, CO₃²⁻). It also includes analogous behaviour of molecules and ions that are acidic but do not donate hydrogen ions (aluminum chloride, AlCl₃, and the silver ion Ag⁺).

A brief treatment of acid-base reactions follows. For full treatment, see MACROPAEDIA: Chemical Reactions.

Typical acid-base reactions can be represented by the equation:

where A⁻ and B are conjugate bases of the acids HA and BH⁺, respectively; similarly, HA and BH⁺ are the conjugate acids of the bases A⁻ and B.

In such generalized equations the presence or absence of an electric charge on any particle does not necessarily indicate the net charge on the particle in question. It merely shows that an acid has one more positive or one less negative charge than its conjugate base, and conversely that a base has one less positive charge or one more negative charge than its conjugate acid.

Among the most important reactions involving acids and bases are their dissociation in water and in nonaqueous solvents, the self-dissociation of amphoteric solvents, neutralization, and the hydrolysis of salts.

When a molecular acid, such as acetic acid, is in an aqueous solution, water acts as a base, or proton acceptor, as in the equation

When a base is in an aqueous solution, water acts as an acid, or proton donor, as in the equation

The dissociation of acids and bases in nonaqueous solvents is analogous to the comparable reactions in water.

acid dye, any bright-coloured synthetic organic compound whose molecule contains two groups of atoms—one acidic, such as a carboxylic group, and one colour-producing, such as an azo or nitro group. Acid dyes are usually applied in the form of their sodium salts, chiefly on wool but also on silk and, to a limited extent, in combination with a mordant, or fixing agent, on cotton and rayon. These dyestuffs produce bright, usually fast shades in a wide range of colours.

acid halide, neutral compound that reacts with water to produce an acid and a hydrogen halide. Acid halides are ordinarily derived from acids or their salts by replacement of hydroxyl groups by halogen atoms. The most important organic acid halides are the chlorides derived from carboxylic acids and from sulfonic acids. The carboxylic acid chlorides, called acyl halides, are generally more reactive than the sulfonic acid chlorides, called sulfonyl chlorides.

The acyl halides are highly reactive substances used primarily in organic syntheses to introduce the acyl group. They react with water, ammonia, and alcohols to give carboxylic acids, amides, and esters, respectively.

Most acyl halides are liquids insoluble in water. They have sharp odours and irritate the mucous membranes. Sulfonyl chlorides (RSO₂Cl) react with ammonia to form sulfonamides, including the sulfa drugs.

Common halides of inorganic acids include chlorosulfuric acid (ClSO₃H; formerly called chlorosulfonic acid) and sulfuryl chloride (SO₂Cl₂), corresponding to the replacement of one or both hydroxyl groups of sulfuric acid, H₂SO₄ or SO₂(OH)₂; thionyl chloride (SOCl₂), the chloride of sulfurous acid; phosphorus trichloride (PCl₃), the chloride of phosphorous acid; and phosphorus oxychloride (POCl₃, also called phosphoryl chloride), the chloride of phosphoric acid.

acid rain, form of precipitation containing a heavy concentration of sulfuric and nitric acids. The term is also commonly applied to snow, sleet, and hail that manifest similar acidification. Such precipitation has become an increasingly serious environmental problem in many areas of North America and Europe. Although this form of pollution is most severe in and around large urban and industrial areas, substantial amounts of acid precipitation may be transported great distances.

The process that results in the formation of acid rain generally begins with emissions into the atmosphere of sulfur dioxide and nitrogen oxide. These gases are released by automobiles, certain industrial operations (*e.g.*, smelting and refining), and electric power plants that burn such fossil fuels as coal and oil. The gases combine with water vapour in clouds to form sulfuric and nitric acids. When precipitation falls from the clouds, it is highly acidic, having a pH value of about 5.6 or lower. (The term pH is defined as the negative logarithm of the hydrogen ion concentration in kilograms per cubic metre. The pH scale ranges from 0 to 14, with lower numbers indicating increased acidity.) At several locations in the eastern United States and western Europe, pH values between 2 and 3 have been recorded. In areas such as Los Angeles, San Francisco, and Whiteface Mountain in New York, fog is often 10 or more times as acidic as the local precipitation.

Precipitation and fog of high acidity contaminate lakes and streams; they are particularly harmful to fish and other aquatic life in regions with thin soil and granitic rock, which provide little buffering to acidic inputs. It also has been discovered that aluminum is leached from the soil in such regions subjected to acid

precipitation, and that dissolved aluminum seems to be extremely toxic to aquatic organisms. All forms of acid precipitation have been found to damage various kinds of vegetation, including agricultural crops and trees, chiefly by inhibiting nitrogen fixation and leaching nutrients from foliage. In addition, these pollutants can corrode the external surfaces of buildings and other man-made structures.

acidosis, abnormally high level of acidity, or low level of alkalinity, in the body fluids, including the blood. Acidosis may be respiratory or metabolic in origin. The former may result from excess retention of carbon dioxide because of faulty oxygen-carbon dioxide exchange in the lungs, or it may result from abnormalities of the chest bellows, from constrictions of the air passages, or from such diseases as emphysema and severe pneumonia. The latter may result from the inability of diseased kidneys to excrete the acids produced within the body. It may also accompany diabetes mellitus, severe diarrhea, or starvation, conditions that involve either the accumulation of acids in the system or the loss of alkali. It may also be brought on by drugs or anesthesia. *Compare* alkalosis.

Acérières Réunies de Burbach-Eich-Dudelange: see ARBED SA.

Ačinsk (Russia): see Achinsk.

Acireale, town and episcopal see, Catania *provincia*, eastern Sicily, Italy, on terraces above the Ionian Sea at the foot of Mount Etna, 7 miles (11 km) northeast of Catania. Known as Aquilia by the Romans, the town was called Reale by Philip IV of Spain in 1642. The first part of its name is derived from the ancient Acis River, which according to legend welled forth at the death of the shepherd Acis, beloved by the Nereid Galatea. Much of the present town was built after the earthquake of 1693. Notable landmarks include the cathedral (1597-1618), with a modern facade; the Baroque church of San Sebastiano; the town hall (1659) containing a library, museum, and picture gallery; an observatory; a fruit experimental station; and the sulfur springs called Santa Venera.

A noted spa since Roman times, Acireale is a climatic and mineral-water resort with a fine beach. Mineral water, wine, and citrus fruit are exported, and textiles and leather goods are produced. Pop. (1990 est.) mun., 47,294.

Acis, in the Greek mythology of Ovid, the son of Faunus (Pan) and the nymph Symaethis. He was a beautiful shepherd of Sicily, the lover of the Nereid Galatea. His rival, Polyphemus the Cyclops, surprised them together and crushed him to pieces with a rock. His blood, gushing forth from beneath, was metamorphosed by Galatea into a river bearing his name, Acis or Acinius, at the base of Mount Etna (the modern river Jaci). The story is known in no other extant source but Ovid.

ackee (tree): see akee.

Ackermann, Konrad Ernst (b. Feb. 1, 1710/12?, Schwerin, Mecklenburg [Germany]—d. Nov. 13, 1771, Hamburg), actor-manager, a leading figure in the development of German theatre.

Attracted to the theatre by reading the French playwright Molière and the Scandinavian writer Ludvig Holberg, although he was a trained scientist and surgeon, he joined the company of Johann Friedrich Schönemann in Lüneburg in 1740. Schönemann specialized in German adaptations of the French plays of Pierre Corneille, Jean Racine, Molière, and Voltaire, and Ackermann's initial training as an actor was along formal lines. In 1749 he married Sophie Charlotte Schröder, the leading lady of Schönemann's company, and with her and a good troupe toured in Russia, the Baltic states, and East Prussia for many years,

until the Seven Years' War forced him to move to the south and into Switzerland.

Gradually Ackermann developed a taste for domestic drama and a technique for parts in which he could mingle the comic and the sentimental. In 1765, with the actor and director Konrad Ekhof in his company, he built a modest playhouse in Hamburg. By opening night he was heavily in debt, dissension gripped his company, and the next year he had to lease his theatre, not regaining control over it until two years later. Shortly before his death he turned the management over to his stepson, Friedrich Ludwig Schröder, who was to bring Shakespeare to the German stage.

Ackermann, Louise-Victorine, *née* CHOQUET (b. Nov. 30, 1813, Paris, Fr.—d. Aug. 2, 1890, Nice). French poet who is best-known for works characterized by a deep sense of pessimism.

Educated by her father in the philosophy of the Encyclopédistes, she traveled to Berlin in 1838 to study German and there married (1843) Paul Ackermann, an Alsatian philologist. Two years later her husband died, and she went to live with her sister at Nice. There she wrote *Contes en vers* (1855; "Stories in Verse") and *Contes et poésies* (1862; "Stories and Poetry"), but her real reputation rests on the *Poésies, premières poésies, poésies philosophiques* (1874; "Poetry, First Poetry, Philosophical Poetry"), a volume of sombre and powerful verse, expressing her revolt against human suffering.

Aclla Cuna (Inca religion): see Chosen Women.

Acmeist, Russian АКМЕИСТ, plural АКМЕИСТЫ, member of a small group of early-20th-century Russian poets reacting against the vagueness and affectations of Symbolism. It was formed by the poets Sergey Gorodetsky and Nikolay S. Gumilyov. They reasserted the poet as craftsman and used language freshly and with intensity. Centred in St. Petersburg, the Acmeists were associated with the review *Apollon* (1909-17). In 1912 they founded the Guild of Poets, whose most outstanding members were Anna Akhmatova and Osip Mandelstam. Because of their preoccupation with form and their ivory-tower aloofness, the Acmeists were regarded with suspicion by the Soviet regime. Gumilyov was executed in 1921 for his alleged activities in an anti-Soviet conspiracy. Akhmatova was silenced during the most productive years of her life, and Mandelstam died after long internment in a concentration camp.

acne, any inflammatory disease of the sebaceous, or oil, glands of the skin. There are some 50 different types of acne. In common usage, the term acne is frequently used alone to designate acne vulgaris, or common acne, probably the most prevalent of all chronic skin disorders.

Acne vulgaris results from an interplay of heredity factors, hormones, and bacteria. In susceptible individuals, it begins in the teen years, being caused by overactive sebaceous glands, which are stimulated by the upsurge in the circulating level of male sex hormones that accompanies the onset of puberty. The primary lesion of acne vulgaris is the comedo, or blackhead, which consists of a plug of sebum (the fatty substance secreted by a sebaceous gland), cell debris, and microorganisms (especially the bacterium *Propionibacterium acnes*) filling up a hair follicle. Comedones may be open, their upper or visible portion being darkened by oxidative changes; or they may be closed (*i.e.*, not reaching the surface to be extruded), in which case, they may be starting points for pustules and deep inflammatory lesions.

The severity of acne is divided generally into four grades. In grade 1, comedones may be sparse or profuse but there is little or no in-

flammation. In grade 2, comedones are intermingled with superficial pustules and papules (small, solid, usually conical elevations). The lesions are ordinarily confined to the face and do not produce significant scarring, unless there has been continued scratching and picking. At this stage, topical (locally applied) medication is reasonably effective. Complete spontaneous remission is ordinarily seen within one to two years. In grades 3 and 4, the acne is characterized by comedones and pustules and deeper inflamed nodules, which are thought to result from the rupture of the sebaceous duct, with extrusion of sebum and bacterial products into the skin tissue. The lesions are likely to extend from the face to the neck and upper trunk and to produce a permanent scarring of the skin.

The course of acne vulgaris is variable, persistence being ordinarily directly related to the severity of the lesions, although changes of climate and emotional stress may markedly improve or exacerbate the acne lesions. Methods of treatment vary from topical medication to sunlight and ultraviolet light, antibiotics, and hormones. In a high proportion of cases, however, the tendency is toward spontaneous cure over several months.

Acoemeti, also called ACOEMETAE (Medieval Latin), Late Greek ΑΚΟΙΜΕΤΟΙ, monks at a series of 5th- to 6th-century Byzantine monasteries who were noted for their choral recitation of the divine office in constant and never interrupted relays. Their first monastery, at Constantinople, was founded in about 400 by St. Alexander Akimetes, who, after long study of the Bible, put into practice his conviction that God should be perpetually praised; he arranged for relays of monks to relieve one another without pause in the choir offices. They also practiced absolute poverty and were vigorous missionaries. The idea of ceaseless singing, new to Eastern monasticism, attracted so many monks from other convents that hostility toward Alexander developed. Driven from Constantinople, he founded another monastery in Bithynia. After his death, in about 430, his successor, Abbot John, transferred the foundation to Irenaion (modern Tchiboukli) on the Asian shore of the Bosphorus, where the local people gave the monks the name of Acoemeti ("Sleepless Ones"). In their enthusiastic attacks on the Monophysites, the Acoemeti were charged with error, and little is heard of them after the 6th century, when they were excommunicated by Pope John II. Later (the date is unknown), they moved their monastery to Constantinople, and they are known to have been in existence as late as the 12th century.

Acoli (people): see Acholi.

acolyte (from Greek *akolouthos*, "server," "companion," or "follower"), in the Roman Catholic church, a person is installed in a ministry in order to assist the deacon and priest in liturgical celebrations, especially the eucharistic liturgy. The first probable reference to the office dates from the time of Pope Victor I (189-199), and it was mentioned frequently in Roman documents after the 4th century. Acolytes also existed in North Africa but were unknown outside Rome and North Africa until the 10th century, when they were introduced throughout the Western Church. The Council of Trent (1545-63) defined the order and hoped to reactivate it on the pastoral level, but it became only a preparatory rite, or minor order, leading to the priesthood. A directive of Pope Paul VI (effective Jan. 1, 1973) decreed that the office of acolyte should no longer be called a minor order but a ministry and that it should be open to laymen.

In the Eastern Church, the order of acolytes was not accepted. In Anglican and Lutheran

churches, acolytes are generally laypersons who light the candles at church services.

Acoma, Indian pueblo, Valencia county, west-central New Mexico, U.S. The pueblo lies 55 miles (89 km) west-southwest of Albuquerque and is known as the "Sky City." Its inhabitants live in terraced dwellings made of stone and adobe atop a precipitous sandstone butte 357 feet (109 m) high. They have always engaged in farming (on the plains below) and pottery making. Believed to be the oldest continuously inhabited place in the area of the United States (since the 10th century), it was described by the conquistador Francisco Vázquez de Coronado in 1540 as the strongest defensive position in the world. The massive mission church of San Esteban Rey was built

Church of San Esteban Rey, Acoma, N.M.

there in 1629–41; its 30-foot (9-metre) log beams were carried from the Cebollita Mountains (30 miles [50 km] southwest) and, with dirt for its graveyard, were hauled up from below. Access is now gained either by a staircase cut into the rock or by a vehicular road. The pueblo's name comes from the Keresan Indian language: *ako* meaning "white rock" and *ma*, "people." About 3 miles (5 km) northeast is the Enchanted Mesa, another butte rising 430 feet (130 m) above the surrounding plain, which is believed by the Acoma Indians to be the dwelling place of their nature gods.

Acominatus, **Nicetas**: see Choniates, Nicetas.

Aconcagua, **Mount**, Spanish CERRO ACONCAGUA, mountain in Argentina. It is commonly regarded as the highest summit in the Western Hemisphere, rising 22,834 feet (6,960 m) above sea level. Aconcagua lies in the northern Andes, its peak being in Mendoza province, in northwestern Argentina, but its western flanks build up from the coastal lowlands of Chile, just north of Santiago. It is of volcanic origin, but it is not itself a volcano. The first attempted ascent, made in 1883, failed; the summit was first reached in 1897 by Matthias Zurbriggen.

Aconcagua River, Spanish RÍO ACONCAGUA, river in central Chile. It rises in the Andes in the northwestern foothills of Mount Aconcagua and flows westward from the Argentine border area through Valparaíso region to enter the Pacific Ocean north of Viña del Mar after a course of 120 miles (190 km). Much of the Chilean trackage of the Transandine Railway to Mendoza, Arg., follows the river valley.

Aconcio, **Giacomo**, Aconcio also spelled ACONZIO, Latin JACOBUS ACONTIUS (b. Sept. 7, 1492, Trent [now Trento, Italy]—d. 1566?, England), advocate of religious toleration during the Reformation whose revolt took a more extreme form than that of Lutheranism.

Aconcio served as secretary to Cristoforo Madruzzo, a liberal cardinal. When the more

conservative Paul IV became pope, Aconcio repudiated Roman Catholic doctrine, left Italy, and eventually found refuge in England. He arrived soon after the accession of Queen Elizabeth I (1558).

On his arrival in London, Aconcio joined the Dutch Reformed Church; before reaching England, however, he had published a treatise on methods of scientific investigation, and his critical spirit made it difficult for him to remain within any of the recognized religious societies. He was later excluded from the sacraments, partly because he was considered to hold Anabaptist beliefs (in the baptism of adult believers) and Arian (anti-Trinitarian) opinions and partly because he defended the radical pastor Adrian Haemstede, who had previously been excommunicated.

In his *Satanae stratagemata* (1565) Aconcio identified the dogmatic creeds that divide the church as the "stratagems of Satan." In the hope of finding a common denominator for the various creeds, he sought to reduce dogma to a minimum.

aconite, any member of two genera of perennial herbs of the buttercup family (Ranunculaceae): *Aconitum*, consisting of summer-flowering poisonous plants (see monkshood), and *Eranthis*, consisting of spring-flowering ornamentals (see winter aconite).

Acontius, in Greek legend, a beautiful youth of the island of Ceos. During the festival of Artemis at Delos, Acontius saw and loved Cypippe, a girl of a rich and noble family. He wrote on an apple the words "I swear to wed Acontius" and threw it at her feet. She picked it up and mechanically read the words aloud, thus binding herself by an oath. Thereafter, although she was betrothed more than once, she always fell ill before the wedding took place. The Delphic oracle at last explained the matter, and she married Acontius.

Açores, **Arquipélago dos** (Atlantic Ocean): see Azores.

acorn and nut weevil, any of about 45 species of weevils that make up the subfamily Curculioninae of the family Curculionidae (order Coleoptera). The insects have extremely long and slender snouts, which in females can be almost twice the body length. Eggs are deposited in holes bored in the nut. These weevils are common in both Europe and North

Nut weevil (*Balaninus nucum*)

Jacques Six

America. Different species prefer certain nuts: *Curculio proboscides* attacks large chestnuts, for example, and *C. rectus* and *C. baculi* feed on acorns.

acorn worm, also called ENTEROPNEUST, any of the soft-bodied invertebrates of the class Enteropneusta, phylum Hemichordata. The front end of these animals is shaped like an acorn, hence their common name. The "acorn" consists of a proboscis and a collar that may be used to burrow into soft sand or mud. The animals vary in length from about 5 cm (about 2 inches) in certain *Saccoglossus* species to more than 180 cm (about 6 feet) in *Balanoglossus gigas*.

Acorn worms live along the seashore and in

water to depths of more than 3,200 m (10,500 feet). Most live in U-shaped burrows, but some deepwater species swim freely over the bottom. They filter food from seawater that passes into the mouth and out through the gill slits. Some species secrete a slime that is swept into the mouth by cilia, or tiny hairs, carrying food particles with it.

Paired gonads are located next to the gills, which lie behind the collar. Females of some species lay a few large eggs with much yolk; others lay many small eggs with little yolk. Some hatch into miniature acorn worms; others hatch into an immature form called tornaria larva.

acosmism, in philosophy, the view that God is the sole and ultimate reality and that finite objects and events have no independent existence. Acosmism has been equated with pantheism, the belief that everything is God. G.W.F. Hegel coined the word to defend Benedict de Spinoza, who was accused of atheism for rejecting the traditional view of a created world existing outside God. Hegel argued that Spinoza could not be an atheist because pantheists hold that everything is God, whereas atheists exclude God altogether and make a godless world the sole reality. Furthermore, because Spinoza's cosmos is part of God, it is not what it seems to be. He is acosmistic insofar as "noncosmic" seems to deny the cosmos—a position, however, very alien to Spinoza's thought.

Acosmism has also been used to describe the philosophies of Hindu Vedānta, Buddhism, and Arthur Schopenhauer; and Johann Gottlieb Fichte used the term to defend himself against accusations similar to those leveled against Spinoza.

Acosta, **Joaquín** (b. Dec. 29, 1799/1800, Guaduas, New Granada [now in Colombia]—d. Feb. 21, 1852, Guaduas, Colom.), Colombian scientist, historian, and statesman who sought to preserve knowledge of his country's early history.

Acosta entered a military career in 1819, becoming an officer in the patriot army under Simón Bolívar. He subsequently became a member of virtually all the scientific and civic societies that were founded in Colombia in his lifetime and contributed generously to the national library and university. On various occasions he was a general, diplomatic envoy, secretary of foreign affairs, and member of Congress; in 1842 he was ambassador in Washington, D.C.

In 1841 he first expressed his intent to reprint some of the chronicles originating during the period of Spanish discovery and colonization, but he abandoned his plan on recognizing that the accounts were incomplete, factually inaccurate, and archaic in language. To fill what he considered a civic need, he composed his *Compendio histórico del descubrimiento y colonización de la Nueva Granada en el siglo décimosexto* ("Historical Compendium of the Discovery and Colonization of New Granada in the 16th Century"), which was published in Paris in 1848. This work covers in 20 chapters the eventful years from Christopher Columbus' earliest landings and explorations on the mainland in 1498 to the death in 1579 of the conqueror of New Granada, Gonzalo Jiménez de Quesada. The account is based partly on Acosta's findings in Colombian archives, partly on his research in the Archives of the Indies in Spain, and partly on his travels throughout Colombia during military operations. Acosta also wrote many shorter historical and scientific works.

Acosta, **José de** (b. 1539, Medina del Campo, Spain—d. Feb. 15, 1600, Salamanca), Jesuit theologian and missionary to the New World, chiefly known for his *Historia natural y moral de las Indias*, the earliest survey of the New World and its relation to the Old.

His works, missionary and literary, mark the end of the period of the religious and scientific incorporation of the newly discovered lands into Western culture.

Acosta joined the Jesuits in 1570, going as a missionary to Peru in 1571. Having been provincial of his order there (1576–81), he was appointed theological adviser to the Third Provincial Council of Lima (1582), later writing a catechism in local Indian languages, the first book printed in Peru. On returning to Spain in 1587, he wrote *Historia natural y moral de las Indias* (1590; *Natural and Moral History of the Indies*), which attempted to place his observations of the physical geography and natural history of Mexico and Peru (including the aboriginal religious and political institutions) in the context of contemporary Jesuit and scientific thought. Acosta's work is especially valuable as a firsthand account of western South America at this time, based on his 16 years' life and travel in the region.

Acosta led the opposition to Claudio Aquaviva (the general of the Jesuits), helping to call the fifth Jesuit congregation to redress alleged grievances. The reformers' proposals were rejected and Acosta was imprisoned (1592–93). After submitting in 1594 Acosta became superior of the Jesuits at Valladolid and rector of the Jesuit college at Salamanca (1598), where he remained until his death.

Acosta's other significant study is the *De procuranda indorum salute* (1588), a systematic examination of the problems of missionary work among the newly discovered "pagans" of the New World.

Acosta, Uriel, original name GABRIEL DA COSTA (b. c. 1585, Oporto, Port.—d. April 1640, Amsterdam, Neth.), freethinking rationalist who became an example among Jews of one martyred by the intolerance of his own religious community. He is sometimes cited as a forerunner of the renowned philosopher Benedict de Spinoza.

The son of an aristocratic family of Marranos (Spanish and Portuguese Jews forcibly converted to Roman Catholicism), Acosta studied canon law and became the treasurer of a cathedral chapter. Disturbed by the conviction that there was no salvation through the Roman Catholic church, he turned to the Judaism of the Old Testament. After converting his mother and brothers to his beliefs, he and the family fled to Amsterdam and embraced Judaism. After circumcision, he took Uriel as his given name.

Acosta soon discovered, however, that the prevailing form of Judaism was not a biblical one but, rather, an elaborate structure based on rabbinic legislation. Stunned, he formulated 11 theses (1616) attacking rabbinic Judaism as nonbiblical, for which he was excommunicated. Acosta then prepared a larger work condemning rabbinic Judaism and denying the immortality of the soul (1623–24). For this denial, the Amsterdam magistracy arrested and fined him and deprived him of his books. A sensitive soul, Acosta found it impossible to bear the isolation of excommunication, and he recanted. Excommunicated again after he was accused of dissuading Christians from converting to Judaism, he made a public recantation in 1640 after enduring years of ostracism. This humiliation shattered his self-esteem, and, after writing a short autobiography, *Exemplar Humanae Vitae* (1687; "Example of a Human Life"), he shot himself. Acosta's *Exemplar* depicted revealed religion as disruptive of natural law and a source of hatred and superstition. In contrast, he advocated a faith based on natural law and reason.

acouchi, either of two species of South American rodents of the genus *Myoprocta*, family Dasyproctidae, which resemble the related agouti. Weighing 600 to 1,300 g (21 to 45.5 ounces), acouchis range in size from 32 to 38 cm (12.5 to 15 inches) long, with 4.5- to

7-centimetre (2- to 3-inch) tails that are white-haired below. The acouchi's coarse fur is reddish or greenish, with yellowish patches on the side of the head. Acouchis eat sitting on their haunches, hoard extra food, and stamp their feet when alarmed.

acoustic impedance, absorption of sound in a medium, equal to the ratio of the sound pressure at a boundary surface to the sound flux (flow velocity of the particles or volume velocity, times area) through the surface. In analogy to electrical circuit theory, pressure corresponds to voltage, volume velocity to current, and acoustic impedance is expressed as a complex number, the real part being referred to as the resistance and the imaginary part the reactance.

acoustic interferometer, device for measuring the velocity and absorption of sound waves in a gas or liquid. A vibrating crystal creates the waves that are radiated continuously into the fluid medium, striking a movable reflector placed accurately parallel to the crystal source. The waves are then reflected back to the source. The strength of the standing wave pattern set up between the source and the reflector as the distance between source and reflector is varied, or as the frequency is varied, indicates the absorption by the medium. The velocity at which the waves travel may be determined from the distance between the peaks in the pattern of standing waves. This method has been brought to a high degree of accuracy and has been used for determining the characteristics of seawater for sonar applications.

acoustic meatus, external: see external auditory canal.

acoustic nerve: see vestibulocochlear nerve.

acoustic neuroma, benign tumour on the vestibulocochlear nerve (also called acoustic nerve) near its point of entry into the inner ear. The tumour, though benign, may spread into the brain cavity if not detected in its first stages. Early symptoms include mild unilateral hearing impairment, tinnitus (ringing in the ear), and sometimes dizziness. If the tumour has extended into the brain cavity, headache and paralysis are experienced. Treatment of acoustic neuroma is surgical excision.

acoustic trauma, physiological changes in the body caused by sound waves. Sound waves cause variations in pressure, the intensity of which depends upon the range of oscillation, the force exerting the sound, and the distribution of waves.

Excessive noise exposures can cause hearing loss and produce physical damage to the components of the ear. The ability to interpret sounds can decrease as a result of continuous exposures to sound waves of sufficient intensity and duration. Hearing loss can be caused by damage to the middle ear, tympanic membrane (eardrum), and inner ear. The hair cells that line the inner ear and take part in the process of hearing can be irreversibly damaged by excessive noise levels. Intense sound blasts can rupture the tympanic membrane and dislocate or fracture the small bones of the middle ear. Hearing loss that comes from middle-ear damage can sometimes be corrected. A ruptured membrane usually heals in time, restoring most of the hearing loss. The small bones of the ear may be repaired or replaced by surgery. Pain felt in the ears from sound waves serves as a warning that the threshold for damage has been reached.

Nonauditory effects of acoustic energy can also occur; most of these can be prevented by use of ear protection devices. The body's equilibrium is partially controlled by the vestibular system in the ears; high-level noise may cause disorientation, motion sickness, and dizziness. Noise does not usually affect the speed at which work is performed; it may increase the

number of errors, however. More constant noises of moderate to high levels cause stress, fatigue, and irritability.

acoustics, the science concerned with the production, control, transmission, reception, and effects of sound.

A brief treatment of acoustics follows. For full treatment, see MACROPAEDIA: Sound.

Sound is one of the pervasive elements of man's environment. The sound in any given setting is characterized by a number of qualities, including intensity (or loudness), information content, reverberation, clarity, and so on. The acoustical engineer attempts to find optimal values of these qualities for particular settings and purposes and then to design physical means for attaining those values.

Acoustics is generally divided into several branches, the principal ones of which are architectural acoustics and environmental acoustics. Other significant fields include musical acoustics, which deals with the principles governing the operation and design of musical instruments and the way musical sounds affect listeners; engineering acoustics, which is concerned chiefly with the development of high-fidelity sound recording and reproduction systems; and ultrasonics, which involves research into acoustical phenomena whose vibration rate is above the audible range (*i.e.*, roughly 20,000 hertz) and their application in industry and biomedical science.

Architectural acoustics focuses on the behaviour of sound waves in closed spaces and on those factors crucial to creating optimal acoustical conditions for different applications. The best-known application of acoustical engineering is in the design of concert halls and auditoriums, where the quality of sound is of critical importance. The characteristics of loudness and distribution of sound, reverberation time, and balance of direct and reflected sound will depend on such design variables as the form and dimensions of the hall, the materials used to finish the walls and especially the ceiling, the arrangement of seats and the materials used to cover them, the placement of special reflecting surfaces, the use of amplification, and the presence of such stage furnishings as curtains and draperies.

Environmental acoustics deals primarily with the problem of noise control. Noise from jet aircraft, factories, heavy construction machinery, and automobiles has become a problem in large urban areas. Control of such forms of noise pollution ranges from efforts to produce quieter machines through the use of absorbent mountings to more careful fabrication of moving parts so as to reduce vibrations that give rise to noise. Noise in office and residential buildings has been curbed by the utilization of improved insulation materials in walls, the erection of suitably designed room partitions, and other procedures.

Acquaviva, Claudio: see Aquaviva, Claudio.

acquired character, in biology, modification in structure or function acquired by an organism during its life, caused by environmental factors. With respect to higher organisms, there is no evidence that such changes are transmissible genetically—the view associated with Lamarckism—but, among protozoans and bacteria, certain induced changes are heritable.

acquired immune deficiency syndrome: see AIDS.

acquittal, in criminal law, acknowledgment by the court of the innocence of the defendant or defendants. Such a judgment may be made by a jury in a trial or by a judge who rules that there is insufficient evidence either for conviction or for further proceedings. An acquittal

removes all guilt in law. An acquittal "in fact" occurs when a jury finds the defendant not guilty. An acquittal "in law" occurs through the mere operation of law. For instance, if the principal in a case is acquitted, an accessory also is deemed acquitted in law.

Acquittal has other meanings. In the Middle Ages it was an obligation of an intermediate lord to protect his tenants against interference from his own overlord. The term is also used in contract law to signify a discharge or release from an obligation.

Acrasieae, class name for cellular SLIME MOLDS (division Myxomycophyta). The class contains a single order, Acrasiales, and about a dozen species. The vegetative phase of these slime molds consists of amoeba-like cells (myxamoebas) that group together ultimately to form a fruiting (reproductive) structure.

Acre, westernmost *estado* (state) of Brazil. Acre covers the southwesternmost part of Brazil's Hiléia (Hylea), the forest zone of the Amazon River basin. Bounded north by Amazonas state, it has western and southern frontiers with Peru and southeastern with Bolivia and has an area of 58,915 sq mi (152,589 sq km). The capital is Rio Branco on the Rio Acre in the eastern part of the state. The state's name is derived from that of the Rio Acre, which seems to be of Indian origin. Covered by tropical rain forest, Acre produces the highest quality rubber in Brazil.

Portuguese explorers, making their way through the immense Amazon forest from the Atlantic estuary of the Amazon River, did not reach Acre before the middle decades of the 18th century, when there were no settled inhabitants but only roving bands of Indians. Under the Brazilian Empire, more expeditions began to penetrate the territory in the 1850s and 1860s; and although the whole area was ceded by Brazil to Bolivia in 1867 (by the Treaty of Ayacucho), the rubber boom of the following decades attracted more and more immigrants from northeastern Brazil. In 1899, during a local revolution, an independent Republic of Acre was proclaimed by Luís Gálvez Rodríguez, a Spanish adventurer, but this regime was short-lived. After further vicissitudes, negotiations sponsored by Brazil's foreign minister culminated in 1903 in the Treaty of Petropolis, whereby Acre was reincorporated with Brazil. The frontier with Peru was agreed upon in 1909. Organized at first as a territory, Acre achieved statehood in 1962.

With an average elevation of 600 ft (183 m) above sea level, the land slopes gently down toward the Amazonian Plain from the higher ground in the west and south. An average annual temperature of 77° F (25° C) and an annual rainfall of 79–98 in. (2,000–2,500 mm) makes the climate warm and humid. The forest is traversed by headstreams of two of the Amazon's major tributaries, the Juruá and the Purus. The principal trees of the forest are rubber and Brazil nut. The fauna include peccaries (piglike animals), red deer, capybaras (rodents with no tail and partly webbed feet), agoutis (short-haired, short-eared rodents), and tapirs (large, hooved quadrupeds).

The local Indian tribes are few and small, most of Acre's population consisting of immigrants, or descendants of immigrants, from northeastern Brazil. The overwhelming majority of the people live on the rivers and tracks that give access to the raw materials of the forests; the remainder live in the towns. The largest city is Rio Branco. Other major towns are Cruzeiro do Sul, Sena Madureira, Tarauacá, and Feijó. The common language is Portuguese, the predominant religion Roman Catholicism. Amoebic dysentery, malaria, and leprosy are the major endemic diseases.

Acre's chief natural resource is rubber, which constitutes the majority of the state's exports; it is Brazil's leading producer of that commodity. Brazil nuts are the next most important natural product of the forest.

Agriculture, which is only of the subsistence type, is concerned with short-cycle crops, chiefly cassava (manioc), corn (maize), and beans. Zebus (humped oxen) are being raised on the open-range system, but this activity is still at an early stage; pigs and chickens are bred quite widely.

Rivers are the main channels of communication. Rio Branco is connected with Manaus, capital of Amazonas, by the Rio Acre-Purus-Amazon linkage and with Brasília—the federal capital—by a land highway; there are also air services connecting Rio Branco with both places. Pop. (2000 prelim.) 557,337.

Acre (Israel): *see* 'Akko.

acre, unit of land measurement in the British Imperial and U.S. Customary systems, equal to 43,560 square feet, or 160 square rods. One acre is equivalent to 0.4047 hectares (4,047 square metres). Derived from the Latin *ager* ("field"), the term acre originated in the primitive technique of measuring land by the oxen needed to plough it or the seed needed to sow it. The Anglo-Saxon acre was defined as a strip of land $1 \times \frac{1}{10}$ furlong, or 40 x 4 rods (660 x 66 feet). "Acre" gradually came to mean a piece of land of any shape measuring the present 4,840 square yards. Larger variant acres include the Scottish, the Irish, and the Cheshire.

Acre River, Portuguese RIO ACRE, river, chiefly in western Brazil, rising on the Peruvian border, along which it continues eastward to form part of the Brazil-Bolivia border. Turning north at Brasília, the remainder of its 400-mi (645-km) course flows in a north-northeasterly direction, through the Brazilian states of Acre and Amazonas, to join the Rio Purus, a tributary of the Amazon, at Bôca do Acre. It was formerly called the Aquiri.

acriflavine, dye obtained from coal tar, introduced as an antiseptic in 1912 by the German medical-research worker Paul Ehrlich and used extensively in World War I to kill the parasites that cause sleeping sickness. The hydrochloride and the less irritating base, neutral acriflavine, both are odourless, reddish-brown powders used in dilute aqueous solutions primarily as topical antiseptics or given orally as urinary antiseptics. Once used in the treatment of gonorrhoea, acriflavine has been replaced by the antibiotics.

acrobatics (Greek: "to walk on tip-toe," or "to climb up"), the specialized and ancient art of jumping, tumbling, and balancing, often later with the use of such apparatus as poles, one-wheel cycles, balls, barrels, tightropes, trampolines, and flying trapezes.

In 1859 the invention of the flying trapeze by J. Léotard, as well as Charles Blondin's crossing of Niagara Falls on a tightrope, rekindled public interest in aerial gymnasts and acrobats. Although the trapeze had never been seen before, ropedancing can be traced back to ancient Greece.

By the turn of the century, acrobatics were important in the circus. About 1900 the Schefers, Craggs, Hanlon-Voltas, Sandow, Lauck and Fox, Cinquevalli, Caicedo, and the Potters were the most prominent European and U.S. acrobats. Later, the Concellos and Codonas on the flying trapeze, Con Colleano on the tightwire, and the juggler Enrico Rastelli captivated audiences with their skill and daring. Popular mid-20th-century acrobats were the Wallendas, a family of high-wire artists originally from Germany. Traditionally, acrobatics and tumbling were the province of eastern Europeans.

Acrobatics are performed in fairgrounds, cir-

cuses, and theatres. They are also related to movements of modern gymnastics and of certain theatre genres, such as the Peking Opera.

acrocephalosyndactyly, also called APERT'S SYNDROME, congenital malformation of the skeleton, affecting the skull, hands, and feet, first described by the French pediatrician Eugène Apert. The head is shortened front-to-back and appears pointed (acrocephaly) because of premature closing of the cranial sutures between the individual bones that make up the skull. The bones and skin of the hands and feet are fused (syndactyly), reducing the normal complement of fingers and toes; in some cases, all five digits may fuse. The skull deformity causes the eyes to appear to bulge because the orbits are shallower than normal. *See also* craniosynostosis.

acrocyanosis, uneven reddish-blue discoloration of the hands caused by spasms in arterioles (small arteries) of the skin. Less commonly the feet are affected. The fingers, or toes, are usually cold and sweat copiously. The condition may be the result of an endocrine disorder or of some anxiety state. It is most common in adolescents and those in the 20s and usually improves with age.

acrolith, statue, especially ancient Greek, in which the trunk of the figure was of wood and the head, hands, and feet of marble. The wood was either gilded or covered by real or metal drapery. Acroliths are known from the descriptions of Pausanias, a 2nd-century-AD Greek geographer and traveller, who mentions, for example, Phidias' acrolith of Athena at Plataea. This form of sculpture was practiced at least as late as the 4th century BC.

acromegaly, growth and metabolic disorder characterized by enlargement of the skeletal extremities. It is the result of overproduction of pituitary growth hormone (somatotropin) after maturity, caused by a tumour of the pituitary gland. Acromegaly is often associated with the abnormal growth in stature known as pituitary gigantism (*see* gigantism).

The onset of acromegaly is gradual. Hands and feet become enlarged; facial features are exaggerated as the jaw lengthens and the nose and brow ridge grow thicker; the skin thickens; and most internal organs enlarge. Headache, excessive sweating, and high blood pressure are other manifestations.

Acromegalic individuals are likely to develop congestive heart failure, particularly when blood pressure becomes high. Muscle weakness is frequent because muscle overgrowth produced by growth hormone decreases their capacity for work. At times, excessive overgrowth of bone edges involves the joints and produces pain. The bones may become thin and porous—a condition known as osteoporosis. Diabetes mellitus appears in 20 to 40 percent of acromegalic individuals because excesses of growth hormone block the action of insulin. If the pituitary tumour enlarges, it can produce visual-field defects, blindness or paralysis of the eye muscles, and can injure the posterior pituitary gland or the hypothalamus. Also, hemorrhage into the tumour can produce sudden loss of vision.

Acromegaly may be treated by surgical removal of the pituitary tumour or destruction of it by X-ray irradiation or liquid nitrogen. Rarely, the pituitary tumour will cease to secrete growth hormone because of a spontaneous hemorrhage or a blockage of the blood supply. Decreases in acromegalic manifestations and amelioration of diabetes mellitus have followed therapy with female hormones—estrogen or medroxyprogesterone—which reduce the secretion of growth hormone. For those treated by pituitary surgery, irradiation, or other measures and for those who spontaneously develop deficits of gonadal, thyroidal, or adrenocortical hormones, replacement-hormone therapy is necessary.

acropolis (Greek: "city at the top"), central, defensively oriented district in ancient Greek cities, located on the highest ground and containing the chief municipal and religious buildings. Because the founding of a city was a religious act, the establishment of a local home

The word was first applied to the prophecies of the Erythraean Sibyl, which were written on leaves and arranged so that the initial letters of the leaves always formed a word. Acrostics were common among the Greeks of the Alexandrine period, as well as with the

The Acropolis, Athens, second half of the 5th century BC, with the Parthenon at centre and the Erechtheum at left

Toni Schneiders

for the gods was a basic factor in Greek city planning. From both a religious and a military point of view, a hilltop site was highly desirable: militarily, because an acropolis had to be a citadel; religiously, because a hill was imbued with natural mysteries—caves, springs, copses, and glens—that denoted the presence of the gods.

Athens has the best-known acropolis, built during the second half of the 5th century BC. The Athenian acropolis, located on a craggy, walled hill, was built as a home of Athena, the patron goddess of the city. The structures that survive consist of the Propylaea, the gateway to the sacred precinct; the Parthenon (*q.v.*), the chief shrine to Athena and also the treasury of the Delian League; the Erechtheum (*q.v.*), a shrine to the agricultural deities, especially Erichthonius; and the Temple of Athena Nike, an architectural symbol of the harmony with which the Dorian and Ionian peoples lived under the government of Athens.

Acropolites, George (b. 1217, Constantinople, Byzantine Empire [now Istanbul, Turkey]—d. 1282, Constantinople), Byzantine scholar and statesman, the author of *Chronikē syngrophē*, a history of the Byzantine Empire from 1204 to 1261. He also played a major diplomatic role in the attempt to reconcile the Greek and Latin churches.

Acropolites was reared at the imperial court, then at Nicaea in Asia Minor. Entrusted with important state missions under the emperor John III Ducas Vatatzes and his successors, Theodore II Lascaris and Michael VIII Palaeologus, he was in 1244 made grand logothete (chancellor). Named governor of the western provinces by Theodore II, Acropolites was engaged (1257) as commander in the field against Michael Angelus, despot of Epirus. He was later captured but released, and he returned to Constantinople when it was retaken from the crusaders (1261). He represented Michael VIII in the negotiations for the reunion of the Western and Byzantine churches that led to the second Council of Lyon (1274), at which, in the emperor's name, he acknowledged the supremacy of Rome. In 1282 he was sent on an embassy to John II, emperor of Trebizond, and died soon after his return.

Acropolites' history of the Byzantine Empire reveals his firsthand knowledge of the events of his day. He also wrote theological and rhetorical works as well as some poems.

acrostic, short verse composition, so constructed that the initial letters of the lines, taken consecutively, form words. The term is derived from the Greek words *akros*, "at the end," and *stichos*, "line," or "verse."

Latin writers Ennius and Plautus, many of the arguments of whose plays were written with acrostics on their respective titles. Medieval monks were also fond of acrostics, as were the poets of the Middle High German and Italian Renaissance periods.

The term acrostic is also applied to alphabetical, or abecedarian, verses, in which each line after the first, which begins with *a*, uses a succeeding letter of the alphabet. Examples of these are some of the Psalms (in Hebrew), such as Psalms 25 and 34, where successive verses begin with the letters of the Hebrew alphabet in order.

Double acrostics are puzzles constructed so that not only the initial letters of the lines but in some cases also the middle or last letters form words. In the United States, the Double Crostic puzzle, devised by Elizabeth Kingsley for the *Saturday Review* in 1934, had an acrostic in the answers to the clues giving the author and title of a literary work; the letters, keyed by number to blanks like those of a crossword puzzle, spelled out a quotation.

acroterion, plural ACROTHERIA, in architecture, decorative pedestal for an ornament or statue placed atop the pediment of a Greek temple; the term has also been extended to refer to the statue or ornament that stands on the pedestal. Originally a petal-shaped ornament with incised pattern, such as the honeysuckle, was placed on the ridge and at the eaves at either side of the pediment. Later this ornamentation was developed into groups of statuary, as at the Temple of Apollo (420 BC) on the island of Delos; the crowning group is dominated by Eos, the dawn, being lifted up by the handsome god Cephalus. At first, acroteria were made of terra-cotta, as were the roof tiles; later they were made of stone. The acroteria of the Apollo temple are made of beautiful semitranslucent Pentelic marble.

The acroterion is sometimes incorporated

Acroteria

From M.S. Briggs, *Everyman's Concise Encyclopaedia of Architecture*. E.P. Dutton and Co. Inc., and J.M. Dent & Sons Ltd

into the design of furniture; for example, it can be placed in the broken pediment of a secretary bookcase.

Acrux (star): *see* Alpha Crucis.

acrylic compound, any of a class of synthetic plastics, resins, and oils used to manufacture many products. By varying the starting reagents and the process of forming, a material may be produced that is hard and transparent, soft and resilient, or a viscous liquid. Acrylic compounds are used to make molded structural and optical parts, jewelry, adhesives, coating compounds, and textile fibres. Orlon and Acrilan are trademark names of acrylic fibres; Lucite (*q.v.*) and Plexiglas are glasslike acrylic materials. *See also* vinyl compounds.

acrylic painting, painting executed in the medium of synthetic acrylic resins. Acrylics dry rapidly, serve as a vehicle for any kind of pigment, and are capable of giving both the transparent brilliance of watercolour and the density of oil paint. They are considered to be less affected by heat and other destructive forces than is oil paint. Because of all these desirable characteristics, acrylic paints became immediately popular with artists when they were first commercially promoted in the 1960s.

Act of ———: *see under* substantive word (*e.g.*, Settlement, Act of), except as below.

Act of Parliament clock, plain, hanging, weight-driven wall clock with a large wooden, painted or lacquered dial. The term Act of

Act of Parliament clock, painted wood with gilt enrichments, English, mid-18th century; in the Victoria and Albert Museum, London

By courtesy of the Victoria and Albert Museum, London

Parliament clock was applied incorrectly to these timepieces, which were thought to have been displayed by innkeepers to save their customers from paying a five-shilling duty on clocks in Great Britain, introduced in 1797 by the English prime minister William Pitt the Younger. (Many clocks were disposed of by their owners, and the effect on the clock-making industry was so disastrous that the act was repealed the following year.) Actually,

these clocks were first displayed in inns during the mid-18th century (before the duty was imposed), probably for the convenience of passengers when coaches began to run on a definite timetable, and are more correctly called tavern, or coaching inn, clocks.

Acta (Latin: "Acts"), in ancient Rome, minutes of public business and gazette of political and social events. They were in two forms: *Acta Senatus* and *Acta diurna*.

The *Acta Senatus*, or *Commentarii Senatus*, were the minutes of the proceedings of the Senate. The emperor Augustus continued to keep them but forbade their publication. From the reign of his successor, Tiberius, in the 1st century AD, a young senator drew up the *Acta*, which were kept in the imperial archives and public libraries. Special permission was necessary in order to examine them.

The *Acta diurna* (*Acta populi*, or *Acta publica*) grew out of Julius Caesar's arrangements for the publishing of official business and matters of public interest. Under the empire (after 27 BC) the *Acta diurna* constituted a type of daily gazette, and thus it was, in a sense, the prototype of the modern newspaper.

Actaeon, in Greek mythology, son of the god Aristaeus and Autonoe (daughter of Cadmus, the founder of Thebes in Boeotia); he was a Boeotian hero and hunter. According to Ovid's *Metamorphoses*, Actaeon accidentally saw Artemis (goddess of wild animals, vegetation, and childbirth) while she was bathing on Mount Cithaeron; for this reason he was changed by her into a stag and was pursued and killed by his own 50 hounds. In another version, he offended Artemis by boasting that his skill as a hunter surpassed hers.

The story was well-known in antiquity, and several of the tragic poets presented it on the stage (e.g., Aeschylus' lost *Toxotides*, "The Archeresses"). Actaeon was worshiped in Plataea and Orchomenus.

ACTH: see adrenocorticotrophic hormone.

actin, protein that is an important contributor to the contractile property of muscle and other cells. It exists in two forms: G-actin (monomeric globular actin) and F-actin (polymeric fibrous actin), the form involved in muscle contraction. In muscle, two long strands of beadlike actin molecules are twisted together to form a thin filament, bundles of which alternate and interdigitate with bundles of thick filaments formed of myosin, the most abundant protein found in muscle. Two other muscle proteins, tropomyosin and troponin, regulate the temporary fusion of actin and myosin; this fusion results in the contraction of muscle.

Actin and myosin have been found in dozens of other (nonmuscle) cells and are believed to be responsible for the contractile properties of animal cells generally.

acting, the performing art in which an actor by means of movement, gesture, and intonation attempts to realize a fictional character for the stage, for motion picture, and for television.

A brief treatment of acting follows. For full treatment, see MACROPAEDIA: Theatre, The Art of the.

A certain difficulty in defining what an actor does derives from the absence in Western theatre of a single tradition of acting technique. Innumerable choices confront the actor in his interpretation of the character, the dynamics of the movement, and the way he will speak the text. The traditional Asian actor, on the other hand, is faced with comparatively few choices. He must master each role down to the minutest details according to a tradition refined over centuries by the subtle innova-

tions of great actors. Within that rigid physical and vocal framework, he is then free to concentrate on spontaneity.

The ephemeral nature of acting also makes it difficult to place in a historical context. A performance exists only for the length of the play and has to be re-created each night. Until the advent of motion pictures and sound recording, there was no way of fixing a performance for all time, so there are only the written descriptions and paintings of contemporaries to indicate what the great actors of the past might have been like.

Most discussion on the craft of acting centres on an effort to understand relationships between the technical skill an actor requires and the sensibilities that lie beneath them, since the actor is both the instrument and the player. The most direct example of this is the question of an actor's emotion: How much of what an actor projects is genuine emotion and how much is feigned?

The history of acting has been paralleled by a search for systems that will lead to a more reliable understanding of the creative process that makes an actor. Aristotle doubted that acting could be taught at all, and more than 2,000 years later the issue remains unresolved. Denis Diderot's 18th-century essay *Paradox of Acting* stressed the need for control, concluding that if the actor is to move the audience, he must himself remain unmoved. How the actor could achieve this on cue several nights running remained to Diderot an unsolved problem.

In the late 19th century the Russian director Konstantin Stanislavsky suggested how the actor might recapture those moments when a performance had been truly inspired. Basing his work on an understanding of human psychology, Stanislavsky developed the concept of "affective memory." By focusing on a deep emotional experience in his past, he suggested, the actor could learn to stimulate a similar emotional state in the present and to channel it to the requirements of a particular scene. Stanislavsky also drew attention to the importance of subtext, the nuances that lay beneath the lines.

Some of Stanislavsky's ideas were adopted in the mid-20th century by Lee Strasberg at the Actors' Studio in New York City and popularized as "the method." This was partly based on misunderstanding, because Stanislavsky's writings in which he stressed the need for technique were not then available in translation. Nevertheless, the movement produced many fine screen actors.

The major influence on acting after Stanislavsky was the German dramatist Bertolt Brecht. He saw characters as representatives of the class struggle and required his actors to stand outside themselves in order to present more objectively the arguments of the play. A third influence was Jerzy Grotowski, the Polish director who in the 1960s introduced a new level of intensity to acting achievable through fiercely rigorous training of the voice and body. All three of these directors emphasized a more disciplined approach to the craft of acting through which the actor could build what Grotowski called "the physical score" of the role. Like the Asian actor, he would then be free to find a spontaneity without the performance losing its shape.

Two important areas of training today are in vocal and physical work. Vocal training aims to help the actor develop strength, expressiveness, and flexibility of voice so that he may portray a variety of characters. Similarly, physical training works to make the body supple and expressive. Physically the actor must operate in a state of concentrated alertness, for which he must find a balance between tension and relaxation. Improvisation, a favourite device of Stanislavsky's, is still at the core of the psychological aspects of training. It helps develop a sense of truthfulness in performance

and encourages the actor to listen and respond naturally to his partner.

The rehearsal process is a period of collaboration with the director and fellow actors to arrive at an interpretation for the character and the play as a whole. This is the time when the actor shapes his creation, testing and revising it until he arrives at a finished, repeatable work. Even after the opening night, a performance should continue to grow as the actor makes new discoveries within what he has created.

One of the preoccupations of 20th-century Western theatre has been the question of style—that is, not the manners and customs of a particular period but rather the specific content and reality of a particular play. The ways in which classic plays—such as those of Shakespeare, Molière, and Chekhov, for example—have been re-created for modern audiences reveal the range of acting styles possible. Performance style is thus (in Western theatre, at least) subject to change with the changing perceptions of succeeding generations.

In motion pictures and television the principles of acting are basically the same as they are for the stage, though truthfulness is even more crucial because the camera in close-up will easily expose any lack of concentration. In motion pictures, editing makes possible a composite performance compiled from several "takes," which has meant that some screen idols have succeeded on the screen through natural charm and looks alone. This is partly why screen actors sometimes lack the technical skills to work in the live theatre, whereas skilled stage actors can often successfully adapt to motion pictures and television.

not letter by letter*

actinide, any of a series of 15 consecutive chemical elements in the periodic table from actinium to lawrencium (atomic numbers 89–103).

A brief treatment of the actinides follows. For full treatment, see MACROPAEDIA: Chemical Elements. See also MICROPAEDIA for entries on each member of the series.

All the actinide elements are heavy metals that are unstable toward radioactive decay. Only four of them—actinium, thorium, protactinium, and uranium—occur in nature in appreciable quantities. The remaining 11 members from neptunium to lawrencium, which are frequently classified as transuranium elements, are produced artificially by bombardment of other related elements with high-energy particles. Uranium (or more properly its isotope uranium-235) is by far the most important actinide because of its fissionability—that is, the tendency of its nucleus to split into fragments of almost equal mass. The result of this fission is the release of large amounts of energy. Both uranium and plutonium are used in nuclear power plants for the production of electrical power and in nuclear bombs for their explosive power.

The actinide elements have a similar electronic structure, which is reflected by strong affinities in their chemical properties and behaviour. Actinides generally show several oxidation states. (When an element combines with others to form a compound, the number of electrons of its atoms that can be involved in the bonds of that particular compound is called the oxidation state of the element.) Most common among the actinides are the +3 and +4 oxidation states. The actinides in both these states bear a distinct resemblance to members of the lanthanide series in identical states. The lanthanides consist of the rare-earth elements with atomic numbers 57–71.

actinium (Ac), radioactive chemical element, in Group IIIb of the periodic table, atomic

number 89. Actinium was discovered (1899) by André-Louis Debierne in pitchblende residues left after Pierre and Marie Curie had extracted radium and was also discovered (1902) independently by Friedrich Otto Giesel. A ton of pitchblende ore contains about 0.15 mg of actinium. The rare, silvery-white metal is highly radioactive, glowing blue in the dark.

The most common isotope of actinium is actinium-227; the others, natural and artificial, are too short-lived to accumulate in macroscopic quantity. Actinium-227, which is one of the decay products of uranium-235, has a 21.6-year half-life and in turn decays almost entirely to thorium-227, but about 1 percent decays to francium-223. This whole disintegration chain with its branches is called the actinium decay series.

Actinium, the ions of which in solution are colourless, exhibits an oxidation state of +3, closely resembling the rare-earth lanthanide elements in its chemical properties, and is the prototype of a second rare-earth-like series, the actinide elements.

atomic number	89
stablest isotope	227
valence	3
electronic config.	2-8-18-32-18-9-2 or (Rn)6d ¹ 7s ²

actinium series, set of unstable heavy nuclei constituting one of the four radioactive series (q.v.).

actinolite, an amphibole mineral in the tremolite-actinolite-ferrotremolite series of calcium, magnesium, and iron silicates. The minerals in this series are abundant in regionally metamorphosed rocks, such as schists. Tremolite may weather to talc, and both tremolite and actinolite may alter to chlorite or carbonates. For chemical formula and detailed physical properties, see amphibole (table).

The fibres of the magnesium-rich members in the series are economically important as asbestos; these varieties, sometimes known as amphibole asbestos, constitute the material to which the name asbestos was originally given. The fibres are fine and silky and possess appreciable tensile strength; those that occur in thin, felted sheets of interwoven fibres are called mountain leather; in thicker sheets, mountain cork; and in compact masses resembling dry wood, mountain wood.

actinometer, in chemistry, a substance or a mixture of substances that reacts through the action of light and that, because of the easily determined quantitative relationship between the extent of the reaction and the energy of the absorbed light, is used as a standard for measurement of light energies involved in photochemical work.

A typical actinometer is a liquid solution of oxalic acid containing uranyl sulfate. Light in the wavelength range of about 2,080 to 4,350 angstroms (ultraviolet to violet light) decomposes the oxalic acid (through a complex process involving initial absorption of the light energy by the uranyl ion) into a mixture of carbon dioxide, carbon monoxide, and water. A standard solution is generally irradiated with light of the proper wavelength and of known intensity, and the quantity of oxalic acid decomposed is accurately measured by titration with potassium permanganate. The experimentally determined relationship between the quantity of oxalic acid transformed and the quantity of light energy absorbed can then be used as a scale from which to predict either quantity when the other is known or measured.

In addition to the oxalic acid-uranyl sulfate solution, other substances commonly used as chemical actinometers include acetone, hydrogen bromide, carbon dioxide, and a solution of ferrioxalate in sulfuric acid.

actinomycete, any member of a heterogeneous group of gram-positive, generally anaerobic

bacteria noted for a filamentous and branching growth pattern that results, in most forms, in an extensive colony, or mycelium. The mycelium in some species may break apart to form rod- or coccoid-shaped forms. Many genera also form spores; the sporangia, or spore cases, may be found on aerial hyphae, on the colony surface, or free within the environment. Motility, when present, is conferred by flagella. Many species of actinomycetes occur in soil and are harmless to animals and higher plants, while others are important pathogens, and still others are beneficial sources of antibiotics.

Many authorities recognize eight different groups of actinomycetes, though these groups are themselves heterogeneous and will require further study to classify fully. Of the specific types of actinomycetes, *Nocardia otitidiscariarum* causes an ear disease in guinea pigs, and *Dermatophilus congolensis* causes dermatophilosis, a severe dermatitis of cattle, sheep, horses, and occasionally humans. Several species of *Streptomyces* cause the disease actinomycosis in humans and cattle. Many of the actinomycetes are sources of antibiotics, however. *Saccharopolyspora hirsuta* is a source of the antibiotic sporaricin, for example, and members of *Streptomyces* produce streptomycin and other antibiotics.

actinomycosis, a noncontagious bacterial infection of humans and cattle that is caused by two anaerobic species of the genus *Actinomyces*. The disease is characterized by multiple painful, hard swellings filled with pus, most often seen on the face, neck, chest, and abdomen. *Actinomyces bovis* is responsible for the disease in cattle and *Actinomyces israeli* for that in humans.

In humans the organism lives chiefly in the mouth and bowel, growing best in the absence of oxygen, and disease is produced by direct invasion of devitalized tissues. Lesions of the neck and face (cervicofacial actinomycosis), notably the jaw, which account for about one-half of all cases, may appear following a wound in the mouth or a tooth extraction, and lesions of the abdomen may follow appendicitis or perforation of the stomach or large intestine. Infection of the lungs and surrounding structures (thoracic actinomycosis) may result from inhalation of the organism into the air passages and is usually associated with weight loss, night sweats, coughing, and high fever. In rare cases the disorder may be disseminated, via the bloodstream, in which case lesions appear in most parts of the body. Treatment is with antibiotics; surgical drainage or excision of accessible lesions are valuable adjuncts.

actinomyxidian, also called ACTINOSPOREAN, any parasitic microorganism of the class Actinomyxidia (Actinosporea), phylum Myxosporidia (Myxospora). It inhabits the alimentary canal of certain aquatic worms. The characteristic spores develop in the host's gut after the union of large and small gametes. The spores contain three polar filaments (possibly anchoring devices) enclosed in capsules and one to many infective sporozoites. The representative species *Triactinomyxon ignotum* lives in the marine worm *Tubifex* and has spore valves that are elongated into three large hooks.

action, in theoretical physics, an abstract quantity that describes the overall motion of a physical system. Motion, in physics, may be described from at least two points of view: the close-up view and the panoramic view. The close-up view involves an instant-by-instant charting of the behaviour of an object. The panoramic view, on the other hand, reveals not only a complete picture of the actual behaviour of an object but also all the possible routes of development connecting an initial situation with a final situation. From the panoramic view, each route between the two

situations is characterized by a specific numerical quantity called its action. Action may be thought of as twice the average kinetic energy of the system multiplied by the time interval between the initial and final position under study or, again, as the average momentum of the system multiplied by the length of the path between the initial and final positions.

The value of the action for any actual motion of a system between two configurations is always a minimum or a maximum. In most instances, the behaviour of the system follows the path of minimum, or least, action. In an optical system, such as a microscope, light travels along the path of least action as it undergoes bending in the lenses. For light, action is proportional to the time of travel, so that the light travels the path that takes the least time.

With the beginning of quantum theory (1900), the concept of action took on a new importance. In describing the behaviour of molecular or atomic particles, one had to invoke a previously unsuspected restriction. Only those states of motion are possible in which actions are whole-number multiples of a certain very small number, known as Planck's constant, named for the German scientist Max Planck, who first proposed a discrete, or quantized, behaviour for objects of subatomic dimensions. Thus Planck's constant is the natural unit, or quantum, of action.

Action Française (French: "French Action"), influential right-wing antirepublican group in France during the first 40 years of the 20th century. *Action Française* was also the name of a daily newspaper (published from March 21, 1908, to Aug. 24, 1944) that expressed the group's ideas.

The Action Française movement originated at the close of the 19th century to champion the antiparliamentarian, anti-Semitic, and strongly nationalist views inspired by the controversy over the Dreyfus Affair. Its leader, Charles Maurras, formulated the doctrine of integral nationalism, which sought a restoration of the monarchy because this was considered the only institution capable of unifying strife-torn French society. Action Française was widely supported by Roman Catholics, small businessmen, and professional men, and though the movement was based on a return to the past, it was revolutionary in advocating the violent overthrow of the parliamentary Third Republic (1870-1940). The disruptive tactics of the Action Française and its youth group, the Camelots du Roi ("Hucksters of the King"), brought it to prominence among right-wing groups prior to World War I.

The Action Française reached its apogee following World War I, when nationalist feeling was strong, but suffered a severe setback in 1926, when it was publicly condemned by the papacy. Yet it was still powerful enough to lead a serious attack on the republic in 1934. Because of its association with the German collaborationist Vichy government (1940-44), the Action Française was discredited and ceased to exist after World War II.

Action painting, direct, instinctual, and highly dynamic kind of art that involves the spontaneous application of vigorous, sweeping brushstrokes and the chance effects of dripping and spilling paint onto the canvas. The term was coined by the American art critic Harold Rosenberg to characterize the work of a group of American Abstract Expressionists (see Abstract Expressionism) who utilized the method from about 1950. Action painting is distinguished from the carefully preconceived work of the "abstract imagists" and "colour-field" painters, which constitutes the other major direction implicit in Abstract Expressionism and resembles Action painting only

in its absolute devotion to unfettered personal expression free of all traditional aesthetic and social values.

"Untitled," Action painting by Jackson Pollock, oil and enamel on metal, 1948; in the Mr. and Mrs. Willard Gidwitz Collection, Illinois

By courtesy of the Sidney Janis Gallery, New York

The works of the Action painters Jackson Pollock, Willem de Kooning, Franz Kline, Bradley Walker Tomlin, and Jack Tworkov reflect the influence of the "automatic" techniques developed in Europe in the 1920s and '30s by the Surrealists. While Surrealist automatism (*q.v.*), which consisted of scribbles recorded without the artist's conscious control, was primarily designed to awaken unconscious associations in the viewer, the automatic approach of the Action painters was primarily conceived as a means of giving the artist's instinctive creative forces free play and of revealing these forces directly to the viewer. In Action painting the act of painting itself, being the moment of the artist's creative interaction with his materials, was as significant as the finished work.

It is generally recognized that Jackson Pollock's abstract drip paintings, executed from 1947, opened the way to the bolder, gestural techniques that characterize Action painting. The vigorous brushstrokes of de Kooning's "Woman" series, begun in the early 1950s, successfully evolved a richly emotive, expressive style. Action painting was of major importance throughout the 1950s in Abstract Expressionism, the most influential art movement at the time in the United States. By the end of the decade, however, leadership of the movement had shifted to the colour-field and abstract imagist painters, whose followers in the 1960s rebelled against the irrationality of the Action painters. *See also* Tachism.

action potential, the brief (about one-thousandth of a second) reversal of electric polarization of the membrane of a nerve cell (neuron) or muscle cell. In the neuron it constitutes the nerve impulse, and in the muscle cell it produces the contraction required for all movement. Sometimes called a propagated potential because a wave of excitation is actively transmitted along the nerve or muscle fibre, an action potential is conducted at speeds that range from 1 to 100 m (3 to 300 feet) per second, depending on the properties of the fibre and its environment.

Before stimulation, a neuron or muscle cell has a slightly negative electric polarization; that is, its interior has a negative charge compared with the extracellular fluid. This polarized state is created by a high concentration of positively charged sodium ions outside the cell and a high concentration of negatively charged chloride (as well as a lower concentration of positively charged potassium) inside.

The resulting resting potential usually measures about -75 millivolts (mV), the minus sign indicating a negative charge inside.

In the classic generation of the action potential, stimulation of the cell by neurotransmitter chemicals or by sensory receptor cells partially opens channel-shaped protein molecules in the membrane. Sodium diffuses into the cell, shifting that part of the membrane toward a less negative polarization. If this so-called local potential reaches a critical state (called the threshold potential and measuring about -60 mV), then sodium channels open completely. Sodium floods that part of the cell, which instantly depolarizes to an action potential of about $+55$ mV (inside positive). Depolarization activates sodium channels in adjacent parts of the membrane, so that the impulse moves along the fibre.

If the entry of sodium into the fibre were not balanced by the exit of another ion of positive charge, an action potential could not decline from its peak value and return to the resting potential. The falling phase of the action potential is caused by the closing of sodium channels and the opening of potassium channels, which allows a charge approximately equal to that brought into the cell to leave in the form of potassium ions. Subsequently, sodium ions are pumped out of the cell, and potassium ions pumped in, by protein transport molecules. This restores the original ion concentrations and readies the cell for a new action potential.

The Nobel Prize for Physiology or Medicine was awarded in 1963 to A.L. Hodgkin, A.F. Huxley, and Sir John Eccles for formulating these ionic mechanisms involved in nerve cell activity.

Actium, Battle of (Sept. 2, 31 BC), naval battle off a promontory in the north of Acarnania, on the western coast of Greece, where Octavian, by his decisive victory over Mark Antony, became the undisputed master of the Roman world (as the emperor Augustus). Antony, with 500 ships and 70,000 infantry, made his camp at Actium, which lies on the southern side of a strait leading from the Ionian Sea into the Ambracian Gulf. Octavian, with 400 ships and 80,000 infantry, arrived from the north and, by occupying Patrae and Corinth, also managed to cut Antony's southward communications with Egypt via the Peloponnese.

Desertions by some of his allies and a lack of provisions soon forced Antony to take action. Either hoping to win at sea because he was outmaneuvered on land or else simply trying to break the blockade, Antony followed Cleopatra's advice to employ the fleet. He drew up his ships outside the bay, facing west, with Cleopatra's squadron behind. The ensuing naval battle was hotly contested, with each side's squadrons trying to outflank the other, until Cleopatra took her Egyptian galleys and fled the battle. Antony then broke off and with a few ships managed to follow her. The remainder of his fleet became disheartened and surrendered to Octavian, and Antony's land forces surrendered one week later.

activated-complex theory: *see* transition-state theory.

activated-sludge method, sewage-treatment process in which sludge, the accumulated, bacteria-rich deposits of settling tanks and basins, is seeded into incoming waste water and the mixture agitated for several hours in the presence of an ample air supply. Suspended solids and many organic solids are absorbed or adsorbed by the sludge, while organic matter is oxidized by the microorganisms. The amounts of air and sludge used can be varied to control the level of treatment obtained. The sludge is then separated out in a settling tank.

activation, also called AROUSAL, in psychology, the stimulation of the cerebral cortex into

a state of general wakefulness or attention. Activation proceeds from various portions of the brain, but mainly from the reticular formation, the nerve network in the midbrain that monitors ingoing and outgoing sensory and motor impulses. Activation, however, is not the same as direct cortical stimulation by specific sense receptors, such as being awakened by noises. It involves, rather, a complex of impulses that are both internal and external to the body.

activation energy, in chemistry, the minimum amount of energy that is required to activate atoms or molecules to a condition in which they can undergo chemical transformation or physical transport. In terms of the transition-state theory (*q.v.*), the activation energy is the difference in energy content between atoms or molecules in an activated or transition-state configuration and the corresponding atoms and molecules in their initial configuration. The activation energy is usually represented by the symbol E_a in mathematical expressions for such quantities as the reaction-rate constant, $k = A \exp(-E_a/RT)$, and the diffusion coefficient, $D = D_0 \exp(-E_a/RT)$.

Activation energies are determined from experimental rate constants or diffusion coefficients that are measured at different temperatures.

activity, in radioactive-decay processes, the number of disintegrations per second, or the number of unstable atomic nuclei that decay per second in a given sample. Activity is determined by counting, with the aid of radiation detectors and electronic circuits, the number of particles and photons (pulses of electromagnetic energy) ejected from a radioactive material during a convenient time interval. This experimental count, however, must be interpreted in the light of a thorough knowledge of the particular manner of radioactive decay in the sample material, because some sources emit more than one particle or photon per disintegration.

The international unit for expressing activity is the curie (abbreviated Ci), exactly equal to 3.7×10^{10} disintegrations per second and very nearly equivalent to the activity of one gram of naturally occurring radium, the old standard curie (abbreviated C).

activity coefficient, in chemistry, the ratio of the chemical activity of any substance to its molar concentration. The measured concentration of a substance may not be an accurate indicator of its chemical effectiveness, as represented by the equation for a particular reaction, in which case an activity coefficient is arbitrarily established and used instead of the concentration in calculations. In solutions, the activity coefficient is a measure of how much a solution differs from an ideal solution—*i.e.*, one in which the effectiveness of each molecule is equal to its theoretical effectiveness.

Acto Adicional of 1834, amendment to the Brazilian constitution of 1824 that abolished some of that charter's extremely centralist and authoritarian aspects. It was enacted as a concession to federalists and republicans who threatened to sunder the nation.

The abdication of the unpopular Brazilian emperor Pedro I in 1831 precipitated the surfacing of violently opposed factions and civil wars—in Pará in 1831, in Minas Gerais in 1833, and in Maranhão and Mato Grosso in 1834. The constitution, which on the whole remained in effect until the inception of the First Republic in 1889, had been drawn up by a council of state appointed by Pedro I. The extensive powers it gave to the emperor, referred to as the *poder moderador* ("mediative power"), included the appointment of the members of the upper house of Parliament for life from lists of nominees prepared by special electors; the convening and dissolving of the

lower house of Parliament, composed of popularly elected representatives; and the right to veto parliamentary acts, although a veto could be overridden if Parliament repassed the measure in three consecutive sessions. Moreover, the popularly elected provincial and municipal assemblies were dominated by imperially appointed presidents.

The Acto Adicional eliminated the reactionary Council of State. It also replaced a three-member regency, which had been instituted for the minority (1831–40) of Pedro II, with a single regent, to make the government more efficient. The amendment also created provincial legislatures, allowed for provincial control over primary and secondary education, and ended the entailing of estates.

Opposition to the central government continued, however, even after the reform: slaves in Bahia revolted in 1835, Maranhão broke out in revolts once again, and a 10-year revolt in Rio Grande do Sul, called the Guerra dos Farrapos ("War of the Ragged Ones"), began in 1835.

Acton (of Aldenham), John Emerich Edward Dalberg Acton, 1st Baron, 8TH BARONET (b. Jan. 10, 1834, Naples—d. June 19, 1902, Tegernsee, Bavaria, Ger.), English Liberal historian and moralist, the first great modern philosopher of resistance to the evil state, whether its form be authoritarian, democratic, or socialist. A comment that he wrote in a letter, "Power tends to corrupt, and absolute power corrupts absolutely," today has become a familiar aphorism. He succeeded to the baronetcy in 1837, and he was raised to the peerage in 1869.

Life. Acton was the only son of Sir Ferdinand Richard Edward Acton (1801–37) by his marriage to Marie Louise Peline von Dalberg, heiress to a very respectable German title. In 1840 his widowed mother married Lord Leveson, the future Lord Granville and Liberal foreign secretary, an alliance that brought Acton early into the intimate circle of the great Whigs. Educated at Oscott College, Warwickshire, he went to Munich to study under the German Catholic Church historian Johann Joseph Ignaz von Döllinger, who grounded him in the new German methods of historical research.

Having spent much time in the United States and Europe, he returned to England, settled at the family seat in Aldenham, Shropshire, and was elected to the House of Commons for Carlou, Shropshire, in 1859. In the same year he became editor, following John Henry Newman, of the Roman Catholic monthly the *Rambler*, but he laid down his editorship in 1864 because of papal criticism of his rigor-

ously scientific approach to history as evinced in that journal.

Despite this, Acton remained firmly attached to Roman Catholicism even after 1870, when the Vatican Council formulated the doctrine of papal infallibility. In 1865 he married Marie von Arco-Valley, daughter of a Bavarian count, by whom he was to have one son and three daughters.

His parliamentary career had ended in 1865—he was an almost silent member—but he was an influential adviser and friend to William Gladstone, the Liberal leader and prime minister. Acton was raised to the peerage on Gladstone's recommendation in 1869, and in 1892 Gladstone repaid his services as adviser by having him made a lord-in-waiting to Queen Victoria.

Acton wrote comparatively little, his only notable later publications being a masterly essay in the *Quarterly Review* (January 1878), "Democracy in Europe"; two lectures delivered at Bridgnorth in 1877 on *The History of Freedom in Antiquity* and *The History of Freedom in Christianity* (both published in 1907)—these last the only tangible portions put together by him of his long-projected "History of Liberty"; and an essay on modern German historians in the first number of the *English Historical Review*, which he helped to found (1886). In 1895 the prime minister Lord Rosebery had him appointed to the regius professorship of modern history at Cambridge. His inaugural *Lecture on the Study of History* (published in 1895) made a great impression in the university, and his influence on historical study was felt. He delivered two valuable courses of lectures on the French Revolution and on modern history, but it was in private that the influence of his teaching was most marked.

In 1899 and 1900 he devoted much of his energy to coordinating the project of *The Cambridge Modern History*, a monument of objective, detailed, collaborative scholarship. His efforts to secure, direct, and coordinate contributors for the project exhausted him, and he died from the effects of a paralytic stroke that he had suffered in 1901.

Assessment. Acton was a stern critic of nationalism; his liberalism was rooted in Christianity. "I fully admit that political Rights proceed directly from religious duties, and hold this to be the true basis of Liberalism." For him, conscience was the fount of freedom, and its claims were superior to those of the state. "The nation is responsible to Heaven for the acts of the State." If democracy could not restrain itself, liberty would be lost. The test of a country's freedom was the amount of security enjoyed by minorities. For Acton, in his judgment of politics as of history, morality was fundamental. He was the great modern philosopher of resistance to the evil state. Civilized, cosmopolitan, rich, learned, and widely connected, he is remembered as much for his few historical writings as for his prescient concern with the problems of political morality.

(A.W.J./Ed.)

BIBLIOGRAPHY. Gertrude Himmelfarb, *Lord Acton: A Study in Conscience and Politics* (1952), an excellent intellectual biography; George Fasnacht, *Acton's Political Philosophy* (1953), and Lionel Kochan, *Acton on History* (1954), two competent, specific studies; Hugh MacDougall, *The Acton-Newman Relations* (1962).

Acton, Sir John Francis Edward, 6TH BARONET (b. June 1736, Besançon, Fr.—d. Aug. 12, 1811, Palermo), commander of the naval forces of Tuscany and then of Naples who as prime minister of Naples allied that kingdom with England and Austria in the period of the French Revolution.

Finding the French Navy unappreciative of his skills, Acton, the son of an expatriate Englishman, joined the forces of Peter Leopold (later Holy Roman emperor Leopold II), grand duke of Tuscany, and distinguished himself

by commanding a Tuscan squadron when Spain and Tuscany joined forces against Algeria (1774). In 1779 Peter Leopold's brother-in-law Ferdinand IV of Naples invited Acton to reorganize the Neapolitan fleet, of which Acton soon became commander.

A favourite of Ferdinand's wife, Maria Carolina, he rose rapidly, disposing of all rivals, becoming minister of the navy, of war, of finance, and finally prime minister with almost absolute powers. His English and Austrian alliances weakened the traditional ruling class and the clergy, which had close ties with Spain. In addition, he engaged Naples in a long struggle against the French Revolution, the liberal ideals of which he opposed.

When the French attacked Naples in 1798, Acton fled to Sicily with the King and Queen aboard the ship of Horatio Nelson, the British admiral. Naples was declared the Parthenopean Republic, but when Ferdinand regained control of Naples five months later, he instituted a reign of terror against those who had supported the French, for which Acton and Nelson must bear principal responsibility.

Acton stayed in power with only one brief interruption until the French attacked Naples again in 1806, and then he fled to Sicily with the royal family. He was the grandfather of the 1st Baron Acton, the renowned 19th-century historian.

actor-manager system, method of theatrical production dominant in England and the U.S. in the 19th century, consisting of a permanent company formed by a leading actor who chose his own plays, took a leading role in them, and handled business and financial arrangements. The advantages of this system became apparent in the 18th century when successful actor-managers such as Colley Cibber and David Garrick achieved performance standards superior to those achieved by theatre owners who hired occasional casts for individual plays. In the 19th century great actor-managers such as William Charles Macready, Sir Henry Irving, Madame Vestris, and Sir Herbert Beerbohm Tree maintained high standards. Shakespeare was an ever-popular staple in their repertoires because it afforded the actor-manager an opportunity for his interpretation of a famous role such as Shylock, Iago, or Richard III. The era of the actor-manager, however, was geared to star performances, and often the actor's most famous performance was in an inferior literary work, such as Sir Henry Irving's role in the horror play *The Bells*. The trend toward realism, partly the result of controlled lighting that allowed for the darkening of the auditorium, thus creating an aesthetic distance between actor and audience, led to the decline of personality-dominated plays. The actor-manager was replaced first by the stage manager, who unified the various effects of the performance from the point of view of an onlooker, and later by the more creative director, who imposed his own interpretation on the play.

Actors Studio, The, prestigious professional actors' workshop in New York City whose members have been among the most influential performers in American theatre and film since World War II. It is one of the leading centres for the Stanislavsky method of dramatic training. Founded in New York City in 1947 by directors Cheryl Crawford, Elia Kazan, and Robert Lewis, it provides a place where actors can work together without the pressures of commercial production. Actors Studio membership, which is for life, is by invitation; from 1,000 auditions, six or seven new members are chosen each year. Lee Strasberg was director from 1948 to 1982. Strasberg extended the teachings of Stanislavsky and developed method acting, in which actors used

their own emotional memory for the purpose of dramatic motivation. In 1962 a production company was added to its activities, and later a western workshop was opened in Los Angeles.

Acts of the Apostles, The, abbreviation ACTS, fifth book of the New Testament, a valuable history of the early Christian church. Acts was written in Greek, presumably by the Evangelist Luke, whose gospel concludes where Acts begins, namely, with Christ's Ascension into heaven. Acts was apparently written in Rome, perhaps between AD 70 and 90, though some think a slightly earlier date is also possible. After an introductory account of the descent of the Holy Spirit on the Apostles at Pentecost (interpreted as the birth of the church), Luke pursues as a central theme the spread of Christianity to the Gentile world under the guiding inspiration of the Holy Spirit. He also describes the church's gradual drawing away from Jewish traditions. The missionary journeys of St. Paul are given a prominent place, because this close associate of Luke was the preeminent Apostle to the Gentiles. Without Acts, a picture of the primitive church would be impossible to reconstruct; with it, the New Testament letters of Paul are far more intelligible. Acts concludes rather abruptly after Paul has successfully preached the gospel in Rome, then the acknowledged centre of the Gentile world.

actuary, one who calculates insurance risks and premiums. Actuaries compute the probability of the occurrence of various contingencies of human life, such as birth, marriage, sickness, unemployment, accidents, retirement, and death. They also evaluate the hazards of property damage or loss and the legal liability for the safety and well-being of others.

Most actuaries are employed by insurance companies. They make statistical studies to establish basic mortality and morbidity tables, develop corresponding premium rates, establish underwriting practices and procedures, determine the amounts of money required to assure payment of benefits, analyze company earnings, and counsel with the company accounting staff in organizing records and statements. In many insurance companies the actuary is a senior officer.

Some actuaries serve as consultants, and some are employed by large industrial corporations and governments to advise on insurance and pension matters.

Acuff, Roy, in full ROY CLAXTON ACUFF (b. Sept. 15, 1903, Maynardville, Tenn., U.S.—d. Nov. 23, 1992, Nashville, Tenn.), American vocalist, songwriter, and fiddle player, called the "King of Country Music," who in the mid-1930s reasserted the mournful musical traditions of Southeastern rural whites and became a national radio star on the "Grand Ole Opry" broadcasts.

Turning his attention to music after an aborted baseball career, Acuff gained immediate popularity with his recordings of "The Great Speckled Bird" and "The Wabash Cannonball." The latter piece became his theme song. By the early 1940s his sincere singing style, backed by the traditional sound of the Smoky Mountain Boys, was earning him \$200,000 per year.

In 1942 he organized Acuff-Rose Publishing Company, the first publishing house exclusively for country music, with songwriter Fred Rose. Following an unsuccessful bid for the Tennessee governorship in 1948, Acuff continued to record extensively from the 1950s on, lending authenticity to the new boom in country music with such albums as *Will the Circle Be Unbroken* (1972), performed with the Nitty Gritty Dirt Band. In 1962 Acuff was

lected the first living member of the Country Music Hall of Fame.

Acuña (Mexico): see Ciudad Acuña.

acupuncture, ancient Chinese medical technique for relieving pain, curing disease, and improving general health. It was devised before 2500 BC in China and by the late 20th century was used in many other areas of the world. Acupuncture consists of the insertion of one or several small metal needles into the skin and underlying tissues at precise points on the body.

Acupuncture grew out of ancient Chinese philosophy's dualistic cosmic theory of the yin and the yang. The yin, the female principle, is passive and dark and is represented by the earth; the yang, the male principle, is active and light and is represented by the heavens. The forces of yin and yang act in the human body as they do throughout the natural universe as a whole. Disease or physical disharmony is caused by an imbalance or undue preponderance of these two forces in the body, and the goal of Chinese medicine is to bring the yin and the yang back into balance with each other, thus restoring the person to health.

An imbalance of yin and yang results in an obstruction of the vital life force, or *ch'i*, in the body. The fundamental energy of the *ch'i* flows through 12 meridians, or pathways, in the body, each in turn associated with a major visceral organ (liver, kidney, etc.) and with a functional body system. Acupuncture is designed to affect the distribution of yin and yang in these channels so that the *ch'i* will be enabled to flow freely and harmoniously.

The actual practice of acupuncture consists of inserting needles into any of hundreds of points located over the 12 basic meridians and over a number of specialized meridians. The needles used may be slightly arrowheaded or may have extremely fine points. The typical insertion is 3 to 10 mm (0.1 to 0.4 inch) in depth; some procedures call for insertions up to almost 25 cm (10 inches). Once inserted, a needle may be twisted, twirled, or connected to a low-voltage alternating current for the duration of its use. The physician frequently inserts needles at a considerable distance from the point on which they are to act; for example, a needle inserted into the pad of the thumb is expected to produce analgesia in the abdomen. Similarly, successive points on a specific meridian may affect widely different areas or conditions; e.g., the first six points

of the yin lung meridian deal primarily with swollen joints, excessive heat in joints, bleeding of the nose, heart pains, mental depression, and inability to stretch the arms above the head. The location of the points is mastered by the use of innumerable diagrams and models, as in the Figure.

Acupuncture appears somehow to be effective in relieving pain and is routinely used in China as an anesthetic during surgery. Western visitors have witnessed ambitious (and ordinarily painful) surgical operations carried out on fully conscious Chinese patients locally anesthetized only by acupuncture.

Several theories have been advanced to explain acupuncture's effectiveness in this regard. There is speculation that the needle insertions stimulate the body's production of such natural opiates (painkilling chemicals) as endorphins or enkephalins. Others have posited that the minor stimulation of acupuncture selectively acts on impulse transmission to the central nervous system, thus closing certain neurological "gates" and blocking the transmission of pain impulses from other parts of the body. Some Western observers studying the method have suggested that acupuncture analgesia is plainly a placebo analgesia—which does not, however, detract from its effectiveness. Chinese assertions that acupuncture can actually cure disease defy rational clinical practice and have yet to be substantiated by Western medical researchers.

ad-Damar (The Sudan): see Dâmir, ad-.

ad valorem tax, any tax imposed on the basis of the monetary value of the taxed item. Literally the term means "according to value." Traditionally, most customs and excises had "specific" rates; the tax base was defined in terms of physical units such as gallons, pounds, or individual items.

Ad valorem rates, which have come into increased use, have the important advantage of adjusting the tax burden according to the amount the consumer spends on the taxed items. They thus avoid the serious discrimination of specific rates against the low-priced varieties of the commodities. The primary difficulty with the ad valorem taxation, especially in the case of tariffs, is in establishing a satisfactory value figure.

Sales taxes of broad scope must of necessity have ad valorem rates. Property taxes are sometimes considered ad valorem taxes, since the rates are applied to the value of the property, as distinguished from special assessments, which are frequently imposed on a specific unit (e.g., front footage) basis.

Ada, city, seat (1907) of Pontotoc county, south-central Oklahoma, U.S. It lies along Clear Boggy Creek, south of the Canadian River, and was named for the daughter of the first postmaster, William J. Reed, who built a log store there in 1889. The railroad arrived in 1900, and the city developed as a marketing and trading centre for a large cattle and grain area. The discovery of oil in the vicinity contributed to Ada's economic growth. Fine silica sand and limestone quarries nearby provide the raw materials for glass and cement industries. Plastics, auto parts, farm implements, and clothing are also manufactured. The large Fitts Oil Field and the Robert S. Kerr Water Research Center are south of the city. Ada is the seat of East Central University (1909). Inc. 1901. Pop. (1992 est.) 16,153.

Ada group, ivory carvings and a group of about 10 illuminated manuscripts, dating from the last quarter of the 8th century, the earliest examples of the art of the Court School of Charlemagne. The group is named after a Gospel book (c. 750; Trier, Cathedral Treasury) commissioned by Ada, supposed half sister of Charlemagne. These earliest manuscripts of the Carolingian period, which initiated a revival of Roman classicism, are

clearly more monumental in conception and more ambitious in the treatment of the human figure than previous Hiberno-Saxon or Merovingian manuscripts; but, as can be seen in the Godescalc Gospels (c. 780; Paris, Bibliothèque Nationale), they continue traditions from these other arts in their basically linear presentation, with a lack of concern for volume and spatial relationships.

Adab, modern BISMĀYAH, ancient Sumerian city located south of Nippur (modern Niffer or Nuffar), Iraq. Excavations (1903–04) carried out by the American archaeologist Edgar James Banks revealed buildings dating from as early as the prehistoric period and as late as the reign of Ur-Nammu (reigned 2112–2095 BC). Adab was an important Sumerian centre only up to about 2000. The Sumerian

king list ascribed to the city one of the early dynasties, comprising only one king, Lugalanne-mundu, who was said to have reigned for 90 years; according to his position on the king list this reign would have been about 2400. At almost all other times in its history Adab was ruled by kings who controlled all or most of Babylonia (southern Mesopotamia). The principal deity of the city was the goddess Ninhursag.

adab, Islāmic concept that became a literary genre distinguished by its broad humanitarian concerns; it developed during the brilliant height of 'Abbāsīd culture in the 9th century and continued through the Muslim Middle Ages.

The original sense of the word was sim-

ply "norm of conduct," or "custom," derived in ancient Arabia from ancestors revered as models. As such practice was deemed praiseworthy in the medieval Muslim world, *adab* acquired a further connotation of good breeding, courtesy, and urbanity.

Parallel to and growing out of this expanded social meaning of *adab* there appeared an intellectual aspect. *Adab* became the knowledge of poetry, oratory, ancient Arab tribal history, rhetoric, grammar, philology, and non-Arab civilizations that qualified a man to be called well-bred, or *adīb*. Such men produced a vast and erudite *adab* literature, concerned with man and his achievements and written in a style rich in vocabulary and idiom, and usually expressive and flexible. They included such writers as the 9th-century essayist al-Jāhīz of Basra and his 11th-century follower Abū Ḥayyān at-Tawḥīdī; the 9th-century Kūfan critic, philologist, and theologian Ibn Qutaybah; and the 11th-century poet al-Ma'arri.

As the golden age of the 'Abbāsīds declined, however, the boundaries of *adab* narrowed into belles lettres: poetry, elegant prose, anecdotal writing (*maqāmāt*). In the modern Arab world *adab* merely signifies literature.

Adad, weather god of the Babylonian and Assyrian pantheon. The name Adad may have been brought into Mesopotamia toward the end of the 3rd millennium BC by Western (Amorite) Semites. His Sumerian equivalent was Ishkur (*q.v.*) and the West Semitic was Hadad (*q.v.*).

An Assyrian governor standing before the deities Adad (centre) and Ishtar (left), limestone relief from Babylon, 8th century BC; in the Museum of Oriental Antiquities, Istanbul

Weidenfeld & Nicolson Ltd

Adad had a twofold aspect, being both the giver and the destroyer of life. His rains caused the land to bear grain, wine, and food for his friends; hence his title Lord of Abundance. His storms and hurricanes, evidences of his anger against his foes, brought darkness, want, and death. The bull and the lion were sacred to him. Adad's father was the heaven god Anu, but he is also designated as the son of Bel, Lord of All Lands and god of the atmosphere. His consort was Shalash, which may be a Hurrian name. The symbol of Adad was the cypress, and six was his sacred number. In Babylonia, Assyria, and Aleppo in Syria, he was also the god of oracles and divination. Unlike the greater gods, Adad quite possibly had no cult centre peculiar to himself, although he was worshipped in many of the important cities and towns of Mesopotamia, including Babylon and Ashur, the capital of Assyria.

'**ādah** (Arabic: "custom"), in Islāmic law, a local custom that is given a particular consideration by judicial authorities even when it conflicts with some principle of canon law (Sharī'ah); in Indonesia it is known as *adat*, in North Africa it is '*urf*, and in East Africa, *dustūr*. Muslim communities developed their '*ādahs* before accepting Islām and did not abandon them entirely afterward. Thus in In-

donesian Minangkabau, where many Muslims still retain old Hindu or pagan traditions, a matriarchate is recognized, contrary to the Sharī'ah; in parts of India, Muslims adopt children, forbidden by canon law, and then again circumvent the Sharī'ah by providing them with an inheritance. Such '*ādahs* are accepted by religious courts as legitimate local laws that must be respected by others. Each community has developed its own norms for handling disputes, and these may often disagree with standard religious teachings. Nevertheless, authorities condone various religious customs to foster harmony and peace in the community.

Adair, John (b. c. 1655—d. c. 1722, London?), Scottish surveyor and cartographer whose maps established a standard of excellence for his time and probably inspired the early 18th-century surveys of Scotland. Between 1680 and 1686 he completed maps of the counties adjoining the River Forth as well as charts of the Firth of Forth, the River Clyde, and the west of Scotland. Manuscripts of these are in the National Library of Scotland and other libraries. Other maps and charts prepared by Adair also exist in manuscript. In 1703 he published the first part of his *Description of the Sea-coast and Islands of Scotland, With Large and Exact Maps, for the Use of Seamen*. The second part was never printed. Judging from his scrupulous delineations, Adair's search for perfection may have delayed completion of his work, but he was also hampered by the inadequacy of the public funds available for his work. In 1723 an annuity was granted to his widow for unpublished manuscripts that were later deposited in the Bodleian Library, Oxford, and in the British Museum.

Adair v. the United States (1908), case in which the U.S. Supreme Court upheld "yellow dog" contracts forbidding workers from joining labour unions. William Adair of the Louisville and Nashville Railroad fired O.B. Coppage for belonging to a labour union, an action in direct violation of the Erdman Act of 1898, which prohibited railroads engaged in interstate commerce from requiring workers to refrain from union membership as a condition of employment. In 1908 the Supreme Court decided in a 6 to 2 vote that the Erdman Act was unconstitutional. The court held that the act represented an unreasonable violation of the due process clause of the Fifth Amendment, which guaranteed freedom of contract and property rights; moreover, according to the majority, Congress' constitutional authority over interstate commerce did not extend to matters of union membership.

Adal (people): see Afar.

Adal, historic Islāmic state of eastern Africa, in the Danakil-Somali region southwest of the Gulf of Aden, with its capital at Harer (now in Ethiopia). Its rivalry with Christian Ethiopia began in the 14th century with minor border raids and skirmishes. In the 16th century, Adal rose briefly to international importance by launching a series of more serious attacks. The first phase, in which the forces of Adal were led by Mahfuz, governor of Zeila on the Gulf of Aden, ended in 1516, when Mahfuz and many of his followers were killed in an Ethiopian ambush.

Within a few years there emerged a new leader, Aḥmad Grāñ (Aḥmad the Left-handed). He gathered a following of Muslim nomads for a *jihād*, or religious war, against Ethiopia. They swept into the highlands, drove the Ethiopian emperor into exile, forced massive conversions, and by 1533 controlled most of central Ethiopia. They destroyed churches and monasteries. The fugitive emperor appealed to Portugal for help. Four hundred Por-

tuguese musketeers landed at Mitsiwa in 1541. Adal then took on reinforcements as well: 900 Arab, Turkish, and Albanian musketeers, plus some cannon. Adal's successes continued until Grāñ was killed in a battle near Lake Tana in 1543. The Oromo (Galla) invasions of the later 16th century put an end to Adal's power. Its rulers fled north into the desert, their nomadic followers lost any semblance of unity, and Adal was reduced to insignificance.

Adalbero OF ARDENNES, also called **ADALBERO OF REIMS**, French **ADALBÉRON D'ARDENNE**, or **ADALBÉRON DE REIMS** (d. January 989), archbishop of Reims who, by declaring the Frankish crown to be elective rather than hereditary, paved the way for the accession of Hugh Capet in place of the Carolingian claimant, Charles, Duke of Lower Lorraine.

Adalbero, a native of Lorraine, had opposed the attempts of the Carolingian king of France, Lothair, to gain Lorraine from the Holy Roman emperor Otto II. Accused of treason, he was summoned by Louis V (986–987), Lothair's son and successor, to appear at an assembly of the leading Franks at Compiègne. But Louis's sudden death prevented the trial from taking place; instead, Adalbero denounced Charles of Lorraine, uncle of Louis, as unfit to succeed to the Frankish throne and supported the candidacy of Hugh Capet. Duly elected, Hugh was crowned by Adalbero in July 987 at Noyon.

Adalbert, Italian **ADALBERTO** (d. c. 966), Lombard king of Italy who shared the throne for 11 years with his father, Berengar II, and after Berengar's exile continued his father's struggle against the German king and Holy Roman emperor Otto I.

Adalbert joined his father in 946–947 in fighting the co-kings of Italy, Hugh of Provence and his son Lothair. After Lothair's death in 950, Adalbert was crowned with Berengar at Pavia. When Lothair's widow, Adelaide, refused to marry Adalbert and Berengar imprisoned her, Otto I marched into Italy in 951 to rescue and marry her. After Otto's return to Germany, Berengar and Adalbert resumed the throne and in August 952 swore homage to Otto.

In 956 Otto sent his son Liudolf against Berengar and Adalbert, but, when Liudolf died of malaria after a temporary victory, the co-kings continued to rule. When Otto again invaded Italy and was crowned emperor (962) by the pope, Adalbert fled to Provence.

Returning to Italy in the autumn of 963, Adalbert was summoned to Rome by Pope John XII, who had quarreled with Otto and now offered his support to Adalbert. Adalbert and the pope fled when Otto marched on Rome, installing a new pope, Leo VIII. With Otto back in Germany, Adalbert assumed the throne again. In 965 an army sent by Otto drove Adalbert from Pavia; the following autumn Otto inflicted a final crushing defeat on him and his supporters.

Adalbert, also spelled **ADELBERT** (b. c. 1000—d. March 16, 1072, Goslar, Saxony [now in Germany]), German archbishop, the most brilliant of the medieval prince bishops of Bremen, and a leading member of the royal administration.

The youngest son of Frederick, Count of Goseck (on the Saale River), Adalbert attended the cathedral school at Halberstadt, becoming subsequently subdeacon and, in 1032, canon. In May 1043 he was appointed archbishop of Hamburg-Bremen by the German king, later the Holy Roman emperor Henry III. High in the emperor's favour, Adalbert tried to increase the influence of his archbishopric and to make Bremen a patriarchal see for northern Europe. Pope Leo IX, however, though

he made Adalbert his vicar for the northern countries in 1053, never allowed him to exercise the authority that he desired.

Adalbert's secular ambitions involved him in conflict with the Saxon nobles and especially with the house of Billung. After the emperor's death in 1056, the lands of his bishopric were ravaged by Bernard II Billung, and Adalbert had to flee to Goslar, where he gained considerable influence in imperial politics during the minority of Henry IV, whom he served as guardian and tutor. Henry granted Adalbert extensive powers in Saxony in 1063 but was obliged to dismiss him as royal adviser in 1066 because of the protests of the nobility. Although he was frequently at court after 1069, Adalbert never regained his political ascendancy. He was buried in the cathedral he had built at Bremen.

Adalbert's death was a serious blow to Bremen's commerce, which under him had developed so rapidly that the town could be described as "the market of the northern peoples." The 11th-century historian Adam of Bremen left a vivid description of Adalbert's personality in his *History of the Archbishops of Hamburg-Bremen*.

Adalbert, SAINT, original name **VOJTĚCH** (b. 956, Libice?, Bohemia [now in Czech Republic]—d. April 23, 997, near Gdańsk, Pol.; canonized 999; feast day, April 23), first bishop of Prague to be of Czech origin.

Descended from the Slavnik princes of Bohemia, he was trained in theology at Magdeburg (Germany). At his confirmation he received his name from St. Adalbert, first archbishop of Magdeburg. As bishop (elected 982), Adalbert promoted the political aims of Boleslav II, prince of Bohemia, by extending the influence of the church beyond the borders of the Czech kingdom. He tried to improve the standards of church life but found little understanding among his countrymen for his lofty ideals.

Critical of the superficial attitude to Christianity prevalent in the country, Adalbert departed in 988 with the intention of leading the ascetic life of a monk. On papal orders he returned in 992 to find little change. He came into sharp conflict with some of the nobility and was probably drawn into the growing feuds between the Czech kings and the Slavnik princes. Disillusioned, in 994 he left Bohemia again to become a missionary along the Baltic coast, where he was martyred three years later. An account of Adalbert's life was written by his friend and disciple St. Bruno of Querfurt.

Adam: see Adam and Eve.

Adam BROTHERS (b. Nancy, France; fl. 18th century), three French brothers who sculpted many monuments for the French and Prussian royal residences. They were exponents of a style that employed the textures of shells, corals, and perforated rocks. Lambert-Sigisbert Adam (1700–59) created sculptures for King Louis XV of France and Frederick the Great of Prussia. Nicolas-Sébastien Adam (1705–78) sculptured for Stanislas I Leszczyński, father-in-law of Louis and former king of Poland. François-Gaspard-Balthasar Adam (1710–61) was responsible for works at Frederick's royal palace of Sans Souci near Potsdam and at Potsdam itself.

Adam DE LA HALLE, byname **ADAM LE BOSSU**, or **ADAM THE HUNCHBACK** (b. c. 1250, Arras, France—d. c. 1306, Naples [now in Italy]), poet, musician, and innovator of the earliest French secular theatre.

Adam's *Jeu de la feuillée* ("Play of the Greensward") is a satirical fantasy based on his own life, written to amuse his friends in Arras upon his departure for Paris to pursue his studies. *Le Congé* ("The Leave Taking") expresses his sorrow at leaving his wife and his native Arras. As court poet and musician

to the Count d'Artois, he visited Naples and became famous for his polyphony as well as his topical productions, which are considered the predecessors of comic opera. *Jeu de Robin et de Marion* is a dramatization of the pastoral theme of a knight's wooing of a pretty shep-

Adam de la Halle, detail from a manuscript, 1278; in the Municipal Library of Arras, France (MS. No. 657) By courtesy of the Bibliotheque Municipale d Arras, France

herdess, with dances and peasants' dialogue. *Jeu du pèlerin* ("Play of the Pilgrim") mocks his friends for forgetting him.

Adam OF BREMEN (fl. 11th century), German historian whose work on the archbishops of Hamburg-Bremen provides valuable information on German politics under the Salian emperors and is also one of the great books of medieval geography.

Of Franconian origin, he was probably educated at the cathedral school in Bamberg but was introduced in 1066 or 1067 into the cathedral chapter at Bremen by Archbishop Adalbert. In 1069 Adam was head of the Bremen cathedral school.

Adam began his *Gesta Hammaburgensis ecclesiae pontificum* (*History of the Archbishops of Hamburg-Bremen*), comprising four books, after Adalbert's death (1072). In Book III a candid and vivid description of the archbishop's personality and activities leads to an account of the German political affairs of the time. Book IV gives a "description of the islands of the north," and besides dealing with Russia, the countries of the Baltic peoples, Scandinavia, Iceland, and Greenland, Adam makes the earliest known reference to Vinland, that part of North America reached by Leif Eriksson.

Adam, Adolphe, in full **ADOLPHE-CHARLES ADAM** (b. July 24, 1803, Paris, France—d. May 3, 1856, Paris), French composer whose music for the ballet *Giselle* (1841) is notable for its dramatic power. It has retained its popularity with dancers and audiences to the present day.

Adam wrote 71 operas, the best of which are generally considered to be *Le Postillon de Longjumeau* (1836) and *Giralda* (1850). In his ballets—which he composed for production in London, Berlin, and St. Petersburg, as well as Paris—he subordinated the music to choreographic demands. His works were successful during the mid-19th century, but few of them are regularly revived.

Adam, Paul (b. Dec. 7, 1862, Paris—d. Jan. 1, 1920, Paris), author whose early works exemplify the Naturalist and Symbolist schools and who later won considerable reputation for his historical and sociological novels. Publication of his first Naturalist novel, *Chair*

molle (1885), led to his being prosecuted; his second, *Le Thé chez Miranda* (1886), written with Jean Moréas, is an early example of Symbolism. In 1899, with *La Force*, he began a series of novels depicting French life during the period 1800–30; the last, *Au soleil de Juillet*, appeared in 1903. He travelled widely and wrote two books on his American journeys, *Vues d'Amérique* (1906) and *Le Trust* (1910). His autobiography, in the form of a novel, *Jeunesse et amours de Manuel Héricourt*, appeared in 1913.

Adam, Robert (b. July 3, 1728, Kirkcaldy, Fife, Scot.—d. March 3, 1792, London), Scottish architect and designer who, with his brother James, transformed Palladian Neoclassicism in England into the airy, light, elegant style that bears their name. His major architectural works included public buildings (especially in London), and his designs were used for the interiors of such country mansions as Syon House, Middlesex (1762–69).

Early life. Robert was the second son of William Adam, the foremost Scottish architect of his time. William, who as Master Mason to the Ordnance in North Britain supervised the design of military buildings, also designed numerous country houses in a conservative Palladian style—the modified classic Roman style that was originally developed by the 16th-century architect Andrea Palladio. The Adam children grew up in the cultured atmosphere of a propertied and well-connected 18th-century family. Shortly after Robert's birth the family moved to Edinburgh, where, at the age of six, he entered the Edinburgh High School. In 1743 he enrolled at Edinburgh College (now University of Edinburgh), but in 1745 he abandoned his studies and the following year entered his father's offices as an apprentice and assistant.

William Adam died in 1748, and his post as Master Mason to the Board of Ordnance passed to his eldest son, John, who took Robert into partnership. In the succeeding few years both benefitted from the lucrative contracts that resulted from the appointment. Besides building Ft. George in the Moray Firth near Inverness, the Adam brothers were also engaged to complete the interior of the Earl of Hopetoun's house. In their interiors the brothers introduced into Scotland a new, lighter, almost Rococo, style of decoration. The other important private commission of these years was Dumfries House, Ayrshire, for Lord Dumfries.

European influences. In 1754 Robert, who by then considered himself to be worth £5,000, was invited to accompany the Honourable Charles Hope, the Earl's younger brother, to Italy. He thus had the opportunity to realize the dream he had been saving for since his father's death, and, just as important, he had the social advantages of travelling with the brother of an earl. He was as much concerned with meeting young noblemen abroad as with acquiring more architectural knowledge from a study of the monuments of Roman antiquity. The letters he wrote to his family during his years abroad give a picture of Robert as a madly ambitious young man, an arrogant social climber, and yet still a dedicated artist.

He met Charles Hope in Brussels, and they proceeded to Paris, where Robert fitted himself out in the latest fashions and set out to "lay in a stock of good acquaintance that may be of use to me hereafter." After fewer than three weeks in Paris, they set off for Italy via the south of France, visiting en route the Roman sites of Nîmes, Arles, the Pont du Gard, and Montpellier. They reached Genoa early in January 1755 and proceeded to Florence via Leghorn. Arriving at the end of the month, they were immediately caught up in the social whirl for which Robert had hoped.

While in Florence, Robert met a man who

was to have an important professional influence upon him. This was the talented young French architect and draftsman Charles-Louis Clérisseau, who agreed to accompany him on his tour as instructor and draftsman. Clérisseau had been a student at the French Academy in Rome but had left in 1754 after a dispute with its director. As a result of his friendship with Clérisseau, Robert came in contact with avant-garde architectural theory in Rome. "I hope," he wrote, "to have my ideas greatly enlarged and my taste formed upon the solid foundation of genuine antiquity." Clérisseau agreed to

serve [him] as an antiquarian . . . teach [him] perspective and drawing . . . [and] give [him] copies of all [Clérisseau's] studies of the antique, bas-reliefs and other ornaments. . . .

Adam left Florence in February 1755 and travelled to Rome, where he had to decide whether to devote himself to elegant society or to architecture:

If I am known in Rome to be an architect, if I am seen drawing or with a pencil in my hand, I cannot enter into genteel company who will not admit an artist or, if they do admit him, will very probably rub affronts on him in order to prevent his appearing at their card-playing, balls and concerts.

He had to decide: "Shall I lose Hope and my introduction to the great, or shall I lose Clérisseau and my taste for the grand?"

He quarrelled with Hope, and the two separated. Taking rooms for himself and Clérisseau, Robert settled down to serious study, visiting, sketching, and measuring the monuments of antiquity. Among the important figures he met in Rome were the art collector Cardinal Albani and the engraver Giambattista Piranesi, who dedicated an engraving and a book to him.

In May 1757 Adam and Clérisseau left Rome and travelled to Dalmatia via Venice to visit the ruins of Diocletian's palace at Spalato (Split). Adam felt he

could not help considering my knowledge of Architecture as imperfect, unless I should be able to add the observation of a private edifice of the Ancients to my study of their public works.

They spent five weeks at Spalato, preparing the drawings that were eventually to be published in 1764 as the *Ruins of the Palace of the Emperor Diocletian at Spalato in Dalmatia*.

Robert Adam, oil painting by an unknown artist; in the National Portrait Gallery, London

The Adam style. Having nearly exhausted his money and anxious to return to England, Robert had to forgo the pleasures of further expeditions to Greece and Egypt. He returned to London in January 1758, his head full of details of Roman antiquities. The current Palladian style was losing its appeal, and the

public was ready for a new architectural style. Adam lost no time in making his reputation, and by the mid 1760s he had, with the help of his younger brother James, who joined him in London in 1763, created and fully developed the Adam style. That style, which he and James later claimed had "brought about, in this country . . . a kind of revolution in the whole system of this useful and elegant art," was marked by a then new lightness and freedom in the use of the classical elements of architecture. In the Royal Society of Arts building (1772–74), for instance, Adam combined an Ionic pilaster—a rectangular column with scroll-like ornaments projecting from a wall—with a Doric entablature—the upper section of a wall designed in the oldest, simplest Greek style, a liberty a Palladian would never have dared take. This new style consisted basically of a fresh combination of many architectural elements. The various influences included the Palladianism of Lord Burlington and William Kent, both architects; the movement and vigour of the architecture of Sir John Vanbrugh; contemporary French influence, discernible particularly in details, planning, and furniture design; Roman archaeological influences; and the influence of Italian Renaissance decoration, particularly the fanciful ornamentation of the 16th century. Adam's genius was thus a result not of isolated influences but of the synthesis of various lines of development. The Adam style was essentially a decorative style, and it is as a designer of interiors that Adam is chiefly remembered. He gave meticulous attention to every part of each room, from the carpets to the most unobtrusive decoration.

Robert's first important work in London was the Admiralty Screen (1758). Through the influence of Lord Bute, a friend of the King, he was appointed Architect of the King's Works in November 1761 along with Sir William Chambers, his principal architectural rival. By the early 1760s he had many domestic commissions; almost without exception these consisted of the completion or redecoration of earlier houses. It was ironic that despite his fame and ability Adam was rarely called upon to build completely new houses, nor was he to realize his grandiose ideas for public buildings until the very end of his life.

The first Adam interiors at Hatchlands, Surrey (1758–61), and Shardeloes, Buckinghamshire (1759–61), were still near-Palladian. But by 1761 his mature style was developing, and important commissions from this time include Harewood, Yorkshire; Croome Court, Worcestershire; Kedleston Hall, Derbyshire; Bowood, Wiltshire; and Osterley Park, Middlesex. In 1762 he was employed to redesign the interior of Syon House, Middlesex.

Robert produced an important plan that proposed filling an old centre court with a vast domed pantheon-like hall; it was not executed, however. The entrance hall of Syon, based on a basilica—a rectangular building divided into three areas by two rows of columns—with its half-domed ends, is one of the most significant Neoclassical interiors in England. Other houses from this early phase include the first completely new house, Mershamle-Hatch, Kent (1762–72); Lansdowne House, Berkeley Square, London (1762–68); Luton Hoo, Bedfordshire (1766–75); Newby Hall, Yorkshire (c. 1767–85); and Kenwood, London (1767–68).

The south front of Kedleston Hall provides an example of Adam's exterior treatment. His theme of a triumphal arch as the exterior expressions of the great domed interior hall is the first use of this particular Roman form in domestic architecture. The double portico (an open space created by a roof held up by columns) at Osterley Park, derived from the

Portico of Octavia, Rome, is a similar Neo-classical motif.

In 1768 Robert and James Adam leased a site on the Thames River for a speculative development to be known as the Adelphi (it was almost totally destroyed in 1936). They invested a large sum on embanking the site and building several terraces of houses (1768–72) in which the Adam interior style of slim pilasters supporting a shallow frieze and cornice—the middle and uppermost sections of an entablature—was brought out of doors. It was, however, a financial disaster. In 1773 they again speculated unsuccessfully in a group of stuccoed terraces in Portland Place, London.

The Adams built three major London houses in the early 1770s, which were superb examples of their mature style—No. 20, St. James's Square for Sir Watkin Williams-Wynn (1772–74); No. 20, Portman Square for the Countess of Home (1775–77; now the Courtauld Institute of Art); and Derby House in Grosvenor Square for the Earl of Derby (1773–74; demolished 1862).

South front of Kedleston Hall, Derbyshire, Eng., by Robert Adam, 1760–65

The National Trust Photographic Library/Mike Williams

In 1773 they published the first volume of *The Works in Architecture of Robert and James Adam*. A second volume followed in 1779, and a third was published posthumously in 1822. In the preface to the first volume they explain their idea of “movement,” an essential aspect of the Adam style:

Movement is meant to express, the rise and fall, the advance and recess, with other diversity of form, in the different parts of a building, so as to add greatly to the picturesque of the composition.

By 1780 Robert Adam's popularity was beginning to decline, and Horace Walpole, after visiting the architect Henry Holland's new Carlton House, wrote, “How sick one shall be, after this chaste palace, of Mr. Adam's gingerbread and sippets of embroidery.”

Neo-Gothic work. Robert Adam designed and built a number of romantic Neo-Gothic castles, mostly dating from the 1780s, in Scotland. The most important of the castles is Culzean, Ayrshire, for the earls of Cassilis (1777–90). Another important work in the Gothic style was the interior at Alnwick Castle, Northumberland (c. 1770–80; destroyed in the 19th century).

Toward the end of his life, Adam built the Register House, Edinburgh (1772–92), in which he at last realized the conception of a monumental domed hall within a square,

envisaged at Syon some years earlier; and in 1789 he designed the University of Edinburgh, whose entrance front is perhaps his most successful exterior. At Fitzroy Square, London (1790), and Charlotte Square, Edinburgh (1791), he experimented for the last time with the introduction of movement into street architecture.

Robert Adam was buried in Westminster Abbey. The bulk of the nearly 9,000 drawings he left were purchased by the architect Sir John Soane in 1833 and are now in the Soane Museum, London.

Furniture design. As a designer of furniture, Adam played a leading role. The furniture style he evolved, popularized by the cabinetmaker George Hepplewhite, was always meant to harmonize with the rest of the interiors. In this field, too, he was prolific, turning his hand to everything from organ cases and sedan chairs to saltcellars and door fittings. It is one of the outstanding features of an Adam interior that everything, even the smallest detail, was part of the unified scheme created by the architect. (S.Mi.)

BIBLIOGRAPHY. Biographies include John Fleming, *Robert Adam and His Circle*, in *Edinburgh & Rome* (1962), based on original letters; and Doreen Yarwood, *Robert Adam* (1970), concentrating on the man rather than the artist. Well-illustrated surveys of the creative work and activities in different genres include Arthur T. Bolton, *The Architecture of Robert & James Adam, 1785–1794*, 2 vol. (1922, reprinted 1984); Eileen Harris, *The Furniture of Robert Adam* (1963, reprinted 1973); Damie Stillman, *The Decorative Work of Robert Adam* (1966, reprinted 1973), with original drawings; and Joseph Rykwert and Anne Rykwert, *Robert and James Adam: The Men and the Style* (1985).

Adam, Roi (poet): see Adenet le Roi.

Adam and Eve, in the Judeo-Christian and Islāmic traditions, the original human couple, parents of the human race.

In the Bible, there are two accounts of their creation. According to the Priestly (P) history of the 5th or 6th century BC (Genesis 1:1–2:4), God on the sixth day of Creation created all the living creatures and, “in his own image,” man both “male and female.” God then blessed the couple, told them to be “fruitful and multiply,” and gave them dominion over all other living things. According to the lengthier Yahwist (J) narrative of the 10th century BC (Genesis 2:5–7, 2:15–4:1, 4:25), God, or Yahweh, created Adam at a time when the earth was still void, forming him from the earth's dust and breathing “into his nostrils the breath of life.” God then gave Adam the primeval Garden of Eden to tend but, on penalty of death, commanded him not to eat of the fruit of the “tree of knowledge of good and evil.” Subsequently, so that Adam would not be alone, God created other animals but, finding these insufficient, put Adam to sleep, took from him a rib, and created a new companion, Eve. The two were persons of innocence until Eve yielded to the temptations of the evil serpent and Adam joined her in eating the forbidden fruit, whereupon they both recognized their nakedness and donned fig leaves as garments. Immediately, God recognized their transgression and proclaimed their punishments—for the woman, pain in childbirth and subordination to man, and, for the man, relegation to an accursed ground with which he must toil and sweat for his subsistence.

Their first children were Cain and Abel. Abel, the keeper of sheep, was highly regarded by God and was killed by Cain out of envy. Another son, Seth, was born to replace Abel, and the two human stems, the Cainites and the Sethites, descended from them. Adam and Eve had “other sons and daughters,” and death came to Adam at the age of 930.

The Hebrew Bible, or Old Testament, does not elsewhere refer to the Adam and Eve

story, except for the purely genealogical reference in 1 Chronicles 1:1. Allusions occur in the apocryphal books (*i.e.*, highly regarded but noncanonical books for Jews and Protestants; deuterocanonical books for Roman Catholics and Orthodox). The story was more popular

“Adam and Eve,” detail by Giulio Clovio from the Book of Hours of Cardinal Alessandro Farnese, completed 1546; in the Pierpont Morgan Library, New York City (MS. 69, fol. 27)

By courtesy of the Pierpont Morgan Library, New York City

among the writers of the pseudepigrapha (*i.e.*, noncanonical books for all traditions), which include the *Life of Adam and Eve*, told with much embellishment.

In the Christian New Testament, Adam is a figure of some theological importance in the Pauline writings. Paul sees Adam as a forerunner to Christ, “a type of the one who was to come” (Romans 5:12). As Adam initiated the life of man upon earth, so Christ initiates the new life of man. Because of the sin of Adam, death came upon all men; because of the righteousness of Christ, life is given to all men. Thus, in Paul's theology, it was Adam's sin and not failure to observe the Law of Moses that made the Gentiles sinners; therefore, Jews and Gentiles alike stand in need of the grace of Christ.

In later Christian theology, the concept of original sin (*q.v.*) took hold—a sin in which human kind has been held captive since the Fall of Adam and Eve. The doctrine was based on Pauline Scripture but has not been accepted by a number of Christian sects and interpreters, especially among those Christians who consider the story of Adam and Eve less a fact and more a metaphor of the relation of God and man.

In the Qur'anic version of the story of Adam and Eve (related largely in surahs 2, 7, 15, 17, and 20), Allah created Adam from clay but exalted him with such knowledge that the angels were commanded to prostrate themselves before him. All did but the angel Iblīs (Satan), who subsequently in the Garden tempted both Adam and his “wife” to eat of the forbidden fruit. Allah then sent them down on earth, where their progeny were doomed to live as enemies; but, being merciful, Allah offered Adam and his progeny eternal guidance if they would follow only him, not Satan. According to Qur'anic teachings, Adam's sin was his sin alone and did not make all men sinners; Adam was responsible for his own actions, as his progeny were for theirs. Later Islāmic traditions have Adam descending from paradise to Ceylon (Sarandīb) and Eve descending to Jidda in Arabia; after a separation of 200 years, they met near Mount 'Arafāt and began

conceiving children. The first two sons, Kābil and Hābil, each had a twin sister, and each son married his brother's sister. Kābil subsequently killed Hābil. Later, Shith was born without a sister and became Adam's favourite and his spiritual heir (*wasi*). Eve eventually bore 20 sets of twins, and Adam had 40,000 offspring before he died.

Adam and Eve, Life of, pseudographic work (a noncanonical writing that in style and content resembles authentic biblical works), one of many Jewish and Christian stories that embellish the account of Adam and Eve as given in the biblical Genesis. Biography was an extremely popular literary genre during the late Hellenistic period of Judaism (3rd century BC to 3rd century AD), and legends of biblical figures were numerous. But all surviving Haggada (folk stories and anecdotes) about Adam and Eve are Christian works and are preserved in a number of ancient languages (e.g., Greek, Latin, Ethiopic). Although all Aramaic and Hebrew texts have been lost, the basic material was presumably of Jewish authorship. Extant versions of the *Life of Adam and Eve* have consequently been used to reconstruct the supposed original, which was probably composed sometime between 20 BC and AD 70, because the apocalyptic portion of the work (chapter 29) seems to imply that the Herodian Temple of Jerusalem was functioning when the book was written. The book is primarily noteworthy for its imaginative retelling of the biblical story and for its inclusion of visions and angelology, both characteristic of Hellenistic religious writing. The detailed descriptions of the penances that Adam and Eve inflicted upon themselves after their expulsion from Eden suggest an ascetic influence.

Adamawa, traditional emirate centred in what is now Adamawa state, eastern Nigeria. The emirate was founded by Modibbo Adama, who was one of Sheikh Ūsman dan Fodio's commanders and who began a Fulani jihad (holy war) in 1809 against the non-Muslim peoples of the region. Adama moved the capital of his kingdom, which was then known as Fumbina, several times before settling it finally in 1841 in Yola, which has since remained the seat of the emirate. At his death, in 1848, Fumbina extended over parts of present-day eastern Nigeria and most of northern Cameroon; even as the easternmost emirate of the Fulani empire, however, it was required to pay annual tribute (mostly in slaves) to the sultans at Sokoto, the Fulani capital, 555 miles (890 km) west-northwest.

Adama was succeeded by four of his sons. Lamido (Lord) Hamman (usually known as Lawal [Lauwal, or Lowal]) consolidated Fulani control during his reign (1848–72). During the weak rule of Sanda (Saanda; 1872–90), the Royal Niger Company established trading posts along the Benue River in Adamawa; when Emir Zubeiru (1890–1901) tried to force the British to leave Yola in 1901, British troops captured the town and compelled him to flee. After Adamawa was partitioned in 1901 between British Northern Nigeria and German Kamerun (Cameroon), Bobbo Ahmadu (Bobo Amadu; 1901–09), Adama's fourth son, became emir of Yola in the British section of the state. After World War I, part of the Cameroon portion of the emirate came under French administration and part remained under British rule. The emirate's territories eventually came to form almost all of northern Cameroon and part of eastern Nigeria.

Adamawa, state, northeastern Nigeria. It was administratively created in 1991 from the northeastern half of former Gongola state. Adamawa is bordered on the north and northwest by Borno and Bauchi states, on the west and southwest by Taraba state, and on the southeast and east by Cameroon.

The Mandara Mountains lie in the north-eastern part of the state along the Cameroon border, and the Shebshi Mountains rise to Mount Dimlang (6,699 feet [2,042 m]) in the state's southeastern portion. Adamawa state is largely covered by short-grass savanna and is drained westward by the Benue River and its tributaries, including the Gongola, Taraba, and Pai rivers.

Besides the dominant Fulani, Adamawa is also inhabited by the Mumuye, Higi, Kapsiki, Chamba, Margi (Marghi), Hausa, Kilba, Gude, Wurkum, Jukun, and Bata peoples. All these groups except the trader Hausa population are primarily engaged in farming and herding (cattle, goats, sheep), but fishing is also important along the riverbanks. Peanuts (groundnuts), cotton, sorghum, millet, rice, and corn (maize) are the main crops. Peanuts and cotton are exported, as are cattle, dyed skins, and gum arabic.

Cottage industries include leatherwork, calabash decoration, mat weaving, pottery making, metalwork, canoe carving, and cloth dyeing. Industries are all agriculturally based and include a sugar-processing plant near Numan, a timber industry at Yola (the state capital), and a cotton ginny at Lamurde. The state's road system is limited. Yola, the site of a federal university of technology, is served by an airport, and the Benue River allows for river transport. Pop. (1991) 2,124,049.

Adamawa-Eastern languages, branch of the Niger-Congo family of languages spoken in east-central Nigeria, northern Cameroon, much of the Central African Republic, and northern Zaire between the Congo and Ubangi rivers. At least one of the languages (Gbaya) is spoken by several million people. Linguists usually divide the Adamawa-Eastern group of languages into two subgroups: Adamawa (spoken in Nigeria and Cameroon) and Eastern (spoken in Zaire and the Central African Republic). See also Niger-Congo languages.

Adamawa Plateau, also spelled ADAMAOUA PLATEAU, volcanic upland in west-central Africa. Though chiefly in north-central Cameroon, part of the plateau, known as the Gotei Mountains, is in southeastern Nigeria. The plateau is the source of the Benue River. Its highest elevations are more than 8,700 feet (2,650 m) above sea level. Many craters and small lakes attest to the region's volcanic origin. Vegetation is chiefly savanna, with some tropical woodlands; the economy is based on pastoralism, with subsistence agriculture, and there are also some cattle ranches. Some tin deposits are exploited, and exploitation of bauxite deposits began in 1976–77. The region is named for Modibbo Adama (d. 1847/48), the founder of a Fulani emirate.

adamellite: see quartz monzonite.

Adamic, Louis (b. March 23, 1899, Blato, Slovenia, Austria-Hungary [now in Slovenia]—d. Sept. 4, 1951, near Riegelsville, N.J., U.S.), novelist and journalist who wrote about the experience of American minorities, especially immigrants, in the early 1900s.

Adamic immigrated to the United States from Yugoslavia at age 14 and was naturalized in 1918. He wrote about what he called the failure of the American melting pot in *Laughing in the Jungle* (1932). He returned to Yugoslavia on a Guggenheim Fellowship and wrote about the experience in *The Native's Return* (1934), the story of a man who finds he cannot slip comfortably into his former life as a peasant. Two successful sequels, *Grandsons* (1935) and *Cradle of Life* (1936), were followed by his first novel, *The House in Antigua* (1937). His following book, *My America* (1938), a mixture of memoir and social philosophy, outlines his dream of a unified American people.

Adamic believed America had great potential but that tensions between ethnic minorities

and the status quo were near crisis. Starting in 1940 he edited *Common Ground*, a magazine that analyzed the interracial culture of the United States.

An intensely political man, Adamic suffered greatly over the fragmentation and occupation of Yugoslavia in World War II, and he supported Josip Broz Tito's communist movement both during and after the war. Adamic was found shot to death, with a rifle in his hands; murder was suspected because of his political views, but the official cause of death was finally determined to be suicide caused by overwork and anxiety.

Adamnan, SAINT, also spelled ADOMNAN, also called EUNAN (b. c. 625, County Donegal, Ire.—d. 704; feast day September 23), abbot and scholar, particularly noted as the biographer of St. Columba.

Nothing is known of Adamnan's early life. In 679 he was elected abbot of Iona, the ninth in succession from St. Columba, the founder. While on a visit to Northumbria, he adopted the Roman rules on the tonsure and for determining the date of Easter that had been accepted for England at the Synod of Whitby in 663/664. He failed, however, to enforce the changes at Iona. He then traveled much in Ireland to promote the observance of the Roman Easter, but he was never able to persuade his own community. At the council of Birr in County Offaly, he succeeded in ameliorating the condition of women, particularly by exempting them from military service; he also made regulations protecting children and clerics, and these reforms became known as the Law of Adamnan.

Adamnan's *Vita S. Columbae*, in which he describes the saint's prophecies, miracles, and visions, is one of the most important hagiographies ever written. He was also the author of *De locis sanctis* ("Concerning the Sacred Places"), a narrative of the pilgrimage (c. 680) made to the Holy Land by the Frankish bishop Arculf, who, forced by storms to the west coast of Britain, became Adamnan's guest. Adamnan is the subject of the *Vision of Adamnan (Fis Adamnáin)*, an Irish tale of the 10th or 11th century describing the glories of heaven and the sufferings of the damned as seen by his own soul.

Adamnan, Vision of, Irish Gaelic FÍS ADAMNÁIN, in the Gaelic literature of Ireland, one of the earliest and most outstanding of medieval Irish visions. This graceful prose work dates from the 10th century and is preserved in the later *The Book of the Dun Cow* (c. 1100). Patterned after pagan voyages (*inramtha*) to the otherworld, the *Vision of Adamnan* vividly describes the journey of Adamnan's soul, guided by an angel, first through a delightful, fragrance-filled heaven; through the seven stages through which a sinful soul passes to reach perfection; and then through the monster-ridden Land of Torment. It is often attributed, erroneously, to St. Adamnan (c. 625–704), the abbot of Iona.

Adamov, Arthur (b. Aug. 23, 1908, Kislovodsk, Russia—d. March 16, 1970, Paris, Fr.), avant-garde writer, a founder and major playwright of the Theatre of the Absurd.

In 1912 Adamov's wealthy Armenian family left Russia and settled in Freudenstadt, Ger. He was subsequently educated in Geneva, Mainz, and Paris, where, having mastered French, he settled in 1924, associating with Surrealist groups. He edited a periodical, *Discontinuité*, and wrote poetry. In 1938 he suffered a nervous breakdown, later writing *L'Aveu* (1938–43; "The Confession"), an autobiography that revealed his tortured conscience, delving into a terrifying sense of alienation and preparing his personal, neu-

rotic stage for some of the most powerful of all Absurdist dramas. He spent almost a year of World War II in the internment camp of Argelès, Fr. A severe depression followed.

Strongly influenced by the Swedish dramatist August Strindberg—with whose own mental crisis Adamov identified—and by Franz Kafka, he began writing plays in 1947. Believing that God is dead and that life's meaning is unobtainable, Adamov turned to a private, metaphysical interpretation of Communistic ideals. His first play, *La Parodie*, features a handless clock that looms eerily over characters who are constantly questioning one another about time. The world of the play is a parody of man, whom Adamov saw as helplessly searching for life's meaning, which, although it exists, is tragically inaccessible to him. In *L'Invasion*, he attempted to depict the human situation more realistically; it impressed André Gide and the director Jean Vilar, and, under Vilar's direction, it opened in Paris in 1950, with his third play, *La grande et la petite manoeuvre*. The latter reveals the influence of his friend, Antonin Artaud, theoretician of the "theatre of cruelty."

Le Professeur Taramme (performed 1953) was about a university professor unable to live up to his public role; though the play is dictated by the absurd logic of a dream, the construction and characterizations are firm and clear. In his best known play, *Le Ping-pong* (performed 1955), the powerful central image is that of a pinball machine to which the characters surrender themselves in a never-ending, aimless game of chance, perfectly illustrating man's adherence to false objectives and the futility of his busy endeavours. Adamov's later plays (*Paolo Paoli*, 1957; *Le Printemps 71*, 1961; *La Politique des restes*, 1963) embodied radical political statements, though his interest in dramatic experimentation continued. Finally admitting that life was not absurd but merely difficult, he committed suicide. In a preface to *Théâtre II* (1955), his second volume of plays, Adamov describes his attitudes toward his work and comments on his career.

Adams, town (township), Berkshire county, northwestern Massachusetts, U.S. It lies at the foot of Mount Greylock (3,491 feet [1,064 m]), on the Hoosic River, 15 miles (24 km) north of Pittsfield. The town of North Adams is 5 miles (8 km) north. Founded by Quakers in 1766, it was known as East Hoosuck until 1778, when it was incorporated and renamed for the Revolutionary War hero Samuel Adams. Local limestone and marble quarries supplied early building stone industries, and waterpower from the Hoosic led to the manufacture of textiles and paper. Mount Greylock, the highest point in the state, is crowned by a 90-foot (27-m) war memorial tower. The mountain and nearby state forests, parks, and ski resorts make Adams a year-round tourist base. In 1784 the town's Quaker meetinghouse was erected. The birthplace (built c. 1810) of the pioneer woman suffragist Susan B. Anthony is also preserved. Pop. (2000) 8,809.

Adams FAMILY, Massachusetts family with deep roots in American history whose members made major contributions to the nation's political and intellectual life for more than 150 years.

Established in America by Henry Adams, who emigrated from England to Massachusetts Bay Colony in about 1636, the family made no special mark until the time of John Adams (q.v.; 1735–1826). Perhaps the most profound political philosopher of the Revolutionary and Early National periods of U.S. history, Adams also served as the country's second president (1797–1801). His wife, Abigail (q.v.; 1744–1818) left a voluminous correspondence testifying to her wit, literary

capabilities, and political insight. John's cousin Samuel Adams (q.v.; 1722–1803) was the firebrand of Revolutionary Boston, constantly organizing protests against British policies and shrewdly directing public opinion toward the goal of independence.

John Quincy Adams (q.v.; 1767–1848), son of John and Abigail, like his father served four unhappy years as president of the United States (1825–29). More than for his presidency, perhaps, he is best remembered for his diplomatic skills, which resulted in the acquisition of Florida and in the Monroe Doctrine, and for his heroic championing of antislavery petitions while a member of the U.S. House of Representatives. His son, Charles Francis Adams (q.v.; 1807–86), continued the battle against slavery as a congressman and as a leader of the Free-Soil Party. During the Civil War he demonstrated his own diplomatic genius while U.S. minister to Great Britain, preventing British recognition of and possible alliance with the Confederacy.

Except for a grandson of Charles Francis Adams—Charles Francis Adams III (1866–1954), who served as secretary of the navy during the Herbert Hoover administration—subsequent generations of the Adams family refrained from participation in public life. Charles Francis Adams, Jr. (1835–1915), was a businessman who for a time was president of the Union Pacific Railroad and who later retired to write a biography of his father and on other historical subjects. His two brothers, Henry Adams (q.v.; 1838–1918) and Brooks Adams (q.v.; 1848–1927), were also historians, as well as profound social critics. Henry Adams, in particular, ranks as one of the truly great American writers since the Civil War.

Adams, Abigail, née SMITH (b. Nov. 22 [Nov. 11, old style], 1744, Weymouth, Mass.—d. Oct. 28, 1818, Quincy, Mass., U.S.), American first lady (1797–1801), the wife of John Adams, second president of the United States, and mother of John Quincy Adams, sixth president of the United States. She was a prolific letter writer whose correspondence gives an intimate and vivid portrayal of life in the young republic.

For a detailed discussion of American first ladies, see MACROPAEDIA: United States Presidency and First Lady.

Abigail Adams, detail of a portrait by Ralph Earl, 1785; in the collection of the New York State Historical Association

By courtesy of the New York State Historical Association, Cooperstown

Born to William Smith, a Congregational minister, and Elizabeth Quincy Smith, Abigail was the second of four children. Educated entirely at home, she read widely in her father's large library, and the constant flow of interesting, intelligent, and well-educated guests at the Smith home turned her into a learned, witty young woman. For her introduction to great literature, she credited her brother-in-law, Richard Cranch.

Abigail's plans to marry John Adams, a Har-

vard-educated lawyer nine years her senior, did not gain the immediate approval of her father, who considered a lawyer's prospects inadequate. When they married on Oct. 25, 1764, the bride's father, who performed the ceremony, amused the guests by citing a passage from the Book of Luke: "John came neither eating bread nor drinking wine and some say he has a devil in him." During the first 10 years of their marriage Abigail gave birth to five children, including a daughter who died in infancy and John Quincy Adams.

She managed the second decade of her marriage on her own, as John participated in the colonial struggle for independence as a member of the Continental Congress and later as a representative of his country in France. Their correspondence during these years, especially when added to the spirited letters penned earlier during their courtship, provides a rich account of their activities and thinking as well as their love and devotion to each other. It is from these letters that historians, including the Adamses' grandson Charles Francis Adams, have concluded that Abigail played a significant role in her husband's career, particularly in managing the family farm and his business affairs. Because of her, the Adamses avoided the financial ruin that befell some other early presidents, such as Thomas Jefferson, after they left office.

As the revolutionary spirit swept through the colonies, Abigail firmly supported the movement for independence. In March 1776, when her husband prepared to gather with his colleagues to write a statement of principles that would soon be adopted by the Continental Congress as the Declaration of Independence, she asked him to "remember the ladies and be more generous and favourable to them than your ancestors." Although this letter has often been cited, correctly, as evidence of her fervent desire for women's rights, she did not champion, then or later, the right of women to vote, a position virtually unheard of at the time. She did, however, strongly support a woman's right to education, and in 1778 she wrote her husband that "you need not be told how much female education is neglected, nor how fashionable it has been to ridicule female learning." She also favoured the abolition of slavery.

Abigail joined her husband in Europe in 1784, when he began serving as American minister to Britain. Her letters from Paris and London contain descriptive musings on British royalty, French customs, and the superiority of the quiet life of an American farmer. She wrote in early 1788 that she much preferred her "own little farm" to "the court of Saint James's where I seldom meet with characters so inoffensive as my Hens and chickens." Later that year the Adamses returned to the United States. When John assumed the vice presidency in 1789, Abigail divided her time between the capital city (first New York City and then, in 1790, Philadelphia) and the family home in Massachusetts. She missed her husband's presidential inauguration in March 1797 in order to care for his sick mother, and during his presidency she often stayed in Massachusetts to look after family matters.

As first lady, she kept a rigorous daily schedule, rising at 5 AM to manage a busy household and receive callers for two hours each day. Unlike Martha Washington, who had been a gracious hostess but avoided all political discussions, Abigail involved herself in the most interesting debates of the day. As the two major political factions, the Federalists and the Anti-Federalists (later the Jeffersonian Republicans), developed into political parties in the 1790s, she pointed out her husband's friends and foes in both groups. About Alexander Hamilton, who along with Adams was a leading Federalist, she wrote that she saw in his eyes "the very devil . . . lascivious-

ness itself." She judged Albert Gallatin, a Republican opponent of her husband, "sly, artful . . . insidious." Her critics objected that the wife of the president should not insinuate herself in political discussions; Gallatin wrote, "She is Mrs. President not of the United States but of a faction . . . It is not right."

In November 1800, just as the election that denied John Adams a second term as president was being held, Abigail oversaw the Adamses' move from Philadelphia to the newly constructed presidential mansion in Washington, D.C. Her letters to family members showed her displeasure at finding the building roughly finished and unfurnished, but she warned her daughter not to reveal her thoughts, since people would think her ungrateful. On New Year's Day 1801 she opened the mansion, soon to be known as the White House, to visitors, continuing a tradition begun by the Washingtons and maintained by every subsequent first lady until 1933.

After leaving office, Abigail and John retired to their home in Massachusetts. She continued a lively correspondence with many people and even resumed writing to Thomas Jefferson, from whom she had been estranged as a result of political differences. She died in October 1818 and was buried in the First Church of Quincy; her husband, who died in 1826, was buried beside her.

Until the 20th century few first ladies shared Abigail Adams' interest in politics or in the treatment of government leaders by the press. She vigorously objected to what she considered inaccurate reporting on her husband and son. But she was not altogether surprised by the "lies [and] Falshoods," writing in 1797 to her sister that she "expected to be vilified and abused, with my whole family." Although her approach to the office of first lady was in many ways advanced, her fame rests primarily on her thousands of letters, which form an eloquent and evocative description of her life and times. (B.B.C.)

BIBLIOGRAPHY. The best picture of Abigail Adams is given in her letters, and many of them have been published. Collections include Stewart Mitchell (ed.), *New Letters of Abigail Adams, 1788-1801* (1947, reprinted 1973); L.H. Butterfield et al. (eds.), *Adams Family Correspondence*, 6 vol. (1963-93); and L.H. Butterfield, Marc Friedlander, and Jo Kline (eds.), *The Book of Abigail and John: Selected Letters of the Adams Family, 1762-1784* (1975, reissued 1997). Biographies include Edith B. Gelles, *Portia: The World of Abigail Adams* (1992, reissued 1995), focusing on the people whom she influenced and who influenced her; and Phyllis Lee Levin, *Abigail Adams* (1987).

Adams, Ansel (b. Feb. 20, 1902, San Francisco—d. April 22, 1984, Carmel, Calif.), the most important landscape photographer of the 20th century.

A brief account of the life and works of Ansel Adams follows. For a full biography, see **MACROPAEDIA: Adams, Ansel**.

Originally a student of music, Adams pursued photography as an avocation until 1927. In that year he published his first portfolio, *Parmellian Prints of the High Sierras*, photographs in the style of the Pictorialists, who imitated Impressionistic painting by suppressing detail in favour of soft, misty effects often achieved in the darkroom.

In 1930 Adams was so impressed by the U.S. photographer Paul Strand, whose photographs emphasized beauty of tone and sharp detail, that he adopted Strand's approach, called "straight photography." With Willard Van Dyke, Adams in 1932 formed Group f.64, an association of photographers who used large cameras and small apertures to capture nature's infinite variety of light and textures. Holding as paragons the crisp brilliance of daguerreotypes and the landscapes of the 19th-century photographers Timothy H. O'Sullivan and William Henry Jackson, Adams became

one of the outstanding technicians in the history of photography. In 1935 he published *Making a Photograph*, the first of many books on photographic technique, illustrated with reproductions of his own prints.

In 1941 Adams began making photo-murals for the U.S. Department of the Interior. Forced by the large scale of this work to master the light and space of such immense landscapes as that seen in "Moonrise, Hernandez, New Mexico" (1941), he developed the zone system, a method of predetermining precisely what tone each part of the scene to be photographed will produce in the final print.

Throughout his career, Adams worked to increase public acceptance of photography as a fine art. In 1940 he helped found the world's first museum collection of photographs at the Museum of Modern Art in New York City, and in 1946 he established at the California School of Fine Arts in San Francisco—the first academic department to teach photography as a profession.

An ardent conservationist since adolescence, Adams served from 1936 as a director of the Sierra Club. Many of his photographic books are collections from the years he spent photographing the wildernesses of the United States, and are pleas for their preservation.

Adams, Brooks (b. June 24, 1848, Quincy, Mass., U.S.—d. Feb. 13, 1927, Boston), historian who questioned the success of democracy in the U.S. and who related the march of civilization to the westward movement of trade centres.

Adams graduated from Harvard in 1870 and practiced law in Boston until 1881. Son of the diplomat Charles Francis Adams and grandson of Pres. John Quincy Adams, he was enabled by an inheritance to travel extensively in Europe, the Middle East, and India.

Adams was particularly close to his brother Henry, a distinguished historian. Through an active correspondence they developed the idea—revolutionary at the time—that by its nature and substance U.S. democracy was foreordained to degradation and decay. In 1895 he published his *Law of Civilization and Decay*, in which he expounded his theory of history. It held that the centre of trade had consistently followed a westward movement from the ancient crossroads in the East to Constantinople, Venice, Amsterdam, and finally to London, in accord with a law relating to the density of populations and the development of new and centralizing techniques of trade and industry.

His *America's Economic Supremacy* (1900) accurately foresaw that within 50 years there would be in the world only two powers, Russia and the United States, the latter possessing economic supremacy. In 1913 he published *The Theory of Social Revolutions*, a study of defects in the American form of government, developing the idea of the imminent danger in the existence of great wealth that exerted private power but declined to accept responsibility. After Henry Adams' death, Adams prepared for publication his brother's book *The Degradation of the Democratic Dogma* (1919), for which he wrote the introduction—a kind of family chronicle that began with John Quincy Adams' troubles and ended with the renunciation by the two grandsons of the democratic dogma.

For most of his life Adams had been an agnostic and a profound skeptic; the roots of his Puritan ancestry were deep, however, and he returned in his last years to the church at Quincy to publicly profess his faith.

Adams, Charles Francis (b. Aug. 18, 1807, Boston—d. Nov. 21, 1886, Boston), U.S. diplomat who played an important role in keeping Britain neutral during the U.S. Civil War (1861-65) and in promoting the arbitration of the important "Alabama" claims.

The son of Pres. John Quincy Adams and the grandson of Pres. John Adams, Charles was early introduced to a cosmopolitan way of life when his father was appointed minister to Russia in 1809. He graduated from Harvard in 1825, and then, during his father's presidency (1825-29), lived for two years in the White House, studying law and moving freely among the political leaders of the period.

Charles Francis Adams

In the 1840s Adams served for six years as a member of the Massachusetts legislature and as the editor of a party journal, the *Boston Whig*. He felt, however, that the Whigs should take a more forthright position against the extension of slavery into the territories, and when, in 1848, the so-called Conscience Whigs broke with the party to form the antislavery Free-Soil Party, Adams received the vice-presidential nomination of the new coalition.

The emergence of the Republican Party in 1856 offered Adams the permanent political affiliation he was seeking, and he was elected to the U.S. Congress from his father's old district in 1858. When the Republicans won at the polls two years later, Adams was named ambassador to Great Britain by his friend William H. Seward, the new secretary of state.

Civil war broke out in April 1861, and, when Adams arrived in London the following month, he found that Great Britain had already recognized Confederate belligerency. So much sympathy was shown in England for the South that Adams' path for the next seven years was strewn with difficulties, but his logic, reserve, and directness appealed to the British, and gradually he won their support.

His main mission was to prevent the British from abandoning neutrality, and, with the issuance of the Emancipation Proclamation (Jan. 1, 1863), the immediate danger of diplomatic recognition of the South was over. Adams then laboured to prevent the building or the outfitting at British shipyards of privateers for Confederate use. He had not been able to prevent the sailing (May 1862) of the highly effective commerce destroyer "Alabama," but his vigorous protestations of the obligations of neutrals succeeded in preventing further launchings. Furthermore, he persistently argued the British government's responsibility for the estimated \$6,000,000 worth of damage done by the "Alabama" to Federal merchant vessels. During this long and taxing period in Anglo-American relations, Adams' judicious and balanced conduct greatly enhanced the reputation of his country abroad.

From 1871 to 1872 Adams served as U.S. arbiter on the international commission that met at Geneva to settle the "Alabama" claims. His name is inseparable from this seminal work in forwarding the concept of world law

through arbitration. He edited *Works of John Adams* (1850–56) and *Memoirs of John Quincy Adams* (1874–77). His biography was written in 1900 by his son, Charles Francis Adams, Jr. A more recent work is Martin B. Duberman's biography, published in 1961.

Adams, Franklin Pierce, byname F.P.A. (b. Nov. 15, 1881, Chicago—d. March 23, 1960, New York City), U.S. newspaper columnist, translator, poet, and radio personality whose humorous syndicated column "The Conning Tower" earned him the reputation of godfather of the contemporary newspaper column. He wrote primarily under his initials, F.P.A.

Adams' newspaper career began in 1903, with the *Chicago Journal*. The next year he went to New York, where he wrote for several newspapers. From 1913 to 1937 his column, "The Conning Tower," appeared in the *Herald Tribune* and several other New York newspapers, interrupted only during the years of World War I, when Adams wrote a column for *Stars and Stripes*, and from 1923 to 1931, when he worked for the *New York World* until it ceased publication. Witty and well-written, his columns consisted of informal yet careful critiques of the contemporary U.S. scene. His column also included writing by such authors as Dorothy Parker and Sinclair Lewis. His Saturday columns imitated the language and style of Samuel Pepys' diary, and Adams is credited with a renewal of interest in Pepys. Reprints were collected in *The Diary of Our Own Samuel Pepys* (1935).

Adams' poetry is light and conventionally rhymed. He hated free verse and was never slow in expressing this opinion. His verse is collected in 10 volumes, beginning with *Tobogganning on Parnassus* (1911); the final volume, *The Melancholy Lute* (1936), is Adams' selection from 30 years of his writing.

In 1938, Adams became one of the panel of experts on the radio show "Information, Please." He achieved almost instant popularity for his humour and erudition, and his name became something of a household word in the 1930s, '40s, and '50s.

Adams, Gerry, in full GERARD ADAMS (b. Oct. 6, 1948, Belfast, N.Ire.), president of Sinn Féin (*q.v.*), the political wing of the Irish Republican Army (IRA), and one of the chief architects of Sinn Féin's shift to a policy of seeking a peaceful settlement to sectarian violence in Northern Ireland. He has been a member of the British Parliament (from West Belfast) and the Northern Ireland Assembly.

Born into a strongly Republican family, Adams became involved in predominantly Roman Catholic civil rights protests in Belfast, N.Ire., which became increasingly violent in the late 1960s. By early 1970 he was suspected of heading a unit of the IRA, a Republican paramilitary organization seeking the unification of predominantly Protestant Northern Ireland with the predominantly Roman Catholic Irish Republic. In 1972, following two years of escalating violence by the IRA and Protestant paramilitary forces, Adams was interned without trial, though he was soon released to participate in secret peace talks with the British government. Following the failure of these talks, Adams reputedly became a top strategist in the IRA, though he consistently denied any direct involvement in the organization, which is illegal in both Northern Ireland and the Republic. Adams was imprisoned again from 1973 to 1976 and in 1978 and was later officially charged with membership in the IRA, though he was never convicted.

In the late 1970s Adams began publicly advocating that the Republican movement adopt a more political strategy, arguing that military victory was unlikely. He played a leading role in planning the hunger strikes undertaken by

Republican prisoners in Northern Ireland in 1981, which galvanized the Catholic community there. In 1983 Adams was elected president of Sinn Féin and a member of the British Parliament, but in keeping with party policy he refused to take his seat to avoid taking the compulsory oath of loyalty to the British monarch. Reelected in 1987, he lost his seat in 1992 but regained it in 1997. In 1988 Adams engaged in sometimes secret talks with SDLP leader John Hume (*q.v.*), which led to follow-up talks in the early 1990s. The two leaders issued a joint statement to the British and Irish governments in 1993, identifying points of agreement and signaling the conditions under which Sinn Féin would be willing to engage in multiparty talks.

In January 1994 Adams was granted a visa to attend a conference in New York City. This controversial visa was followed by others, which allowed Adams to raise funds for Sinn Féin on American soil. The process of bringing Sinn Féin closer to the political mainstream, reflected in Adams' visits to the United States, led to an 18-month IRA cease-fire beginning in August 1994. In September 1997, after the declaration of a second IRA cease-fire in July of that year, Adams and his negotiating team joined multiparty talks to end the conflict in Northern Ireland. Adams supported the Good Friday Agreement (April 1998) on steps leading to power-sharing self-government in the province, and he campaigned for acceptance of the accord within Sinn Féin and in referenda that were passed in Northern Ireland and the Republic of Ireland in May. In elections in June 1998 he won a seat in the new Northern Ireland Assembly.

Charismatic, articulate, and possessing experience that generated respect within his constituency, Adams was a powerful leader of a highly organized movement. Along with Martin McGuinness, he led his party from its traditional violent rejection of British rule to parliamentary politics as part of a new government in Northern Ireland. (Pa.A./K.C./Ed.)

BIBLIOGRAPHY. Gerry Adams, *Before the Dawn* (1996), is an autobiography. Adams discusses his goals in *Free Ireland: Towards a Lasting Peace*, rev. ed. (1995).

Adams, Henry (Brooks) (b. Feb. 16, 1838, Boston—d. March 27, 1918, Washington, D.C.), historian, man of letters, and author of one of the outstanding autobiographies of Western literature, *The Education of Henry Adams*.

Adams was the product of Boston's Brahmin class, a cultured elite that traced its lineage to Puritan New England. He was the great-grandson of John Adams and the grandson of John Quincy Adams, both presidents of the United States. The Adams family tradition of leadership was carried on by his father, Charles Francis Adams (1807–86), a diplomat, historian, and congressman. His younger brother, Brooks (1848–1927), was also a historian; his older brother, Charles Francis, Jr. (1835–1915), was an author and railroad executive. Through his mother, Abigail Brown Brooks, Adams was related to one of the most distinguished and wealthiest families in Boston. Tradition ingrained a deep sense of morality in Adams. He never escaped his heritage and spoke of himself as a child of the 17th and 18th centuries who was forced to come to terms with the new world of the 20th century.

Adams was graduated from Harvard in 1858 and, in typical patrician fashion, embarked upon a grand tour of Europe in search of amusement and a vocation. Anticipating a career as an attorney, he spent the winter of 1859 attending lectures in civil law at the University of Berlin. With the outbreak of the U.S. Civil War in 1861, Pres. Abraham Lincoln appointed Adams' father minister to England. Henry, age 23, accompanied him to London, acting as his private secretary until 1868.

Returning to the United States, Adams travelled to Washington, D.C., as a newspaper correspondent for *The Nation* and other leading journals. He plunged into the capital's social and political life, anxious to begin the reconstruction of a nation shattered by war. He called for civil service reform and retention of the silver standard. Adams wrote numerous essays exposing political corruption and warning against the growing power of economic monopolies, particularly railroads. These articles were published in *Chapters of Erie and Other Essays* (1871). The mediocrity of the nation's "statesmen" constantly irritated him. Adams liked to repeat Pres. Ulysses S. Grant's remark that Venice would be a fine city if it were drained.

Adams continued his reformist activities as editor of the *North American Review* (1870–76). Moreover, he participated in the Liberal Republican movement. This group of insurgents, repelled by partisanship and the scandals of the Grant administration, bolted the Republican Party in 1872 and nominated the Democrat Horace Greeley for president. Their crusade soon foundered. Adams grew disillusioned with a world he characterized as devoid of principle. He was disgusted with demagogic politicians and a society in which all became "servant[s] of the powerhouse." Americans, he wrote, "had no time for thought; they saw, and could see, nothing beyond their day's work; their attitude to the universe outside them was that of the deep-sea fish." His anonymously published novel *Democracy, an American Novel* (1880) reflected his loss of faith. The heroine, Madeleine Lee, like Adams himself, becomes an intimate of Washington's political circles. As confidante of a Midwestern senator, Madeleine is introduced to the democratic process. She meets the President and other figures who are equally vacuous. After her contact with the power brokers, Madeleine concluded: "Democracy has shaken my nerves to pieces."

In 1870 Charles W. Eliot, president of Harvard College, appointed Adams professor of medieval history. He was the first American to employ the seminar method in teaching history. In 1877 he resigned to edit the papers of Thomas Jefferson's treasury secretary, Albert Gallatin. Pursuing his interest in U.S. history, Adams completed two biographies, *The Life of Albert Gallatin* (1879) and *John Randolph* (1882). He continued to delve into the nation's early national period, hoping to understand the nature of an evolving American democracy. This study culminated in his nine-volume *History of the United States of America* during the administrations of Jefferson and

Henry Adams

Madison, a scholarly work that received immediate acclaim after its publication (1889–91). In this work he explored the dilemma of governing an egalitarian society in a political world in which the predominant tendency was to aggrandize power. In 1884 Adams wrote another novel, *Esther*. Published under a pseudonym, *Esther* dealt with the relationship between religion and modern science, a theme that engaged Adams throughout his life.

Adams was stunned when, in 1885, his wife of 13 years, Marian Hooper, committed suicide. Distraught, he arranged for the sculpture of a mysterious, cloaked woman to be placed upon her grave. The union had produced no children, and Adams never remarried. After his wife's death, Adams began a period of restless wandering. He travelled the globe from the South Sea islands to the Middle East. Gradually the circuit narrowed to winters in Washington and summers in Paris.

Though Adams referred to his existence during this period as that of a "cave-dweller," his life was quite the opposite. From the 1870s until his last years, intellectuals gravitated to his home to discuss art, science, politics, and literature. Among them were the British diplomat Sir Cecil Arthur Spring-Rice, the architect Henry Hobson Richardson, and Sen. Henry Cabot Lodge. His closest friends were the geologist Clarence King and the diplomat John Hay. Adams and King were inseparable. Their letters remain a rich source of information on everything from gossip to the most current trends of thought.

While in France, Adams pushed further into the recesses of history in search of "a fixed point . . . from which he might measure motion down to his own time." That point became medieval Christendom in the 13th century. In *Mont-Saint-Michel and Chartres* (printed privately, 1904; published, 1913) he described the medieval world view as reflected in its cathedrals. These buildings, he believed, expressed "an emotion, the deepest man ever felt—the struggle of his own littleness to grasp the infinite." Adams' attraction to the Middle Ages lay in the era's ideological unity; a coherence expressed in Catholicism and symbolized by the Virgin Mary.

The Education of Henry Adams (printed privately, 1906; published 1918) was a companion volume to *Chartres*. The *Education* remains Adams' best known work and one of the most distinguished of all autobiographies. In contrast to *Chartres*, the *Education* centred upon the 20th-century universe of multiplicity, particularly the exploding world of science and technology. In opposition to the medieval Virgin, Adams saw a new godhead—the dynamo—symbol of modern history's anarchic energies. The *Education* recorded his failure to understand the centrifugal forces of contemporary life. The book traced Adams' confrontations with reality as he moved from the custom-bound world of his birth into the modern, existential universe in which certainties had vanished.

Neither history nor education provided an answer for Henry Adams. Individuals, he believed, could not face reality; to endure, one adopts illusions. His attempt to draw lines of continuity from the 13th to the 20th century ended in futility. Adams concluded that all he could prove was change.

In 1908 Adams edited the letters and diary of his friend John Hay, secretary of state from 1898 to 1905. His last book, *The Life of George Cabot Lodge*, was published in 1911. In two speculative essays, "Rule of Phase Applied to History" (1909) and *Letter to American Teachers of History* (1910), Adams calculated the demise of the world. Basing his theory on a scientific law, the dissipation of energy, he described civilization as having retrogressed through four stages: the religious, mechanical, electrical, and ethereal. The cata-

clysm, he prophesied, would occur in 1921. How literally Adams intended his prediction remains a point of dispute.

In 1912, at the age of 74, Adams suffered a stroke. His haunting fear of senility became real for a short time. For three months he lay partially paralyzed, his mind hovering between reason and delirium. He recovered sufficiently, however, to travel to Europe once again. When he died, in his sleep in his Washington home, he was, according to his wish, buried next to his wife in an unmarked grave. In 1919 he was posthumously awarded a Pulitzer Prize for the *Education*.

Adams is noted for an ironic literary style coupled with a detached, often bitter, tone. These characteristics have led some critics to view him as an irascible misfit. They contend that his fascination with the Middle Ages and his continuous emphasis upon failure were masks behind which he hid a misanthropic alienation from the world. More sympathetic commentators see Adams as a romantic figure who sought meaning in the chaos and violence of the 20th century. As Adams described it, he was in pursuit of ". . . a world that sensitive and timid natures could regard without a shudder." (C.McH.)

BIBLIOGRAPHY. Henry Adams, *The Degradation of the Democratic Dogma* (1919, reprinted 1969), a collection of Adams' theoretical essays with a lengthy introduction by his brother Brooks; "The Great Secession Winter 1860–1861," *Proceedings*, Massachusetts Historical Society, 43:656–687 (1909–10), an essay, written during the secession crisis of 1860–61 but not published for 50 years, which analyzed the political developments that led to the Civil War; *Essays in Anglo-Saxon Law* (1876), a collection of studies in early British history written by Adams and his seminar students; *Historical Essays* (1891), a reprint of articles Adams had previously published in various journals; and introductions to *Documents Relating to New England Federalism* (1877), which shed light on the politics of the early national period; Ernest Samuels (ed.), *The Education of Henry Adams* (1973), is the definitive edition in which collation is made between the privately printed text and the revised text of the published edition. Worthington Chauncey Ford (ed.), *A Cycle of Adams Letters, 1861–1865*, 2 vol. (1920, reprinted in 1 vol. 1969), *Letters of Henry Adams, 1858–1891* (1930, reprinted 1969), and *Letters of Henry Adams, 1892–1918* (1938, reprinted 1969), all contain a rich selection of Adams' letters; Ernest Samuels, *The Young Henry Adams* (1948), *Henry Adams: The Middle Years* (1958), and *Henry Adams: The Major Phase* (1964), the most comprehensive and distinguished biography of Adams; J.C. Levenson, *The Mind and Art of Henry Adams* (1957), an unexcelled interpretative work centring upon both the man and his writings; Melvin Lyon, *Symbol and Idea in Henry Adams* (1970), an examination of the problem of illusion and reality, which Adams often expressed through symbols, as seen in his six major works; Vern Wagner, *The Suspension of Henry Adams: A Study of Manner and Matter* (1969), a discussion of Adams' writing style as an example of unique literary artistry; Frederic Cople Jaher, *Doubtfuls and Dissenters: Cataclysmic Thought in America, 1885–1918* (1964), a critical study of Adams, seeing him as a displaced Brahmin afloat in an industrialized world he was helpless to understand; William Dusingberre, *Henry Adams: The Myth of Failure* (1980), is a reconsideration.

Adams, Herbert Baxter (b. April 16, 1850, Shutesbury, Mass., U.S.—d. July 30, 1901, Amherst, Mass.), historian and educator, one of the first to use the seminar method in U.S. higher education and one of the founders of the American Historical Association.

The son of a successful merchant and manufacturer, Adams graduated from Amherst College, Massachusetts, in 1872 and attended lectures in Germany between 1874 and 1876, receiving his Ph.D. from Heidelberg in July 1876. His stay in Germany started him on the road toward a "germ theory of politics," which traced American political institutions to their supposed origin in early Anglo-Saxon village

institutions; it also convinced him of the superior quality of scholarship and instruction possible in the seminar method of teaching.

When Adams joined the faculty of Johns Hopkins University, Baltimore, in 1876, he was influential in instituting a seminar in history that became an important model for American higher education. He was named secretary of the newly formed American Historical Association in 1884.

Herbert Adams

By courtesy of the Library of Congress, Washington D.C.

While Adams' own scholarship and criticism were relatively undistinguished, his enthusiasm and interest were highly influential on his students, among them the future U.S. president Woodrow Wilson and the eminent historian Frederick Jackson Turner.

Adams, John (b. Oct. 30 [Oct. 19, Old Style], 1735, Braintree [now in Quincy], Mass. [U.S.]—d. July 4, 1826, Quincy, Mass.), first vice president (1789–97) and second president (1797–1801) of the United States, who earlier had served the American independence movement as a politician and political theorist, influencing the content of state constitutions.

A brief account of the life of John Adams follows. For a full biography, see *MACROPAEDIA: Adams, John*.

Adams was the eldest of three sons of Deacon John Adams, a farmer and selectman, and Susanna Boylston of Braintree, Mass. He graduated from Harvard University in 1755 and later practiced law. In 1764 he married Abigail Adams.

Adams became a leading figure in the resistance to British rule in colonial America, supporting opposition to the Stamp Act (*q.v.*; 1765) and the Townshend Acts (*q.v.*; 1767).

In 1774 Adams was elected to serve in the Massachusetts delegation to the First Continental Congress, in which he became a leader. Adams is credited with nominating George Washington to serve as commander of the Continental Army and choosing Thomas Jefferson to draft the Declaration of Independence.

During the United States War of Independence, Adams served as head of the Board of War and Ordnance. He also traveled to Paris to enlist French support for the American war effort, though an alliance with France was negotiated before his arrival. Near the end of the war he was part of the delegation charged with negotiating a treaty with Britain, and he later served as minister to the United Kingdom.

He was elected as the first vice president of the United States in 1788 and as its second president in 1796. His tenure in office was marked by various crises. He was criticized by both his allies and opponents for his handling of a naval conflict with France and evoked the animus of the Jeffersonian Republicans for his support of the Alien and Sedition Acts (*q.v.*).

He was defeated for reelection by Jefferson in 1800 and retired to Massachusetts. He and Jefferson later corresponded frequently on major political questions, and the two men died within hours of each other on the country's 50th birthday, July 4, 1826.

Adams, John Couch (b. June 5, 1819, Laneast, Cornwall, Eng.—d. Jan. 21, 1892, Cambridge, Cambridgeshire), British mathematician and astronomer, one of two people who independently discovered the planet Neptune. On July 3, 1841, Adams had entered in his journal: "Formed a design in the beginning of this week of investigating, as soon as possible after taking my degree, the irregularities in the motion of Uranus . . . in order to find out whether they may be attributed to the action of an undiscovered planet beyond it. . . ." In September 1845 he gave James Challis, director of the Cambridge Observatory, accurate information on where the new planet, as yet unobserved, could be found; but unfortunately the planet was not recognized at Cambridge until much later, after its discovery at the Berlin Observatory on Sept. 23, 1846.

Adams also showed (1866) that the Leonid meteor shower had an orbit closely matching that of a comet (1866 I). He described the Moon's motion more exactly than had Pierre-Simon Laplace and studied terrestrial magnetism.

After being made professor of mathematics at the University of St. Andrews (Fife) in 1858 and Lowndean professor of astronomy and geometry at Cambridge in 1859, he became director of Cambridge Observatory in 1861.

Adams, John Quincy (b. July 11, 1767, Braintree, Mass.—d. Feb. 23, 1848, Washington, D.C.), eldest son of Pres. John Adams and sixth president of the United States (1825–29). In his pre-presidential years he was one of America's greatest diplomats (formulating, among other things, what came to be called the Monroe Doctrine); in his post-presidential years (as U.S. congressman, 1831–48) he conducted a consistent and often dramatic fight against the expansion of slavery.

Early life and career. John Quincy Adams entered the world at the same time that his maternal great-grandfather, John Quincy, for many years a prominent member of the Massachusetts legislature, was leaving it; hence his name. He grew up as a child of the American Revolution. He watched the Battle of Bunker Hill from Penn's Hill and heard the cannons roar across the Back Bay. His patriot father, John Adams, at that time a delegate to the Continental Congress, and his patriot mother, Abigail Smith Adams, had a strong molding influence on his education after the war had deprived Braintree of its only schoolmaster. In 1778 and again in 1780 the boy accompanied his father to Europe. He studied at a private school in Paris in 1778–79 and at the University of Leiden, Neth., in 1780. Thus, at an early age he acquired an excellent knowledge of the French language and a smattering of Dutch. In 1780, also, he began to keep regularly the diary that forms so conspicuous a record of his doings and those of his contemporaries through the next 60 years of American history. Self-appreciative, like most of the Adams clan, he once declared that, if his diary had been even richer, it might have become "next to the Holy Scriptures, the most precious and valuable book ever written by human hands."

In 1781, at the age of 14, he accompanied Francis Dana, United States envoy to Russia, as his private secretary and interpreter of French. Dana, after lingering for more than a year in St. Petersburg, was not received by the Russian government, so in 1782 Adams, returning by way of Scandinavia, Hanover, and

The Netherlands, joined his father in Paris. There he acted, in an informal way, as an additional secretary to the American commissioners in the negotiation of the treaty of peace that concluded the U.S. War of Independence. Instead of remaining in London with his father, who had been appointed United States minister to the Court of St. James's, he chose to return to Massachusetts, where he attended Harvard College, graduating in 1787. He then read law at Newburyport under the tutelage of Theophilus Parsons, and in 1790 he was admitted to the bar in Boston. While struggling to establish a practice, he wrote a series of newspaper articles in which he controverted some of the doctrines in Thomas Paine's *Rights of Man*. In a later series he ably supported the neutrality policy of George Washington's administration as it faced the war that broke out between France and England in 1793. These articles were brought to President Washington's attention and resulted in Adams' appointment as U.S. minister to The Netherlands in May 1794.

The Hague was then the best diplomatic listening post in Europe for the War of the First Coalition against Revolutionary France. Young Adams' official dispatches to the secretary of state and his informal letters to his father, who was then the vice president, kept the government well informed of the diplomatic activities and wars of the distressed Continent and the danger of becoming involved in the European vortex. These letters were also read by President Washington: some of Adams' phrases, in fact, appeared in Washington's *Farewell Address* of 1796. During the absence of Thomas Pinckney, the regular U.S. minister to Great Britain, Adams transacted public business in London with the British Foreign Office relating to the exchange of ratifications of the Jay Treaty of 1794 between the United States and Great Britain. In 1796 Washington, who came to regard young Adams as the ablest officer in the foreign service, appointed him minister to Portugal, but before his departure his father became president and changed the young diplomat's destination to Prussia.

John Quincy Adams was married in London in 1797, on the eve of his departure for Berlin, to Louisa Catherine Johnson (1775–1852), daughter of the United States consul Joshua Johnson. Adams had first met her when he was 12 years old and his father was minister to France. Fragile in health, she suffered from migraine headaches and fainting spells. Yet she proved to be a gracious hostess who played the harp and was learned in Greek, French, and English literature. Accompanying her husband on his various missions in Europe, she became one of the most-traveled women of her time.

Johnson was not, however, Adams' first love. When he was 14 years old, he had had a "crush" on an actress he saw perform in France, and for years afterward, he confessed, she was in his dreams. At age 22 he fell deeply in love with one Mary Frazier but was dissuaded from marrying her by his mother, who insisted that he was not able to support a wife. Ultimately, Adams could see that, in marrying a rich heiress like Louisa Johnson, he might be able to enjoy the leisure to pursue a career as a writer, but her family suffered business reverses and declared bankruptcy only a few weeks after the wedding.

The union had many stormy moments. Adams was cold and often depressed, and he admitted that his political adversaries regarded him as a "gloomy misanthropist" and "unsocial savage." His wife is said to have regretted her marriage into the Adams family. The loss of two sons in adulthood and a daughter in infancy may have heightened the strains between husband and wife. The eldest son, George Washington Adams, was a gambler, womanizer, and alcoholic whose death by drowning may have been suicide. The second

son, John Adams II, succumbed to alcohol. He remains the only son of a president who was married in the White House. On that occasion, the president unbent and danced the Virginia reel. A third son, Charles Francis Adams, brought honour to the family name once again, being elected to the House of Representatives and serving as United States minister to England during the American Civil War.

While in Berlin, Adams negotiated (1799) a treaty of amity and commerce with Prussia. Recalled from Berlin by President Adams after the election of Thomas Jefferson to the presidency in 1800, the younger Adams reached Boston in 1801 and the next year was elected to the Massachusetts Senate. In 1803 the Massachusetts legislature elected him a member of the Senate of the United States.

Break with the Federalists. Up to this time John Quincy Adams was regarded as belonging to the Federalist Party, but he found its general policy displeasing. He was frowned upon as the son of his father by the followers of Alexander Hamilton and by reactionary groups, and he soon found himself practically powerless as an unpopular member of an unpopular minority. Actually he was not then, and indeed never was, a strict party man; all through his life, ever aspiring to higher public service, he considered himself a "man of my whole country." Adams arrived in Washington too late to vote for ratification of the treaty for the purchase of Louisiana, which had been opposed by the other Federalist senators, but he voted for the appropriations to carry it into effect and announced that he would have voted for the purchase treaty itself. Nevertheless, he joined his Federalist colleagues in voting against a bill to enable the president to place officials of his own appointment in control of the newly acquired territory; such a bill, Adams vainly protested, overstepped the constitutional powers of the presidency, violated the right of self-government, and imposed taxation without representation. In December 1807 he supported President Jefferson's suggestion of an embargo on all commerce with foreign nations in order to secure British and French recognition of American trading rights, and he vigorously urged instant action, saying: "The President has recommended the measure on his high responsibility. I would not consid-

er, I would not deliberate; I would act!" Within five hours the Senate had passed the embargo bill and had sent it to the House of Representatives. Support of this measure, hated by the Federalists and unpopular in New England because it stifled the region's economy, cost Adams his seat in the Senate. His successor was chosen on June 3, 1808, several months before the usual time of electing a senator for the next term, and five days later Adams resigned. In the same year he attended the Republican congressional caucus, which nominated James Madison for the presidency, and thus he allied himself with that party. From 1806 to 1809 Adams was Boylston Professor of Rhetoric and Oratory at Harvard College.

In 1809 President Madison sent Adams to Russia to represent the United States at the court of Tsar Alexander I. He arrived at St. Petersburg at the psychologically important moment when the tsar had made up his mind to break with Napoleon. Adams therefore met with a favourable reception and a disposition to further the interests of American commerce in every possible way. From this vantage point he watched and reported on Napoleon's invasion of Russia and the final disastrous retreat and dissolution of France's Grand Army. On the outbreak of war between the United States and England in 1812, he was still in St. Petersburg. In September of that year the Russian government suggested that the tsar was willing to act as mediator between the two belligerents. Madison precipitately accepted this proposition and sent Albert Gallatin and James Bayard to act as commissioners with Adams, but England refused to negotiate. In August 1814, however, these gentlemen, with Henry Clay and Jonathan Russell, began negotiations with English commissioners that resulted in the signing of the Treaty of Ghent on December 24 of that year. Adams then visited Paris, where he witnessed the return of Napoleon from Elba, and next went to London, where, with Clay and Gallatin, he negotiated (1815) a "Convention to Regulate Commerce and Navigation." Soon afterward he became U.S. minister to Great Britain, as his father had been before him, and as his son, Charles Francis Adams, was to be after him. After accomplishing little in London, he returned to the United States in the summer of 1817 to become secretary of state in the cabinet of President James Monroe. This appointment was due primarily to his diplomatic experience but also due to the president's desire to have a sectionally well-balanced cabinet in what came to be known as the Era of Good Feeling.

Secretary of state. As secretary of state, Adams played the leading part in the acquisition of Florida. Ever since the acquisition of Louisiana, successive administrations had sought to include at least a part of Florida in that purchase. In 1819, after long negotiations, Adams succeeded in getting the Spanish minister to agree to a treaty in which Spain would abandon all claims to territory east of the Mississippi River, the United States would relinquish all claims to what is now Texas, and a boundary of the United States would be drawn (for the first time) from the Atlantic to the Pacific Ocean. This Transcontinental Treaty was perhaps the greatest victory ever won by a single man in the diplomatic history of the United States. Adams himself was responsible for the idea of extending the country's northern boundary westward from the Rocky Mountains to the Pacific—considered a stroke of diplomatic genius. To use his own word, it marked a triumphant "epoch" in U.S. continental expansion. Before the Spanish government ratified the Transcontinental Treaty in 1819, however, Mexico (including Texas) had rebelled against the mother country, and the United States had occupied Florida by force of arms.

As secretary of state, Adams was also responsible for concluding the treaty of 1818 with Great Britain, laying down the northern boundary of the United States from the Lake of the Woods to the Rocky Mountains along the line of latitude 49° N. Years later, as a member of the House of Representatives, he supported latitude 49° N as the boundary of Oregon from the Rocky Mountains to the Pacific Ocean: "I want that country for our Western pioneers." In fact, President James K. Polk's Oregon treaty of 1846 drew that boundary along the line of 49°. The Monroe Doctrine rightly bears the name of the president who in 1823 assumed the responsibility for its promulgation, but its formulation was the work of John Quincy Adams more than of any other man.

Presidency and feud with Jackson. As President Monroe's second term drew to a close in 1824, there was a lack of good feeling among his official advisers, three of whom—Secretary of State John Quincy Adams, Secretary of War John C. Calhoun, and Secretary of the Treasury William H. Crawford—aspired to succeed him. Henry Clay, speaker of the House, and General Andrew Jackson were also candidates. Calhoun was nominated for the vice presidency. Of the other four, Jackson received 99 electoral votes for the presidency, Adams 84, Crawford 41, and Clay 37; because no one had a majority, the decision was made by the House of Representatives, which was confined in its choice to the three candidates who had received the largest number of votes. Clay, who had for years assumed a censorious attitude toward Jackson, threw his support to Adams, whose election was thereby secured on the first ballot. A few days later Adams offered Clay the office of secretary of state, which he accepted. Jackson's supporters charged a "corrupt bargain" and turned Adams' term in office into a four-year campaign to win for their man what they regarded as his rightful place, the presidency.

Up to this point Adams' career had been almost uniformly successful, but his presidency (1825–29), during which the country prospered, was in most respects a political failure because of the virulent opposition of the Jacksonians. Adams worked hard, rising between four and six o'clock in the morning and often going for a walk around the city or for a swim in the Potomac River before breakfast. Once he almost drowned as the sleeves of his blouse filled with water and weighed him down. But he knew he was not a man of the people. He had admitted in his inaugural address that he was "less possessed of your confidence . . . than any of my predecessors." He favoured, among other forward-looking proposals, creating a national university and a national astronomical observatory; he wished the western territories to be held in trust by the federal government and developed only gradually; and he proposed a vast expansion of the country's roads with federal aid. Congress generally turned a deaf ear to his initiatives.

In 1828 Jackson was elected president over Adams, with 178 electoral votes to Adams' 83. It was during Jackson's administration that irreconcilable differences developed between his followers and those of Adams, the latter becoming known as the National Republicans, who, with the Anti-Masons (a political force formed initially in opposition to Freemasonry), were the precursors of the Whigs. Adams' intense dislike of Jackson and what he represented remained unabated. When Harvard College in 1833 awarded Jackson an honorary degree, Adams refused to attend the ceremony at his alma mater. He avowed that he would not "be present to witness [Harvard's] disgrace in conferring its highest honors upon a barbarian who could not write a sentence of grammar and could hardly spell his own name."

Adams had retired to private life in 1829 in the Massachusetts town of Quincy, but only

for a brief period; in 1830, supported largely by members of the Anti-Masonic movement, he was elected a member of the national House of Representatives. When it was suggested to him that his acceptance of this position would degrade a former president, Adams replied that no person could be degraded by serving the people as a representative in Congress or a selectman of his town. He served in the House of Representatives from 1831 until his death, in 1848. But he had not abandoned his hopes for reelection to the presidency—whether as nominee of the Anti-Masonic Party (in which he was very active as long as that party had political possibilities), the National Republican Party, a union of both parties, or even of the later Whig Party—always in his own mind as a "man of the whole nation." Gradually, these hopes faded.

Second career in Congress. Adams' long second career in Congress was at least as important as his earlier career as a diplomat. Throughout, he was conspicuous as an opponent of the expansion of slavery and was at heart an Abolitionist, though he never became one in the political sense of the word. In 1839 he presented to the House of Representatives a resolution for a constitutional amendment providing that every child born in the United States after July 4, 1842, should be born free; that, with the exception of Florida, no new state should be admitted into the Union with slavery; and that neither slavery nor the slave trade should exist in the District of Columbia after July 4, 1845. The "gag rules," a resolution passed by Southern members of Congress against all discussion of slavery in the House of Representatives, effectively blocked any discussion of Adams' proposed amendment. His prolonged fight for the repeal of the gag rules and for the right of petition to Congress for the mitigation or abolition of slavery was one of the most dramatic contests in the history of Congress. These petitions, from individuals and groups of individuals from all over the Northern states, increasingly were sent to Adams, and he dutifully presented them. Adams contended that the gag rules were a direct violation of the First Amendment to the federal Constitution, and he refused to be silenced on the question, fighting indomitably for repeal in spite of the bitter denunciation of his opponents. Each year the number of anti-slavery petitions received and presented by him grew greatly. Perhaps the climax was in 1837, when Adams presented a petition from 22 slaves and, threatened by his opponents with censure, defended himself with remarkable keenness and ability. At each session the majority against him decreased until, in 1844, his motion to repeal the standing 21st rule of the House was carried by a vote of 108 to 80, and his long battle was over.

Another spectacular contribution by Adams to the antislavery cause was his championing of the African slaves arrested aboard the slave ship *Amistad*, who had mutinied and escaped from their Spanish owners off the coast of Cuba and eventually brought the ship into United States waters near Long Island, New York. Adams defended them as freemen before the Supreme Court in 1841 against efforts of the administration of President Martin Van Buren to return them to their masters, who would certainly have killed them.

As a member of Congress—in fact, throughout his life—Adams supported the improvement of the arts and sciences and the diffusion of knowledge. He did much to conserve the bequest of James Smithson (an eccentric Englishman) to the United States and to create and endow the Smithsonian Institution with the money from Smithson's estate.

Perhaps the most dramatic event in Adams' life was its end. On February 21, 1848, in the

act of protesting an honorary grant of swords by Congress to the generals who had won what Adams considered a "most unrighteous war" with Mexico, he suffered a cerebral stroke, fell unconscious to the floor of the House, and died two days later in the Capitol building. His obsequies in Washington and in his native Massachusetts assumed the character of a nation-wide pageant of mourning. Senator Thomas Hart Benton, the main eulogist at the service in the Capitol, asked: "Where would death have found him except at the place of duty?"

Personality: Few men in American public life have possessed more independence, more public spirit, and more ability than did Adams. Still, throughout his political career he was handicapped by a certain personal reserve and austerity and coolness of manner that prevented him from appealing to the imaginations and affections of the people. He had few intimate friends, and not many men in American history have been regarded, during their lifetimes, with so much hostility or attacked with so much rancour by their political opponents. (S.F.Be./Ed.)

BIBLIOGRAPHY. Worthington Chauncy Ford (ed.), *Writings of John Quincy Adams*, 7 vol. (1913-17, reprinted 1968), is a collection of works from 1779 to 1823. Versions of Adams' diaries include Charles Francis Adams (ed.), *Memoirs of John Quincy Adams, Comprising Portions of His Diary from 1795 to 1848*, 12 vol. (1874-77, reprinted 1969); Allan Nevins (ed.), *The Diary of John Quincy Adams, 1794-1845* (1928, reissued 1969), a selection from the longer work above; and David Grayson Allen et al. (eds.), *Diary of John Quincy Adams*, 2 vol. (1981), which contains Adams' diaries from the age of 12 to 21. Family letters are published in L.H. Butterfield et al. (eds.), *Adams Family Correspondence*, 6 vol. (1963-93). The best pictorial record is Andrew Oliver, *Portraits of John Quincy Adams and His Wife* (1970). Biographies include John T. Morse, Jr., *John Quincy Adams* (1882, reissued 1980); Bennett Champ Clark, *John Quincy Adams, "Old Man Eloquent"* (1932); Samuel Flagg Bemis, *John Quincy Adams and the Foundations of American Foreign Policy* (1949, reprinted 1981), a diplomatic biography, and *John Quincy Adams and the Union* (1956, reprinted 1980), covering the period 1824-48; Marie B. Hecht, *John Quincy Adams. A Personal History of an Independent Man* (1972, reissued 1995), treating Adams' private relationships as well as his political life; and two works focusing on his life after the presidency, when Adams served as a member of the U.S. House of Representatives: Leonard Falkner, *The President Who Wouldn't Retire* (1967); and Leonard L. Richards, *The Life and Times of Congressman John Quincy Adams* (1986). A full-length study is Paul C. Nagel, *John Quincy Adams: A Public Life, A Private Life* (1997).

Dexter Perkins, "John Quincy Adams," in Samuel Flagg Bemis (ed.), *The American Secretaries of State and Their Diplomacy*, vol. 4 (1928, reprinted 1963), treats his important pre-presidential years. Mary W.M. Hargreaves, *The Presidency of John Quincy Adams* (1985), focuses on the organization of the Adams administration and its handling of domestic and foreign affairs. Greg Russell, *John Quincy Adams and the Public Virtues of Diplomacy* (1995), examines Adams' view of the relationship between ethics and statesmanship. Lynn H. Parsons (compiler), *John Quincy Adams: A Bibliography* (1993), includes a chapter of entries on Adams' associates from throughout his career. (S.F.Be./Ed.)

Adams, Léonie (Fuller) (b. Dec. 9, 1899, Brooklyn, N.Y., U.S.—d. June 27, 1988, New Milford, Conn.), American poet and educator whose verse interprets emotions and nature with an almost mystical vision.

After graduating from Barnard College (A.B., 1922), she became editor of *The Measure*, a literary publication, in 1924 and was persuaded to publish a volume of poetry, *Those Not Elect*, in 1925. She began to teach the writing

of poetry in New York City and in 1932 edited *Lyrics of François Villon*. She lectured at various American colleges and universities over the years and served as poetry consultant for the Library of Congress (1948-49). She won a National Institute of Arts and Letters grant in Literature (1949) and won various poetry awards thereafter. *Poems, a Selection* (1954) won the Bollingen Prize for Poetry in 1955.

Adams, Louisa, née LOUISA CATHERINE JOHNSON (b. Feb. 12, 1775, London, Eng.—d. May 15, 1852, Washington, D.C., U.S.), American first lady (1825-29), the wife of John Quincy Adams, sixth president of the United States. Louisa was the only first lady born abroad.

For a detailed discussion of American first ladies, see MACROPAEDIA: United States Presidency and First Lady.

Louisa Johnson was born to Joshua Johnson, an American businessman from Maryland, and an Englishwoman, Katherine Nuth Johnson. When she was three years old her parents moved to Nantes, Fr., where she received her early education and became fluent in French. In 1783 her family, now including six children, returned to London, and Louisa, the second child, enrolled briefly in boarding school. After her father's business suffered losses, Louisa and her sisters were forced to withdraw from school, thus ending their formal education. But they were tutored at home by a governess, and Louisa became an avid reader.

Joshua Johnson often entertained fellow Americans at his London home, and it was there in 1795 that Louisa met 28-year-old John Quincy Adams, recently named American minister to The Netherlands. Over the next few months they agreed to marry, though neither set of parents approved of the match. By the time the ceremony took place in London on July 26, 1797, family circumstances had changed for both the bridegroom and the bride: John Quincy's father, John Adams, had become president of the United States, and Louisa's father had suffered financial ruin. All her life Louisa brooded that her husband had never received the dowry that he had expected; in an unpublished memoir that she wrote for her children, she lamented that he had "connected himself with a ruined house."

After President Adams appointed John Quincy minister to Prussia, the Adamsses moved to Berlin, where, despite her frequent illnesses, Louisa managed to be a popular hostess. In 1800, after John Adams lost his bid for reelection, the Adamsses returned to the United States, and Louisa met her husband's family for the first time. It was not a pleasant experience for her, and she later wrote that she could not have been more astonished if she had stepped "into Noah's Ark." Although she was never on the best of terms with her no-nonsense mother-in-law, Abigail Adams, Louisa became an instant and durable favourite of her father-in-law.

In 1801, after several miscarriages, Louisa gave birth to a son. Two other boys followed in 1803 and 1807.

In 1809 Louisa left the United States again: Without consulting her, John Quincy had accepted an appointment as American minister to Russia. The Adamsses settled in St. Petersburg, where Louisa was greatly depressed by the absence of her two eldest children, whom she had left in the care of their grandparents in Massachusetts. She gave birth to a daughter in St. Petersburg in 1811, and when the baby died a year later her sense of loss increased. In letters and other writing from that time she explained how she turned to reading—including biographies of women connected to powerful men—for solace. A gift from her husband, a book on the "diseases of the mind," was ap-

parently of little comfort. She may have had this period in mind when she later wrote to her son that the Adams men were "peculiarly harsh and severe in their relations with women."

In 1814, after helping negotiate the Treaty of Ghent (which ended the War of 1812 between the United States and Great Britain), John Quincy asked Louisa to close up their St. Petersburg home (since his assignment there had ended) and meet him in Paris. The following February she began a harrowing 40-day journey by coach through countryside ravaged by the invasion of Russia by French armies under Napoleon, risking dangerous winter weather and thieving bands of retreating soldiers. Although neither she nor her husband made much fuss about her accomplishment at the time, she later wrote her own account of it, *Narrative of a Journey from Russia to France, 1815*, which her grandson published after her death. Two happy years in London followed. John Quincy served as American minister to Britain, and Louisa was finally reunited with her two elder sons and visited old friends and places she had known in her youth.

In 1817 John Quincy was appointed secretary of state by President James Monroe, and he began his long quest for the presidency, an endeavour in which Louisa played an important role. Staging many lavish parties and entertaining hundreds of visitors at their home on F Street, she also made many social calls. "It is understood," she wrote in her diary, "that a man who is ambitious to become President of the United States must make his wife visit the Ladies of the members of Congress first. Otherwise he is totally inefficient to fill so high an office." Despite her determination, Louisa resented these visits, which she complained would drive her "crazy." Her social success may well have helped her husband win the bitter election of 1824.

As first lady, Louisa Adams set no new precedents, choosing not to follow the pattern set by her politically active mother-in-law. In fact, the younger Mrs. Adams complained bitterly of being watched at every public appearance for some clue as to how her husband was thinking about some important matter. Although she was among the first women to attend congressional debates, she did not attempt to play a part in decision making. "I have nothing to do with the disposal of affairs and have never but once been consulted," she wrote.

John Quincy lost the presidential election of 1828 to Andrew Jackson but was elected to Congress two years later, and he and Louisa resumed living on F Street. The Adamsses were struck by tragedy when their two elder children died, one apparently by suicide just after his parents left the White House, the other five years later from alcoholism. Louisa had initially resented her husband's decision to return to public office after the presidency but gradually came to appreciate his courage during those years he served in Congress.

Following her husband's death in 1848, Louisa continued to live in Washington, where she died in 1852. In an unprecedented mark of respect for a former first lady, Congress adjourned for her funeral so that members could pay their respects. She was buried beside her husband and his parents at the First Church in Quincy, Mass. (B.B.C.)

Adams, Maude, original name MAUDE KISKADDEN (b. Nov. 11, 1872, Salt Lake City, Utah, U.S.—d. July 17, 1953, Tannersville, N.Y.), American actress, best-known for her portrayals of Sir James Barrie's heroines.

Her mother, whose maiden name she adopted, was leading lady of the Salt Lake City stock company. From Adams' first triumph at the age of five as Little Schneider in *Fritz* at the San Francisco Theatre, she played child roles. In 1888 she joined E.H. Soth-

Maude Adams in *L'Aiglon*, 1901

ern as ingenue. From her appearance in C.H. Hoyt's *Midnight Bell* (1889), her popularity grew rapidly. The next year Charles Frohman cast her in William Gillette's *All the Comforts of Home*, and when John Drew left Augustin Daly for the Frohmans in 1892 she became his leading lady for five years. From 1897 she was for many years a Frohman star, especially successful in *The Little Minister*, *Peter Pan*, *What Every Woman Knows*, *Quality Street*, and *A Kiss for Cinderella*. She also played the Shakespearean roles of Juliet, Viola, and Rosalind, and Joan of Arc in Schiller's *Die Jungfrau von Orleans*. She left the stage in 1918, experimented for a time with stage lighting, returned in 1931 as Portia to Otis Skinner's *Shylock*, and made her last appearance as Maria in *Twelfth Night* in 1934. She became professor of dramatic art at Stephens College, Columbia, Mo., in 1937. Phyllis Robbins' *Maude Adams: An Intimate Portrait* was published in 1956.

Adams, Robert (b. c. 1791, Ireland—d. Jan. 13, 1875, Dublin), clinician noted for his contributions to the knowledge of heart disease and gout. In 1827 he described a condition characterized by a very slow pulse and

Robert Adams, drawing by an unknown artist

By courtesy of the Royal College of Surgeons, Dublin

by transient giddiness or convulsive seizures, now known as the Adams-Stokes disease or syndrome.

Educated at Trinity College, Dublin, Adams studied medicine in Europe and then returned to Dublin, where he established his practice and served as surgeon to the Jervis Street and Richmond hospitals. In 1861 he was appointed surgeon to the queen in Ireland and regius professor of surgery at the University of Dublin.

Adams, Roger (b. Jan. 2, 1889, Boston—d. July 6, 1971, Champaign, Ill., U.S.), chemist and teacher known for determining the chemical constitution of such natural substances as chaulmoogra oil (used in treating leprosy), the toxic cottonseed pigment gossypol, mari-

huana, and many alkaloids. He also worked in stereochemistry and with platinum catalysts and the synthesis of medicinal compounds.

Receiving his Ph.D. from Harvard University (1912), Adams studied in Germany and taught briefly at Harvard. In 1916 he went to the University of Illinois, becoming professor of organic chemistry (1919) and head of the chemistry department (1926). A consultant to the chemical industry, he also served as a scientific adviser to the government during World War II. He accepted a research professorship (1954) and retired in 1957. His many honours include the American Chemical Society's Priestley Medal (1946).

Adams, Samuel (b. Sept. 27 [Sept. 16, old style], 1722, Boston—d. Oct. 2, 1803, Boston), politician of the American Revolution, leader of the Massachusetts "radicals," who was a delegate to the Continental Congress (1774–81) and a signer of the Declaration of Independence. He was later lieutenant governor (1789–93) and governor (1794–97) of Massachusetts.

Samuel Adams, oil portrait by John Singleton Copley, c. 1700–72; in the Museum of Fine Arts, Boston

By courtesy of the Museum of Fine Arts, Boston, deposited by the City of Boston

Early career. A second cousin of John Adams, second president of the United States, Samuel Adams was graduated from Harvard College in 1740 and briefly studied law; he failed in several business ventures. As a tax collector in Boston, he neglected to collect the public levies and to keep proper accounts, thus exposing himself to suit.

Although unsuccessful in conducting personal or public business, Adams took an active and influential part in local politics. By the time the English Parliament passed the Sugar Act (1764) taxing molasses for revenue, Adams was a powerful figure in the opposition to British authority in the Colonies. He denounced the act, being one of the first of the colonials to cry out against taxation without representation. He played an important part in instigating the Stamp Act riots in Boston that were directed against the new requirement to pay taxes on all legal and commercial documents, newspapers, and college diplomas.

Commitment to American independence. His influence was soon second only to James Otis, the lawyer and politician who gained prominence by his resistance to the revenue acts. Elected to the lower house of the Massachusetts general court from Boston, Adams served in that body until 1774, after 1766 as its clerk. In 1769 Adams assumed the leadership of the Massachusetts radicals. There is

some reason to believe that he had committed himself to American independence a year earlier. John Adams may have erred in ascribing this extreme stand to his cousin at so early a time, but certainly Samuel Adams was one of the first American leaders to deny Parliament's authority over the Colonies; and he was also one of the first—certainly by 1774—to establish independence as the proper goal.

John Adams described his cousin as a plain, modest, and virtuous man. But in addition, Samuel Adams was a propagandist who was not overscrupulous in his attacks upon British officials and policies, and a passionate politician as well. In innumerable newspaper letters and essays over various signatures, he described British measures and the behaviour of royal governors, judges, and customs men in the darkest colours. He was a master of organization, arranging for the election of men who agreed with him, procuring committees that would act as he wished, and securing the passage of resolutions that he desired.

During the crisis over the Townshend duties (1767–70), the import taxes on previously duty-free products proposed by Cabinet Minister Charles Townshend, Adams was unable to persuade the Massachusetts colonists to take extreme steps, partly because of the moderating influence of Otis. British troops sent to Boston in 1768, however, offered a fine target for this propaganda, and Adams saw to it that they were portrayed in the colonial newspapers as brutal soldiery oppressing citizens and assailing their wives and daughters. He was one of the leaders in the town meeting that demanded and secured the removal of the troops from Boston after some British soldiers fired into a mob and killed five Americans. When news came that the Townshend duties, except for that on tea, had been repealed, his following dwindled. Nevertheless, during the years 1770–73, when other colonial leaders were inactive, Adams revived old issues and found new ones; he was responsible for the foundation (1772) of the committee of correspondence of Boston that kept in contact with similar bodies in other towns, in whose establishment he also had a hand. These committees later became effective instruments in the fight against the British.

The passage by Parliament of the Tea Act of 1773, which granted the East India Company a monopoly on tea sales in the Colonies, gave Adams ample opportunity to exercise his remarkable talents. Although he did not participate in the Boston Tea Party, he was undoubtedly one of its planners. He was again a leading figure in the opposition of Massachusetts to the execution of the Intolerable (Coercive) Acts passed by the British Parliament in retaliation for the dumping of tea in Boston Harbor; and as a member of the First Continental Congress, which spoke for the 13 Colonies, he insisted that the delegates take a vigorous stand against Britain. A member of the provincial congress of Massachusetts in 1774–75, he participated in making preparations for warfare should Britain resort to arms. When the British troops marched out of Boston to Concord, Adams and the president of the Continental Congress, John Hancock, were staying in a farmhouse near the line of march; and it has been said that the arrest of the two men was one of the purposes of the expedition. But the troops made no effort to find them, and British orders called only for destruction of military supplies gathered at Concord. When Gen. Thomas Gage issued an offer of pardon to the rebels some weeks later, however, he excepted Adams and Hancock.

Membership in Continental Congress. As a member of the Continental Congress, in which he served until 1781, Adams was less con-

spicuous than he was in town meetings and the Massachusetts legislature, for the congress contained a number of men as able as he. He and John Adams were among the first to call for a final separation from Britain, both signed the Declaration of Independence, and both exerted considerable influence in the congress.

Adams was a member of the convention that framed the Massachusetts constitution of 1780 and also sat in the convention of his state that ratified the Federal Constitution. He was at first an anti-Federalist who opposed the ratification of the Constitution for fear that it would vest too much power in the federal government, but he finally abandoned his opposition when the Federalists promised to support a number of future amendments, including a bill of rights. He was defeated in the first congressional election. Returning to political power as a follower of Hancock, he was lieutenant governor of Massachusetts from 1789 to 1793 and governor from 1794 to 1797. When national parties developed, he affiliated himself with the Democratic Republicans, the forerunner of the Democratic Party. After being defeated as a presidential elector favouring Thomas Jefferson in 1796, he retired to private life.

For a general introduction to the period of the Revolution, its causes, developments, and the people, see Stewart Beach, *Samuel Adams: The Fateful Years, 1764-1776* (1965); and Cass Canfield, *Samuel Adams's Revolution, 1765-1776* (1976). Biographies include Ralph Volney Harlow, *Samuel Adams, Promoter of the American Revolution: A Study in Psychology and Politics* (1923, reprinted 1975); John C. Miller, *Sam Adams: Pioneer in Propaganda* (1936, reissued 1960); and Paul Lewis (Noel Bertram Gerson), *The Grand Incendiary* (1973).

Adams, Samuel Hopkins (b. Jan. 26, 1871, Dunkirk, N.Y., U.S.—d. Nov. 15, 1958, Beaufort, S.C.), American journalist and author of more than 50 books of fiction, biography, and exposé.

Adams graduated from Hamilton College in 1891 and was with the *New York Sun* until 1900. From 1901 to 1905 he was associated in various editorial and advertising capacities with McClure's syndicate and *McClure's Magazine*.

One of the so-called muckrakers of the period, Adams contributed to *Collier's*, *the National Weekly* in 1905 a series of articles exposing quack patent medicines, followed by *The Great American Fraud* (1906), which furthered the passage of the Pure Food and Drug Act in 1906. In articles appearing in 1915-16 in the *New York Tribune*, he exposed dishonourable practices in advertising. The novel *Revelry* (1926) and a biography of Warren G. Harding, *Incredible Era* (1939), set forth the scandals of the Harding administration. Adams also wrote biographies of Daniel Webster (*The Godlike Daniel*, 1930) and Alexander Woollcott (1945). Several of his novels became movie scenarios, notably *It Happened One Night* (1934) and a musical, *The Harvey Girls* (1942). *Grandfather Stories* (1955) was based on reminiscences of his grandfather in upper New York State. He also wrote under the name Warner Fabian.

Adams, Walter (Sydney) (b. Dec. 20, 1876, Syria—d. May 11, 1956, Pasadena, Calif., U.S.), American astronomer who is best known for his spectroscopic studies. Using the spectroscope, he investigated sunspots and the rotation of the Sun, the velocities and distances of thousands of stars, and planetary atmospheres.

Born of missionary parents who returned to the United States when he was eight years old, Adams studied astronomy at Dartmouth

Walter Adams

College, Hanover, N.H.; the University of Chicago; and the University of Munich. In 1904 he became a member of the original staff of Mount Wilson Observatory in California, where he served as director from 1923 to 1946. Adams took an important part in planning the 200-inch (5,080-millimetre) telescope for the Palomar Mountain Observatory.

Adams, William (b. 1564, Gillingham, Kent, Eng.—d. May 16, 1620, Japan), navigator, merchant-adventurer, and the first Englishman to visit Japan.

At the age of 12 Adams was apprenticed in the merchant marine, afterward sailing in the British navy and later serving a company of Barbary merchants. In 1598 he shipped as pilot major with five Dutch ships bound from Europe for the East Indies via the Straits of Magellan. The trouble-ridden fleet was scattered, and in April 1600 the *Charity*, her crew sick and dying, anchored off southern Japan. Adams was summoned to Ōsaka, where the shogun Tokugawa Ieyasu was so impressed with Adams' knowledge of ships and shipbuilding that he presented him with an estate. Adams officiated between the shogunate and the Dutch and English traders who began visiting Japan, and about 1613 he helped to establish an English trading factory for the East India Company. Initially refused permission to return to England, he settled permanently in Japan, married a Japanese woman (though he had an English wife and family), and was given a title. A Tokyo street, Anjin-chō, was named in his honour.

Adams' career in Japan was the inspiration for James Clavell's best-selling novel *Shogun* (1975).

Adams, William Taylor, pseudonym OLIVER OPTIC (b. July 30, 1822, Medway, Mass., U.S.—d. March 27, 1897, Boston, Mass.), American teacher and author of juvenile literature, best known for his children's magazine and the series of adventure books that he wrote under his pseudonym.

Although he never graduated from college, Adams was a teacher and principal in Boston elementary schools for more than 20 years. Under the pen name Oliver Optic, he wrote stories for boys, and in 1865 he resigned his position as a principal to pursue his writing full-time. Soon after that he began *Oliver Optic's Magazine for Boys and Girls* (1867-1875), which enjoyed great popularity.

Adams was a prolific writer, producing about a thousand magazine and newspaper stories and well over a hundred full-length books. His books are written in series and take young heroes through exotic and educational adventures. His characters travel much and are well mannered, athletic, and patriotic, and the stories are laced with a strong moral. Adams' books were popular with girls as well as boys, although girls appeared infrequently as characters in his writing.

Critics charge that, to the adult reader, Adams' books reveal careless writing and are remarkable only for their vivid narratives.

Adam's Bridge, also called RAMA'S BRIDGE, chain of shoals, between the islands of Mannar, near northwestern Sri Lanka, and Rāmeswaram, off the southeastern coast of India. The bridge is 30 miles (48 km) long and separates the Gulf of Mannar (southwest) from the Palk Strait (northeast). Some of the sandbanks are dry, and nowhere are the shoals deeper than 4 feet (1 m); thus, they seriously hinder navigation. Dredging operations, now abandoned, were begun as early as 1838 but never succeeded in maintaining a channel for any vessels except those of light draft. Geologic evidence suggests that Adam's Bridge represents a former land connection between India and Sri Lanka. Traditionally, it is said to be the remnant of a huge causeway constructed by Rāma, the hero of the Hindu epic *Rāmāyana*, to facilitate the passage of his army from India to Ceylon (Sri Lanka) for the rescue of his abducted wife, Sītā. According to Muslim legend, Adam crossed there to Adam's Peak, Ceylon, atop which he stood repentant on one foot for 1,000 years.

Adams-Onís Treaty: see Transcontinental Treaty.

Adam's Peak, mountain in southwestern Sri Lanka (Ceylon), 7,360 feet (2,243 m) high and 11 miles (18 km) northeast of Ratnapura; it is located in the Sri Lanka hill country. Its conical summit terminates in an oblong platform about 74 by 24 feet (22 by 7 m), on which there is a large hollow resembling the print of a human foot, 5 feet 4 inches by 2 feet 6 inches. The depression is venerated alike by Buddhists, Muslims, and Hindus, who regard

Adam's Peak, Sri Lanka

Ed Lark—Aristreet

it as the footprint of the Buddha, Adam, and Sīva, respectively. Many pilgrims of all faiths visit the peak every year. Heavy chains on the mountain's southwestern face, said to have been placed there by Alexander the Great, mark the route to the summit.

adamsite, in chemical warfare, sneeze gas developed by the United States and used during World War I. Adamsite is an arsenical diphenylaminechlorarsine and an odourless crystalline organic compound employed in vaporous form as a lung irritant. It appears as a yellow smoke that irritates eyes, lungs, and mucous membranes and causes sneezing, vomiting, and acute discomfort in the nose, throat, and chest. Eventually severe nausea develops, with headache, general physical weakness, and despondency. The effect usually lasts about 12 hours. The only protection against inhaling the gas is a good mechanical filter.

'Adan (Yemen): see Aden.

Adan le Menestrel (poet): see Adenet le Roi.

Adana, city, south-central Turkey, situated in the plain of Cilicia, on the Seyhan River (the ancient Sarus River). An agricultural and industrial centre and the nation's fourth largest

city, it probably overlies a Hittite settlement that dates from approximately 1400 BC; and its history has been profoundly influenced by its location at the foot of the Taurus Mountain passes leading to the Syrian plains. Conquered by Alexander the Great in 335–334 BC, it came under the rule of the 'Abbāsīd Arabs at the end of the 7th century AD and changed hands intermittently in the next 600 years until the establishment of the Turkmen Ramazan dynasty in 1378. The Ramazan rulers retained control of local administration even after Adana was conquered by the Ottoman sultan Selim I in 1516. In 1608 Adana was reconstituted as a province under direct Ottoman administration. Adana became a provincial capital in 1867. One of the earlier extant monuments in the area is a stone bridge 220 yards (200 m) long spanning the Seyhan River, dating from the time of Justinian, and restored by several Arab rulers of the area in the 8th and 9th centuries. On the right bank of the river is a ruined fortress built by the future 'Abbāsīd caliph Hārūn ar-Rashīd in 782. The principal mosque, the Ulu Cami, dates from 1542.

Adana's prosperity has long come from the fertile valleys behind it and its position as a bridgehead on the Anatolian-Arabian trade routes. It is a centre of the Turkish cotton industry and manufactures textiles, cement, agricultural machinery, and vegetable oils. Adana lies on the Istanbul-Baghdad railway and is connected by a branch line to the Mediterranean port of Mersin, 32 miles (51 km) southwest, through which its products are shipped. Çukurova University was established at Adana in 1973. Adana is the centre of an agricultural region producing cotton, rice, sesame, oats, and citrus fruits. Pop. (1985) 777,554.

Adangme, people occupying the coastal area of Ghana from Kpone to Ada, on the Volta River, and inland along the Volta; they include the Ada, Kpone, Krobo, Ningo, Osudoku, Prampram, and Shai, all speaking variants of Ga-Adangme of the Kwa branch of the Niger-Congo family of languages.

The chief Adangme occupation is farming, based on the *huza* system, in which a tract of land is purchased by a group of people, usually kinsmen; the tract is subdivided among the purchasers according to the amount each has paid, and the individual thereafter has complete control of his own section. Negotiations with the seller are carried out by an elected *huzatse* ("father of the *huza*"), who later acts as the *huza* leader and representative. Millet was formerly the staple food, but more common crops now include cassava, yams, corn (maize), plantain, cocoa, and palm oil.

The Adangme are organized into clans based on patrilineal descent; the clans are subdivided into localized patrilineages, the basic units of Adangme political organization. Lineage members generally return to the traditional lineage home from the *huza* farms several times a year to participate in the festivals of their lineage gods. There are also many annual festivals.

Adanson, Michel (b. April 7, 1727, Aix-en-Provence, Fr.—d. Aug. 3, 1806, Paris), French botanist who devised a natural system of classification and nomenclature of plants, based on all their physical characteristics, with an emphasis on families.

In 1749 Adanson left for Senegal to spend four years as an employee with the Compagnie des Indes, a trading company. He returned with a large collection of plant specimens, some of which became part of the French royal collection under the supervision of the naturalist Georges Buffon; most of them now belong to the National Museum of Natural History in Paris. He published *Histoire naturelle du Sénégal* (1757), describing the flora of Senegal, and a survey of mollusks.

Adanson's *Familles des plantes* (1763) described his classification system for plants, which was much opposed by Carolus Linnaeus, the Swedish botanist. Adanson's classification of mollusks, a group that he originally described, was based on anatomical characters. Adanson also introduced the use of statistical methods in botanical classification and studied electricity in torpedo fish and regeneration of limbs and heads in frogs and snails. Although Adanson was well known to European scientists, his system of classification was not widely successful, and it was superseded by the Linnaean system.

Adapa, in Mesopotamian mythology, legendary sage and citizen of Eridu, a Sumerian city the ruins of which are in southern Iraq. Endowed with vast intelligence by Ea (Sumerian: Enki), the god of wisdom, Adapa became the hero of the Sumerian version of the myth of the Fall of Man. The myth relates that Adapa, in spite of his possession of all wisdom, was denied immortality. One day, while he was fishing, the south wind blew so violently that he was thrown into the sea. In his rage he broke the wings of the south wind, which then ceased to blow. Anu (Sumerian: An), the sky god, summoned him before his gates to receive punishment, but jealous Ea cautioned him not to touch the bread and water that would be offered him. When Adapa came before Anu, the two heavenly doorkeepers Tammuz and Ningishzida interceded for him and explained to Anu that as Adapa had been endowed with omniscience he needed only immortality to become a god. Anu, in a change of heart, then offered Adapa the bread and water of eternal life, which he refused to take. Thus mankind became mortal. The legend is preserved among the cuneiform tablets discovered during the 19th century in Ashurbanipal's library at Nineveh.

Adapazarı, city, northwestern Turkey, lying in a fertile plain west of the Sakarya River. It is situated along the old military road from Istanbul. The region came under Ottoman control in the early 14th century, and the city acquired its present name at the end of the 18th century. An agricultural and industrial centre, Adapazarı is connected by a branch line to the main Anatolian railway system by which its wheat, tobacco, fruits, and vegetables are transported to the Istanbul markets. The city has a large sugar beet processing plant. A stone bridge that was built during the reign of the Roman emperor Justinian is the only surviving ancient monument. Pop. (1985) 152,291.

adaptation, in biology, process by which an animal or plant becomes fitted to its environment; it is the result of natural selection acting upon heritable variation. Even the simpler organisms must be adapted in a great variety of ways: in their structure, physiology, and genetics; in their locomotion or dispersal; in their means of defense and attack; in their reproduction and development; and in other respects.

Accurate adaptations may involve migration to, or survival in, favourable conditions of, for example, temperature. Alternatively, organisms may partly manufacture their own environment, as do the mammals, for example, which produce their own optimum body temperature. To be useful, adaptations must often occur simultaneously in a number of different parts of the body. A change from a more carnivorous to a more vegetarian diet necessitates alterations not only of the teeth, digestive juices, and length of the digestive tract but also in habit and defense mechanisms.

Some of the most fundamental biological adaptations are chemical and genetic. The conditions in which the cells of the body can live are restricted and have changed very little

since life first arose in the sea. Exploitation of fresh water and of land was possible only through the evolution of adaptive mechanisms capable of maintaining at least a semblance of the original constitution of body fluids. Thus, even in humans and other mammals, the blood is chemically quite closely related to seawater.

adaptive radiation, evolution of an animal or plant group into a wide variety of types adapted to specialized modes of life. A striking example is the radiation, beginning in the Tertiary period (beginning 66.4 million years ago), of basal mammalian stock into forms adapted to running, leaping, climbing, swimming, and flying.

adat, customary law of the indigenous peoples of Malaysia and Indonesia. It was the unwritten, traditional code governing all aspects of personal conduct from birth to death. Two kinds of Malay adat law developed prior to the 15th century: Adat Perpatih developed in a matrilineal kinship structure in areas occupied by the Minangkabau people in Sumatra and Negeri Sembilan; Adat Temenggong originated in bilaterally based territorial social units. Both adat forms were markedly transformed by Islāmic and later European legal systems.

Adat Perpatih emphasized law based on group responsibility. Criminal or civil offenses were not differentiated. Punishment stressed compensation rather than retribution. A crime was absolved by payment in kind, for example, or by a reconciliation feast given to the aggrieved person. Payment was enforced by community pressure. Mutilation and death penalties rarely were invoked. Acceptance of circumstantial evidence was a prominent feature of Adat Perpatih.

Prior to Islāmic influence Adat Temenggong consisted of a mixture of Hindu law and native custom. It encompassed civil, criminal, constitutional, and maritime law and invoked torture, amputation, or even death as punishment for offenses.

Both adat systems continued into the 20th century, until formalized European jurisprudence largely displaced them.

Adda River, Italian FIUME ADDA, river, in the Lombardia (Lombardy) *regione* of northern Italy, issuing from small lakes in the Rhaetian Alps at 7,660 feet (2,335 m). The Adda flows southward from Bormio to Tirano, where it turns west past Sondrio to enter Lake Como near its northern end after a course of 194 miles (313 km). The river's upper course is known as the Valtellina (*q.v.*). Leaving Lake Como at Lecco, it crosses the Lombardy Plain, flowing past Lodi and forming the Milan-Cremona provincial boundary before joining the Po River just upstream from Cremona city. The drainage basin of the Adda covers 3,000 square miles (7,800 square km), and the river's average flow in its lower course, navigable for 50 miles (80 km), is about 8,800 cubic feet (250 cubic m) per second, varying between 600 and 28,000. The river is used extensively for hydroelectric power production in the Valtellina and for irrigation on the Lombardy Plain. Historically the Adda (Addua) was a strategic defense line in many wars as early as the Roman period.

Addams, Charles (Samuel) (b. Jan. 7, 1912, Westfield, N.J., U.S.—d. Sept. 29, 1988, New York City), cartoonist whose drawings, known mostly through *The New Yorker* magazine, became famous in the United States as examples of macabre humour.

Addams attended various schools from 1929 to 1932; thereafter, aside from a brief period as a commercial artist, he was a free-lance cartoonist, selling his first work to *The New*

Yorker in 1933. His cartoons began to attract considerable popular attention about 1940. Addams became famous for his ironic depictions of morbid or inexplicable behaviour by sinister-looking individuals. His best-known cartoons centred on a family of ghouls whose activities travestied those of a conventional family; for example, parent ghouls beam approval as their children behead a doll with a toy guillotine. Addams' ghoulish characters served as the basis of "The Addams Family," a popular television series in the mid-1960s. Collections of his cartoons include *Drawn and*

Quartered (1942), *Addams and Evil* (1947), *Monster Rally* (1950), *Homebodies* (1954), *Nightcrawlers* (1957), *Dear Dead Days* (1959), *Black Maria* (1960), *The Charles Addams Mother Goose* (1967), *My Crowd* (1970), *Chas. Addams Favorite Haunts* (1976), and *Creature Comforts* (1981).

Addams, Jane (b. Sept. 6, 1860, Cedarville, Ill., U.S.—d. May 21, 1935, Chicago, Ill.), American social reformer and pacifist, co-winner (with Nicholas Murray Butler) of the Nobel Prize for Peace in 1931. She is probably best known as the founder of Hull House, Chicago, one of the first social settlements in North America.

Jane Addams

By courtesy of the University of Illinois at Chicago, Jane Addams Memorial Collection

After graduation from Rockford (Ill.) College in 1881, Addams entered the Woman's Medical College, Philadelphia, but her health failed, and for two years she was an invalid. Then (1883–85, 1887–88) she traveled extensively in Europe, visiting the Toynbee Hall settlement house (founded 1884) in the Whitechapel industrial district of London. Upon returning to the United States, she and her traveling companion, Ellen Gates Starr, determined to create something like Toynbee Hall. In a working-class district in Chicago, they acquired a large vacant residence built by Charles Hull in 1856, and, calling it Hull

House, they moved into it on Sept. 18, 1889. Eventually the settlement included 13 buildings and a playground, as well as a camp near Lake Geneva, Wis. Many prominent social workers and reformers—Julia Lathrop, Florence Kelley, Grace and Edith Abbott—came to live at Hull House, as did others who continued to make their living in business or the arts while helping Addams in settlement activities.

Among the facilities at Hull House were included a day nursery, a gymnasium, a community kitchen, and a boarding club for working girls. Hull House offered college-level courses in various subjects; furnished training in art, music, and crafts such as bookbinding;

and sponsored one of the earliest little-theatre groups, the Hull House Players. In addition to making available services and cultural opportunities for the largely immigrant population of the neighbourhood, Hull House afforded an opportunity for young social workers to acquire training.

Addams worked with labour as well as other reform groups toward goals including the first juvenile-court law, tenement-house regulation, an eight-hour working day for women, factory inspection, and worker's compensation. She strove in addition for justice for immigrants and blacks, advocated research aimed at determining the causes of poverty and crime, and supported woman suffrage. In 1910 she became the first woman president of the National Conference of Social Work, and in 1912 she played an active part in the Progressive Party's presidential campaign for Theodore Roosevelt. At The Hague in 1915 she served as chairman of the International Congress of Women, following which was established the Women's International League for Peace and Freedom.

The establishment of the Chicago campus of the University of Illinois in 1963 forced the Hull House Association to relocate its headquarters. The majority of its original buildings were demolished, but the Hull residence itself was preserved as a monument to Jane Addams.

Among Addams' books are *Democracy and Social Ethics* (1902), *Newer Ideals of Peace* (1907), *Twenty Years at Hull-House* (1910), and *The Second Twenty Years at Hull-House* (1930).

addax (species *Addax nasomaculatus*), desert-dwelling antelope, family Bovidae (order Artiodactyla), once found throughout the Sahara but now much reduced in numbers and distribution and threatened with extinction from overhunting. A heavy-bodied, short-legged, gregarious antelope, the addax is characterized by broad hooves that are adapted to travel in loose sand and by long, spirally twisted horns, present in both sexes. It stands approximately 1 m (39 inches) high at the

Addax (*Addax nasomaculatus*)

shoulder and is grayish in summer, darker in winter. Its legs, underparts, and a patch on the face are white, and there is a tuft of dark hair on the forehead.

adder, any of several venomous snakes of the viper family, Viperidae, and the death adder, a viperlike member of the cobra snake family, Elapidae. The name adder may also be applied to certain other snakes, such as the hognose snake (*q.v.*), a harmless North American species. Among the adders of the viper family are included the common adder (*Vipera berus*), the puff adders (several species including *Bitis arietans*), and the night adders (four species of *Causus*).

Common adder (*Vipera berus*)

Walther Rohdich—Annan Photo Features

The common adder, or European viper, the serpent often mentioned in works of literature, is a stout-bodied snake that is widely distributed across Europe and Asia, even ranging north of the Arctic Circle in Norway. It grows to a maximum length of approximately 80 cm (30 inches) and is usually gray with a black zigzag band on the back and black spots on the sides. The common adder eats lizards and

Puff adder (*Bitis arietans*)

Copyright © 1971 Z. Leszczynski—Animals Animals

small mammals. Six to 20 young are born in August or early September. Its bite is rarely fatal to humans.

The puff and night adders are terrestrial African vipers. The puff adder (so named because it gives warning by inflating its body and hissing loudly) is a large, extremely venomous snake found in the semiarid regions of Africa and Arabia. It is about 1 to 1.5 m (3 to 5 feet) long and is gray to dark brown with thin yellow chevrons on its back. A thick-bodied snake with a potentially lethal bite, it tends to stay put, rather than flee, when approached. Night adders are small, relatively slender vipers found south of the Sahara. They are gray with darker blotches, up to approximately 1 m long, and are characterized by small fangs and a relatively weak venom that is unlikely to cause more than pain and swelling in humans. Two of the four species, *C. rhombeatus* and *C. resimus*, have long venom glands that extend back from the head into the body cavity.

The death adder (*Acanthophis antarcticus*) is found in Australia and nearby islands, though not in Tasmania, in a variety of habitats. The desert death adder, *A. pyrrhus*, is found only in the deserts and ranges of central and Western Australia. Although death adders are related to the slender-bodied cobras, they are viperlike in appearance, with thick bodies, short tails, and broad heads. They are about 45 to 90 cm (18 to 35 inches) long and are gray or brownish with darker crosswise bands. The death adder is a dangerous snake that has a potent venom that can cause death in about one-half of untreated cases.

Adderley, Herb, byname of HERBERT ANTHONY ADDERLEY (b. June 8, 1939, Philadelphia, Pa., U.S.), American professional National Football League (NFL) defensive cornerback and kickoff-return specialist.

Adderley graduated from Michigan State University (East Lansing) and joined the Green Bay Packers as their first draft choice in 1961. He played for them until he was traded to the Dallas Cowboys in 1969. In 1973, his final season, he played for the Los Angeles Rams and the New England Patriots. Adderley scored six touchdowns after interceptions in one season and made a 60-yard touchdown run after an interception in the 1968 Super Bowl. He played in four Super Bowl games (Green Bay, 1967–68, and Dallas, 1971–72). He was elected to the football Hall of Fame in 1980.

adding machine, a type of calculator (*q.v.*) used for performing simple arithmetical operations.

Addington, Henry: *see* Sidmouth, Henry Addington, 1st Viscount.

Addis Ababa, also spelled ADDIS ABEBA, capital and largest city of Ethiopia. It is located on a well-watered plateau surrounded by hills and mountains, in the geographic centre of the country.

Only since the late 19th century has Addis Ababa been the capital of the Ethiopian state. Its immediate predecessor, Entoto, was situated on a high tableland and was found to be unsatisfactory because of extreme cold and an acute shortage of firewood. The empress Taitu, wife of Emperor Menelik II (reigned 1889–1913), persuaded the emperor to build a house near the hot springs at the foot of the tableland and to grant land in the area to members of the nobility. The city was thus founded in 1887 and was named Addis Ababa ("New Flower") by the empress.

In its first years the city was more like a military encampment than a town. The central focus was the emperor's palace, which

was surrounded by the dwellings of his troops and of his innumerable retainers. As the population increased, firewood became scarce. In 1905 a large number of eucalyptus trees were imported from Australia; the trees spread and provided a forest cover for the city.

Addis Ababa was the capital of Italian East Africa from 1935 to 1941. Modern stone houses were built during this period, particularly in the areas of European residence, and many roads were paved. Other innovations included the establishment of a water reservoir at Gefarsa to the west and the building of a hydroelectric station at Akaki to the south. There were only limited changes in Addis Ababa between 1941 and 1960, but development has been impressive since then.

Addis Ababa is the educational and administrative centre of Ethiopia. It is the site of Addis Ababa University (1950) and contains several teacher-training colleges and technical schools. Also located in the city are the Museum of the Institute of Ethiopian Studies (operated by the university), the National School of Music, the National Library and Archives, palaces of former emperors, and governmental ministries. Several international organizations have their headquarters in the city; the most important are the Organization of African Unity and the United Nations Economic Commission for Africa, both located in Africa Hall.

Addis Ababa's manufactures include textiles, shoes, food, beverages, wood products, plastics, and chemical products. Most of Ethiopia's service industries are also located in the city. Banking and insurance services are concentrated in Addis Ababa, and the nation's major newspapers are published there.

The bulk of the export and import trade of Ethiopia is channeled through Addis Ababa on its way to or from the ports of Djibouti, on the Gulf of Aden, or Aseb (Assab), Eritrea, on the Red Sea. The city is also the collection and distribution centre for much of the country's internal trade. The Mercato, located in the western part of the city, is one of the largest open-air markets in Africa. The Piazza in the central city contains the more expensive European-style shopping centres.

Addis Ababa is the hub of the nation's transportation network. Several roads connect it to other major cities; the only railway runs to Djibouti. The city is also served by an international airport.

Formally designated recreational areas are limited, but there are many open spaces suitable for recreational purposes. A small zoo is located in a park near the university, and the lake region, which is a short drive to the south, has facilities for boating, waterskiing, bathing, and bird-watching. The most popular spectator sport is soccer. Basketball, volleyball, and other sports are also played, chiefly by school teams. Pop. (1994) 2,112,737.

Addison (of Stallingborough), Christopher Addison, 1st Viscount, BARON ADDISON OF STALLINGBOROUGH (b. June 19, 1869, Hogsthorpe, Lincolnshire, Eng.—d. Dec. 11, 1951, West Wycombe, Buckinghamshire), British surgeon and statesman who was prominent in both Liberal and Labour governments between the wars and after World War II.

Addison was educated at Trinity College, Harrogate, Yorkshire, and at St. Bartholomew's Hospital Medical College, London. He became an anatomy lecturer at St. Bartholomew's, professor of anatomy at University College, Sheffield, and, in 1901, Hunterian professor at the Royal College of Surgeons, London. Elected Liberal member of Parliament in 1910, he was parliamentary secretary to the Board of Education (1914–15), minister of munitions (1916–17), minister in charge of postwar reconstruction (1917), and first minister of health (1919–21). He promoted an ambitious state-subsidized housing

scheme, which caused an outcry against the heavy burden upon the taxpayers it would involve and which strained the hitherto close relations between himself and David Lloyd George, the prime minister. In 1921 Addison was transferred to a ministry without portfolio, and in the same year he resigned from the government altogether.

In 1922 he transferred his allegiance to the Labour Party; that same year he published *The Betrayal of the Shums* and, in 1926, *Practical Socialism*. In the 1929 general election Addison was returned to Parliament, in the Labour interest, and the new prime minister, Ramsay MacDonald, appointed him parliamentary secretary to the Ministry of Agriculture and Fisheries (1929–30) and minister of agriculture and fisheries (1930–31). In 1937 he was created a baron, and, when the Labour Party was returned to power in 1945, he was elevated to a viscountcy and appointed dominions secretary, remaining in charge when this department became the Commonwealth Relations Office in 1947. In the same year, however, he asked to be relieved of some of his heavy duties because of his responsibilities as leader of the House of Lords, and he was appointed lord privy seal. In 1948–49 he was paymaster general. When in March 1951 Herbert Morrison became foreign secretary, Addison succeeded him as lord president of the council.

Addison, Joseph (b. May 1, 1672, Milston, Wiltshire, Eng.—d. June 17, 1719, London), English essayist, poet, and dramatist, who, with Richard Steele, was a leading contributor to and guiding spirit of the periodicals *The Tatler* and *The Spectator*. His writing skill led to his holding important posts in government while the Whigs were in power.

Joseph Addison, oil painting by M. Dahl, 1719; in the National Portrait Gallery, London

Early life. Addison was the eldest son of the Reverend Lancelot Addison, later archdeacon of Coventry and dean of Lichfield. After schooling in Amesbury and Salisbury and at Lichfield Grammar School, he was enrolled at the age of 14 in the Charterhouse in London. Here began his lifelong friendship with Richard Steele, who later became his literary collaborator. Both went on to the University of Oxford, where Addison matriculated at Queen's College in May 1687. Through distinction in Latin verse he won election as Demy to Magdalen College in 1689 and took the degree of M.A. in 1693. He was a fellow from 1697 to 1711. At Magdalen he spent 10 years as tutor in preparation for a career as a scholar and man of letters. In 1695 *A Poem to his Majesty* (William III), with a dedication to Lord Keeper Somers, the influential Whig statesman, brought favourable notice not only from Somers but also Charles Montague (later

Earl of Halifax), who saw in Addison a writer whose services were of potential use to the crown. A treasury grant offered him opportunity for travel and preparation for government service. He also attained distinction by contributing the preface to Virgil's *Georgics*, in John Dryden's great translation of 1697.

The European tour (1699–1704) enabled Addison not only to become acquainted with English diplomats abroad but also to meet contemporary European men of letters. After time in France, he spent the year 1701 in leisurely travel in Italy, during which he wrote the prose *Remarks on Several Parts of Italy* (1705; rev. ed. 1718) and the poetic epistle *A Letter from Italy* (1704). From Italy Addison crossed into Switzerland, where, in Geneva, he learned in March 1702 of the death of William III and the consequent loss of power of his two chief patrons, Somers and Halifax. He then toured through Austria, the German states, and the Netherlands before returning to England in 1704.

Government service. In London Addison renewed his friendship with Somers and Halifax and other members of the Kit-Cat Club, which was an association of prominent Whig leaders and literary figures of the day—among them Steele, William Congreve, and Sir John Vanbrugh. In August 1704 London was electrified by the news of the Duke of Marlborough's sweeping victory over the French at Blenheim, and Addison was approached by government leaders to write a poem worthy of the great occasion. Addison was meanwhile appointed commissioner of appeals in excise, a sinecure left vacant by the death of John Locke. *The Campaign*, addressed to Marlborough, was published on December 14 (though dated 1705). By its rejection of conventional classical imagery and its effective portrayal of Marlborough's military genius, it was an immediate success that perfectly expressed the nation's great hour of victory.

The Whig success in the election of May 1705, which saw the return of Somers and Halifax to the Privy Council, brought Addison increased financial security in an appointment as undersecretary to the secretary of state, a busy and lucrative post. Addison's retention in a new, more powerful Whig administration in the autumn of 1706 reflected his further rise in government service. At this time he began to see much of Steele, helping him write the play *The Tender Husband* (1705). In practical ways Addison also assisted Steele with substantial loans and the appointment as editor of the official *London Gazette*. In 1708 Addison was elected to Parliament for Lostwithiel in Cornwall, and later in the same year he was made secretary to the Earl of Wharton, the new lord lieutenant of Ireland. Addison's post was in effect that of secretary of state for Irish affairs, with a revenue of some £2,000 a year. He served as Irish secretary until August 1710.

The *Tatler* and *The Spectator*. It was during Addison's term in Ireland that his friend Steele began publishing *The Tatler*, which appeared three times a week under the pseudonym of Isaac Bickerstaff. Though at first issued as a newspaper presenting accounts of London's political, social, and cultural news, this periodical soon began investigating English manners and society, establishing principles of ideal behaviour and genteel conduct, and proposing standards of good taste for the general public. The first number of the *Tatler* appeared on April 12, 1709, while Addison was still in England; but while still in Ireland he began contributing to the new periodical. Back in London in September 1709, he supplied most of the essays during the winter of 1709–10 before returning to Ireland in May.

The year 1710 was marked by the overturn

of the Whigs from power and a substantial Tory victory at the polls. Although Addison easily retained his seat in the Commons, his old and powerful patrons were again out of favour, and, for the first time since his appointment as undersecretary in 1705, Addison found himself without employment. He was thus able to devote even more time to literary activity and to cultivation of personal friendships not only with Steele and other Kit-Cats but, for a short period, with Jonathan Swift—until Swift's shift of allegiance to the rising Tory leaders resulted in estrangement. Addison continued contributing to the final numbers of *The Tatler*, which Steele finally brought to a close on Jan. 2, 1711. Addison had written more than 40 of the *Tatler's* total of 271 numbers and had collaborated with Steele on another 36 of them.

Thanks to Addison's help *The Tatler* was an undoubted success. By the end of 1710 Steele had enough material for a collected edition of *The Tatler*. Thereupon, he and Addison decided to make a fresh start with a new periodical. *The Spectator*, which appeared six days a week, from March 1, 1711, to Dec. 6, 1712, offered a wide range of material to its readers, from discussion of the latest fashions to serious disquisitions on criticism and morality, including Addison's weekly papers on John Milton's *Paradise Lost* and the series on the "pleasures of the imagination." From the first Addison was the leading spirit in *The Spectator's* publication, contributing 274 numbers in all. In bringing learning "out of closets and libraries, schools and colleges, to dwell in clubs and assemblies, at tea-tables, and in coffee-houses," *The Spectator* was eminently successful. One feature of *The Spectator* that deserves particular mention is its critical essays, in which Addison sought to elevate public taste. He devoted a considerable proportion of his essays to literary criticism, which was to prove influential in the subsequent development of the English novel. His own gift for drawing realistic human characters found brilliant literary expression in the members of the Spectator Club, in which such figures as Roger de Coverley, Captain Sentry, Sir Andrew Freeport, and the Spectator himself represent important sections of contemporary society. More than 3,000 copies of *The Spectator* were published daily, and the 555 numbers were then collected into seven volumes. Two years later (from June 18 to Dec. 20, 1714), Addison published 80 additional numbers, with the help of two assistants, and these were later reprinted as volume eight.

Addison's other notable literary production during this period was his tragedy *Cato*. Performed at Drury Lane on April 14, 1713, the play was a resounding success—largely, no doubt, because of the political overtones that both parties read into the play. To the Whigs *Cato* seemed the resolute defender of liberty against French tyranny, while the Tories were able to interpret the domineering Caesar as a kind of Roman Marlborough whose military victories were a threat to English liberties. The play enjoyed an unusual run of 20 performances in April and May 1713 and continued to be performed throughout the century.

Later years. With the death of Queen Anne on Aug. 1, 1714, and the accession of George I, Addison's political fortunes rose. He was appointed secretary to the regents (who governed until the arrival of the new monarch from Hanover) and in April 1717 was made secretary of state. Ill health, however, forced him to resign the following year. Meanwhile, he had married the dowager Countess of Warwick and spent the remaining years of his life in comparative affluence at Holland House in Kensington. A series of political essays, *The Free-Holder, or Political Essays*, was published from Dec. 23, 1715, to June 29, 1716, and his comedy *The Drummer* was produced at Drury Lane on March 10, 1716.

Meanwhile, Addison had a quarrel with the most gifted satirist of the age, Alexander Pope, who after Addison's death would make him the subject of one of the most celebrated satiric "characters" in the English language. In 1715 Pope had been angered by Addison's support of a rival translation of the *Iliad* by Thomas Tickell, and in 1735 Pope published "An Epistle to Dr. Arbuthnot," in which there appears a notable portrait of Addison as a narcissistic and envious man of letters. A second quarrel further embittered Addison; the dispute over a bill for restricting the peerage, in which he and Steele took opposing sides, estranged the two friends during the last year of Addison's life. Addison was buried in Westminster Abbey, near the grave of his old patron and friend Lord Halifax.

Assessment. Addison's poem on the Battle of Blenheim brought him to the attention of Whig leaders and paved the way to government employment and literary fame. He became an influential supporter of the Whigs (who sought to further the constitutional principles established by the Revolution of 1688) in a number of government posts. As a writer Addison produced one of the great tragedies of the 18th century in *Cato*, but his principal achievement was to bring to perfection the periodical essay in his journal, *The Spectator*. Dr. Samuel Johnson's praise of *The Spectator* as a model of prose style established Addison as one of the most admired and influential masters of prose in the language.

Ketcham, *Transparent Designs: Reading, Performance, and Form in the Spectator Papers* (1985).

Addison, Thomas (b. April 1793, Longbenton, Northumberland, Eng.—d. June 29, 1860, Bristol, Gloucestershire), English physician after whom Addison's disease, a metabolic dysfunction caused by atrophy of the adrenal cortex, and Addison's (pernicious) anemia were named. He was the first to correlate a set of disease symptoms with pathological changes in one of the endocrine glands.

In 1837 Addison became a full physician at Guy's Hospital, London, and a joint lecturer on medicine with Richard Bright, with whom he wrote *Elements of the Practice of Medicine* (1839). He gave a preliminary account in 1849 of the two diseases named after him and in 1855 wrote *On the Constitutional and Local Effects of Disease of the Supra-Renal Capsules*. He was author, with John Morgan, of *An Essay on the Operation of Poisonous Agents upon the Living Body* (1829), the first English book on the subject.

Addison's anemia: see pernicious anemia.

Addison's disease, also called ADRENAL CORTICAL INSUFFICIENCY, insidious disease caused by progressive atrophy of the cortex of the adrenal glands. Most of the cortex is destroyed before the symptoms of the disease become apparent. The symptoms—which include weakness, abnormal pigmentation of the skin and mucous membranes, weight loss, low blood pressure, and gastrointestinal upset—are caused by lack of hydrocortisone (a substance secreted by the cortex of the adrenal glands) and overproduction of pituitary hormones. In many cases, replacement of the hydrocortisone with drugs known as adrenal corticosteroids restores normal health. These drugs are usually supplemented by sodium-retaining hormones to stabilize salt level in body fluids.

In the mid-19th century, when the disorder was first recognized, the atrophy was attributed to tuberculosis, which remains the second

leading cause of Addison's disease. More than half of all cases are now believed to result from destruction of the adrenal cortex by the body's own antibodies in an autoimmune reaction.

addition reaction, any of a class of chemical reactions in which an atom or group of atoms is added to a molecule.

Addition reactions are typical of unsaturated organic compounds—*i.e.*, alkenes, which contain a carbon-to-carbon double bond, and alkynes, which have a carbon-to-carbon triple bond—and aldehydes and ketones, which have a carbon-to-oxygen double bond. An addition reaction may be visualized as a process by which the double or triple bonds are fully or partially broken in order to accommodate additional atoms or groups of atoms in the molecule. Addition reactions to alkenes and alkynes are sometimes called saturation reactions because the reaction causes the carbon atoms to become saturated with the maximum number of attached groups.

A typical addition reaction may be illustrated by the hydrochlorination of propene (an alkene), for which the equation is

The reaction proceeds in two stages: first, the hydrogen ion, H^+ , of hydrogen chloride (the positively charged component) adds to one of the pair of carbon atoms joined by double bonds—in this case, the less alkylated carbon atom—followed by addition of the chloride ion, Cl^- (the negatively charged component), to the other carbon atom.

In addition reactions to aldehydes and ketones, the sequence of events is reversed; *i.e.*, the initial step is addition of the negatively charged component of the reagent to the carbon atom, followed by addition of the positively charged component to the oxygen atom. Thus, the reaction of a methyl ketone ($\text{CH}_3(\text{C}=\text{O})\text{R}$, where R is an alkyl group) with hydrogen cyanide proceeds as follows:

The hydrochlorination of propene or, in general, the addition to alkenes is said to be initiated by electron-seeking (electrophilic) reagents, while the additions to alkynes, aldehydes, and ketones are said to be initiated by electron-rich (nucleophilic) reagents. Other forms of addition reactions include: catalyzed addition reactions, such as the self-addition of alkenes (catalyzed by acids) or the hydrogenation of alkenes, aldehydes, and ketones (catalyzed by metals); addition reactions in which cyclic compounds are formed; and addition reactions that proceed by chain mechanisms.

additive, in foods, any of various chemical substances added to foods to produce specific desirable effects. The term additive may also be expanded to include substances—possibly useless or deleterious—that enter foods unintentionally. Additives include such substances as artificial or natural colourings and flavourings; stabilizers, emulsifiers, texturizers, and thickeners; preservatives; flavour enhancers; and supplementary nutrients. Salt, used for centuries to preserve meat, is an additive, as are baking soda, vinegar, and many spices commonly used in home food preparation.

In commercial food processing, additives may be used for aesthetic reasons (to improve colour or consistency) or for considerations of health (to retard spoilage or to increase nutritional value). Some artificial flavourings

and colourings are used for economic reasons, because they are cheaper than the natural ingredients. Other chemicals are added to extend the shelf life of products; for example, humectants, which help to retain moisture; anticaking agents, which maintain the free-flowing qualities of salt, sugar, and similar products; and release agents, used to prevent confections and baked goods from sticking to their wrappings. Although many additives are beneficial—or, at least, harmless—others have the effect of reducing nutritional value or concealing inferior raw materials or processing.

In the United States, prior to 1958, any such substance added to food by manufacturers and producers was assumed to be safe unless proven otherwise. Since that time, however, many additives have come under scrutiny as possible causes of cancer (carcinogens) and birth defects (teratogens). Thus, the U.S. government, along with many others, became involved in regulating the use of additives, both to protect public health and to avoid consumer deception.

Incidental additives, or contaminants, are substances that enter food inadvertently or accidentally during production, processing, or handling. Pesticides used to protect crops may leave residues in foods, as may drugs added to livestock feed to control disease and improve meat yield. Legislation often establishes limits for such residue in food products. Maximum levels may also be specified for chemicals employed in packaging materials, which may actually introduce toxic substances into the products they contain.

For more information on additives, *see* emulsifier; food colouring; nutritional supplement; preservative.

Addo Elephant National Park, national park in Eastern Cape province, South Africa. It lies in the Sundays River valley south of the Suurberge Range, north of Port Elizabeth, and has an area of 45 square miles (117 square km). The park, established in 1931, is largely covered with dense, impenetrable evergreen scrub and preserves a band of about 100 elephants, remnant of a great herd that roamed the area before an extermination campaign was started by landowners in 1919. It is also the habitat of hippopotamuses, scarce Cape buffalo, several species of transplanted

antelope, black rhinoceroses from Kenya, and numerous small birds, mammals, and reptiles. Headquarters are at Port Elizabeth.

adductor muscle, any of the muscles that draw a part of the body toward its median line or toward the axis of an extremity (*compare* abductor muscle), particularly three pow-

erful muscles of the human thigh—adductor longus, adductor brevis, and adductor magnus. Originating at the pubis and the ischium (lower portions of the pelvis—the hipbone), these ribbonlike muscles are attached along the femur (thighbone). Their primary action is adduction of the thigh, as in squeezing the thighs together; they also aid in rotation and flexion of the thigh.

For a depiction of the adductor brevis and adductor longus in human anatomy, shown in relation to other parts of the body, *see* the colour Trans-Vision in the PROPAEDIA: Part Four, Section 421.

Other muscles named for this function include the adductor pollicis, which draws in and opposes the thumb, and the adductor hallucis, which acts on the great toe.

Ade, George (b. Feb. 9, 1866, Kentland, Ind., U.S.—d. May 16, 1944, Brook, Ind.), American playwright and humorist whose *Fables in Slang* summarized the kind of wisdom accumulated by the country boy in the city.

Graduated from Purdue University, Ade was on the staff of the *Chicago Record* newspaper from 1890 to 1900. The characters he introduced in his widely acclaimed editorial-page column, "Stories of the Streets and of the Town," became the subjects of his early books, *Artie* (1896), *Pink Marsh* (1897), and *Doc Home* (1899). His greatest recognition came with *Fables in Slang* (1899), a national best-seller that was followed by a weekly syndicated fable and by 11 other books of fables. The fables, which contained only a little slang, were, rather, examples of the vernacular.

In 1902 Ade's light opera *The Sultan of Sulu* began a long run in New York, followed by such successful comedies as *The County Chairman* (1903) and *The College Widow* (1904). He was recognized as one of the most successful playwrights of his time. He established an estate near Brook, Ind., which became his permanent home. He wrote many motion-picture scripts and, during the Prohibition era, what many called one of his most amusing books, *The Old Time Saloon* (1931).

Adela, French ADÉLE (b. 1062?—d. 1137), daughter of William I the Conqueror of England and mother of Stephen, king of England, whose right to the throne derived through her.

Adela was married to Stephen, count of Meaux and Brie, in 1080 at Breteuil. Upon the death of his father in 1090, her husband succeeded to the countships of Blois and Chartres. She took an active interest in civil and ecclesiastical affairs and was instrumental in rebuilding the Cathedral of Chartres in stone. In 1095 she became regent when her husband, at her urging, took part in the First Crusade to the Holy Land. He returned in 1099 but left to join the Second Crusade in 1101 and was killed in battle at Ramula. Adela continued as regent during the minority of her sons and was increasingly active in public life.

Anselm, the archbishop of Canterbury, her guest and teacher in 1097, was often entertained by her between 1103 and 1105, and she helped to effect a temporary reconciliation between him and her brother the English king Henry I in regard to the investiture controversy. In 1107 Adela entertained Pope Paschal II during Easter and in the following year was hostess to Bohemond I, prince of Antioch. She made her son Theobald her successor in 1109 and entered a convent in the diocese of Autun but continued to wield an important influence in public and clerical affairs. She persuaded Theobald to join her brother Henry I against the king of France in 1117.

Adelaer, also spelled ADELER (Norwegian: "Eagle"), byname of CORT, or CURT, SIVERT-

SEN, Italian CURZIO SUFRIDO (b. Dec. 16, 1622, Brevik, Nor.—d. Nov. 5, 1675, Copenhagen, Den.), Norwegian-born seaman and naval officer, distinguished in both Venetian and Danish naval history.

He entered the Dutch navy in 1639 as an *adelborst* ("cadet") and served under Martin van Tromp but in 1642 moved into Venetian service, where he was known as Curzio Sufrido Adelborst. He soon distinguished himself and in 1650 was sent to patrol the Dardanelles. On May 16, 1654, his Venetian squadron took part in the Battle of the Dardanelles, when his ship alone sank 15 Turkish galleys; and on the following day he compelled the surrender of the Turks at Tenedos. In 1659 he was made a knight of St. Mark and given a pension for life, and in 1660 he became lieutenant admiral of the Venetian fleet.

Two years later, in 1662, he returned to Denmark as admiral of the Danish fleet, receiving at the same time various honours and revenues from King Frederick III. His most important work was the refitting and reorganization of the fleet. In 1665 he received an invitation to command the Dutch fleet against England, but this he refused. He was ennobled by Frederick III in 1666 and was sent to India to negotiate with the court of Coromandel three years later (1669–70). Under Christian V he was appointed to command the Danish fleet against Sweden but died before the expedition.

Adelaide, capital of the state of South Australia. Situated at the base of the Mount Lofty Ranges, 9 miles (14 km) inland from the centre of the eastern shore of the Gulf St. Vincent, it has a Mediterranean climate with hot summers (February mean temperature 74° F [23° C]), mild winters (July mean 54° F [12° C]), and an average annual rainfall of 21 inches (530 mm). The site, chosen in 1836 by William Light (the colony's first surveyor general), is on slightly rising ground along the Torrens River, which divides it into a southern business district and a northern residential section. The city is separated from its suburbs by extensive areas of parklands. Named for Queen Adelaide, consort of the British king

Park lands along the Torrens River, Adelaide, South Australia
Picturepoint

William IV, it was incorporated as Australia's first municipal government in 1840, but the city council ran into considerable debt and became defunct in 1843. Adelaide was thereafter controlled by the provincial government until 1849, when a city commission was formed. A municipal corporation was reestablished in 1852, and the city gained a lord mayoralty in 1919.

The fertility of the surrounding plains, easy access to the Murray lowlands to the east and

southeast, and the presence of mineral deposits in the nearby hills all contributed to the city's growth. As an early agricultural marketing centre, it handled wheat, wool, fruits, and wine. Adelaide, aided by its central position and a ready supply of raw materials, has since become industrialized, with factories producing automobile components, machinery, textiles, and chemicals. A petroleum refinery was completed in 1962 at Hallett Cove, south of Adelaide near Port Noarlunga; a second refinery has also been completed. Adelaide is connected by pipeline with the Gidgealpa natural-gas fields in Cooper Basin, northeastern South Australia. A focus of rail, sea, air, and road transportation, Adelaide receives the bulk of the products of the lower Murray River valley, which has no port at its mouth. Adelaide's own harbour facilities are at Port Adelaide, 7 miles (11 km) northwest.

Notable city landmarks include the University of Adelaide (founded in 1874), Parliament and Government houses, the Natural History Museum, and two cathedrals—St. Peter's (Anglican) and St. Francis Xavier's (Roman Catholic). The biennial Adelaide Festival of Arts (1960) was the first international celebration of its kind to be held in Australia. Pop. (2001 prelim.) city, 13,483; (1999 est.) metropolitan area, 1,092,900.

Adelaide, SAINT, German ADELHEID DIE HEILIGE, French SAINTE ADÉLAÏDE, Italian SANTA ADELAIDE (b. 931—d. Dec. 16, 999, Seltz, Alsace [now in France]; feast day December 16), consort of the Western emperor Otto I and, later, regent for her grandson Otto III; she helped strengthen the German church while subordinating it to imperial power.

The daughter of Rudolf II (d. 937), king of Burgundy, and Bertha of Swabia, Adelaide was married (947) to Lothair, who succeeded his father, Hugh of Arles, as king of Italy in the same year. After Lothair died (950), Berengar of Ivrea, his old rival, seized the Italian throne and imprisoned Adelaide (April 951) at Garda. After her escape four months later, she asked the German king Otto I the Great to help her regain the throne. Otto marched into Lombardy (September 951), declared himself king, and married her (December 951). They were crowned emperor and empress by Pope John XII in Rome in 962. She devoted her time to promoting Cluniac monasticism and to strengthening the allegiance of the German church to the emperor.

After Otto's death (May 7, 973), Adelaide exercised influence over her son Otto II until their estrangement in 978, when she left the court and lived in Burgundy with her brother King Conrad. At Conrad's urging she became reconciled with her son, and, before his death in 983, Otto appointed her his regent in Italy. With her daughter-in-law, Empress Theophano, she upheld the right of her three-year-old grandson, Otto III, to the German throne. She lived in Lombardy from 985 to 991, when she returned to Germany to serve as sole regent after Theophano's death (991). She governed until Otto III came of age (994), and, when he became Holy Roman emperor in 996, she retired from court life, devoting herself to founding churches, monasteries, and convents.

Adelaide River, river in northwestern Northern Territory, Australia, rising in the hills west of Brock's Creek and flowing (with marked summer increases in volume) for 110 miles (180 km) northeastward to Adam Bay, an inlet of the Timor Sea on Clarence Strait. From its mouth, 32 miles (50 km) northeast of Darwin, it is navigable for 80 miles (130 km). The river was reached in 1839 by L.R. Fitzmaurice of the ship HMS *Beagle* and named after the British dowager queen Adelaide. It was explored by John McDouall Stuart in 1862, and the first settlement along its banks was Escape Cliffs (1864–67). Since the 1890s

the fertile black soils lining the Adelaide's lower reaches have been used for agricultural experiments—vegetables and rice—and cattle-farming projects. The town of Adelaide River, located where the Stuart Highway and North Australia Railway cross the stream, is a tourist base for the Rum Jungle and Daly River districts.

adelantado (Spanish: "one who goes before"), representative of the kings of Castile (Spain) who in the early European Middle Ages headed military expeditions and, from the reign of Ferdinand III (1217–52) until the 16th century, held judicial and administrative powers over specific districts. Greater adelantados (*adelantados mayores*) served as appeal judges and in times of war were responsible for organizing their territories' armies. Lesser adelantados (*adelantados menores*) held similar powers, but they were often stationed along the frontiers, becoming known as frontier adelantados (*adelantados fronterizos*), and figured prominently in the military conquest of the Americas. In the 16th century the office was replaced by that of alcalde (magistrate).

Adelard of Bath (fl. early 12th century), English Scholastic philosopher and early interpreter of Arabic scientific knowledge.

Adelard translated into Latin an Arabic version of Euclid's *Elements*, which for centuries served as the chief geometry textbook in the West. He studied and taught in France and traveled in Italy, Cilicia, Syria, Palestine, and perhaps also in Spain (c. 1110–25) before returning to Bath, Eng., and becoming a teacher of the future king Henry II. In his Platonizing dialogue *De eodem et diverso* ("On Sameness and Diversity"), his atomism and his attempt to reconcile the reality of universals with that of individuals distinguish him from other Platonists. His *Quaestiones naturales* (76 discussions of human nature, meteorology, astronomy, botany, and zoology) are based on Arabic science. His other writings include works on the abacus and the astrolabe and a translation of an Arabic astronomical table.

Adelbert (German archbishop): see Adalbert.

Adeler (Norwegian seaman): see Adelaer.

Adélie Coast, also called ADÉLIE LAND, part of the coast of Wilkes Land in eastern Antarctica, extending from Claire Coast (west) to George V Coast (east). The region is an ice-covered plateau rising from the Indian Ocean and occupying an area of about 150,000 square miles (390,000 square km). Discovered in 1840 by the French explorer Jules-Sébastien-César Dumont d'Urville, who named it after his wife, it is the basis of France's claim on the continent between longitude 136° and 142° E; administratively it is a part of Terres Australes et Antarctiques Françaises (*q.v.*). The French meteorological station Dumont d'Urville base was established in 1952 at Géologie Archipelago, replacing the original station of Port-Martin (founded 1950), which was destroyed by fire.

Adelung, Johann Christoph (b. Aug. 8, 1732, Spantekow bei Anklam, Pomerania, Prussia [now in Germany]—d. Sept. 10, 1806, Dresden, Saxony [now in Germany]), one of the most influential German-language scholars before Jacob Grimm. His grammars, dictionary, and works on style helped to standardize the language.

He engaged in private research from 1761 to 1787, when he became principal librarian to the elector of Saxony at Dresden, a post he retained to the end of his life.

Adelung's *Versuch eines vollständigen Grammatisch-kritischen Wörterbuchs der hochdeutschen Mundart* (1774–86; "Attempt at a Complete Grammatical-Critical Dictionary of the High German Dialect") revealed an intimate knowledge of the history of dialects basic to modern German. At the time of his

death, he was still at work on *Mithridates, oder allgemeine Sprachenkunde*, 3 vol. (1806–17: “Mithridates, or General Linguistics”), in which he affirmed the relation of Sanskrit and the major European languages and also collected the Lord’s Prayer in some 500 languages and dialects.

Adémar OF MONTEIL, also called **ADÉMAR OF PUY**: see *Adhémar of Monteil*.

Aden, Arabic ‘ADAN, city of Yemen. It is situated along the north coast of the Gulf of Aden and lies on a peninsula enclosing the eastern side of At-Tawāhī Harbour. The peninsula enclosing the western side of the harbour is called Little Aden.

Aden has its earliest recorded mention in the Old Testament book of Ezekiel, where it is named alongside Canneh as one of the places with which Tyre had trading connections. Canneh and Aden were the two principal termini of the spice road of western Arabia, which was in use for about a millennium until the 3rd century AD. Later, Aden continued to function as a trading centre under Yemeni, Ethiopian, or Arab control. In the 16th century the Turks established themselves as rulers there. British interest in Aden as a strategic base dates from Napoleon’s conquest of Egypt, a conquest that was regarded as a menace to Britain’s communications with India. About 1800 the British established a garrison at Aden, and in 1802 they signed a treaty with the harbour’s ruler, the sultan of Lahij.

When steam navigation was introduced some years later, it became necessary to have a coaling station on the Red Sea route to India. Aden, which the British had captured in 1839 from the sultan, was chosen as the most

quarter; At-Tawāhī, the business section; and Ma’allah, the native harbour area. Its economy is based almost entirely on its functions as a commercial centre for nearby states and as a refueling stop for ships; the latter activity declined considerably during the closure of the Suez Canal (1967–75). The city has some small industries, including light manufacturing, evaporation of seawater to obtain marine salt, and boatbuilding. Aden was a free port, with no customs duties, until 1970, when duties were imposed. There is an international airport at Khaur Maksār, a former Royal Air Force (RAF) base just north of Aden. The University of Aden was opened in 1970. Pop. (1984 est.) 318,000.

Aden, Gulf of, deepwater basin that forms a natural sea link between the Red Sea and the Arabian Sea. Named after the seaport of Aden, in southern Yemen, the gulf is situated between the coasts of Arabia and the Horn of Africa. To the west, it narrows into the Gulf of Tadjoura; its eastern geographic limits are defined by the meridian of Cape Guardafui (51°16’ E). In oceanographic and geologic terms, however, it extends to the eastern limits of the continental shelf beyond the Kuria Muria Islands to the north and the island of Socotra to the south, covering an area of some 205,000 square miles (530,000 square km). Its total length, measured from east-northeast to west-southwest, is 920 miles (1,480 km), and its mean width, measured from north-northeast to south-southwest, is 300 miles (480 km).

The dominant relief feature of the gulf’s terrain is the Sheba Ridge, an extension of the Indian Ocean ridge system, which extends along the middle of the gulf. The rough topography of the ridge includes a well-defined median valley that is continually offset by faults running approximately northeast to southwest. The largest of these faults forms the Alula-Fartak Trench, in which is found the gulf’s maximum recorded depth of 17,586 feet (5,360 m). The Sheba Ridge is flanked on both sides by sediment-filled basins that reach depths of 13,000 feet (3,900 m) at the mouth of the gulf. To the west, the ridge gives way to a relatively shallow east-west-trending valley known as the Tadjoura Trench.

The main factor in the gulf’s geologic formation is the spreading of the seafloor away from the Sheba Ridge axis. The African continent and the Arabian Peninsula split initially along their present margins either in the late Eocene epoch (57.8 to 36.6 million years ago) or else in the Oligocene epoch (36.6 to 23.7 million years ago). They have since drifted apart in a direction parallel to the gulf’s faults.

The intensive exchange of water between the Red Sea, the Gulf of Aden, and the Arabian Sea, as well as strong evaporation and monsoon (rain-bearing) winds that constitute part of the airflow, all assist in the formation of a complex water structure. The surface layer is highly saline, and eddies complicate its flow pattern. Surface temperatures of the gulf’s waters are generally between 77° and 88° F (25° and 31° C).

The gulf’s marine life is rich in both the quantity and the variety of its species. Seasonally variable upwelling of waters in the coastal zone provides the surface layer with a considerable supply of nutrient elements, which produce an abundant growth of plankton. Sardines and mackerel abound in these areas of upwelling. The main open-sea fish are dolphin, tuna, billfish, and sharks. Whales are frequently sighted. The gulf provides a breeding ground for sea turtles, and rock lobster are abundant.

Despite a lack of large-scale commercial fishing facilities, the coastline supports many iso-

lated fishing towns and villages. Local fishing takes place close to the shore; sardines, tuna, kingfish, and mackerel make up the bulk of the annual catches. Crayfish and sharks are also fished locally, while survey ships have occasionally pulled in exceptional catches of fish.

BIBLIOGRAPHY. The morphology, geology, and geophysics of the gulf and its surrounding areas are comprehensively covered in various articles in the *Philosophical Transactions of the Royal Society*, Series A, vol. 267, no. 1181 (1970), which also contains up-to-date bathymetric and magnetic charts of the gulf itself. The hydrological structure of the water mass is described by V.A. Khimitsa in *Oceanology*, 8:318–322 (1968); while its physical and chemical properties are covered in the *University of California, Institute of Marine Resources Report, I.M.R. Reference 67-12* (1967).

Adena culture, culture of various communities of ancient North American Indians, about 500 BC–AD 100, centred in what is now southern Ohio. Groups in Indiana, Kentucky, West Virginia, and possibly Pennsylvania bear similarities and are roughly grouped with the Adena culture. (The term Adena derives from the home of an early Ohio governor, located near Chillicothe, Ohio, around which Adena-type mounds were found.)

Stone pipe carved in the form of a human figure, found in an Adena mound near Chillicothe, Ohio

By courtesy of the Ohio Historical Society

The Adena usually lived in villages containing circular houses with conical roofs, constructed of poles, willows, and bark, though some of them lived in rock shelters. They subsisted by hunting, fishing, and gathering wild plant foods. Their utensils consisted of such items as stone hoes, axes, and projectiles, stone smoking pipes, and simple pottery. Adena ornaments of copper, mica, and seashells attest to trade with faraway peoples.

Adenauer, Konrad (b. Jan. 5, 1876, Cologne [now in Germany]—d. April 19, 1967, Rhöndorf, W.Ger.), first chancellor of the Federal Republic of Germany (West Germany; 1949–63), presiding over its reconstruction after World War II. A Christian Democrat and firmly anticommunist, he supported NATO, and he worked to reconcile Germany with its former enemies, especially France.

Commercial harbour at Aden, Yemen

suitable location and later became so heavily used as a coal-bunkering facility that it was nicknamed the “Coalhole of the East.” Certain mainland areas were purchased by the British between 1868 and 1888, and in 1937 Aden became a British crown colony. In 1953 an oil refinery was built at Little Aden, on the western side of the bay.

Aden became partially self-governing in 1962 and was incorporated in the Federation of South Arabia (comprising the former Aden Protectorate territories) in 1963. When the federation was promised independence from Britain by 1968, however, Aden became the focus of a struggle between two rival nationalist organizations, the Egyptian-supported Front for the Liberation of Occupied South Yemen (FLOSY) and the Marxist-oriented National Liberation Front (NLF), for eventual control of the country. It was as a part of the NLF-ruled People’s Republic of Southern Yemen that Aden achieved its independence on Nov. 30, 1967, and became the national capital in 1968 of what was known as South Yemen, or Yemen (Aden). In 1990 North Yemen and South Yemen merged into the single country of Yemen, and San’a’ became the national capital of Yemen.

The contemporary city of Aden consists of three sections: Crater, the old commercial

Early career The son of a Cologne civil servant, Adenauer grew up in a Roman Catholic family of simple means in which frugality, fulfillment of duty, and religious dedication were stressed. He studied jurisprudence and political science at the universities of Freiburg, Munich, and Bonn. In 1906 he was elected to the Cologne City Council and, in 1917, during World War I, was chosen *Oberbürgermeister*, or lord mayor, of the city. In this post, which he retained until 1933, he created new port facilities, a greenbelt, sports grounds, and exhibition sites and, in 1919, sponsored the refounding of the University of Cologne.

In 1918 Adenauer had hoped at first that the Rhineland might become one of the member-states of the new republican Germany, but when the British had finally evacuated Cologne (1926), the city, with its district, remained part of the Prussian Rhine Province. Adenauer, who had been a member of the Prussian Herrenhaus (Upper Chamber of Parliament) before its abolition in 1918, was a member of the Staatsrat (the central organ representing the Diets of the Prussian provinces) from 1920 and became speaker of it in 1928. Politically he belonged to the Centre Party, which reflected Catholic principles.

With the advent of the Nazis to power in 1933, Adenauer lost all his offices and posts. After intermittent persecutions, he was finally sent to a concentration camp in 1944. At the end of World War II the U.S. military authorities restored him as chief mayor of Cologne, but the British, who assumed control of the city in June 1945, removed him from office in October. This second fall from power did not cause Adenauer to withdraw from public life. On the contrary, it released him for his real mission.

Chancellor. Even before the end of the war, a new political party was being formed—the German Christian Democratic Union (CDU)—in which Catholics and Protestants buried their long-standing differences to present a common front against Nazism and to promote Christian principles in government. Adenauer was now able to play an important role in the formation of this new party, and in 1946 he became its chairman in the British zone of occupation. The CDU began expanding in the four zones of the Allied occupation. As the Soviet Union began increasingly to obstruct the Allied Control Council, the Western Allies decided to give their three occupation zones a federal-state organization. Adenauer became president of the Parlamentarischer Rat (Parliamentary Council), which produced a provisional constitution for the intended German Federal Republic. In 1949 Adenauer became chairman of the CDU for the whole of West Germany; and in the first general elections under the new regime, his party and its regular ally, the Christian Social Union (CSU), together won 139 of the 402 seats in the Bundestag (Federal Parliament). He managed to form a coalition government; but it was only by a majority of one vote that the Bundestag, on Sept. 15, 1949, confirmed his appointment as chancellor.

As chancellor Adenauer was opposed to Socialist ideas and rejected the notion of an egalitarian mass society. His leading political theme was individualism under the rule of law. He was imbued with the conviction that the state must guarantee its citizens optimal room for independent intellectual and economic development, as well as absolute protection under the law. The political platform of the CDU, however, went beyond Adenauer's ideas; it advocated some programs of a Socialist nature. Adenauer was quite pragmatic in response. He was willing to compromise on domestic programs with which he philosophically disagreed so that he could promote the

unity of the country and give West Germany an important place in the European community.

The focus of his interest throughout his career lay in foreign affairs. He viewed the expansion of Communist rule into the heart of Europe as a direct threat to the West and its values. He had no faith in the possibility of peaceful coexistence with the Communist world and felt the need for tough opposition to any aggressive military threats from the Communist bloc. He considered as irreconcilable the differences between individualistic rule of law and totalitarian dictatorship and between humanistic-Christian teachings and Communist social regimentation. He therefore became a strong advocate of the politics of containment. As a result, he energetically supported German contributions to the North Atlantic Treaty Organization (NATO) and its nuclear arsenal, and he would have preferred the development of a European defense community. He worked with all his strength for the reconciliation of Germany with its neighbours, especially France.

Important events in West German history during Adenauer's term in power were: in 1950, West Germany's associate membership

Adenauer

©Karsh—Woodfin Camp and Associates

of the Council of Europe; in 1951, the establishment of a German Foreign Office (with Adenauer himself as minister of foreign affairs until 1955), full membership in the Council of Europe, and founder membership of the European Coal and Steel Community; in 1952, the project for the European Defense Community (EDC); in 1954–55, after the collapse of EDC, recognition of West Germany as a sovereign state and its admission to the North Atlantic Treaty Organization (NATO), with the Western powers' approval of German rearmament; and in 1957–58, founder membership of the European Economic Community (EEC).

Meanwhile, Adenauer's rising prestige had been reflected in two successive elections (1953 and 1957), in both of which the CDU-CSU coalition won a strikingly increased majority in the Bundestag, so that Adenauer's retention of the chancellorship had been unchallenged. Within the CDU, however, the terms on which he secured West Germany's membership in the EEC were criticized by Ludwig Erhard, who as minister of economic affairs from 1949 enjoyed the main credit for the "miracle" of the West German economic recovery. Erhard became vice-chancellor in 1957, but antagonism between him and Adenauer grew more pronounced, and in 1959 Adenauer tried to exclude him from eventual succession to the chancellorship.

In the elections of 1961 the CDU-CSU lost a number of seats in the Bundestag. If he was to form the next government, Adenauer had to bring the Free Democrats back into coalition with his own party (as in 1949 and in 1953, but not in 1957). The Free Democrats, however, made him promise to relinquish the

chancellorship before the end of the parliamentary term. In 1963, after achieving his long-sought treaty of cooperation with General de Gaulle's France, Adenauer accordingly resigned his government office. Erhard succeeded him. Adenauer remained chairman of the CDU until March 1966.

During Adenauer's chancellorship his opponents had demanded that Germany be neutralized and placed in a position of nonalignment between the Eastern and Western blocs. But Adenauer and his party won all major elections because they declared that the risks to security in such a policy would be intolerable. To the end of his life, Adenauer was reproached, unfairly, for not having seriously worked for the reunification of Germany, but he believed that such was the duty rather of the powers that had partitioned Germany than of the West German government.

Adenauer enjoyed congenial relations with important American and European statesmen, particularly U.S. secretary of state John Foster Dulles and French president Charles de Gaulle. His use of language served him in his political goals, for it was sharpened to be intelligible and convincing to the common man and its simplicity emphasized his authority. In his personal life, Adenauer was unpretentious and extremely disciplined. He was married twice and was twice widowed. On his death, the leaders of the United States and France, as well as many other heads of state, including David Ben-Gurion of Israel, attended his funeral.

BIBLIOGRAPHY. Konrad Adenauer, *Erinnerungen*, 4 vol. (1965–68), his autobiography encompassing the years 1945 to 1963; Rudolf Morse and Konrad Repgen (eds.), *Adenauer-Studien*, vol. 1 (1971), contributions by four German historians and political scientists on the politics and personality of Adenauer; Paul Weymar, *Konrad Adenauer* (1955), an authorized popular biography that provides the best description of his life.

Adenet LE ROI, also called ROI ADAM, LI ROIS ADENES, ADAN LE MENESTREL, OF ADAM REX MENESTRALLUS (b. c. 1240—d. c. 1300), poet and musician, interesting for the detailed documentary evidence of his career as a household minstrel.

He received his training in the court of Henry III, duke of Brabant, at Louvain; after his patron's death in 1261, his fortunes wavered, owing to dynastic rivalries and the growth of Flemish literature at court, until in 1268 or 1269 he entered the service of Guy of Dampierre, heir to the county of Flanders, as principal minstrel (whence his title *roi*—i.e., "king of minstrels"). Adenet accompanied Guy in 1270–71 on the Tunisian crusade, and his poems contain many precise references to parts of their return through Sicily and Italy. Of his rather pallid and unoriginal written work, three chansons de geste are preserved: *Buevon de Commarhis*, *Les Enfances Ogier* ("The Youthful Exploits of Ogier the Dane," part of the Charlemagne legends), and *Berte aus grans piés* ("Berta of the Big Feet"). Also extant is *Cléomadès*, a romance about a flying wooden horse, written at the suggestion of Marie de Brabant, daughter of his old patron and queen of Philip III of France.

adenine, organic compound belonging to the purine family, occurring free in tea or combined in many substances of biological importance, including the nucleic acids, which govern hereditary characteristics of all cells.

Partial decomposition of ribonucleic and deoxyribonucleic acids yields mixtures from which the compounds adenylic acid and deoxyadenylic acid, respectively, may be separated. These acids, called nucleotides, are phosphate esters of adenosine and deoxyadenosine, which are smaller units (nucleosides) composed of adenine and either ribose or deoxyribose. Compounds of adenine include vitamin B₁₂ as well as adenosine triphosphate and other

coenzymes (substances that act in conjunction with enzymes).

adenoids, also called PHARYNGEAL TONSILS, a mass of lymphatic tissue, similar to the (palatine) tonsils, that is attached to the back wall of the nasal pharynx (*i.e.*, the upper part of the throat opening into the nasal cavity proper). An individual fold of such nasopharyngeal lymphatic tissue is called an adenoid.

The surface layer of the adenoids consists of ciliated epithelial cells covered by a thin film of mucus. The cilia, which are microscopic hairlike projections from the surface cells, move constantly in a wavelike manner and propel the blanket of mucus down to the pharynx proper. From that point the mucus is caught by the swallowing action of the pharyngeal (throat) muscles and is sent down to the stomach. The adenoids also contain glands that secrete mucus to replenish the surface film. The function of the adenoids is protective. The moving film of mucus tends to carry infectious agents and dust particles inhaled through the nose down to the pharynx, where the epithelium is more resistant. Immune substances, or antibodies, are thought to be formed within the lymphatic tissue, which, combined with phagocytic action, tends to arrest and absorb infectious agents.

The adenoids usually enlarge in early childhood. Infections in childhood can cause swelling and inflammation of the adenoids and may permanently enlarge them. Large adenoids obstruct breathing through the nose and interfere with sinus drainage, thus predisposing the person to infections of the sinuses. Chronic respiratory obstruction and the resultant mouth breathing produce a characteristic vacant facial expression on a person with enlarged adenoids. The adenoids' infection and enlargement also predispose to blockage of the eustachian tubes (the passages extending from the nasal pharynx to the middle ear) and thus to middle-ear infections. Surgical removal, often in conjunction with the removal of the tonsils (tonsillectomy), is frequently recommended for children with enlarged or infected adenoids. Adenoids normally decrease in size after childhood. *See also* tonsil.

adenosine triphosphate (ATP), coenzyme (so called because it functions with an enzyme) in many enzyme-catalyzed reactions in animals, plants, and microorganisms. The energy-rich molecule ATP functions as the carrier of chemical energy from the energy-yielding oxidation of foodstuffs to the energy-demanding processes within cells. It is converted to adenosine diphosphate (ADP) and inorganic phosphate or to adenosine monophosphate (AMP) and inorganic pyrophosphate in such energy-requiring processes as the performance of chemical, electrical, and osmotic work.

There are three metabolic sources of ATP: fermentation (*q.v.*), the tricarboxylic acid cycle (*q.v.*), and oxidative phosphorylation coupled to the transfer of electrons. *See also* cellular respiration; metabolism.

adenovirus, any virus belonging to the family Adenoviridae. This group of viruses was discovered in the 1950s and includes more than 45 types that cause sore throat and fever in humans, hepatitis in dogs, and several diseases in fowl, mice, cattle, pigs, and monkeys. The virus particle lacks an outer envelope; is spherical, about 80 nanometres (1 nm = 10⁻⁹ metre) across; is covered with 252 regularly arranged protein subunits called capsomeres; and has a core of double-stranded deoxyribonucleic acid (DNA) wrapped in a protective coat of protein. Adenoviruses develop within the nuclei of infected cells, where they often can be observed packed in an apparently crystalline arrangement.

In humans, adenoviruses cause acute mucous-membrane infections of the upper respiratory tract, the eyes, and frequently the

regional lymph nodes, bearing considerable resemblance to the common cold. Like the cold viruses, adenoviruses are often found in latent infections in clinically healthy persons. There are more than 45 different members of the adenovirus group, but only a few commonly cause illness in humans; it is thus possible to prepare a vaccine against these viruses. In contrast, there are more than 100 cold viruses, all of which are fairly commonly found as disease agents; this great number makes the development of a vaccine for the common cold virtually impossible.

Adeodatus, name of Roman Catholic popes grouped below chronologically and indicated by the symbol ●.

● **Adeodatus I:** *see* Deusdedit, Saint.

● **Adeodatus II** (b. Rome [Italy]—d. June 17, 676), pope (672–676) who was the first pontiff to date events in terms of his reign, which began with his election on April 11, 672.

Adeodatus played no known role in the political events of the day or in the liquidation of monothelism (a heresy teaching that Christ had only one will), although he did defend orthodoxy. He devoted his attention to restoring churches in a state of disrepair. A Benedictine monk, he took the Abbey of St. Peter and St. Paul (St. Augustine's) under his protection; he improved the Monastery of St. Erasmus; and he seems to have recognized the exemption of the Abbey of St. Martin of Tours from episcopal authority. Some hagiographers style him "Saint" and give him June 26 as a feast day, but the Bollandists, who edit and publish the *Acta Sanctorum*, insist that he had no cult and therefore is not entitled to a feast day.

Ader, Clément (b. Feb. 4, 1841, Muret, France—d. March 5, 1926, Toulouse), self-taught French engineer and inventor, and a pioneer of flight before the Wright brothers.

Ader was an early enthusiast of aviation who constructed a balloon at his own expense during the Franco-German War of 1870–71. In 1876 he quit his job in the Administration of Bridges and Highways to make more money to support his hobby. His early inventions in electrical-communications included a microphone and a public-address device. He then focused on the problem of heavier-than-air flying machines and in 1890 built a steam-powered, bat-winged monoplane, which he named the *Eole*. On October 9 he flew it a distance of 50 m (160 feet) on a friend's estate near Paris. The steam engine was unsuitable for sustained and controlled flight, which required the gasoline engine; nevertheless, Ader's short hop was the first demonstration that a manned heavier-than-air machine could take off from level ground under its own power.

Adernò (Sicily): *see* Adrano.

adhān (Arabic: "announcement"), the Muslim call to Friday public worship and to the five daily hours of prayer. It is proclaimed by the muezzin, a servant of the mosque chosen for good character, as he stands at the door or side of a small mosque or in the minaret of a large one. The *adhān* was originally a simple "Come to prayer," but, according to tradition, Muḥammad consulted his followers with a view to investing the call with greater dignity. The matter was settled when 'Abd Allāh ibn Zayd dreamed that the faithful should be summoned by a crier. The standard Sunnite *adhān* can be translated as: "Allāh is most great. I testify that there is no god but Allāh. I testify that Muḥammad is the prophet of Allāh. Come to prayer. Come to salvation. Allāh is most great. There is no god but Allāh." The first phrase is proclaimed four times, the final phrase once, and the others twice, the worshippers making a set response to each phrase.

Adhémar de Chabannes (b. 988, Limousin, Aquitaine [France]—d. 1034), Frank-

ish chronicler whose major work, *Chronicon Aquitanicum et Francicum* ("Chronicle of Aquitaine and France"), traces the history of Aquitaine and of the Franks from the times of the legendary king Pharamond.

The first two books of Adhémar's history are of little value because his sources were severely limited. The third book, however, contains a reasonably accurate history of western France between 814 and 1028. Adhémar seems to have been more concerned about the development of his narrative than the accuracy of his dates. He also invented the famous dialogue between Hugh Capet, the first Capetian king of France, and his vassal in which Hugh asked his vassal, "Who made you duke?" and received the response, "Who made you king?" Adhémar's works were critically edited by J. Chavanon (1897) and his minor works published by J.-P. Migne in *Patrologia Latina*, vol. 141 (1853).

Adhémar of Monteil, also called ADHÉMAR OF PUY, Adhémar also spelled ADÉMAR, or AIMAR (d. Aug. 1, 1098, Antioch, Syria [now Antakya, Tur.]), French bishop, papal legate, and a leader of the First Crusade.

Adhémar was bishop of Le Puy from 1077 and made a pilgrimage to the East in 1086–87. Responding to Pope Urban II's call in November 1095 for a holy expedition to the East, he was appointed papal legate and leader of the Crusade. Wounded and temporarily captured, he recovered and entered Constantinople with Raymond IV of Toulouse and his troops and had friendly audiences with the Byzantine emperor. With the patriarch Symeon II of Jerusalem, who was in exile in Cyprus, he appealed to the West for more crusaders. Adhémar did not preach Western papal supremacy, despite Urban II's plans for such a policy, but, by effectively directing many battles, as well as organizing relief for poor pilgrims and ordering repentance fasts for the crusaders, he proved to be a forceful, unifying leader. His death from the plague left the Crusade without a leader and widened the breach between Rome and Constantinople.

adhesive, substance used to join separate materials through surface attachment.

A brief treatment of adhesives follows. For full treatment, *see* MACROPAEDIA: Industrial Polymers.

Egyptians used glue in woodworking 3,300 years ago and also used flour paste in the production of papyrus. Several other naturally occurring organic materials, including beeswax and vegetable resins, were important as adhesives in ancient and medieval industries in Europe, and the development of glues and sealants (protective coatings) derived from animal tissue greatly improved the efficiency of wood and paper manufacture. During the 19th century the introduction of rubber-based products was an especially significant development. It has been during the 20th century, however, that the most revolutionary changes in the industry have occurred, owing primarily to the invention of synthetic resins and compounds.

Modern research indicates that adhesion occurs on a minute and intimate molecular level. This explanation, called the adsorption theory, holds that adhesion depends on the same molecular attraction as that which binds all solid matter; any two materials can thus theoretically adhere if they are placed in close enough molecular proximity. Other factors, however, such as tensile strength, evaporative properties, and flexibility, determine a material's practicality as an adhesive.

Most adhesives, both natural and synthetic, are based on polymers. Polymers consist of giant, complex molecules formed by the union of many simpler molecules, called monomers.

Polymeric substances offer a great degree of strength and flexibility, two necessary attributes of any sophisticated adhesive.

The most important types of polymers employed in modern adhesives are thermoplastic resins, thermosetting resins, and elastomers. The thermoplastics provide strong, durable adhesion at normal temperature but can be softened by heating for manipulation and reconfiguration without undergoing chemical deterioration. Thermosetting resins form permanent bonds that cannot be heated to the softening point without undergoing a chemical change. They are extremely useful in industry, especially aircraft and aerospace technology. Elastomers are rubbery polymers that provide important properties of flexibility and tack (stickiness). In various combinations, these polymers are used to make adhesives of many types, including contact cements, usually applied to both bonding surfaces; hot-melt adhesives, applied exclusively in a molten state; pressure-sensitive adhesives, carried on sheets or tapes; and remoistenable adhesives, in which a solution is applied to a backing, allowed to dry, and then reactivated by water.

Natural adhesives are made from both animal and vegetable materials. Animal glues are generally a preparation of collagen, the primary component protein of mammalian bone and skin. These substances are still used in the production of wood and paper materials. Other important mammalian glues are refined from casein, a milk protein, and from blood albumin. Vegetable adhesives are those adhesives extracted from plants that also are soluble or dispersible in water. Starches, obtained from a number of grains and vegetables, form the base material for many such adhesives. Another group, the natural gums, include agar, a colloid (minute particle suspension) of marine plants; algin, a derivative of seaweed; and gum arabic, extracted from the acacia tree.

Although natural adhesives are less expensive to produce, most important modern adhesives are synthetic. Based on complex polymeric compounds, synthetic adhesives are strong, heat-resistant, and durable. They are easily modified to suit specific functions and can be manufactured in a constant and uniform manner.

Ādi-Buddha, among some sects of Mahāyāna Buddhism, the first, or self-existing, Buddha, from whom are said to have evolved the five Dhyāni-Buddhas (see Dhyāni-Buddha). Though the concept of an Ādi-Buddha was never generally popular, a few groups, particularly in Nepal, Tibet, and Java, elevated Vairocana to the position of Ādi-Buddha or named a new deity, such as Vajradhara or Vajrasattva, as the supreme lord. The Ādi-Buddha is represented in painting and sculpture as a crowned Buddha, dressed in princely garments and wearing the traditional ornaments of a bodhisattva ("buddha-to-be").

Ādi Granth (Punjabi: "First Book"), the sacred scripture of Sikhism, a religion of India. The book (also known as *Granth*, or *Granth Sahib* ["The *Granth* Personified"]) is a collection of nearly 6,000 hymns of the Sikh Gurūs (religious leaders) and various early and medieval saints of different religions and castes.

The *Ādi Granth* is the central object of worship in all *gurdwarās* (Sikh temples) and is accorded the reverence paid a living Gurū. It is ritually opened in the morning and wrapped up and put away for the night. On special occasions continuous readings of it are held, which last from 2 to 15 days. On the birthdays of the Gurūs or anniversaries commemorating Sikh martyrs, the *Granth* is sometimes taken out in procession.

The first version of the book was compiled

Pnest worshipping the Ādi Granth
Foto Features

by the fifth Sikh Gurū, Arjun, at Amritsar in AD 1604. He included his own hymns and those of his predecessors, the Gurūs Nānak, Aṅgad, Amar Dās, and Rām Dās, and a selection of devotional songs of both Hindu and Islāmic saints (notably the poet Kabīr). In AD 1704 the tenth and last Gurū, Gobind Singh, added the hymns of his predecessor, Gurū Tegh Bahādur (the sixth, seventh, and eighth Gurūs did not write hymns), and enjoined that after his own death the *Granth* would take the place of the Gurū. The book opens with the *Mūl Mantra* (basic prayer), which is a declaration of the nature of God as Truth, followed by the *Japji* (Recital), the most important Sikh scripture, written by the founder of the Sikh religion, Gurū Nānak. The hymns are arranged according to the musical modes (ragas) in which they are to be sung. The language is mostly Punjabi or Hindi, interspersed with Marathi, Persian, and Arabic words.

After the death of Gurū Gobind Singh his hymns and other writings were compiled into a book known as the *Dasam Granth* (q.v.).

adiabatic demagnetization, process by which the removal of a magnetic field from certain materials serves to lower their temperature. This procedure, proposed by chemists Peter Debye (1926) and William Francis Giauque (independently, 1927), provides a means for cooling an already cold material (at about 1 K) to a small fraction of 1 K.

The mechanism involves a material in which some aspect of disorder of its constituent particles exists at 4 K or below (liquid helium temperatures). Magnetic dipoles—i.e., atoms that have poles like bar magnets—in a crystal of paramagnetic salt (e.g., gadolinium sulfate, $Gd_2(SO_4)_3 \cdot 8H_2O$) have this property of disorder in that the spacing of the energy levels of the magnetic dipoles is small compared with the thermal energy. Under these conditions the dipoles occupy these levels equally, corresponding to being randomly oriented in space. When a magnetic field is applied, these levels become separated sharply; i.e., the corresponding energies are widely different, with the lowest levels occupied by dipoles most closely aligned with the applied field. If the magnetic field is applied while the paramagnetic salt is in contact with the liquid helium bath (an isothermal process in which a constant temperature is maintained), many more dipoles will become aligned, with a resultant transfer of thermal energy to the bath. If the magnetic field is decreased after contact with the bath has been removed, no heat can flow back in (an adiabatic process), and the sample will cool. Such cooling corresponds to the dipoles remaining trapped in the lower energy states (i.e., aligned). Temperatures from 0.3 K to as low as 0.0015 K can be reached in this way.

Much lower temperatures can be attained by an analogous means called adiabatic nuclear demagnetization. This process relies on ordering (aligning) nuclear dipoles (arising from

nuclear spins), which are at least 1,000 times smaller than those of atoms. With this process, temperatures of the ordered nuclei as low as 16 microdegrees (0.000016 degree) absolute have been reached.

adiabatic process, in thermodynamics, change occurring within a system as a result of transfer of energy to or from the system in the form of work only. A rapid expansion or contraction of a gas is very nearly adiabatic. Any process that occurs within a container that is a good thermal insulator is also adiabatic. Adiabatic processes are characterized by an increase in entropy, or degree of disorder, if they are irreversible and by no change in entropy if they are reversible. Adiabatic processes cannot decrease entropy.

Adiabene, petty kingdom that was a vassal state of the Parthian empire (247 BC–AD 224) in northern Mesopotamia (now Iraq). Its capital was Arba-ilu (Arbela; modern Irbīl). In the 1st century AD its royal family embraced Judaism; the queen mother Helena (d. AD 50), famous for her generosity to the Jews and the Temple, and her sons Monobazus II and Izates II were buried in the Tombs of the Kings at Jerusalem. Adiabene was frequently attacked by the Romans during their campaigns against the Parthians.

Adiantaceae, one of several families in the fern order Filicales. It consists of about 60 genera with 850 species and is distributed throughout the world, especially in tropical America. The family is characterized by spore-producing structures (sporangia) located in lines along the veins of the leaves or on or at the vein tips; these structures may be unprotected (lacking indusium), in grooves, or covered by the rolled leaf margin (false indusium).

The best-known species of Adiantaceae are found in the subfamily Adiantoidae. The maidenhair fern (genus *Adiantum*) has about 200 species and shows glossy, usually smooth fronds and characteristic architecture. The Northern maidenhair (*Adiantum pedatum*) is found in woods of North America and East Asia. Also found in Adiantoidae are the cliff brakes (*Pellaea*) and lip ferns (*Cheilanthes*), both of which tend to grow on rock cliffs or ledges.

Northern maidenhair fern (*Adiantum pedatum*)

In this classification, a second subfamily, Vittarioideae (shoestring ferns), contains seven genera, the largest being *Vittaria* and *Antrophyum*, both found throughout the tropics.

adiaphorism (from Greek *adiaphora*, "indifferent"), in Christian theology, the opinion that certain doctrines or practices in morals or religion are matters of indifference because

they are neither commanded nor forbidden in the Bible. Two adiaphorist controversies occurred in Germany after the Reformation.

The first controversy arose over the religious compromise between the Lutheran theologians of Wittenberg, primarily Philipp Melancthon, and Saxony's civil and ecclesiastical leaders. The elector Maurice of Saxony succeeded in making the Wittenberg theologians accept, for political reasons, the Leipzig Interim (December 1548), which sanctioned the jurisdiction of Roman Catholic bishops and observance of certain rites (such as extreme unction and confirmation), while all were to accept the doctrine of justification by faith, the added word "alone" being treated as one of the adiaphora. Matthias Flacius Illyricus, a Lutheran Reformer and church historian, passionately opposed this policy on the grounds that under political pressure no adiaphora could be accepted, and, therefore, no concession could be allowed.

In practice the controversy was ended in September 1555 by the religious Peace of Augsburg, when Lutheranism was acknowledged as a legitimate religion. The theoretical question of adiaphora, however, continued to be debated by Protestants. The Formula of Concord (1577), a Lutheran confession, attempted to settle the matter by stating that rites and ceremonies that were matters of religious indifference could not be imposed during times of controversy.

Another adiaphorist controversy took place in the field of morality in 1681, when Pietists opposed the construction of a theatre in Hamburg. The Pietists denounced worldly amusements as anti-Christian, whereas Lutherans generally defended Christian freedom in such matters.

Adige River, Italian FIUME ADIGE, Latin ATHEISIS, German ETSCH, longest stream of Italy after the Po River. The Adige rises in the north from two Alpine mountain lakes below Resia Pass and flows rapidly through the Venosta Valley south and east past Merano and Bolzano. Having received the waters of the Isarco River at Bolzano, the Adige turns south to flow through the Trentino-Alto Adige region in its middle course, known as the Lagarina Valley. Entering the Po lowland near Verona, it veers southeast and, after several long meanders, enters the Adriatic Sea just south of Chioggia and north of the Po River delta after a course of 255 miles (410 km). It drains a basin of 4,710 square miles (12,200 square km).

In early Christian times the river's course was probably several miles farther north until, about AD 589, the river broke through its banks and built its present course. The dikes constructed during the past several centuries have had to be raised several times; the last 50 miles (80 km) or so of the river's course are entirely man-made. The Adige supplies hydroelectric power in its upper Alpine section and irrigation for the Veneto in its lower course. Floods, such as occurred in 1951 and 1966, do great damage and require constant control of the riverbank.

'Ādil Shāhī DYNASTY (1489–1686), ruling family of the kingdom of Bijāpur, India, one of the two principal successor states to the Muslim sultanate of Bahmani in the Deccan. The dynasty strongly resisted the Mughal advance southward in the 17th century until it was extinguished by Aurangzeb with the capture of Bijāpur in 1686. It was named after its founder, Yūsuf 'Ādil Shāh, said to have been a son of the Ottoman sultan Mu-

rad II. He introduced a form of Islām but practiced toleration. At the end of his reign, Goa was lost (1510) to the Portuguese. After constant wars a coalition of Bijāpur and with the three other Muslim Deccan states—Golconda, Bidar, and Ahmadnagar—overthrew the Hindu Vijayanagar empire, threatening from the south, at Talikota in 1565.

The dynasty's greatest period was during the reign of Ibrāhīm 'Ādil Shāh II (1579–1626), who extended his frontier as far south as Mysore and was a skillful administrator and a generous patron of the arts. He reverted to the Sunnite form of Islām but remained tolerant of other religions, including Christianity. Thereafter, increasing weakness permitted Mughal encroachment and the successful revolt of the Marāthā Śivaji, who killed the Bijāpur general Afzal Khān and scattered his army. The dynasty left a tradition of cosmopolitan culture and artistic patronage, whose architectural remains are to be seen in the capital city of Bijāpur.

Ādilābād, formerly EDLĀBĀD, city, northern Andhra Pradesh state, southern India. It is an agricultural-trade centre 160 miles (260 km) north of Hyderābād, on the Nāgpur-Hyderābād section of the Vārānasi-Kanniyākumāri National Highway. Nearby, at Māhūr (Mahārāshtra state), is a fort dating from the Bahmanī and 'Imād Shāhī dynasties (14th–16th century).

The city is situated on a well-forested plateau (2,000 feet [600 m] high) between the Godāvāri and Penganga rivers. Teak and ebony are commercially lumbered in the region. Agriculture and mining are significant in the regional economy. Rice, sorghum, and wheat rank among the major crops, and coal, talc, and limestone are mined. Pop. (1991 prelim.) 84,233.

Ādinātha: see Rṣabhanātha.

adipose cell, also called FAT CELL, connective-tissue cell specialized to synthesize and contain large globules of fat. The chief chemical constituents of this fat are the neutral glycerol esters of stearic, oleic, and palmitic acids. The fat stored in these cells in part comes directly from the fats eaten and in part is manufactured within the body from fats and carbohydrates in the food and sometimes from protein. The main reservoir of fat in the body is the adipose tissue beneath the skin, called the panniculus adiposus. There are also deposits of fat between the muscles, among the intestines and in their mesentery, around the heart, and elsewhere.

Besides acting as a fuel reserve against times of starvation or great exertion, adipose tissue helps conserve the heat of the body and forms soft and elastic pads between the various organs.

adiposogenital dystrophy: see Fröhlich's syndrome.

Adirondack Mountains, byname ADIRONDACKS, mountains in northeastern New York state, U.S. They extend southward from the St. Lawrence River valley and Lake Champlain to the Mohawk River valley. The mountains are only sparsely settled, and much of the area exists in a primitive natural state, protected by state law.

Although they are frequently included in the Appalachian system, the Adirondack Mountains are related geologically to the Laurentian Highlands of Canada and were formed by a fracturing of the Earth's crust and long years of erosion. The Adirondacks region is circular in outline and covers more than 6,000,000 acres (2,400,000 hectares). The region is made up of hundreds of peaks and foothills, with more than 40 summits higher than 4,000 feet (1,200 m); the tallest are Mount Marcy, which at 5,344 feet (1,629 m) is the highest point in the state, and Algonquin Peak of Mount

McIntyre at 5,114 feet (1,559 m). Although the peaks are primarily rounded in shape, several of the higher ones, including Mount Whiteface (4,868 feet [1,484 m]), reveal bare rock walls in vertical escarpments.

The Adirondack Mountains are covered with spruce, hemlock, and pine forests, interspersed with hardwoods on the lower slopes. The action of retreating glaciers during the last Ice Age left the area covered by glacial till (clay, sand, gravel, and boulders intermingled) and created the many spectacular gorges, waterfalls, lakes, ponds, and swamps for which the region is noted. As many as 2,800 lakes and ponds dot the landscape. More than 31,000 miles (50,000 km) of rivers and streams radiate from the upland region into the St.

Mixed evergreen and hardwood forest on the slopes of the Adirondack Mountains near Keene Valley, N.Y.

Jerome Wyckoff

Lawrence, Hudson, and Mohawk rivers and into Lakes Ontario and Champlain. Summers in the Adirondacks are moderated by cool mountain breezes, while winters, though quite cold, are mitigated by dry air and clear skies.

The name Adirondack means "eater of tree bark," a derisive term bestowed on a local Algonquin tribe by their Iroquois neighbours. The French explorer Samuel de Champlain became the first European to sight the Adirondacks in 1609, but the area resisted all but sparse settlement until the late 19th century. In 1892 the New York state legislature created Adirondack Park, which has grown over the years to nearly 6,000,000 acres (2,430,000 hectares), making it the largest American state or national park outside of Alaska. The park covers one-fifth of New York state and is about the size of Vermont. The state-owned Adirondack Forest Preserve now comprises more than 2,400,000 acres (970,000 hectares) within the park and is a popular tourist area. Lumbering and mining (iron, graphite, and titanium), though once major industries in the region, have been considerably restricted by state control.

Numerous parks, private resort villages, and state campsites in the Adirondacks provide facilities for camping, swimming, hiking, and canoeing, especially around the Saranac River and Lake Placid. Winter sports include Olympic ski and bobsled runs at Lake Placid and other sites. Good highways provide ac-

cess to some parts of the region, but its more remote portions are accessible only to hikers or canoers. Historic landmarks in the area include Fort Ticonderoga, Saratoga National Park, Lake George, and Plattsburgh. The Adirondack Museum, on a campus of exhibit buildings near Blue Mountain Lake, houses relics of human activities in the mountains since colonial times.

adit, horizontal opening, or entrance, made from the Earth's surface, usually to intersect a seam of coal or a mineral vein. An adit is frequently called a tunnel, a term more properly reserved for a working that is open at both ends, such as through a mountain or a ridge. Adits are often driven during tunnel construction to drain water from the workings.

Adits can be driven only in hilly country where the portal will be at such an elevation as to provide an adequate slope for water to flow out and to favour removal of coal or ore.

Where either a vertical shaft or an adit can be used to reach a mineral deposit, both the generally lower cost of driving an adit and the saving in the cost of pumping water and hoisting the coal or ore through the shaft dictate in favour of the adit. Consequently adits as long as one or two miles are often economically feasible.

The cross section of adits is square, round, elliptical, or—more commonly—horseshoe-shaped. The diameter is usually just enough to allow a person to stand erect or to allow passage of haulage equipment. The walls may be of the natural rough rock or may be lined with concrete, masonry, wood, or steel.

Āditi (Sanskrit: "The Boundless"), in the Vedic phase of Hindu mythology, the personification of the infinite, and mother of a group of celestial deities, the Ādityas. As a primeval goddess, she is referred to as the mother of many gods, including Vishnu in his dwarf incarnation and, in a later reappearance, Krishna. She supports the sky, sustains all existence, and nourishes the earth. It is in the latter sense that she is often represented as a cow.

Her sons, the Ādityas, are of uncertain number and identity. Varuṇa is their chief, and they are called like him "Upholders of *ṛta* ('divine order')." One hymn names them as Varuṇa, Mitra, Aryaman, Dakṣa, Bhaga, and Amśa. Sometimes Dakṣa is excluded and Indra, Savitr (the sun), and Dhātṛ are added. Occasionally the term is extended to include all the gods. In later periods their number is increased to 12, and they are linked to the 12 solar months of the year. Āditya in the singular form is a name of the sun.

Adiyaman, formerly HÜSNÜMANSUR, Arabic HİŞN MANŞÜR, city located in a valley of southeastern Turkey. Founded in the 8th century by the Umayyad Arabs near the site of ancient Perre, Hişn Mansūr was later fortified by Caliph Hārūn ar-Rashīd and became the chief town of the area, replacing Perre. Ruled successively by the Byzantines, Seljuq Turks, and the Turkmen Dulkadir dynasty after the Arabs, it was incorporated into the Ottoman Empire near the end of the 14th century. Under the Turkish republic, it was renamed Adiyaman in 1926. The ruins of Perre are just to the north. The city is a local market for the agricultural products of the area.

The region around Adiyaman contains mountains and plateaus drained by the Euphrates River and its tributaries. Many of the residents in the region are Kurds. Products include cereals, cotton, tobacco, pistachio nuts, and grapes. Pop. (1990) 100,045.

adjective law: see procedural law.

Adkins v. Children's Hospital (1923), U.S. Supreme Court case in which the court inval-

idated a board established by Congress to set minimum wages for women workers in the District of Columbia. Congress in 1918 had authorized the Wage Board to ascertain and fix adequate wages for women employees in the nation's capital.

The court ruled in a 5-3 vote that the law authorizing the Wage Board infringed upon Fifth Amendment guarantees of life, liberty, and property. Employer and employee, according to the majority opinion, had a constitutional right to contract in whatever manner they pleased. Thus, the establishment of the Wage Board was an unjustified interference with the freedom of contract.

In their dissent, justices William Howard Taft, Oliver Wendell Holmes, Jr., and Edward T. Sanford argued that Congress had the policing power to correct recognizable evils. The effects of *Adkins v. Children's Hospital* were reversed in *West Coast Hotel Company v. Parrish* (1937), when the Supreme Court overturned the position adopted by the court's conservative majority.

Adler, Alfred (b. Feb. 7, 1870, Penzing, Austria—d. May 28, 1937, Aberdeen, Aberdeenshire, Scot.), psychiatrist whose influential system of individual psychology introduced the term inferiority feeling, later widely and often inaccurately called inferiority complex. He developed a flexible, supportive psychotherapy to direct those emotionally disabled by inferiority feelings toward maturity, common sense, and social usefulness.

Throughout his life Adler maintained a strong awareness of social problems, and this served as a principal motivation in his work. From his earliest years as a physician (M.D., University of Vienna Medical School, 1895), he stressed consideration of the patient in relation to his total environment, and he began developing a humanistic, holistic approach to human problems.

Alfred Adler

By courtesy of the Österreichische Nationalbibliothek Vienna

About 1900 Adler began to explore psychopathology within the context of general medicine and in 1902 became closely associated with Sigmund Freud. Gradually, however, differences between the two became irreconcilable, notably after the appearance of Adler's *Studie über Minderwertigkeit von Organen* (1907; *Study of Organ Inferiority and Its Psychological Compensation*), in which he suggested that persons try to compensate psychologically for a physical disability and its attendant feeling of inferiority. Unsatisfactory compensation results in neurosis. Adler increasingly downplayed Freud's basic contention that sexual conflicts in early childhood cause mental illness, and he further came to confine sexuality to a symbolic role in human strivings to overcome feelings of inadequacy. Outspokenly critical of Freud by 1911, Adler and a group of followers severed ties with Freud's circle and began developing what they called individual psychology, first outlined in *Über den nervösen Charakter* (1912; *The Neurotic Constitution*). The system was elaborated in later editions of this work and in other writ-

ings, such as *Menschenkenntnis* (1927; *Understanding Human Nature*).

Individual psychology maintains that the overriding motivation in most people is a striving for what Adler somewhat misleadingly termed superiority—*i.e.*, self-realization, completeness, or perfection. This striving for superiority may be frustrated by feelings of inferiority, inadequacy, or incompleteness arising from physical defects, low social status, pampering or neglect during childhood, or other causes encountered in the natural course of life. Individuals can compensate for their feelings of inferiority by developing their skills and abilities, or, less healthily, they may develop an inferiority complex, which comes to dominate their behaviour. Overcompensation for inferiority feelings can take the form of an egocentric striving for power and self-aggrandizing behaviour at others' expense.

Each person develops his personality and strives for perfection in his own particular way, in what Adler termed a style of life, or lifestyle. The individual's lifestyle forms in early childhood and is partly determined by what particular inferiority affected him most deeply during his formative years. The striving for superiority coexists with another innate urge: to cooperate and work with other people for the common good, a drive that Adler termed the social interest. Mental health is characterized by reason, social interest, and self-transcendence; mental disorder by feelings of inferiority and self-centred concern for one's safety and superiority or power over others. The Adlerian psychotherapist directs the patient's attention to the unsuccessful, neurotic character of his attempts to cope with feelings of inferiority. Once the patient has become aware of these, the therapist builds up his self-esteem, helps him adopt more realistic goals, and encourages more useful behaviour and a stronger social interest.

In 1921 Adler established the first child-guidance clinic in Vienna, soon thereafter opening and maintaining about 30 more there under his direction. Adler first went to the United States in 1926 and became visiting professor at Columbia University in 1927. He was appointed visiting professor of the Long Island College of Medicine in New York in 1932. In 1934 the government in Austria closed his clinics. Many of his later writings, such as *What Life Should Mean to You* (1931), were directed to the general reader. H.L. and R.R. Ansbacher edited *The Individual Psychology of Alfred Adler* (1956) and *Superiority and Social Interest* (1964).

BIBLIOGRAPHY. Biographies and analyses of his work include Phyllis Bottome, *Alfred Adler: Apostle of Freedom*, 3rd ed. (1957); Rudolf Dreikurs, *Fundamentals of Adlerian Psychology* (1950); and Hertha Orgler, *Alfred Adler*, 4th ed. (1973).

Adler, Cyrus (b. Sept. 13, 1863, Van Buren, Ark., U.S.—d. April 7, 1940, Philadelphia, Pa.), scholar, educator, editor, and Conservative Jewish leader who had great influence on American Jewish life in his time.

Adler received his Ph.D. in Semitics in 1887 from Johns Hopkins University, where he later taught Semitic languages. In 1892 he founded the American Jewish Historical Society, of which he was president from 1898 until 1922. For the Jewish Publication Society of America, he planned the *American Jewish Year Book*, which he edited from its first year (1899) until 1905 and again in 1916. Under his chairmanship, the Bible Committee of the Jewish Publication Society published the first authoritative Jewish translation of the Hebrew Scriptures in the English language (1917).

Adler helped develop the Jewish Theological Seminary in New York City, an institution for research in Judaica and the training of rabbis; he did so principally by bringing Solomon Schechter from Europe, in 1902, to head the institution. In 1908 Adler became

the first president of Dropsie College for Hebrew and Cognate Learning, in Philadelphia. There Adler published and edited the *Jewish Quarterly Review*, which had been previously printed in England. With Schechter, in 1913, he created the United Synagogue of America, a laymen's organization that remains the chief organ of Conservative Judaism in the United States. When Schechter died in 1915, Adler became acting president of the Jewish Theological Seminary and from 1924 until his death served as president. During his tenure, the seminary accumulated one of the world's foremost collections of Judaica.

Adler, Dankmar (b. July 3, 1844, Stadtlangsfeld, Prussia [Germany]—d. April 16, 1900, Chicago, Ill., U.S.), architect and engineer whose partnership with Louis Sullivan was

Chicago Stock Exchange designed by Dankmar Adler, 1897, demolished 1972

Chicago Architectural Photographing Co

perhaps the most famous and influential in American architecture.

Adler immigrated to the United States in 1854 and settled in Detroit, where he began his study of architecture in 1857. Later he moved to Chicago, where he became a draftsman in the office of Augustus Bauer. The American Civil War interrupted his career, and upon his return to Chicago in 1865 he held a succession of positions in the offices of Bauer, A.J. Kinney, and Edward Burling. The first of his important buildings was the Central Music Hall in Chicago, in which he made initial use of his knowledge of acoustics.

In 1881 the partnership of Adler and Sullivan was founded. The commercial buildings which they designed—particularly the Auditorium (Chicago), Wainwright (St. Louis), and Guaranty (Buffalo)—constituted a new architectural style with the essential features of modern building art. Adler acted as engineering designer and administrator, Sullivan as planner and artist. The association ended in July 1895.

Adler wrote extensively on the technical and legal aspects of architecture and building construction. His most important paper is "The Influence of Steel Construction and Plate Glass upon the Development of Modern Style" (1896).

Heidelberg, he became professor of Hebrew and Oriental literature at Cornell University, Ithaca, N.Y. In 1902 he was appointed professor of political and social ethics at Columbia University.

In 1876 Adler established in New York City the Society for Ethical Culture. This marked the beginning of the Ethical Movement, the aim of which was to assert the importance of the moral factor in all life's relations, without regard to considerations of a supreme being.

Adler took a prominent part in social reform movements, such as the erection of model tenement houses and the abolition of child labour. Among his writings are *Creed and Deed* (1877), *The Moral Instruction of Children* (1892), *The World Crisis and Its Meaning* (1915), *An Ethical Philosophy of Life* (1918), and *The Reconstruction of the Spiritual Ideal* (Hibbert lectures at Oxford, 1923).

Adler, Guido (b. Nov. 1, 1855, Eibenschütz, Moravia, Austrian Empire [now Ivančice, Czech Republic]—d. Feb. 15, 1941, Vienna), Austrian musicologist and teacher who was one of the founders of modern musicology.

Adler's family moved to Vienna in 1864, and four years later he began to study music theory and composition with Anton Bruckner at the Vienna Conservatory. Intending to pursue a career in law, Adler studied at Vienna University, receiving a doctoral degree in 1878. During this period he gave a series of lectures on Richard Wagner at the university (later published as *Richard Wagner*, 1904) and, in cooperation with Felix Mottl, established the Akademischer Wagnerverein ("Academic Wagner Society").

Influenced by the writings of outstanding contemporaries in the field of music history, Adler abandoned law; he wrote a dissertation on Western music before 1600 and was awarded a Ph.D. in 1880. Two years later he became a lecturer and completed a work on the history of harmony. In collaboration with Philipp Spitta and K.F.F. Chrysander, Adler founded the *Viertel-jahrsschrift für Musikwissenschaft* ("Quarterly of Musicology") in 1884. The following year he was appointed professor of the history of music at the German University at Prague.

In 1888 he recommended that the Austrian government publish an edition of great Austrian music. This project came into being as the *Denkmäler der Tonkunst in Österreich* ("Monuments of Music in Austria"), and Adler was its general editor from 1894 to 1938, producing 83 volumes in the series.

In 1892 Adler became organizer of the music section of the International Music and Theatre Exhibition in Vienna. In 1898, Adler was named professor of music history at Vienna University, where he founded an institute devoted to musicological research. His lectures were popular and were attended by students from throughout Europe. A considerable number of his pupils later attained fame as composers or musicologists. In addition to music history, Adler's interests extended to contemporary music; he developed a close

friendship with Gustav Mahler, about whom he published a book in 1916, and he also admired the work of Arnold Schoenberg.

As one of the earliest musicologists, Adler articulated the major principles and methods of the new discipline as it was taking form in the late 19th century; he was the first music historian to emphasize style criticism in research. His attitudes and procedures are evident in the *Handbuch der Musikgeschichte* ("Handbook of Music History"), of which he became the editor in 1924.

Adler, Larry, byname of LAWRENCE CECIL ADLER (b. Feb. 10, 1914, Baltimore, Md., U.S.—d. Aug. 6, 2001, London, Eng.), American harmonica player generally considered to be responsible for the elevation of the mouth organ to concert status in the world of classical music.

Adler's family was not particularly musical, but their observance of Orthodox Judaism provided access to religious music. By age 10 he was the youngest cantor in Baltimore, although unhappy in school. By feigning a nervous breakdown, he convinced his parents to let him enroll in the Peabody Conservatory of Music, but he was soon dismissed as untalented. The rebuff made him even more determined. At age 11, without his parents' consent, he ordered a piano for their home, which he then persuaded them to accept. He also began playing the mouth organ. Unable to read music, he listened assiduously, buying records and concert tickets.

In 1927 he won the Maryland National Harmonica Championship, playing a Beethoven minuet. The following year in New York City he accompanied early motion-picture cartoons and performed vaudeville routines dressed as a vagabond. He had played in both musicals and motion pictures before he was invited to play with an orchestra. His solo debut took place in 1939 with the symphony orchestra of Sydney, Australia. Adler did not learn to read music until 1940, when the French composer Jean Berger wrote a harmonica concerto for him. Ralph Vaughan Williams, Darius Milhaud, and others also wrote musical scores for Adler. Accused of communist sympathies and blacklisted during the ascendancy of U.S. Senator Joseph R. McCarthy, Adler was unable to find work and moved to England.

He wrote musical scores for motion pictures and television and also wrote several books, including *How I Play* (1937) and *Larry Adler's Own Arrangements* (1960). His autobiography, *It Ain't Necessarily So*, was published in 1987.

Adler, Mortimer J., in full MORTIMER JEROME ADLER (b. Dec. 28, 1902, New York, N.Y., U.S.—d. June 28, 2001, San Mateo, Calif.), American philosopher, educator, editor, and advocate of education by study of the great writings of the Western world.

Mortimer Adler, 1989

Bachrach

While still in public school he was taken on as a copyboy by the *New York Sun*, where he stayed for two years doing a variety of editorial work full-time. He then attended Columbia University, completed his coursework for a bachelor's degree, but did not receive a diploma because he had refused physical education (swimming). He stayed at Columbia to teach and earn a Ph.D. (1928) and then became professor of the philosophy of law at the University of Chicago. There, with Robert M. Hutchins, he led in the pursuit of liberal education through regular discussions based on reading great books. He had studied under John Erskine in a special honours course at Columbia in which the "best sellers of ancient times" were read as a "cultural basis for human understanding and communication."

Adler was associated with Hutchins in editing the 54-volume *Great Books of the Western World* (1952) and conceived and directed the preparation of its two-volume index of great ideas, the *Syntopicon*.

In 1952 Adler became director of the Institute for Philosophical Research (initially in San Francisco and from 1963 in Chicago), which prepared *The Idea of Freedom*, 2 vol. (1958–61). His books include *How to Read a Book* (1940; rev. ed. 1972), *A Dialectic of Morals* (1941), *The Capitalist Manifesto* (with Louis O. Kelso, 1958), *The Revolution in Education* (with Milton Mayer, 1958), *Aristotle for Everyone* (1978), *How to Think About God* (1980), and *Six Great Ideas* (1981).

With Hutchins, Adler edited for Encyclopædia Britannica, Inc., the 10-volume *Gateway to the Great Books* (1963) and from 1961 an annual, *The Great Ideas Today*. He also edited the 20-volume *Annals of America*, including a two-volume *Conspectus*, *Great Issues in American Life* (1968). Under the sponsorship of Britannica, he delivered several series of lectures at the University of Chicago that were published later as books: *The Conditions of Philosophy* (1965), *The Difference of Man and the Difference It Makes* (1967), and *The Time of Our Lives* (1970). In 1969 he became director of planning for the 15th edition of *Encyclopædia Britannica*, published in 1974. He was chairman of the *Encyclopædia Britannica's* Board of Editors from 1974 to 1995. Adler's memoirs consist of *Philosopher at Large: An Intellectual Autobiography* (1977) and *A Second Look in the Rearview Mirror* (1992). As the spokesman for a group of noted educators, he wrote, after considerable study and debate, *The Paideia Proposal: An Educational Manifesto* (1982) and *The Paideia Program: An Educational Syllabus* (1984), calling for the abolition in American schools of multitrack educational systems, arguing that a single elementary and secondary school program for all students would ensure the upgrading of the curriculum and the quality of instruction to serve the needs of the brightest and to lift the achievement of the least advantaged. He proposed that specialized vocational or preprofessional training be given only after students had completed a full course of basic education in the humanities, arts, sciences, and language.

Among Adler's later works were *How to Speak, How to Listen: A Guide to Pleasurable and Profitable Conversation* (1983) and *Ten Philosophical Mistakes* (1985).

Adler, Nathan Marcus (b. Jan. 15, 1803, Hanover [Germany]—d. Jan. 21, 1890, Brighton, East Sussex, Eng.), chief rabbi of the British Empire, who founded Jews' College and the United Synagogue.

Adler became chief rabbi of Oldenburg in 1829 and of Hanover in 1830. On Oct. 13, 1844, he was elected chief rabbi in London. There he originated and carried out his scheme

Nathan Adler
The Mansell Collection

for a Jewish college for teachers (Jews' College, still in existence), which was founded in London on Nov. 11, 1855, with Adler himself as its first president. In 1860 he formulated a plan to establish a United Synagogue to bring all the British congregations under a central administration; this idea was realized in 1870, when Parliament passed the United Synagogue bill.

Adler, Victor (b. June 24, 1852, Prague, Bohemia, Austrian Empire [now in Czech Republic]—d. Nov. 11, 1918, Vienna, Austria), Austrian Social Democrat, founder of a party representing all the nationalities of Austria-Hungary.

Victor Adler, pastel drawing by L. Braun

By courtesy of the Bild-Archiv, Österreichische Nationalbibliothek, Vienna

Born into a wealthy Jewish family, Adler studied medicine at the University of Vienna, receiving his degree in 1881. While there, he became a member of Georg von Schönerer's German nationalist organization, a movement he left when its anti-Semitic character became more pronounced. After meeting the German socialists Friedrich Engels and August Bebel while traveling in Germany, Switzerland, and England (1883), Adler became a dedicated socialist. He remained a lifelong friend of and correspondent with Engels.

Adler founded and headed the socialist weekly *Gleichheit* (1886–89, "Equality") and, after its ban, published the *Arbeiter Zeitung* ("Workers' Paper"), which became the socialists' main organ. He was chiefly responsible for founding the united Social Democratic Party of Austria (December 1888–January 1889), in which he remained a leading figure, and he made it into a multinational party advocating federalism and autonomy for the peoples of Austria-Hungary. He was elected to the Lower Austrian Landtag (Diet) in 1905 and quickly became a leader in the fight for universal suffrage (introduced in 1907).

The breakaway of the Czech Social Democrats in 1911 frustrated Adler's efforts to maintain a single, united party. During World War I, he worked for a peaceful settlement at the abortive socialist conference in Stockholm (1917). Entering the new Austrian government in October 1918, he advocated

the *Anschluss* (unification) of the rump Austrian state with Germany but died before he could pursue this project.

Adlergebirge (eastern Europe): see Orlice Mountains.

Adlersparre, Georg, Greve (Count) (b. March 28, 1760, Hovermo, Sweden—d. Sept. 23, 1835, near Kristinehamn), political and social reformer who was a leader of the 1809 coup d'état that overthrew Sweden's absolutist king Gustav IV.

Holding the rank of lieutenant colonel in the army, Adlersparre led a faction of officers that, with another group, the "men of 1809," deposed Gustav IV on March 13, 1809, after several years of planning. A liberal, Adlersparre had been moved to conspire against the monarch by Gustav's refusal to summon a Riksdag (estates general) during a decade of excessive taxation and disastrous wars. After the coup, however, Adlersparre retreated somewhat from his earlier liberalism and championed the strong monarchy that the new constitution was soon to provide. He served in the Council of State (1809–10) and then as governor of the county of Skaraborg (1810–24). In 1814 he declined the post of governor-general of Norway (administered under the Swedish crown from 1814 to 1905), urging unsuccessfully that a Norwegian hold that office. Adlersparre also championed such social projects as prison reform.

Admetus, in Greek legend, son of Pheres, king of Phrae in Thessaly. Having sued for the hand of Alcestis, the most beautiful of the daughters of Pelias, king of Iolcos in Thessaly, Admetus was first required to harness a lion and a boar to a chariot. The god Apollo, who served him, yoked the pair for Admetus, who thus obtained Alcestis. Finding that Admetus was soon to die, Apollo persuaded the Fates to prolong his life, on the condition that someone could be found to die in his place. Alcestis consented, but she was rescued by Heracles, who successfully wrestled with Death at the grave. The death and resurrection of Alcestis form the subject of many ancient reliefs and vase paintings and of Euripides' *Alcestis*.

administrative law, the law regulating the powers, procedures, and acts of public administration. It applies to the organization, powers, duties, and functions of public officials and public agencies of all kinds. Its development has been concurrent with the modern growth in the functions of government and in bureaucracy and with the parallel expanding need for legal safeguards over the agencies and officials of government.

A brief treatment of administrative law follows. For full treatment, see MACROPAEDIA: Public Administration.

Of the powers delegated to administrative authorities by modern regulatory statutes, four types may be mentioned: (1) the *rulemaking power*, or the power to issue general rules and regulations having the force of law for the purpose of filling up the details of statutory policy; (2) the *licensing power*, or the power to grant or refuse, to renew, and to revoke licenses or permits that may be required by statute for the pursuit of such professions as law and medicine and the conduct of certain forms of business; (3) the *investigatory power*, or the power to require witnesses to testify and produce books, papers, and records for the purpose of acquiring the information needed for effective regulation; and (4) the *directing power*, or the power to issue, usually after notice and an opportunity to be heard, administrative orders by which a private party is required, in conformity with the governing statute, to do or refrain from doing specified things.

Whatever the public-service and control functions of the administrative system may be, however, their performance depends upon

the conduct of everyday auxiliary operations: the management of personnel and matériel, financing, planning, and so on. Accordingly, the law must also establish rules to authorize and govern these auxiliary and managerial operations and the relations that the administrative system is to bear, with respect to these operations, to other parts of the government.

In the broadest sense, the problem of administrative law is an aspect of the central problem of political theory: the reconciliation of authority and liberty. More specifically, the purposes of legal control of public administration are: (1) to establish administrative authorities and enable them to carry out public policies designed to protect the public interest and (2) to safeguard private interests against administrative arbitrariness or excess of power.

It is important to remember, however, that in the larger view each of these interests includes the other as a factor. The public interest includes the welfare of all members of the community, those who are regulated no less than those for whose protection regulation is undertaken. Accordingly, the public interest itself suffers if those who are regulated become victims of administrative oppression. Yet it is equally true that the private interest of those who are regulated includes in the long run the public interest. They may profit in the short run if the law renders ineffective those administrative efforts designed to prevent their exploitation of the public; but by the same token it may render ineffective their protection against forms of exploitation indulged in by others. The aim of administrative law is thus to attain a synthesis of public and private interests in terms of the social and economic circumstances and ideals of the age.

Administrative law has a valuable contribution to make as an instrument for controlling the bureaucracy. In social democratic regimes, political control and judicial control of administration are regarded as complementary but distinct. Political control is concerned with questions of policy and the responsibility of the executive for administration and expenditure. Judicial control is concerned with inquiring into particular cases of complaint. Administrative law does not include the control of policy by ministers or the head of state.

admiral, the title and rank of a senior naval officer, often referred to as a flag officer, who commands a fleet or group of ships of a navy or who holds an important naval post on shore. The term is sometimes also applied to the commander of a fleet of merchant vessels or fishing ships.

The title of admiral has an ancient lineage. It apparently originated before the 12th century with Muslim Arabs, who combined *emir*, or *amir* ("commander"), the article *al*, and *bahr* ("sea") to make *amir-al-bahr*. Shortened to *amiral*, the title was adopted for naval use by the Sicilians. The French copied the word from the Genoese during the Seventh Crusade (1248–54). The Latin word *admirabilis* ("admirable") may have contributed to the designation admiral for the commander of the Cinque Ports in England before the end of the 13th century.

In Europe it became the title of a great officer of the crown: in France as *grand amiral*, in Spain as *almirante mayor*, and in England as lord high admiral. The noblemen who held these posts were not seamen and did not command at sea except on rare occasions; they were heads of departments that administered naval affairs. They were responsible for providing ships for war, and their duties usually brought them large fees. They also had jurisdiction in certain legal cases.

By 1620 the word admiral was used in England to denote a commander at sea. In that year the fleet was formed into three squadrons with the admiral commanding the centre squadron, his ships flying red ensigns.

The vice admiral in the van squadron flew white ensigns, and the rear admiral flew blue ensigns in his squadron.

In the U.S. Navy a fleet admiral ranks with a general of the army or general of the air force. Admiral ranks with general, vice admiral with lieutenant general, and rear admiral with major general. Rank insignia for U.S. or British admirals consist of a broad gold stripe encircling the lower sleeve with one or more narrower stripes above it.

admiral, any of several butterfly species belonging to the family Nymphalidae (order Lepidoptera). They are colourful, fast-flying, and much prized by collectors. The migratory red admiral (*Vanessa atalanta*), widespread in Eu-

Red admiral (*Vanessa atalanta*)
William E. Ferguson

rope, Scandinavia, North America, and North Africa, feeds on stinging nettles. The Indian red admiral, *V. indica*, found in the Canary Islands as well as India, is distinguished by a red band on the forewings wider than that of *V. atalanta*. A Eurasian and North American species, the white admiral (*Limenitis camilla*, or *Basilarchia arthemis*), distributed from Great Britain across the European continent to Japan, feeds on honeysuckle.

Admiral carpet, any of a number of 14th- or 15th-century carpets handwoven in Spain, probably at Letur or at Liétor in Murcia. The carpets were made with the Spanish knot, on a single warp. In most cases they show heraldic shields with coats of arms against a background diaper of small octagons, many of which contain eight-pointed stars; the shields of some of these carpets bear the blazons of members of the Enriquez family, hereditary

Heraldic shield with the coat of arms of Admiral Fadrique Enriquez, detail of an Admiral carpet, 15th century; in the Philadelphia Museum of Art

By courtesy of the Philadelphia Museum of Art. The Joseph Lees Williams Memorial Collection photograph, Otto E. Nelson

admirals of Castile, and others show the arms of Maria of Castile, queen of Aragon. Other Admiral carpets display merely the diapered ground, without shields. The borders are complex, the outermost stripe usually a defor-

mation of Kūfic script interspersed with tiny stylized animals, birds, and human figures.

Many of these carpets originally were very long but were shortened in the course of their use in the convents upon which they were bestowed in the 15th century and where they were preserved until removed to museums. Admiral carpets appear in several Spanish paintings, in a fresco painted about 1346 at Avignon, and in Hans Holbein the Younger's painting "Solothurn Madonna" (1522; Museum der Stadt Solothurn, Switzerland).

Admiral's Cup, racing trophy awarded to the winner of a biennial international competition among teams of sailing yachts; it was established in 1957 by the Royal Ocean Racing Club (RORC) of Great Britain. Teams of three yachts rated at 25 to 70 feet (8 to 21 m) by RORC rules (formerly 30 to 60 feet [9 to 18 m] waterline length) represent each nation in six races (five until 1987) off the southern coast of England, culminating in the 605-mile (975-kilometre) Fastnet Cup Race. The Admiral's Cup is one of the most prized ocean-racing trophies. For winners, see *Sporting Record: Yachting*.

Admiral's Men, a theatrical company in Elizabethan and Jacobean England. About 1576–79 they were known as Lord Howard's Men, so called after their patron Charles Howard, 1st Earl of Nottingham, 2nd Baron Howard of Effingham. In 1585 he became England's lord high admiral, and the company changed its designation to Admiral's Men. It was later known successively as Nottingham's Men, Prince Henry's Men, and the Elector Palatinate's (Palsgrave's) Men.

The chief actor of the Admiral's Men was Edward Alleyn; their manager and effectively their employer until his death in 1616 was Philip Henslowe (*q.v.*), whose *Diary*, covering the years 1592 to 1603, documents the Elizabethan theatre and its organization. The company disbanded in 1625.

Admiralty, in full BOARD OF ADMIRALTY, in Great Britain, until 1964, the government department that managed naval affairs. In that year the three service departments—the Admiralty, the War Office, and the Air Ministry—were abolished as separate departments and merged in a new unified Ministry of Defence, and the Admiralty was renamed the Admiralty Board of the Defence Council.

England's navy was originally governed by a "great officer of state" called the lord high admiral of England. Early in the 18th century this office was placed in the hands of commissioners known as the Board of Admiralty. The board derived its powers from the royal prerogative: no act of Parliament defined or circumscribed them, except inasmuch as the discipline of the navy was regulated by a Naval Discipline Act. In pure law the members of the Admiralty Board shared a joint and equal responsibility, but an order in council in 1869 conferred upon the first lord of the admiralty overriding powers. He was directly responsible to Parliament for the navy.

The Admiralty differed from other British service departments in that it functioned as an operational authority, sometimes actually issuing direct orders to ships at sea. In the 20th century there were usually 10 members of the Board of Admiralty; 3 were members of Parliament, 6 were naval officers, and 1 was permanent secretary.

admiralty: see maritime law.

Admiralty, High Court of: see High Court of Admiralty.

Admiralty Inlet, passage of water located between Brodeur and Borden peninsulas and indenting for 230 miles (370 km) the north-

west coast of Baffin Island in the Northwest Territories, Canada. The inlet, leading southward from Lancaster Sound of Baffin Bay, is 2 to 20 miles (3 to 32 km) wide, with a shoreline that rises abruptly about 1,000 to 1,500 feet (300 to 460 m). Arctic Bay, a mineral exploration and hunting base, is on its northeastern shore.

Admiralty Islands, in Papua New Guinea, extension of the Bismarck Archipelago comprising a group of about 40 islands. The group lies in the southwestern Pacific Ocean, about 190 miles (300 km) off the northern coast of Papua New Guinea. The volcanic Manus Island (*q.v.*) constitutes the majority of its land area and is the site of Lorengau, the islands' principal settlement.

Admiralty Islands

Possibly explored by the Spaniard Álvaro Saavedra in 1528, the group was sighted by the Dutch navigator Willem Schouten in 1616 and named by the British captain Philip Carteret in 1767. Constituted part of a German protectorate in 1884, the islands were captured by Australia in 1914 and were included in the territory mandated to that nation in 1921. They were occupied by Japan from 1942 to 1944 and made part of the UN Trust Territory of New Guinea in 1946. When Papua New Guinea attained its independence in 1975, the islands became part of that country.

The economy of the Admiralty Islands is primarily agricultural, consisting of copra production and some coffee growing. Copper deposits were located on Manus Island in 1972. The indigenous population, which is Melanesian, engages in fishing and local trading. Many are adherents of the cargo cult founded by the prophet Paliu after World War II. Pop. (1990 prelim.) 32,830, almost all of whom live on Manus Island.

Admonition to Parliament (1572): *see* Parliament, Admonition to.

Ado-Ekiti, town, Ondo state, southwestern Nigeria. It lies in the Yoruba Hills, at the intersection of roads from Akure, Ilawe, Ilesha, Ila (Illa), and Ikare, and is situated 92 miles (148 km) east-northeast of Ibadan. An urban and industrial centre of the region, it was founded by the Ekiti people, a Yoruba subgroup whose members belonged to the Ekiti-Parapo, a late 19th-century confederation of Yoruba peoples that fought against Ibadan for control of the trade routes to the coast.

Ado-Ekiti became the site of a large textile mill in 1967, its occupants having a long-standing tradition of cotton weaving. The town also produces shoes and pottery and is a collecting point for commercial crops such as tobacco, cacao, palm oil and kernels, and cot-

ton. Yams, cassava, corn (maize), upland rice, fruits, pumpkins, palm produce, and okra are marketed locally. Ado-Ekiti town has several secondary schools, a government hospital, and a livestock station. Pop. (1996 est.) 359,400.

adobe, a heavy clay soil used to make sun-dried bricks. The term, Spanish-Moorish in origin, also denotes the bricks themselves.

Adobe is a mixture of clay, sand, and silt with good plastic qualities that will dry to a hard uniform mass. In areas with arid or semiarid climates, adobe construction dates back several millennia. This use of earth for building construction resulted partly from the scarcity of wood as a building medium, partly from the ease of such construction, and partly from its insulation value against both heat and cold. Adobe or sun-dried bricks are found in the Old World in the dry areas east of the Mediterranean Sea, in North Africa, and in southern Spain. In the Western Hemisphere adobe appears in many of the pre-Columbian sites from the American Southwest to Peru, always, again, in those regions with a dry climate. The American Indians built walls by hand manipulation of the plastic clay into courses, allowing each course to dry before adding the next. In the 20th century, adobe also became a fashionable construction material in the American Southwest.

Water and a small amount of straw or other fibrous material is mixed with a clay soil, which is then shaped into bricks in simple molds. Depending on intended use, the bricks range from 8 to 13 cm (3 to 5 inches) thick, 25 to 30 cm wide, and 35 to 50 cm long. Before they can be used the bricks must be "air" cured, which usually takes at least two weeks in arid climates. The addition of fibre is solely to prevent the bricks from cracking during the curing process.

Adobe walls are normally built on a solid, waterproof foundation of stone or concrete; otherwise the capillary action of groundwater may cause the lower courses to disintegrate. The bricks are laid in a mortar of the same material, then finished with a coat of adobe or with lime or cement plaster. With proper construction and maintenance, an adobe wall may last centuries.

Adobe Systems Inc., American publisher of personal computer software. Its headquarters are located in San Jose, Calif.

Adobe was founded in 1982 by John Warnock and Charles Geschke. While employed by the Xerox Corp., the two computer scientists had developed a programming language to describe the precise position, shape, and size of objects on a computer-generated page. This page description language, later known as PostScript, described letters and graphics in mathematical terms, without reference to any specific computer or printer. Warnock and Geschke formed Adobe when Xerox declined to market the technology. Along with laser printers, PostScript enabled computer users to produce professional-looking reports, flyers, and newsletters without specialized lithography equipment—a phenomenon that became known as desktop publishing.

During the 1990s company revenues increasingly came from sales of application software, initially for the Macintosh but later also for the UNIX and Windows operating systems. The first such application, introduced in 1987, was Illustrator, a PostScript-based drawing program for artists, designers, and technical illustrators. Photoshop, an application for retouching digitized photographic images, followed three years later and quickly became Adobe's most successful program. By 1997 almost 80 percent of Adobe's revenues came from application sales, and that year marked the first time that Windows-product revenues exceeded Macintosh-product revenues.

adolescence, transitional phase of growth and development between childhood and

adulthood. "Adolescence" is a convenient label for the "teen" years, the period in the life span between ages 12 and 20.

A brief treatment of adolescence follows. For full treatment, *see* MACROPAEDIA: Behaviour, The Development of Human.

In many societies adolescence is narrowly equated with puberty (*q.v.*) and the cycle of physical changes culminating in reproductive maturity. Western societies understand adolescence in terms of a broader sense of development—that is, it encompasses psychological, social, and moral terrain as well as the strictly physical aspects of maturation.

Adolescence is the period during which the individual experiences an upsurge of sexual feelings following the latency period of childhood. During this time the individual learns to control and direct his sex urges. Another issue that usually arises in adolescence is that of emotional (if not physical) separation from parents as a necessary step in the establishment of personal values. This new responsibility for self-determination and self-sufficiency forces an array of adjustments upon many adolescents. Furthermore, teenagers often have no defined role of their own in society but are caught in the ambiguous overlap between the reasonably clearly defined roles of childhood and adulthood. In a sense these issues define adolescence in Western cultures, and the response to them partly determines the nature of an individual's adult years.

Adolf, also spelled ADOLPH, name of rulers grouped below by country and indicated by the symbol ●.

Foreign-language equivalents:

Dutch Adolf

German Adolf

French Adolphe

GERMANY/HOLY ROMAN EMPIRE

● **Adolf**, also called ADOLF, COUNT (Graf) VON NASSAU (b. c. 1250—d. July 2, 1298, Göltheim, near Worms [Germany]), German king from May 5, 1292, to June 23, 1298, when he was deposed in favour of his Habsburg opponent, Albert I.

Adolf of Nassau (centre), ivory carving, 13th century; in the Germanisches Museum, Nürnberg

Archiv für Kunst und Geschichte, Berlin

Adolf, who was count of Nassau from 1277 and a mercenary soldier of repute, was chosen king at Frankfurt by the German electors, who preferred him to Albert as successor to Albert's father, Rudolf I, the first Habsburg king. After his coronation at Aachen on June 24, 1292, Adolf had to face exorbitant demands by his electors and the hostility of Albert, who as duke of Austria commanded great financial and territorial resources.

Adolf seized Meissen as a vacant fief and purchased the right of succession in Thuringia from the landgrave Albert. His alliance with King Edward I of England against France

(Aug. 24, 1294) brought him a cash subsidy, which he spent in defeating the landgrave's disinherited sons. Frederick the Dauntless and Dietzmann (Dietrich). The German electors, alarmed by Adolf's growing power, decided to transfer the crown to Albert, with whom they had been negotiating. Albert's large army was present at Mainz when the sentence of deposition was pronounced. Adolf attempted to regain the throne in battle against his rival's superior forces but was defeated and killed.

LUXEMBOURG

• **Adolf**, also called **ADOLF, DUKE** (Herzog) **VON NASSAU**, in full **ADOLF WILHELM AUGUST KARL FRIEDRICH** (b. July 24, 1817, Biebrich, Nassau [Germany]—d. Nov. 17, 1905, Hohenberg, Württemberg, Ger.), duke of Nassau from 1839 to 1867, who, as grand duke of Luxembourg from 1890 to 1905, was the first ruler of that autonomous duchy.

The son of Duke William of Nassau-Weilburg and Charlotte of Saxony, Adolf became duke of Nassau upon his father's death (1839). Educated in Vienna and a military supporter of the Habsburgs, he sided with Austria against Prussia in the Seven Weeks' War (over hegemony in German affairs); and, upon the defeat of Austria (1866), Nassau was annexed by Prussia. He formally abdicated as duke of Nassau (Sept. 9, 1867) and was granted 8,500,000 thalers and a few castles as compensation. He served as regent of Luxembourg for King William III of The Netherlands in 1889; when the male line of Orange-Nassau ended with William III's death (1890) and the personal union between Luxembourg and The Netherlands ceased, the grand duchy reverted, according to the 1783 Nassau Succession Agreement, to him as the head of the ducal house of Nassau-Weilburg. Ruling until his death, he was succeeded by his son, Grand Duke William IV.

Adolf Frederick, German **ADOLF FRIEDRICH**, Swedish **ADOLF FREDRIK** (b. May 14, 1710, Gottorp, Schleswig—d. Feb. 12, 1771, Stockholm, Swed.), king of Sweden from 1751 to 1771. He was the son of Christian Augustus (1673–1726), Duke of Schleswig-Holstein-Gottorp, and of Albertina Frederica of Baden-Durlach.

Adolf Frederick, detail from an oil painting by Lorenz Pasch the Younger, in Gripsholm Castle, Sweden

By courtesy of the Svenska Portrattarkivet, Stockholm

While Adolf Frederick was bishop of Lübeck (1727–50), he administered Holstein-Kiel (1739–45) during the minority of Duke Charles Peter Ulrich (afterward Peter III of Russia). In 1743 he was elected heir to the throne of Sweden by the "Hat" faction, which favoured a foreign policy that would regain Swedish hegemony in the Baltic. The Hats hoped by their choice to obtain better conditions of peace from the Russian empress Elizabeth, who was favourable to the house of Gottorp. He thus succeeded to the throne after the death of Frederick I (1751).

Most of the power during the new king's reign rested in the Riksdag (parliament). Twice he tried to free himself of its control: in his

first attempt (1756) he nearly lost his throne, but in his second (1768–69)—with the assistance of his son, Crown Prince Gustav—he brought about the overthrow of the generally pro-Russian and pro-Prussian "Cap" Party in the Riksdag. The victorious Hats, however, reneged on their promise to increase the king's power.

Adonai, surrogate for the name of the God of the ancient Israelites. *See* **Yahweh**.

Ādoni, city, western Andhra Pradesh state, southern India. It lies 140 miles (225 km) southwest of Hyderābād, on the Madras-Bombay railway route. Ādoni was once the stronghold for the rulers of the medieval Hindu kingdom of Vijayanagar. Muslims later controlled it until 1792, when a war between the British East India Company and Tippu Sultan resulted in its cession to the nizām of Hyderābād. A magnificent mosque (Jāmi' Masjid) was built there in 1680. Ādoni now manufactures cotton cloth and carpets. Pop. (1991 prelim.) 135,718.

Adonias Filho, in full **ADONIAS AGUIAR FILHO** (b. Nov. 27, 1915, Itajuípe, Brazil—d. Aug. 2, 1990, Ilhéus), novelist, essayist, journalist, and literary critic whose works of fiction embrace universal themes within the provincial setting of Brazil's rural northeast.

His literary career began in the early 1930s under the aegis of the Neo-Catholic writers' group (Tasso da Silveira and Andrade Murici, among others) of Rio de Janeiro. Until the late 1940s he dedicated his energies principally to journalism in periodicals such as *O Correio da Manhã* and the *Revista do Brasil*. He subsequently established a column of literary criticism in the *Jornal de Letras* and began to publish translations of English-language fiction (notably the works of Graham Greene, Virginia Woolf, and William Faulkner).

For a time in the 1950s Adonias Filho served as director of the National Book Institute and worked in the National Theatrical Service. He subsequently became director of the National Library and was elected to the Brazilian Academy of Letters in 1965. In 1972 he was elected president of the Brazilian Press Association.

His career as a writer of fiction was launched in the 1940s with the publication of *Os Servos da Morte* (1946; "The Servants of Death"), the first of three novels depicting life in the cacao-growing region of northeastern Brazil. *Memórias de Lázaro* (1952; *Memories of Lazarus*) and *O Forte* (1965; "The Strong Man") complete the trilogy. In 1962 he published the novel *Corpo Vivo* ("Living Body"), which maintains the dreamlike ambience that characterizes the trilogy.

Adonis, in Greek mythology, a youth of remarkable beauty, the favourite of the goddess Aphrodite. Traditionally, he was the product of the incestuous love Smyrna (Myrrha) entertained for her own father, the Syrian king Theias. Charmed by his beauty, Aphrodite put the newborn infant Adonis in a box and handed him over to the care of Persephone, the queen of the underworld, who afterward refused to give him up. An appeal was made to Zeus, the king of the gods, who decided that Adonis should spend a third of the year with Persephone and a third with Aphrodite, the remaining third being at his own disposal. Adonis became an enthusiastic hunter, and was killed by a wild boar during the chase. Aphrodite pleaded for his life with Zeus, who allowed Adonis to spend half of each year with her and half in the underworld.

The central idea of the myth is that of the death and resurrection of Adonis, which represent the decay of nature every winter and

its revival in spring. He is thus viewed by modern scholars as having originated as an ancient spirit of vegetation. Annual festivals called Adonia were held at Byblos and else-

"Venus and Adonis," oil painting by Titian, 16th century, showing Aphrodite (Roman: Venus) and Adonis; in the National Gallery of Art, Washington, D.C.

where to commemorate Adonis for the purpose of promoting the growth of vegetation and the falling of rain. The name Adonis is believed to be of Phoenician origin (from *adon*, "lord"), Adonis himself being identified with the Babylonian god Tammuz.

adoption, the act of establishing a person as parent to one who is not in fact or in law his child. Adoption is so widely recognized that it can be characterized as an almost worldwide institution with historical roots traceable into antiquity.

In most ancient civilizations and in certain later cultures as well, the purposes served by adoption differed substantially from those emphasized in modern times. Continuity of the male line in a particular family was the main goal of these ancient adoptions. The importance of the male heir stemmed from political, religious, or economic considerations, depending on the culture. The person adopted invariably was male and often adult. In addition, the welfare of the adopter in this world and the next was the primary concern; little attention was paid to the welfare of the one adopted.

In contrast, contemporary laws and practices aim to promote child welfare and are regarded as one facet of the state's general program to protect its young. Although the desire to continue a family line or to secure rights to inheritance are still among the personal motives for adoption, society's interest now centres more on the creation of a parent-child relationship between a married couple and a young child. This attitude developed primarily in the period following World War I, when vast numbers of children were orphaned, and the number of illegitimate births increased. The desirability of adoption was further emphasized by developments in psychology and sociology that stressed the influence on child development of a stable family life. In the latter part of the 20th century, a decline in the number of children available for legal adoption stimulated changes in traditional restrictions on adult-child age differential, level of income, the mother's employment outside the home, and placements across religious and ethnic lines. Single-parent adoptions were accepted by a number of agencies.

Although adoption of adults is permitted in most countries, the legal provisions are generally formulated in terms of child adoption, and the adopter must usually be an adult. The laws typically provide for the consent of any older child (commonly one over 12 or 14 years), an investigation of the suitability of the

prospective home according to criteria stated in the governing statute, and a probationary period of residence in the adoptive home.

In the matter of inheritance, laws differ considerably. As a general rule, the child may inherit from the adopting parents and they from him. Inheritance by the child from his natural parents, once commonplace, is increasingly prohibited, with the exception of adoption by stepparents. In addition, there has been a tendency to broaden the child's right to inherit from relatives of the adopting parents, although great variation appears among laws on this point.

Adoptionism, either of two Christian heresies: one developed in the 2nd and 3rd centuries and is also known as Dynamic Monarchianism (see Monarchianism); the other began in the 8th century in Spain and was concerned with the teaching of Elipandus, archbishop of Toledo. Wishing to distinguish in Christ the operations of each of his natures, human and divine, Elipandus referred to Christ in his humanity as "adopted son" in contradistinction to Christ in his divinity, who is the Son of God by nature. The son of Mary, assumed by the Word, thus was not the Son of God by nature but only by adoption.

Opposition to this view of Christ was expressed, which led Pope Adrian I to intervene and condemn the teaching. Elipandus gained the support of Felix, bishop of Urgel, who eventually engaged in a literary duel with Alcuin of York over the doctrine.

In 798 Pope Leo III held a council in Rome that condemned the "Adoptionism" of Felix and anathematized him. Felix was forced to recant in 799 and was placed under surveillance. Elipandus remained unrepentant, however, and continued as archbishop of Toledo, but the Adoptionist view was almost universally abandoned after his death. It was temporarily revived in the 12th century in the teachings of Peter Abelard and his followers.

Adorno FAMILY, Genoese family prominent in the politics of that city's "popular" (democratic) dogeship (1339-1528), when the old aristocracy was exiled and new families seized power. Branches of the family became prominent in Flanders and Spain.

They acceded to real power in the 14th century when a revolution ended the rule of the old nobility in Genoa and eventually inaugurated that of two families, the Adorno and the Fregoso, who contended for the office of doge for a century and a half. The Adorno contributed six doges to the Republic of Genoa. Gabriele, elected in 1363, served for seven years, was named imperial vicar by the Holy Roman emperor Charles IV in 1368, and was driven from power two years later by an uprising led by Domenico Fregoso. Eight years later the Adorno returned to office with Antoniotto I (d. 1397), who was alternately ousted and reinstated until he was elected doge by a large majority in 1394. Rising factional strife, however, forced him to turn the city over to King Charles VI of France.

Another Adorno doge, Agostino (served 1487-99), a faithful supporter of the Sforza dukes of Milan, relinquished his office when Louis XII of France conquered Milan. His son Antoniotto II came to power during the stormy early 16th century, ruling the city briefly in 1513 as vicar of the king of France, later transferring his allegiance to Spain, and becoming doge in 1522, when the marchese di Pescara took Genoa for the Holy Roman emperor Charles V. Antoniotto's five-year rule ended in 1527, when Genoa was conquered by Andrea Doria for Francis I of France. Antoniotto retired to Milan, while Doria quarreled with the French king and recaptured Genoa for Charles V.

A line of the Adorno in Flanders, founded by Obizzo (d. 1307), a crusader in the forces of Comte Guy de Dampierre, established itself in Bruges. Pietro (d. 1409) served as treasurer of the commune of Bruges, and his sons Giacomo and Pietro established in Bruges in 1428 the Church of Jerusalem, a replica of the Church of the Holy Sepulchre in Jerusalem. In Spain another branch of the family produced many soldiers and admirals.

In 1463 Giuliano Adorno married Caterina Fieschi (d. 1510), a member of another famous Genoese family, who was canonized in 1737 as St. Catherine of Genoa.

Adorno, Theodor Wiesengrund (b. Sept. 11, 1903, Frankfurt am Main, Ger.—d. Aug. 6, 1969, Visp, Switz.), German philosopher who also wrote on sociology, psychology, and musicology.

Adorno obtained a degree in philosophy from Johann Wolfgang Goethe University in Frankfurt in 1924. His early writings, which emphasize aesthetic development as important to historical evolution, reflect the influence of Walter Benjamin's application of Marxism to cultural criticism. After teaching two years at the University of Frankfurt, Adorno immigrated to England in 1934 to escape the Nazi persecution of the Jews. He taught at the University of Oxford for three years and then went to the United States (1938), where he worked at Princeton (1938-41) and then was codirector of the Research Project on Social Discrimination at the University of California, Berkeley (1941-48). Adorno and his colleague Max Horkheimer returned to the University of Frankfurt in 1949. There they rebuilt the Institute for Social Research and revived the Frankfurt school of critical theory, which contributed to the German intellectual revival after World War II.

One of Adorno's themes was civilization's tendency to self-destruction, as evinced by Fascism. In their widely influential book *Dialektik der Aufklärung* (1947; *Dialectic of Enlightenment*), Adorno and Horkheimer located this impulse in the concept of reason itself, which the Enlightenment and modern scientific thought had transformed into an irrational force that had come to dominate not only nature but humanity itself. The rationalization of human society had ultimately led to Fascism and other totalitarian regimes that represented a complete negation of human freedom. Adorno concluded that rationalism offers little hope for human emancipation, which might come instead from art and the prospects it offers for preserving individual autonomy and happiness. Adorno's other major publications are *Philosophie der neuen Musik* (1949; *Philosophy of Modern Music*), *The Authoritarian Personality* (1950, with others), *Negative Dialektik* (1966; *Negative Dialectics*), and *Ästhetische Theorie* (1970; "Aesthetic Theory").

Adour River, river in southwestern France. The Adour River rises in the central Pyrenees near Tourmalet Pass, just south of Midi de Bigorre Peak, and flows in a curve, north, then west, to enter the Bay of Biscay just below Bayonne after a course of 208 miles (335 km). Draining a basin of 5,800 square miles (15,000 square km), it traverses the scenic Campan Valley and, after passing Bagnères-de-Bigorre, crosses the Tarbes plain. Beyond Tarbes the river feeds many irrigation canals, the most important of which is the Canal d'Alaric, which follows the right bank. Within Landes *département* the Adour flows west and southwest and is joined on the left by the Larcis, Gabas, Louts, Luy, and Gave de Pau and on the right by the Midouze. The Adour, which is navigable upstream to Dax, enters the bay through an estuary made hazardous by a shifting sandbar.

Adowa (Ethiopia): see Adwa.

Adowa, Battle of, Adowa also spelled ADWA, Italian ADUA (March 1, 1896), military clash at Adowa (Adwa), in north-central Ethiopia, between the Ethiopian army of King Menilek II and Italian forces. The decisive Ethiopian victory checked Italy's attempt to build an empire in Africa comparable to that of the French or the British.

The death (in 1889) of the Ethiopian emperor Yohannes IV was followed by great disorder, during which the Italians helped Menilek of Shewa (Shoa) win the throne. Furthermore, the Treaty of Ucciali (Wichale), which Italy had signed with Menilek in 1889, was interpreted by the Italian premier Francesco Crispi as implying the declaration of an Italian protectorate over Ethiopia. Accordingly, the Italian possessions in Africa were constituted (January 1890) as Colonia Eritrea.

Menilek first repudiated in September 1890 the ambiguous Article XVII of the treaty and then, in September 1893, repudiated the treaty altogether, afterward preparing to combat the Italians' attempt to impose their dominion militarily. Italian victories at the beginning of the campaign were brilliant but fruitless, and at the end of 1895 large Ethiopian armies were threatening the Italian outposts. The Italian governor of Eritrea, General Oreste Baratieri, sighted Menilek's forces on Feb. 7, 1896, but remained inactive. On February 28 Crispi sent Baratieri a furious telegram to try to goad him into action. Desperate to retrieve his position, Baratieri advanced to Adowa with 14,500 men against an Ethiopian army of some 100,000; the Italian columns, moreover, were disorganized and lacked adequate maps of the area. Humiliatingly routed on March 1 by Menilek's forces, the Italians retreated through difficult terrain, harassed by a hostile population. As much as 70 percent of the Italian force was killed, wounded, or captured.

The Treaty of Addis Ababa, signed in October 1896, abrogated the Treaty of Ucciali and reestablished peace, and Italy recognized the independence of Ethiopia. The Italian claim to a protectorate over all Ethiopia was thereafter abandoned; and the Italian colony of Eritrea, finally delimited by a treaty of peace (September 1900), was reduced to a territory of about 80,000 square miles (200,000 square km).

Adrano, formerly (until 1929) ADERNÒ, town, Catania *provincia*, eastern Sicily, Italy. It lies near the Simeto River on a lava plateau on the western slopes of Mount Etna, northwest of Catania city. It originated as the ancient town of Hadranon, founded about 400 BC by Dionysius the Elder, tyrant of Syracuse, near a sanctuary dedicated to the Siculan god Adranus (Hadranus). Conquered in 263 BC by the Romans, who called it Adranum (Hadranum), it belonged in the Middle Ages to Count Roger I of Sicily. The Holy Roman emperor Frederick II made it a countship, and it was held from 1549 to 1812 by the Moncada, princes of Paternò. In 1929 it resumed the classical name, which had been corrupted to Adermò. There are ruins of Greek walls and ancient burial grounds. The Norman castle (rebuilt in the 13th century) and the former monastery of Santa Lucia (founded in 1157 by Roger I) are also notable. Citrus fruits and grapes are cultivated locally, and honey is produced. Pop. (1993 est.) mun., 34,097.

Adrar, formerly TIMMI, palm grove settlement, the largest of the Touat oasis group, southwestern Algeria, in the Sahara. The settlement lies between the Erg (sand dunes) Chech and the Grand Erg Occidental near the streambed of the Wadi Messaoud. The Adrar area was historically a strategic point on the trade route between North and West Africa. The settlement's distinctive thick-walled red-wash architecture is characterized by sawtooth crenellation.

The French captured Adrar from Moroccan forces in 1900, and in 1962 it became part of

independent Algeria. The contemporary town is entered through a monumental gateway and has two main squares and rectangular avenues. The surrounding region consists almost entirely of sand-dune-covered plains. Nearly all of the region's inhabitants live in the vicinity of the Touat oases group, although palm-grove settlements are strung out along the Wadi Messaoud. Pop. (1987 prelim.) mun., 28,495.

Adrar, traditional region of central Mauritania in western Africa. It consists of a low central massif with noticeable cliffs that rise to about 800 feet (240 m). The terrain is arid and almost totally unsuitable for cropping. There is, however, sufficient water at the base of the uplands to support date-palm groves, and during the wetter part of the year there is cultivation of millet, sorghum, melons, and vegetables in gorges. The population of the Adrar (Berber for "mountain") formerly was nomadic. The major town in the region is Atar. Historic sites include Oquadane, formerly a caravan and gold-trading centre, and Chinguetti, an ancient centre of learning and of Islam.

adrenal cortical insufficiency: *see* Addison's disease.

adrenal gland, also called SUPRARENAL GLAND, either of two small and virtually identical triangular endocrine glands, one at the upper end of each kidney.

For a depiction of the adrenal glands in human anatomy, shown in relation to other parts of the body, *see* the colour Trans-Vision in the PROPAEDIA: Part Four, Section 421.

The adrenal glands show considerable species variation in size, shape, and nerve supply. In humans each gland averages a weight of about 4.5 g (0.16 ounce) and measures about 25 mm (1 inch) wide, 50 mm (2 inches) long, and 5 mm (0.2 inch) thick. Each gland consists of two parts: an inner medulla, which produces epinephrine and norepinephrine (*q.v.*), and an outer cortex, which secretes steroid hormones. The two parts are completely different in embryological origin, structure, and function. In almost all other vertebrates, the cells of the two parts are to varying degrees interspersed.

In the adult human the outer cortex comprises about 90 percent of the gland. The cortex is made up of three structurally different concentric zones. From the outermost inward, they are zona glomerulosa, zona fasciculata, and zona reticularis. The zona glomerulosa is principally responsible for the secretion of aldosterone. Aldosterone maintains the concentration of sodium, potassium, and chloride in the blood within the narrow limits essential for life.

The inner two zones—fasciculata and reticularis—operate almost as a physiological unit and are controlled by the adrenocorticotropic hormone, secreted by the pituitary gland (*q.v.*). Their principal function is the secretion of cortisol and of some adrenal androgens, or male hormones. Cortisol has two primary roles: (1) gluconeogenesis—*i.e.*, the breakdown of protein to form glucose—and (2) an anti-inflammatory action. It also exerts a potent antiallergic action. Thus cortisol can reduce disease manifestations without having any direct effect on the causative agent.

The medulla of the adrenal gland is made up of columnar cells that secrete epinephrine and norepinephrine. These hormones belong to a class of chemicals called catecholamines, which are darkened when oxidized by potassium dichromate. The medulla, therefore, is frequently referred to as chromaffin tissue.

Diseases of the adrenal glands may be divided into those of the cortex and those of the medulla. The only known disease of the medulla is a tumour (pheochromocytoma; *q.v.*) that results in secretion of excessive quantities of epinephrine and norepinephrine.

Symptoms are periodic episodes of high blood pressure, palpitation of the heart, sweats, pounding headaches, anxiety, nausea, and vomiting. The symptoms can be successfully treated with medication.

Diseases of the cortex may be manifested as hyperfunction (excessive secretion of adrenocortical hormones) or hypofunction (insufficient secretion of such hormones). The latter is known as Addison's disease (*q.v.*).

Adrenocortical hyperactivity may be congenital or acquired; the former always is due to hypertrophy, or enlargement, of both adrenal glands, the latter to either tumour or hypertrophy. Congenital adrenal hypertrophy in the female infant results in masculinization with pseudohermaphroditism; in the male, virilism or sexual precocity occurs.

Acquired adrenocortical hyperfunction is manifested by Cushing's syndrome or the adrenogenital syndrome (*qq.v.*), or both. Cushing's syndrome is characterized by obesity, rounding of the face, amenorrhea, high blood pressure, diabetes, osteoporosis, thinning and easy bruising of the skin, weakness, and often mental disturbances. The adrenogenital syndrome consists of virilizing manifestations in the female and sexual precocity in the preadolescent male.

The treatment for adrenal tumour is surgical removal of the affected adrenal gland. The forms of therapy available for acquired nontumorous adrenal hyperfunction with Cushing's syndrome are: (1) irradiation of the pituitary, (2) pituitary irradiation and removal of one adrenal gland, (3) removal of most of the adrenals, (4) total removal of the adrenals, and (5) removal of the pituitary. If both adrenals are removed, the patient must thereafter be maintained on controlled dosages of synthetic cortisol-like and related adrenal steroids.

Primary aldosteronism (*i.e.*, the production of excess aldosterone) is a selective form of adrenocortical hyperfunction, usually due to a tumour. The syndrome is characterized by (1) hypertension, (2) reduction in the serum potassium level, (3) an increase in the carbon dioxide content of the blood, (4) evidence of renal damage, (5) an increase in the urinary excretion of potassium, and (6) a considerable increase in the urinary excretion of aldosterone. The clinical manifestations often include tetany, muscle weakness, and passage of large amounts of urine. Successful removal of the adrenal tumour generally results in a reversal of the symptoms. *See also* endocrine system.

adrenaline and noradrenaline: *see* epinephrine and norepinephrine.

adrenergic drug, any of various drugs that interfere with the functioning of the sympathetic nervous system by affecting the release or action of norepinephrine and epinephrine. The former are hormones, secreted by the adrenal gland, that constrict blood vessels (thus increasing blood pressure) and accelerate the rate and force of contractions of the heart.

Adrenergic drugs that stimulate the release or activity of norepinephrine or that mimic its effects are termed sympathomimetic agents. Among the sympathomimetic drugs are the amphetamines and ephedrine. Because these drugs raise the blood pressure and increase the heart rate, they are useful in treating systemic trauma, including bronchial asthma, shock, and cardiac arrest. They are also used to effect nasal decongestion and appetite suppression and to relieve allergic disorders.

Drugs that block or inhibit the release or activity of norepinephrine are known as adrenergic blocking agents. These drugs dilate blood vessels (thus lowering blood pressure) and slow the heart rate. They are very useful in treating hypertension, angina, and heart dysrhythmias. Among the adrenergic blocking agents are phenoxybenzamine, propranolol, and prazosin.

adrenergic nerve fibre, nerve fibre that releases the neurotransmitter norepinephrine at the synapse, or junction, between a nerve and its end organ, which may be a muscle, gland, or another nerve. Such fibres make up the sympathetic nervous system, one of two peripheral nervous systems controlling involuntary activities, such as digestion, respiration, and circulation.

Adrenergic fibres innervate smooth muscle, cardiac muscle, visceral glands, and various central nervous system structures and sense organs; their stimulating action on these organs is opposite to the inhibiting action of the cholinergic fibres of the parasympathetic system. Peripheral adrenergic neurons (nerve cells) integrate signals from other nerves of the central nervous system and peripheral sense organs; an adrenergic nerve impulse is triggered when one nerve fires repeatedly or when several nerves fire simultaneously.

adrenocorticotropic hormone (ACTH), also called CORTICOTROPIN, a polypeptide hormone formed in the pituitary gland that regulates the activity of the outer region (cortex) of the adrenal glands. In mammals the action of ACTH is limited to those areas of the adrenal cortex in which the glucocorticoid hormones—cortisol and corticosterone (*see* corticoid)—are formed. The secretion of ACTH by the pituitary is itself regulated by another polypeptide, a so-called corticotropin-releasing hormone (CRH), that is discharged from the hypothalamus in response to impulses transmitted by the nervous system.

adrenogenital syndrome, a complex of symptoms resulting from an excessive secretion of androgenic 17-ketosteroids by the adrenal cortex. (These androgenic hormones further the development of masculine secondary sexual characteristics—the growth of body hair, deepening of the voice, development of male body build, and so on.) The adrenogenital syndromes of infancy and childhood are caused by genetically determined deficiencies in the synthesis of cortisol by the adrenal glands, with a resulting excess of androgen production by those glands. The impending or actual shortage of cortisol triggers an increased secretion of adrenocorticotropic hormone (ACTH) by the pituitary gland, which in turn increases cortisol production by the adrenals back to normal but also simultaneously raises above normal the adrenals' production of androgens (*i.e.*, the androgenic 17-ketosteroids).

In infantile adrenogenital syndromes, simple virilism (the development of masculine secondary sexual characteristics in the female or their precocious development in the preadolescent male) is the chief result. The syndrome may produce malelike genital changes (pseudohermaphroditism) in females and excessive penile development with small testes in males. A deep melanin skin pigmentation is usually present, and there may also be an abnormal loss of sodium, severe hypertension, lipid hyperplasia, dehydrogenase deficiency, or altered levels of steroid hormone production in general.

In adults the adrenogenital syndrome, since it causes masculinization, may be relatively unnoticed in the male, but it brings about virilism in the female. She develops a male body build, receding hairline, facial and body hair, atrophic breasts, acne, enlargement of the clitoris, and an irreversible deepening of the voice. Menstruation and ovulation cease, and there is a heavy masculine musculature.

Adret, Solomon ben Abraham, Hebrew RABBI SHLOMO BEN ABRAHAM ADRET, acronym RASHBA (b. 1235, Barcelona, Spain—d. 1310, Barcelona), outstanding spiritual

leader of Spanish Jewry of his time (known as El Rab de España [the Rabbi of Spain]); he is remembered partly for his controversial decree of 1305 threatening to excommunicate all Jews less than 25 years old (except medical students) who studied philosophy or science.

As a leading scholar of the Talmud, the rabbinical compendium of law, lore, and commentary, Adret received inquiries on Jewish law from all over Europe, and more than 3,000 of his responsa (replies) still remain. Besides providing cultural data on Adret's time, his responsa strongly influenced the later development of authoritative codes of Jewish law, such as the *Shulhan 'arukh* ("The Well-Laid Table") of the codifier Joseph Karo (1488–1575). Adret's many other writings include commentaries on the Talmud and polemics defending it against attacks by non-Jews.

Late in life, Adret became embroiled in a quarrel between the followers of the medieval Jewish philosopher Maimonides and the members of a conservative, antirationalist movement led by a zealot known as Astruc of Lunel, who believed that the followers of Maimonides were undermining the Jewish faith by, for example, interpreting the Bible allegorically. It was Astruc who induced Adret to issue his famous decree against the study of philosophy and science. Although the ban itself did not bring about an end to such studies, it precipitated among Jews in Spain and southern France a bitter controversy that continued during Adret's last years.

Adrets, François de Beaumont, baron des (b. 1512/13, Château of La Frette, Isère, Fr.—d. Feb. 2, 1587, La Frette), French military leader of the Wars of Religion, notorious for his cruelty.

During the reign of Henry II of France, Adrets served with distinction in the royal army and became colonel of the "legions" of Dauphiné, Provence, and Languedoc. In 1562, however, he joined the Huguenots, probably from motives of ambition and personal dislike of the Roman Catholic house of Guise. His campaign against the Roman Catholics in 1562 was eminently successful. In June of that year Adrets was master of the greater part of Dauphiné. But his brilliant military qualities were marred by his atrocities. He exacted fierce reprisals on the Roman Catholics after their massacres of the Huguenots at Orange. The garrisons that resisted him were butchered, and at Montbrison, in Forez, he forced 18 prisoners to precipitate themselves from the top of the keep.

Having alienated the affections of the Huguenots by his pride and violence, Adrets entered into communication with the Roman Catholics and declared himself openly in favour of conciliation. On Jan. 10, 1563, he was arrested on suspicion by some Huguenot officers and confined in the citadel of Nîmes. He was liberated at the Edict of Amboise in the following March and, distrusted alike by Huguenots and Roman Catholics, retired to the Château of La Frette, where he died, a Roman Catholic, 23 years later.

Adria, Latin *ATRIA*, or *HADRIA*, town and episcopal see of *Rovigo provincia*, in the Veneto regione of northern Italy, on the Bianco Canal just east of Rovigo. Founded by the Etruscans or the Veneti of northeastern Italy, it later became a Roman town and was a flourishing port on the Adriatic Sea (to which it gave its name) until the silting up of the Po and Adige deltas caused the sea (now 13.5 miles [22 km] east) to recede from the town. It has a fine museum of antiques and an 18th-century cathedral. It is now an agricultural and commercial centre of the Polesine (delta district), with diversified manufactures. Pop. (1988 est.) mun., 21,397.

Adrian (Roman emperor): *see* Hadrian.

Adrian, also spelled *HADRIAN*, Latin *ADRIANUS*, or *HADRIANUS*, name of Roman Catholic popes, grouped below chronologically and indicated by the symbol •.

• **Adrian I** (b. Rome [Italy]—d. Dec. 25, 795), pope from 772 to 795 whose relationship with the emperor Charlemagne symbolized the medieval ideal of union of church and state in a united Christendom.

Having been born an aristocrat and having served Popes Paul I and Stephen III (IV), he was elected pope on February 1 with the support of the Frankish party at Rome. As pope, Adrian invoked Frankish aid against the Lombard king Desiderius, who had attacked the papal possessions and was threatening Rome. By Easter 774, Charlemagne was in Rome, having destroyed the Lombard kingdom. Thenceforth, Adrian's policies were determined by the Frankish alliance rather than by relations with the Byzantine emperors of Constantinople.

The relationship between Charlemagne and Adrian was characterized by amicable rivalry. Charlemagne used the church to hold his empire together and to enforce overlordship on the Papal States, while Adrian fought firmly but adroitly for ecclesiastical autonomy and painstakingly pieced together a papal domain that was not lost until the 19th century.

Adrian strongly opposed Adoptionism, the doctrine of the dual sonship of Christ, and condemned the teachings of Archbishop Elipandus of Toledo, Spain. Constantinople was conciliated by Adrian's cooperation in opposing the Iconoclasts in the second Council (787) of Nicaea. Adrian confirmed the council's decrees, but, partly because of faulty translation, they were attacked by Charlemagne. Despite their difference of opinion, the rulers remained in rapport. Charlemagne commemorated Adrian in an epitaph composed by the scholar Alcuin and preserved at St. Peter's in Rome.

• **Adrian II** (b. 792, Rome [Italy]—d. Dec. 14, 872), pope from 867 to 872.

A relative of two previous popes, Stephen V and Sergius II, he was elected on December 14. Under his vigorous predecessor, St. Nicholas I, the papacy had reached a high point that Adrian could not maintain. Vacillatory and lacking continuity, he was snubbed by Charles II the Bald, king of France. He readmitted King Lothair II of Lorraine to communion, but Lothair's early death (869) created a difficult problem of succession in which Adrian ineffectually intervened. Adrian also had difficulties with the powerful Archbishop Hincmar of Reims, Fr., by steadfastly upholding the unlimited right of bishops to appeal to the pope.

Adrian II, detail from a fresco, 11th century; in the lower Basilica of San Clemente, Rome

Alinari—Art Resource/EB Inc

Adrian approved the use of the Slavic language in liturgy by Saints Cyril and Methodius. By making Methodius archbishop of Sirmium, Adrian won the Moravians' faithfulness.

Adrian's legates took part in the eighth ecumenical council and the fourth Council of Constantinople (869–870), which deposed the Byzantine patriarch Photius. For the sake of reuniting East with West, Adrian accepted the council's 21st canon, which gave the patriarch of Constantinople rank second to that of the Roman see. He refused, however, to sanction the transfer of the Bulgarians to the patriarchate of Constantinople, and Bulgaria was lost to the Roman Catholic church during Adrian's pontificate.

• **Adrian III**, SAINT (b. Rome?—d. c. September 885, near Modena, Bishopric of Modena [Italy]; canonized June 2, 1891; feast day July 8), pope from 884 to 885.

Adrian's brief pontificate came during troubled times. He died en route to the Diet of Worms after being summoned by the Frankish king Charles III the Fat to settle the succession to the empire and discuss the rising Saracen power. The motives for his veneration are practically unknown, but he was noted for having aided the Romans during a famine.

• **Adrian IV**, original name *NICHOLAS BREAKSPEAR* (b. 1100?, Abbot's Langley, near St. Albans, Hertfordshire, Eng.—d. Sept. 1, 1159, Anagni, near Rome [Italy]), the only Englishman to occupy the papal throne (1154–59).

He became a canon regular of St. Ruf near Avignon, Fr., and in about 1150 Pope Eugenius III appointed him cardinal bishop of Albano, Italy. Eugenius sent him in 1152 as legate to Scandinavia, where his mission to reorganize the hierarchy was so successful that on his return in 1154 he was elected pope (December 4). Adrian crowned Frederick I Barbarossa as Holy Roman emperor in 1155, after Frederick had captured and handed over to him Arnold of Brescia, who had led a revolt in Rome.

The papal policy toward the Normans of southern Italy, however, aroused the emperor's anger. Thereafter, the relations between Adrian and Frederick laid the groundwork for the struggle to come between Pope Alexander III and Frederick. Adrian refused to recognize William I the Bad, who had been crowned king of Sicily (1154). That step caused the Sicilians, after unsuccessfully attacking the papal possession of Benevento, to wage war in the southern Campania. Thereupon the pope excommunicated William.

Adrian then marched to Benevento, during which time he received John of Salisbury, secretary to the archbishop of Canterbury, and granted him the Donation of Ireland (known as the bull *Laudabiliter*), which supposedly gave Ireland to Henry II of England. Attacked for false representation, the bull was subsequently refuted. (Even if *Laudabiliter* is authentic, which is doubtful, it does not grant hereditary possession of Ireland to the English king.)

Meanwhile, in June 1156, peace was made with the Sicilians, and Adrian agreed to invest William, who in turn became the pope's liege man, which further embittered Frederick.

• **Adrian V**, original name *OTTOBONO FIESCHI*, (b. Genoa [Italy]—d. Aug. 18, 1276, Viterbo, Papal States [Italy]), pope for about five weeks in 1276.

His uncle Pope Innocent IV appointed him cardinal. He was legate to England (1265–68), charged with establishing peace between the English king Henry III and the rebellious barons. Elected as successor to Innocent V on July 11, he died a little more than a month later, having, however, revoked the stern conclave regulations of Pope Gregory X. Dante in his *Purgatory* (XIX, 97–126) portrays him

Adrian V, detail from a tomb monument by Vassalletto Iacopo, 1276; in the church of St. Francis, Viterbo, Italy

Ainan—Art Resource

as lamenting his avarice and acknowledging "how the great mantle weighs" and "so justice here holds us close."

• **Adrian VI**, original name ADRIAN FLORENZ-
SZOON BOEYENS (b. March 2, 1459, Utrecht,
Bishopric of Utrecht—d. Sept. 14, 1523,
Rome), the only Dutch pope, elected in 1522.
He was the last non-Italian pope until the
election of John Paul II in 1978.

He studied at the University of Louvain,
where he was ordained priest and became,
successively, professor of theology, chancellor,
and rector. The great Humanist Erasmus was
one of his pupils. In 1507 the Holy Roman
emperor Maximilian I appointed Adrian tutor
of his grandson Charles (later Holy Roman
emperor as Charles V), who afterward en-
trusted him to perform many of the highest
offices.

Adrian VI, Flemish commemorative medallion, 16th century

By courtesy of the National Gallery of Art Washington D.C. the Samuel H. Kress Collection

He became bishop of Tortosa in 1516 and
grand inquisitor of Aragon (1517) and Castile
(1518); he was created cardinal in 1517. He
was elected pope on January 9, 1522, and was
crowned at Rome on August 31. Adrian took
up the task of reforming the church with great
earnestness, starting with the Curia, but could
accomplish little in the face of opposition by
the Italian cardinals, the German Protestants,
and the Turkish armies.

Adrian, city, seat (1826) of Lenawee county,
southeastern Michigan, U.S., on the Raisin
River. Addison J. Comstock settled the site in
1826 as Logan and renamed it in 1828 for the
Roman emperor Hadrian (the *H* was dropped
in 1838). He built the Erie and Kalamazoo
Railroad (1832–36, the first west of New York
State) connecting Adrian and Toledo, Ohio
(34 mi [55 km] southeast); its cars were horse
drawn until replaced by a locomotive in 1837.
An agricultural centre, the city has acquired
some light industry (notably the manufacture
of auto parts and aluminum, paper, and wood
products). Adrian College was founded in
1845, and Siena Heights College in 1919. Inc.
village, 1836; city, 1853. Pop. (1990) 22,097.

Adrian (of Cambridge), Edgar Douglas
Adrian, 1st Baron (b. Nov. 30, 1889, Lon-
don—d. Aug. 4, 1977, London), electrophysi-

ologist who with Sir Charles Sherrington won
the Nobel Prize for Physiology or Medicine in
1932 for discoveries regarding the nerve cell.
Adrian graduated in medicine in 1915 from
Trinity College, Cambridge. After medical ser-
vice during World War I, he spent the greater
part of his professional life at Cambridge in
research and teaching, and as master of Trin-
ity College (1961–65) and chancellor of the
University (1968–75).

Adrian researched nerve impulses from sense
organs, amplifying variations in electrical po-
tential and recording smaller potential changes
than had been detectable previously. Later he
recorded nerve impulses from single sensory
endings and motor nerve fibres, measurements
contributing to a better understanding of the
physical basis of sensation and the mechanism
of muscular control. After 1934 Adrian stud-
ied the electrical activity of the brain; his work
on the variations and abnormalities of the
changes known as the Berger rhythm opened
new fields of investigation in epilepsy and in
the location of cerebral lesions.

Lord Adrian, 1956

Keystone

He was president of the Royal Society (1950–
55) and of the British Association for the Ad-
vancement of Science (1954). In 1942 he was
awarded the Order of Merit and in 1955 a
barony. Among his writings are *The Basis of
Sensation* (1927), *The Mechanism of Nervous
Action* (1932), and *The Physical Background
of Perception* (1947).

Adrianople (Turkey): see Edirne.

Adrianople, Battle of, Adrianople also
spelled HADRIANOPOLIS (Aug. 9, AD 378),
battle fought at present Edirne, in European
Turkey, resulting in the defeat of a Roman
army commanded by the emperor Valens at
the hands of the Germanic Visigoths led by
Fritigern and augmented by Ostrogothic and
other reinforcements. It was a major victory of
barbarian horsemen over Roman infantry and
marked the beginning of serious Germanic in-
roads into Roman territory.

The Goths annihilated the Roman army; by
some accounts, the Romans lost 40,000 men.
Valens, who had failed to await reinforcements
from Gratian, his nephew and co-emperor,
was killed on the battlefield. An accommoda-
tion (382) was reached with the Goths by
Theodosius I, Valens' successor as Eastern co-
emperor, whereby the Goths agreed to aid in
the imperial defenses in exchange for annual
food subsidies, establishing a pattern for later
barbarian intrusions into the empire.

Adrianople, Treaty of (1829): see Edirne,
Treaty of.

Adriatic Sea, Italian MARE ADRIATICO, arm
of the Mediterranean Sea, lying between the
Italian and Balkan peninsulas. The Strait of
Otranto at its southeasterly limit links it with
the Ionian Sea. It is about 500 mi (800 km)
long with an average width of 100 mi, a max-
imum depth of 4,035 ft (1,324 m), and an
area of 50,590 sq mi (131,050 sq km). The
Adriatic has been of great importance in the
historical development of Mediterranean Eu-

rope and is of considerable scientific interest
in itself. Modern study of the Adriatic has
been carried out mainly under the auspices of
several Italian and Balkan scientific institutes.

There is a striking contrast between its two
shores. The Italian coast is relatively straight
and continuous, having no islands, whereas
the Balkan coast is full of both large and small
islands, generally oblong in shape and running
parallel to the continental shore. Many tortu-
ous straits also form inlets between the islands
similar to those of the Norwegian fjords and
make the coastline very intricate.

The depths of the Adriatic near its shores
bear a close relationship to the physiography of
the adjacent coasts. Wherever such coasts are
high and mountainous, the nearby sea depths
are considerable, as in the case of the Istrian
and Dalmatian areas of Slovenia and Croatia.
Where low and sandy shores are found, the
nearby sea is shallow, as in the vicinity of
Venice or, farther south, near the delta of the
Italian Po River. Generally speaking, the wa-
ters are shallow all along the Italian coast. The
site of maximum depth of the Adriatic Sea
is situated south of the central area; average
depth is 1,457 ft (444 m).

The Adriatic has two types of rather spe-
cial sea bottoms, difficult to arrange in a
rigorous classification but very common in
the Mediterranean, namely, inlet-derived sedi-
ments and heat-altered sediments of the sea
bottom proper. In general, the seabed consists
of a yellowish mud and sand, containing frag-
ments of shells, fossil mollusks, and corals.
The main winds prevailing in the area are
the bora, a strong northeast wind that blows
from the nearby mountains into the sea, and
a southeasterly wind named the sirocco that is
less troublesome from a navigational point of
view. During the six winter months, bora and
sirocco alternate, with or without an interval
of a few days calm. The tides of the Adriatic,
which have been intensively studied, follow a
complicated pattern, sweeping into the region
from the south and being linked with those of
the Ionian Sea.

The tidal range is about three ft, in contrast
to the general Mediterranean tidal range of
about 0.9 ft. The surface currents are chiefly
influenced by the blowing winds, with cur-
rents spurred by north winds reaching a speed
of four miles per hour.

Temperatures in the surface layers of the
sea reach 75°–77° F (24°–25° C) during the
month of August, and the minimum read-
ings, some 50° F (10° C), are usually reached
during January and February. In the northern
Adriatic, river mouth temperatures are even
lower because the waters are cooled by melting
ice and snow. At greater depths (820–980 ft)
the maximum temperatures fluctuate around
57° F (14° C) while minimum temperatures
are about 52° F (11° C).

The Adriatic Sea, like the Mediterranean in
general, is deficient in life; nutrient content,
as indicated by the amount of phosphates and
nitrates, is extremely low. Three main areas of
marine life may nevertheless be recognized. In
the northern Adriatic area significant winter
cooling and a lowered salinity further impover-
ish the typical Mediterranean marine life. In
the middle Adriatic area, life is much richer
than further north, while the southern Adri-
atic area has its own distinctive forms of life.

Articles are alphabetized word by word,
not letter by letter

adsorption, capability of all solid substances
to attract to their surfaces molecules of gases
or solutions with which they are in contact.
Solids that are used to adsorb gases or dis-

solved substances are called adsorbents; the adsorbed molecules are usually referred to collectively as the adsorbate. An example of an excellent adsorbent is the charcoal used in gas masks to remove poisons or impurities from a stream of air.

Adsorption refers to the collecting of molecules by the external surface or internal surface (walls of capillaries or crevices) of solids or by the surface of liquids. Absorption, with which it is often confused, refers to processes in which a substance penetrates into the actual interior of crystals, of blocks of amorphous solids, or of liquids. Sometimes the word sorption is used to indicate the process of the taking up of a gas or liquid by a solid without specifying whether the process is adsorption or absorption.

Adsorption can be either physical or chemical in nature. Physical adsorption resembles the condensation of gases to liquids and depends on the physical, or van der Waals, force of attraction between the solid adsorbent and the adsorbate molecules. There is no chemical specificity in physical adsorption, any gas tending to be adsorbed on any solid if the temperature is sufficiently low or the pressure of the gas sufficiently high. In chemical adsorption, gases are held to a solid surface by chemical forces that are specific for each surface and each gas. Chemical adsorption occurs usually at higher temperatures than those at which physical adsorption occurs; furthermore, chemical adsorption is ordinarily a slower process than physical adsorption and, like most chemical reactions, frequently involves an energy of activation.

'**Aḍud ad-Dawlah** (b. 936—d. 983), greatest ruler (949–983) of the Iranian Būyid dynasty.

Becoming ruler of Fārs province in southern Iran in 944, 'Aḍud ad-Dawlah did not actually reign on his own until almost a decade later. But by 979 his authority extended, through inheritance and conquest, over all southern Iran and most of what is now Iraq. He became famous for his public works, which included a dam still standing near Shirāz, and he also consolidated the internal security and administrative order of the dynasty and patronized arts and letters. *See also* Būyid dynasty.

'**Aḍud al-Dawla** (Turkish sultan): *see* Alp Arslan.

adularia, a feldspar mineral that contains more than 80 percent potassium aluminosilicate ($KAlSi_3O_8$). It commonly forms colourless, glassy, prismatic, twinned crystals in low-temperature veins of acidic plutonic rocks and in cavities in crystalline schists. Typical occurrences include the schists of the Alps.

Adularia and microcline are sometimes considered identical, differing only in the size of their twinned crystals: the twins, two sets of fine, tapering lamellae at right angles to each other that are microscopically visible in microcline, are supposedly present, but invisible, in adularia. Slight differences in refractive indices, specific gravity, temperature of their conversion to sanidine (a high-temperature form of potassium feldspar), and axial angle, however, indicate the existence of two different species.

'**Adullam**, ancient city and modern development region, in the upper part of Ha-Shefela, central Israel. The mound of Tel 'Adullam, or Ḥorbat ("Ruins of") 'Adullam (Arabic: Tall Ash-Shaykh Madhkūr), 22.5 miles (36 km) southwest of Jerusalem, is generally accepted as the site of the ancient city. The earliest reference to 'Adullam is in the book of Genesis, which tells of the activities of Judah, son of Jacob, in the area (Genesis 38). After the exodus from Egypt and the Israelite conquest, 'Adullam was assigned to the tribe of Judah (Joshua

15:35). Later, during David's flight from King Saul, he and his followers took refuge in the fortified caves there (1 Samuel 22:1–4). Following the division of the Jewish kingdom (10th century BC), Solomon's son, Rehoboam, first king of Judah, fortified 'Adullam, but it and the other fortified cities of Judah were taken by Pharaoh Sheshonk I (biblical Shishak), who ruled Egypt about 935–914 BC.

In later centuries 'Adullam was reoccupied by the Jews after the Babylonian Exile (early 6th century BC). During the Hasmonean revolt (2nd century BC), Judas Maccabeus took the fortified city from Gorgias, one of Antiochus IV Epiphanes' generals (2 Maccabees 12:38).

In modern Israel the name 'Adullam is given to the planned development region in the former (1949–67) "Jerusalem corridor," west of the capital. This hilly area, on the boundary of Ha-Shefela and the Yehuda (Judean) Mountains, includes the ancient site. Settlement commenced in 1958; several agricultural villages and rural subcentres were established. No main regional centre was built because of the area's proximity to Jerusalem, but most villages were clustered around three rural centres. Orchards are prominent in the north-eastern part of the region, while field crops predominate in the southwest. Mixed light manufacturing has been located in some of the villages.

Adullamite, member of a group of English politicians who rebelled against their leaders in the Liberal Party and defeated the Reform Bill of 1866. Their name was derived from the biblical reference to the caves of 'Adullam (1 Samuel 22:1), which served as a refuge for the discontented. The Liberal politician John Bright applied the term to party rebels who opposed the extension of the franchise proposed by W.E. Gladstone and John Russell, 1st Earl Russell, in 1866. Some of the group of about 40 members of Parliament acted out of fear of losing their seats, but most agreed with their leader Robert Lowe (later Viscount Sherbrooke) in his fear of the effects of democracy.

adult education, also called CONTINUING EDUCATION, any form of learning undertaken by or provided for mature men and women. In a 1970 report, the National Institute of Adult Education (England and Wales) defined adult education as "any kind of education for people who are old enough to work, vote, fight and marry and who have completed the cycle of continuous education, [if any] commenced in childhood." Adult education comprehends such diverse modes as independent study consciously pursued with or without the aid of libraries; broadcast programs or correspondence courses; group discussion and other "mutual aid" learning in study circles, colloquia, seminars or workshops, and residential conferences or meetings; and full- or part-time study in classes or courses in which the lecturer, teacher, or tutor has a formal leading role. Types of adult education can also be classified as follows:

1. Education for vocational, technical, and professional competence. (Such education may aim at preparing an adult for a first job or for a new job, or it may aim at keeping him up to date on new developments in his occupation or profession.)

2. Education for health, welfare, and family living. (Such education includes all kinds of education in health, family relations, consumer buying, planned parenthood, hygiene, child care, and the like.)

3. Education for civic, political, and community competence. (Such education includes all kinds of education relating to government, community development, public and international affairs, voting and political participation, and so forth.)

4. Education for "self-fulfillment." (Such education embraces all kinds of liberal education

programs: education in music, the arts, dance, theatre, literature, arts and crafts, whether brief or long-term. These programs aim primarily at learning for the sake of learning rather than at achieving the aims included in the other categories.)

5. Remedial education: fundamental and literacy education. (Such education is obviously a prerequisite for all other kinds of adult education and thus, as a category, stands somewhat apart from the other types of adult education.)

In reference to the fifth category, adults frequently need to compensate for inadequacies of earlier education. If these inadequacies are not remedied, they inhibit recourse to modes of education that are "adult"—adult, that is, in terms of sophistication in modern society and not in terms of age. Such remedial education is required most extensively in societies changing rapidly from a subsistence to an industrial economy and concurrently changing politically and socially. Mass literacy acquires a new importance in these nations of Asia, Africa, and Latin America, and the establishment of universal primary education becomes a social imperative. To prevent a "generation gap" in reading skills and education while an effective school system is being created for the young, governments must attempt to provide parallel facilities for adults. Even in countries with mature systems of childhood education, however, opportunities for higher or even sometimes secondary education are unequal among various regional, occupational, and social groups. Hence there are adult programs for completing high school or preparing for examinations normally taken at the end of secondary school.

Any classification of agencies and institutions involved in adult education must necessarily be arbitrary, given the great variety found not only among nations but within single nations. The following are the general types.

The folk high schools, first established in Denmark and now found in all Scandinavian countries, are residential schools in which young adults who have completed formal schooling and usually have had some subsequent work experience pursue at least several months of study. The study aims at furthering both moral and intellectual development and instilling an understanding of local and national traditions and conditions. Although at first they were independent or separate institutions, they are now frequently promoted or supported by communal boards of education. Although rarely exported with success in their pure form, the folk high schools have influenced the development of residential forms of adult education in countries as diverse as Canada, Kenya, India, and The Netherlands.

Nonresident adult education centres, which are the most widely distributed specialized institutes for adult education, are represented by such organizations as "workers' academies" in Finland, "people's high schools" in Germany and Austria, "adult education centres" in Great Britain, and "people's universities" in The Netherlands, Italy, and Switzerland. The distinguishing characteristics of these institutions are that they are independent of the general education authorities, at least in terms of programming; that student attendance is voluntary and part-time; and that teachers and administrators are either volunteers or professionals offering mainly part-time services. Traditionally these schools do not prepare students for examinations or offer training in advanced vocational skills. Typically the curriculum includes instruction in practical and domestic crafts, fine arts, music and drama, familial and social problem solving, and modern languages, as well as instruction designed to reinforce primary and secondary education.

Agricultural extension services, though almost wholly an American development, are conducted on a scale great enough to rate

separate mention. The extension service of the U.S. Department of Agriculture conducts agricultural, home economics, and even public affairs programs in every county in the United States. It has had special significance in developing "demonstration" as a method of adult education and in emphasizing the adoption of new farming practices.

The open university, a recent British institution, is significant for its new dimension and sharp break with previous degree programs for adults. In some educationally advanced countries—such as Australia, New Zealand, Canada, and the United States—adults have long had opportunities to pursue part-time education leading to university degrees, but these programs have usually been carbon copies of programs offered to regular undergraduates. The open university, in theory at least, aspires to a kind of universal higher education. It is intended to serve only mature or older adults studying part-time; it has no standardized entry requirements; and it attempts to combine various educational technologies and techniques—correspondence instruction, mass-communication media, personal counseling, and short-term residential courses.

Commercial enterprises have provided correspondence courses or class instruction (part- or full-time) for adults who are usually seeking some form of vocational qualification (but who may, however, be simply seeking "self-improvement," as in speed-reading programs). Such schools may be licensed or supervised by state agencies (as in Sweden and The Netherlands), or they may be self-policing through associations offering accreditation. Some schools are nonprofit organizations.

Extension services include both public-school programs for adults and the university extensions mentioned earlier. The school programs are administered by the public-school systems, and they are popularly termed night schools because ordinarily they are housed in the same school buildings used in the daytime for school-age youth and also because some of the same teachers are often involved. (Much of the teaching, however, is also done by subject specialists not employed as schoolteachers.) Though often originating in efforts to remedy or supplement inadequate childhood education, many of these programs now cater to the same range of interests served by the "nonresident adult education centres" cited previously. They often retain elements of vocational preparation at a less specialized level, generally for younger adults—for example, in commercial and trade skills.

The extension services offered by institutions of higher learning are of two broad types. The British tradition, influential in most Commonwealth countries and former colonial territories, has emphasized the provision of non-credit courses of "liberal" studies. The North American tradition, found in countries influenced by the United States and Canada, places a larger emphasis on credit programs duplicating courses offered to regular undergraduates; such programs are offered via television or correspondence or in separate urban colleges. Both traditions seem in the process of modification—the British in the direction of offering more credit-earning and vocation-related refresher courses, the North American toward a wider acceptance of the provision of general liberal studies for the public at large and for specialized vocational groups. It is everywhere apparent that universities are assuming more responsibility for the continuance and renewal of education for the highly educated.

In addition to the various schools or services listed above, there are countless organizations whose main purposes may not be adult education but that offer some kind of instruction or leisure-time activities for adults. They include such bodies as the Young Men's Christian Association, the Young Women's Christian Association, political parties and labour unions,

women's organizations, and temperance organizations. Other agencies for which adult education is a related rather than a primary function are libraries, museums, botanical gardens, and the like. Not only do these agencies provide the means of individual self-education but also they frequently promote group activities or put their accommodations and resources at the disposal of adult education agencies. Finally there should be mentioned the advisory and instructional services offered by various social and welfare agencies in the fields of health, safety, marital guidance, family planning, and so forth.

adultery, sexual relations by a married person with someone other than the spouse. Prohibitions or taboos against adultery, written or customary, constitute part of the marriage code of virtually every society. Indeed, adultery seems to be as universal and, in some instances, as common as marriage.

The Code of Hammurabi (18th century BC) in Babylonia provided a punishment of death by drowning for adultery. In ancient Greece and in Roman law, the offending female spouse could be killed, but men were not severely punished. The Jewish, Islāmic, and Christian traditions are unequivocal in their condemnation of adultery. The culpability of men as well as women is more explicitly expressed in the New Testament and the Talmud than in the Old Testament or the Qur'an.

The attitude toward adultery within different cultures varies widely. Whereas the traditional Senufo (Senoufo) and Bambara of West Africa, for instance, tacitly condone the honour crime of killing the adulterous female spouse and her companion, among the Kaka in Cameroon, a man may have sexual relations with the wives of certain relatives with impunity. Wife lending is part of Eskimo hospitality. Nonincestuous adultery is permitted by many South Sea island peoples, and among certain Pueblo Indian societies adultery is so common that it is tolerated if kept secret.

Under ancient Hindu law, marriage was an indissoluble sacrament, and not even a wife's adultery could sever the legal tie and dissolve the marriage act. In the modern Hindu code, divorce will be granted to either offended party, but not for occasional violations; the spouse must actually be living in adultery with another.

In western Europe and North America, adultery is a ground for divorce. The diffusion of this principle, as well as Western notions of egalitarianism and modern expectations of mutual emotional support in marriage, has resulted in unprecedented pressure for equal marital rights for women in traditional African and Southeast Asian societies.

In many eastern European countries, adultery does not in itself constitute grounds for divorce; both partners must testify, under the principle of "general breakdown," that the offense results in the decline of those feelings of which marital unity is composed.

adulthood, the period in the human lifespan in which full physical and intellectual maturity have been attained. Adulthood is commonly thought of as beginning at age 20 or 21 years. Middle age, commencing at about 40 years, is followed by old age at about 60 years.

A brief treatment of development during adulthood follows. For full treatment, see MACROPAEDIA: Growth and Development, Biological; Behaviour, The Development of Human.

Physically, early and middle adulthood are marked by slow, gradual declines in body functioning, which accelerate as old age is reached. The muscle mass continues to increase through the mid-20s, thereafter gradually decreasing. The skeletal mass increases until age 30 or so, and then begins to decrease, first in the central skeleton (pelvis and spine) and last in the peripheral skeleton (fingers

and toes). Throughout adulthood there is a progressive deposition of cholesterol in the arteries, and the heart muscle eventually grows weaker even in the absence of detectable disease. The production of both male and female hormones also diminishes with age, though this cannot be directly related to the gradual diminution in sexual activity that occurs in both males and females between 20 and 60.

There is clear evidence that with increasing age adults display a slow, very gradual tendency toward decreasing speed of response in the execution of intellectual (and physical) tasks. Slowing rates of electrical activity in the older adult brain have been linked to the slowing of behaviour itself. This decline in the rate of central nervous system processing does not necessarily imply similar changes in learning, memory, or other intellectual functions. The learning capacity of young adults is superior to that of older adults, as is their ability to organize new information in terms of its content or meaning. Older adults, on the other hand, are equal or superior to young adults in their capacity to retain general information and in their accumulated cultural knowledge. See also aging; old age.

Adur, district, county of West Sussex, England. It is named for the River Adur, which cuts through the chalk ridge of the South Downs via an impressive water gap before entering the English Channel at Shoreham-by-Sea. The district is small and occupies the lower valley of the river between the urban areas of Worthing to the west and Brighton-Hove to the east. Area 16 square miles (42 square km). Pop. (1991 prelim.) 57,400.

Aduwa (Ethiopia): see Adwa.

Advaita (Sanskrit: "Nondualism," or "Monism"), most influential of the schools of Vedānta, an orthodox philosophy of India. While its followers find its main tenets already fully expressed in the *Upaniṣads* and systematized by the *Vedānta-sūtras*, it has its historical beginning with the 7th-century thinker Gauḍapāda, author of the *Māṇḍūkya-kārikā*, a commentary in verse form on the late *Māṇḍūkya Upaniṣad*.

Gauḍapāda builds further on the Mahāyāna Buddhist philosophy of Śūnyavāda ("Emptiness"). He argues that there is no duality; the mind, awake or dreaming, moves through *māyā* ("illusion"); and only nonduality (*advaita*) is the final truth. This truth is concealed by the ignorance of illusion. There is no becoming, either of a thing by itself or of a thing out of some other thing. There is ultimately no individual self or soul (*jīva*), only the *ātman* (all-soul), in which individuals may be temporarily delineated just as the space in a jar delineates a part of main space: when the jar is broken, the individual space becomes once more part of the main space.

The medieval Indian philosopher Śāṅkara, or Śāṅkarācārya (Master Śāṅkara, c. 700–750), builds further on Gauḍapāda's foundation, principally in his commentary on the *Vedānta-sūtras*, the *Śāri-raka-mīmāṃsā-bhāṣya* ("Commentary on the Study of the Self"). Śāṅkara in his philosophy does not start from the empirical world with logical analysis but, rather, directly from the absolute (Brahman). If interpreted correctly, he argues, the *Upaniṣads* teach the nature of Brahman. In making this argument, he develops a complete epistemology to account for the human error in taking the phenomenal world for real. Fundamental for Śāṅkara is the tenet that the Brahman is real and the world is unreal. Any change, duality, or plurality is an illusion. The self is nothing but Brahman. Insight into this identity results in spiritual release. Brahman is outside time, space, and causality, which

are simply forms of empirical experience. No distinction in Brahman or from Brahman is possible.

Śaṅkara points to scriptural texts, either stating identity ("Thou art that") or denying difference ("There is no duality here"), as declaring the true meaning of a Brahman without qualities (*nirguṇa*). Other texts that ascribe qualities (*saḡuṇa*) to Brahman refer not to the true nature of Brahman but to its personality as God (*īśvara*).

Human perception of the unitary and infinite Brahman as the plural and infinite is due to human beings' innate habit of superimposition (*adhyāsa*), by which a thou is ascribed to the I (I am tired; I am happy; I am perceiving). The habit stems from human ignorance (*ajñāna*, *avidyā*), which can be avoided only by the realization of the identity of Brahman. Nevertheless, the empirical world is not totally unreal, for it is a misapprehension of the real Brahman. A rope is mistaken for a snake; there is only a rope and no snake, but, as long as it is thought of as a snake, it is one.

Śaṅkara had many followers who continued and elaborated his work, notably the 9th-century philosopher Vācaspati Miśra. The Advaita literature is extremely extensive, and its influence is still felt in modern Hindu thought.

Advance Australia Fair, national anthem of Australia, adopted on April 19, 1984. It was first officially proposed in 1974 to replace "God Save the Queen," which had been the national anthem from 1788 to 1974 and which, in 1984, was designated the royal anthem, to be played at public appearances of members of the British royal family.

The original music and lyrics were composed by a Scottish-born Australian, Peter Dodds McCormick (1834?–1916), and first performed in Sydney in 1878. In 1977, in a country-wide public opinion poll to choose a national tune, "Advance Australia Fair" won out over three other contenders, including "Waltzing Matilda." Some of the original words, however, were altered for the official version—including the first line, changed from "Australia's sons, let us rejoice" to "Australians all, let us rejoice."

Australians all, let us rejoice,
For we are young and free;
We've golden soil and wealth for toil,
Our home is girt by sea.
Our land abounds in Nature's gifts
Of beauty rich and rare;
In history's page, let every stage
Advance Australia fair.
In joyful strains then let us sing,
"Advance Australia Fair."

Beneath our radiant Southern Cross
We'll toil with hearts and hands;
To make this Commonwealth of ours
Renowned of all the lands;
For those who've come across the seas
We've boundless plains to share;
With courage let us all combine
To Advance Australia fair.
In joyful strains then let us sing,
"Advance Australia Fair."

advection, in climatology, change in a property of a moving mass of air because the mass moves to a region where the property has a different value (e.g., the change in temperature when a warm air mass moves into a cool region). Attention can be centred on either the horizontal or vertical components of the motion, but the term advection commonly signifies only the horizontal transport of air.

Advent (from Latin *adventus*, "coming"), in the Christian church, a period of preparation

for the celebration of the birth of Jesus Christ at Christmas and also of preparation for the Second Coming of Christ. It begins on the Sunday nearest to November 30 (St. Andrew's Day) and is the beginning of the church year. The date when the season was first observed is uncertain. Bishop Perpetuus of Tours (461–490) established a fast before Christmas that began on November 11 (St. Martin's Day), and the Council of Tours (567) mentioned an Advent season.

Although a penitential season, Advent is no longer kept with the strictness of Lent, as it once was, and fasts are no longer required. In many countries it is marked by a variety of popular observances, such as the lighting of Advent candles.

Advent Christian Church, one of several Adventist churches that evolved from the teachings in the late 1840s of William Miller. It was organized in 1860. Doctrinal emphasis is placed on the anticipated Second Coming of Christ and on the Last Judgment, after which the wicked will be destroyed and the chosen will be resurrected to live in a restored paradise on Earth. The church is congregational in polity and, unlike the Seventh-day Adventists, holds services on Sunday. In 1964 the former Life and Advent Union merged with the Advent Christian Church.

Adventist, member of any of a group of Protestant Christian churches arising in the United States in the 19th century and distinguished by their doctrinal belief that the personal, visible return of Christ in glory (i.e., the Second Coming) is close at hand. Adventism is rooted in Hebrew and Christian prophetic, messianic, and millennial expectations recorded in the Bible. Adventists believe that at Christ's Second Coming he will separate the saints from the wicked and inaugurate his millennial (1,000-year) kingdom. See millennium.

History. It was in an atmosphere of millennialist revival in the United States that William Miller (1782–1849), a founder of the Adventists, began to preach. Miller, while an officer in the U.S. Army in the War of 1812, had become a skeptic. After a conversion, he began to study the books of Daniel and Revelation and to preach as a Baptist, the faith of his father. He concluded that Christ would come sometime between March 21, 1843, and March 21, 1844, and was encouraged in his views by a number of clergymen and numerous followers.

Miller was accused of fanaticism because of his millenarianism, and he stressed the coming of Christ in conjunction with a fiery conflagration, which distressed his hearers. Christ, however, did not return on the first appointed date, so Miller and his followers set a second date, Oct. 22, 1844. The quiet passing of this day led to what is called the "Great Disappointment" among Adventists and the convening of a Mutual Conference of Adventists in 1845 to sort out problems. Those who met, however, found it difficult to shape a confession and form a permanent organization.

Among those who persisted after the failure of Miller's prophecy were Joseph Bates, James White, and his wife, Ellen Harmon White. These Adventists, called Millerites in the press, believed that Miller had set the right date, but that they had interpreted what had happened incorrectly. Reading Daniel, chapters 8 and 9, they concluded that God had begun the "cleansing of the heavenly sanctuary"—i.e., an investigative judgment that would be followed by the pronouncing and then the execution of the sentence of judgment. What actually began in 1844, then, in their view, was an examination of all of the names in the Book of Life. Only after this was completed would Christ appear and begin his millennial reign. Though they did not set a new date, they insisted that Christ's advent was immi-

nent. They also believed that observance of the seventh day, Saturday, rather than Sunday, would help to bring about the Second Coming. These Millerites founded an official denomination, the Seventh-day Adventists, in 1863. Mrs. White was thought to have the gift of prophecy, and she traveled and lectured widely in America, Europe, and Australia and wrote prolifically.

Other Adventist bodies emerged in the 19th century as a direct or indirect result of the prophecy of William Miller. These include the Evangelical Adventists (1845), Life and Advent Union (1862), Church of God (Seventh Day, 1866), Church of God General Conference (Abrahamic Faith, 1888), and the Advent Christian Church. These Advent Christians do not accept the teachings of Mrs. White as in any way prophetic. They also reject the teachings of the Seventh-day Adventists about sabbath observance and dietary laws. They are congregational in polity and coordinate work in the United States and throughout the world through the Advent Christian General Conference of America. In 1964 the Advent Christian Church united with the Life and Advent Union.

Beliefs and practices. Seventh-day Adventists share many basic beliefs held by most Christians. They accept the authority of the Old and New Testaments. They are Arminian (emphasizing human choice and God's election) rather than Calvinist (emphasizing God's sovereignty) in their interpretation of Christ's atonement, and they argue that his death was "provisionally and potentially for all men," yet efficacious only for those who avail themselves of its benefits.

In addition to the emphasis upon the Second Advent of Christ, two other matters set them apart from other Christians. First, they observe the seventh day of the week, rather than the first day, as the sabbath. This day, according to the Bible, was instituted by God since the Creation, and the commandment concerning sabbath rest is a part of God's eternal law. Second, they also avoid eating meat and taking narcotics and stimulants, which they consider to be harmful. Though they appeal to the Bible for the justification of these dietary practices, they maintain that these are based upon the broad theological consideration that the body is the temple of the Holy Spirit and should be protected.

Adventists stress tithing and therefore have a high annual giving per capita that allows them to carry on worldwide missionary and welfare programs. Because of their unwillingness to work on Saturday, they have suffered some job discrimination.

Institutions. Sending out its first missionary, John Nevins Andrews, in 1874, Seventh-day Adventism eventually expanded into a worldwide movement, with churches in nearly every country by the late 20th century. The Seventh-day Adventists' emphasis on missionary work won their church many new adherents in Latin America, the Caribbean, and sub-Saharan Africa, so that by the late 20th century the church had more than 5,500,000 members.

The General Conference, the church's main governing body, has its headquarters in Takoma Park, Washington, D.C., where it was moved in 1903 from Battle Creek, Mich. The meeting of the General Conference is held quadrennially and is made up of delegates from divisions, union and local, that are also called conferences. These local conferences provide pastoral oversight for the local congregations, which are governed by elected lay elders and deacons. The General Conference supervises the work of evangelism in more than 500 languages, a large parochial school system, and numerous medical institutions called sanitariums, of which the first was established in Battle Creek in 1866. Publishing houses are operated in many countries, and

Adventist literature is distributed door to door by volunteers. (J.H.Sm.)

BIBLIOGRAPHY. Le Roy Edwin Froom, *The Prophetic Faith of Our Fathers*, 4 vol. (1946–54), is a rich description of Adventist literature by an Adventist. Reference works include Arthur W. Spalding, *Origin and History of Seventh-Day Adventists*, 4 vol. (1961–62); Gary Land (ed.), *Adventism in America: A History* (1986); and *Seventh-Day Adventist Encyclopedia*, rev. ed. (1976).

adventure bay pine: see celery-top pine.

adversary procedure, in law, one of the two methods of exposing evidence in court (the other being the inquisitorial procedure; *q.v.*).

The adversary procedure requires the opposing sides to bring out pertinent information and to present and cross-examine witnesses. This procedure is observed primarily in countries in which the Anglo-American legal system of common law predominates.

Under the adversary system, each side is responsible for conducting its own investigation. In criminal proceedings, the prosecution represents the people at large and has at its disposal the police department with its investigators and laboratories, while the defense must find its own investigative resources and finances. Both sides may command the attendance of witnesses by subpoena (*q.v.*). If the defendant is indigent, his attorney's opportunities for a broader investigation are limited by the provisions of the jurisdiction in which the trial is conducted. In criminal law under the adversary system, the accused need not be present in grand jury indictment proceedings (no longer conducted in Great Britain and recommended by some authorities for eventual abolition in the United States). If an indictment is handed down by the grand jury, its proceedings are available to the defendant. Under civil law the adversary system works similarly, except that both plaintiff and respondent must prepare their own cases, usually through privately engaged attorneys.

In any adversary trial, the opposing sides present evidence, examine witnesses, and conduct cross-examinations, each in an effort to produce information beneficial to its side of the case. Skillful questioning can often produce testimony that can be made to take on various meanings. What seemed absolute in direct testimony can raise doubts under cross-examination. The skills of the attorneys are also displayed at the time of summation, especially in a jury trial, when their versions of what the jury has heard may persuade the jury to interpret the facts to the benefit of the side that is most persuasive.

In adversary proceedings before juries the judge functions as moderator and referee on points of law, rarely taking part in the questioning unless he or she feels that important points of law or fact must be made clearer. In a bench trial (without a jury) the judge makes findings of fact as well as of law.

adverse possession, in Anglo-American property law, holding of property under some claim of right with the knowledge and against the will of one who has a superior ownership interest in the property. Its legal significance is traced back to the English common-law concept known as *seisin*, a possession of land by one who owns the property at least for the period of his life, having a complete right to possession of the property as against all others. The possession by any other under some claim of right to the land was known as *disseisin*. One who was disseised of his property could take the matter to the king's court through a legal action known as the *assize of novel disseisin*. If the land held by a disseisor was claimed by an heir of the original owner in *seisin*, the heir could bring a similar legal action known as the *assize of mort d'ancestor*. After the 17th century more expeditious legal actions were developed.

In the United States, *disseisin* developed as the concept of adverse possession. Statutes of limitation in most of the U.S. states set time limits within which an owner can bring an action for possession, after which time an adverse possessor acquires a legal title to the land.

advertising, the techniques and practices used to bring products, services, opinions, or causes to public notice for the purpose of persuading the public to respond in a certain way toward what is advertised. Most advertising involves promoting a good that is for sale, but similar methods are used to encourage people to drive safely, to support various charities, or to vote for political candidates, among many other examples. In many countries advertising is the most important source of income for the media (*e.g.*, newspapers, magazines, or television stations) through which it is conducted. In the noncommunist world advertising has become a large and important service industry.

A brief treatment of advertising follows. For a full treatment, see **MACROPAEDIA: Marketing and Merchandising**.

In the ancient and medieval world such advertising as existed was conducted by word of mouth. The first step toward modern advertising came with the development of printing in the 15th and 16th centuries. In the 17th century weekly newspapers in London began to carry advertisements, and by the 18th century such advertising was flourishing.

The great expansion of business in the 19th century was accompanied by the growth of an advertising industry; it was that century, primarily in the United States, that saw the establishment of advertising agencies. The first agencies were, in essence, brokers for space in newspapers. But by the early 20th century agencies became involved in producing the advertising message itself, including copy and artwork, and by the 1920s agencies had come into being that could plan and execute complete advertising campaigns, from initial research to copy preparation to placement in various media.

There are eight principal media for advertising. Perhaps the most basic medium is the newspaper, which offers advertisers large circulations, a readership located close to the advertiser's place of business, and the opportunity to alter their advertisements on a frequent and regular basis. Magazines, the other chief print medium, may be of general interest or they may be aimed at specific audiences (such as people interested in outdoor sports or computers or literature) and offer the manufacturers of products of particular interest to such people the chance to make contact with their most likely customers. Many national magazines publish regional editions, permitting a more selective targeting of advertisements.

In Western industrial nations the most pervasive media are television and radio. Although in some countries radio and television are state-run and accept no advertising, in others advertisers are able to buy short "spots" of time, usually a minute or less in duration. Advertising spots are broadcast between or during regular programs, at moments sometimes specified by the advertiser and sometimes left up to the broadcaster. For advertisers the most important facts about a given television or radio program are the size and composition of its audience. The size of the audience determines the amount of money the broadcaster can charge an advertiser, and the composition of the audience determines the advertiser's choice as to when a certain message, directed at a certain segment of the public, should be run.

The other advertising media include direct mail, which can make a highly detailed and personalized appeal; outdoor billboards and posters; transit advertising, which can reach the millions of users of mass-transit systems;

and miscellaneous media, including dealer displays and promotional items such as matchbooks or calendars.

For an advertisement to be effective its production and placement must be based on a knowledge of the public and a skilled use of the media. Advertising agencies serve to orchestrate complex campaigns whose strategies of media use are based on research into consumer behaviour and demographic analysis of the market area. A strategy will combine creativity in the production of the advertising messages with canny scheduling and placement, so that the messages are seen by, and will have an effect on, the people the advertiser most wants to address. Given a fixed budget, advertisers face a basic choice: they can have their message seen or heard by many people fewer times, or by fewer people many times. This and other strategic decisions are made in light of tests of the effectiveness of advertising campaigns.

There is no dispute over the power of advertising to inform consumers of what products are available. In a free-market economy effective advertising is essential to a company's survival, for unless consumers know about a company's product they are unlikely to buy it. In criticism of advertising it has been argued that the consumer must pay for the cost of advertising in the form of higher prices for goods; against this point it is argued that advertising enables goods to be mass marketed, thereby bringing prices down. It has been argued that the cost of major advertising campaigns is such that few firms can afford them, thus helping these firms to dominate the market; on the other hand, whereas smaller firms may not be able to compete with larger ones at a national level, at the local level advertising enables them to hold their own. Finally, it has been argued that advertisers exercise an undue influence over the regular contents of the media they employ—the editorial stance of a newspaper or the subject of a television show. In response it has been pointed out that such influence is counteracted, at least in the case of financially strong media firms, by the advertiser's reliance on the media to convey his messages; any compromise of the integrity of a media firm might result in a smaller audience for his advertising.

advertising coloration, in animals, the use of biological coloration to make an organism unique and highly visible as compared with the background, thereby providing easily perceived information as to its location, identity, and movement. Such advertisement may serve the function of attracting individuals in order to enter into some advantageous interaction (*e.g.*, courtship for reproductive purposes) or of warning or repelling other organisms.

advisory opinion, in law, the opinion of a judge, a court, or a law official, such as an attorney general, upon a question of law raised by a public official or legislative body. Advisory opinions adjudicate nothing and are binding upon no one. Federal courts in the United States will not issue advisory opinions, but such opinions are issued occasionally by state courts and routinely by the attorneys general of the various states upon the request of the governor, legislators, or other state officials. The opinions typically refer to the legality of some contemplated official action. Advisory opinions originated very early in English law as a result of extralegal consultation of judges by the Crown or the House of Lords on questions that often were not even related to the law. The function of the opinions was wholly non- or extralegal.

advocate, in law, a person who is professionally qualified to plead the cause of an-

other in a court of law. As a technical term, advocate is used mainly in those legal systems that derived from the Roman law. In Scotland the word refers particularly to a member of the bar of Scotland, the Faculty of Advocates. In France *avocats* were formerly an organized body of pleaders, while the preparation of cases was done by *avoués*; today this distinction exists only before the appellate courts. In Germany, until the distinction between counselor and pleader was abolished in 1879, the *Advokat* was the adviser rather than the pleader. The term has traditionally been applied to pleaders in courts of canon law, and thus in England those who practiced before the courts of civil and canon law were called advocates. In the United States the term advocate has no special significance, being used interchangeably with such terms as attorney, counsel, or lawyer.

Advocates, Faculty of, the members of the bar of Scotland. Barristers are the comparable group in England. The faculty grew out of the Scots Act of 1532, which established the Court of Session in Scotland. The advocates had, and still have, the sole right of audience in the Court of Session and High Court of Judiciary. They constitute a self-governing faculty under annually elected officers. When properly instructed by an agency of the law, an advocate is bound and entitled to plead in any court in Scotland and also before the House of Lords, the Judicial Committee of the Privy Council, and committees of Parliament. *See also* Scottish law.

advocatus diaboli: *see* devil's advocate.

Adwa, also spelled ADOWA, Italian ADUA, town, northern Ethiopia. Adwa lies on the east-west highway between Aksum and Adi Grat at its junction with the road north to Asmara (Asmera), in Eritrea. Adwa is a market centre (grains, honey, hides, coffee) for the Tigray people. The town is located 10 miles (16 km) west of an area of fantastic volcanic formations. On March 1, 1896, Emperor Menilek II defeated an Italian force there. Nearby are the ruins of Fremona, headquarters for the Portuguese Jesuits who came to Ethiopia in the 16th and 17th centuries. Pop. (1991 est.) 24,519.

Adwa, Battle of (1896): *see* Adowa, Battle of.

Adwick le Street, town, Doncaster metropolitan borough, metropolitan county of South Yorkshire, historic county of Yorkshire, England. The town derives its name from the great north British Roman routeway, Ermine Street. The earliest references to the town are found in Domesday Book (1086), and the parish church of St. Lawrence dates from the 12th century. The Washington family—from which George Washington, the first president of the United States, was probably descended—occupied Adwick Hall in the town in the 16th and 17th centuries. A former coal-mining town, Adwick is now mainly a centre of light industry. Pop. (1991) 10,288.

Ady, Endre (b. Nov. 22, 1877, Érmindszent, Hung., Austria-Hungary [now Ady Endre, Rom.]—d. Jan. 27, 1919, Budapest, Hung.), one of Hungary's greatest lyric poets.

Ady was born into an impoverished but noble family. On leaving school he studied law for a time, but in 1899 he published an insignificant volume of verse, *Versek*, and from 1900 until his death he worked as a journalist. In 1903 he published another volume of poetry, *Még egyszer*, in which signs of his exceptional talent could be seen. With his next book, *Új versek* (1906; "New Poems"), he burst into Hungarian literary life. Poetry in Hungary had been dormant at the end of the 19th and the beginning of the 20th centuries,

Ady

By courtesy of the Petöfi Irodalmi Múzeum, Budapest

and imitations of Sándor Petöfi and János Arany were prevalent. None of the few original poets had been powerful enough to make an impression on the public, which was thus unprepared for the "new verses of a new era," as Ady described his work. These poems were revolutionary in form, language, and content; his unconventional though splendid language, with its unusual choice of adjectives, shocked the public. The outrage was furthered by the general tone of his poems. Ady's stay as a journalist in Paris had made Hungary seem to him narrow and materialistic, and in these poems he unleashed a storm of violent and insulting attacks upon his country. Though the artistic value of the "new poems" is beyond question, Ady became the target of onslaughts that soon developed into a political struggle, Ady being supported by the left-wing radicals, who hailed him as a prophet, and abused by right-wing nationalists.

In his later work, Ady abandoned gratuitous insult and attained a higher level of social and political censure. His understanding of his country, of its social and political ills, and of the sufferings that had been inflicted by World War I inspired him to find new means of expressing pain and anger. By that time his failing health, undermined by a profligate life, proved unable to stand up to the pressure of constant hard work. He had published 10 volumes of poetry in 12 years, as well as short stories and countless articles. He died a victim of alcoholism.

Ady's love of the Hungarian people was only one of his themes. His love poems are striking in their originality and their mystical approach to physical love. His religious poems, which seemed blasphemous to many, reveal his search for God "who is at the bottom of all things, to whom all the bells toll and on whose left I, alas, sit."

Adygea, also spelled ADYGEYA, republic, southwestern Russia. It extends from the Kuban River south to the Caucasus foothills. Adygea was established as an *oblast'* (province) in 1922 for the Adyghian people, one of two major branches of the Circassians (Cherkess), who make up about one-fifth of its total population. Apart from the foothills in the south, which are covered in deciduous forest, most of Adygea is an undulating plain with rich soils that are used almost wholly for agriculture. Corn (maize), wheat, sunflowers, hemp, tobacco, melons, potatoes, and other vegetables are grown. A local specialty is flowers, especially Crimean roses and lavender, grown for scent. On the marshy floodplain along the Kuban River, some 20,000 acres (8,000 hectares) have been reclaimed for market gardening. Adygea's industry is chiefly concerned with processing farm produce, but oil and natural gas are exploited near Maykop (*q.v.*), the administrative centre of the republic. There is some timbering in the south. Area 2,900 square miles (7,600 square km). Pop. (1999 est.) 449,000.

adz, also spelled ADZE, hand tool for shaping wood. One of the earliest tools, it was widely

distributed in Stone Age cultures in the form of a handheld stone chipped to form a blade. By Egyptian times it had acquired a wooden haft, or handle, with a copper or bronze blade set flat at the top of the haft to form a T. In this form the adz continued to be the prime hand tool for shaping and trimming wood. A log or other piece of timber was laid

Adz

on the ground or floor, and the carpenter stood astride or on it, swinging the adz in a picklike action down and toward himself.

Adzhariya (Georgia): *see* Ajaria.

Adzopé, town, southeastern Côte d'Ivoire (Ivory Coast). A traditional market centre for the Attie people, it sends coffee, bananas, cocoa, and timber (mahogany, sipo) to Abidjan, 55 miles (89 km) south, for export. Adzopé is the site of Roman Catholic and Protestant missions, a government agricultural-training institute (1964), a leprosy hospital, and a model housing project. Pop. (1988) 35,085.

AE, pseudonym of GEORGE WILLIAM RUSSELL (b. April 10, 1867, Lurgan, County Armagh, Ire.—d. July 17, 1935, Bournemouth, Hampshire, Eng.), poet and mystic, a leading figure in the Irish literary renaissance of the late 19th and early 20th centuries. Russell took his pseudonym from a proofreader's query about his earlier pseudonym, "AEon."

After attending the Metropolitan School of Art, Dublin, where he met the poet William Butler Yeats, Russell became an accounts clerk in a drapery store but left in 1897 to organize agricultural cooperatives. Eventually he became editor of the periodicals *The Irish Homestead* (1904–23) and *The Irish Statesman* (1923–30). In 1894 he published the first of many books of verse, *Homeward: Songs by the Way*. His first volume of *Collected Poems* appeared in 1913 and a second in 1926. He maintained a lifelong interest in theosophy, the origins of religion, and mystical experience. *The Candle of Vision* (1918) is the best guide to his religious beliefs.

At the turn of the century, Russell was considered by many to be the equal of Yeats, but he did not continue to grow and develop as Yeats did. He was prolific and versatile, but many critics found his poetry facile, vague, and monotonous, with "rather too much of the Celtic Twilight" in it.

Aeacus, in Greek mythology, son of Zeus and Aegina, the daughter of the river god Asopus. His mother was carried off by Zeus to the island of Oenone, afterward called by her name. Aeacus was celebrated for justice and in Attic tradition became a judge of the dead, together with Minos and Rhadamanthus. His successful prayer to Zeus for rain during a drought was commemorated by a temple at

Aegina, where a festival, the Aiakeia, was held in his honour.

Sven Samelius

than 140 species distributed in South America. Spiny-edged leaves, usually about 30 to 60 cm (about 12 to 24 inches) long, grow in a rosette from the root. A spike of red and yellow flowers, often with blue tips, grows from the centre. Many species are grown as indoor ornamentals for their colourful foliage or showy flowers. The fibrous leaves of *A. magdalenae*, native to Central and South America, are made into rope and twine.

aecium, also called **AECIDIUM**, a cluster-cup or fruiting body of certain rust fungi (order Uredinales, division Mycota). Yellow to orange in colour, aecia develop after fertilization and bear one-celled spores (aeciospores, or aecidiospores). Aecia are usually found on lower leaf surfaces of plants.

Aedan (king of Dalriada): see Aidan.

Aedesius (d. 355), Greek philosopher whose ideas had their roots in Neoplatonism, a school of philosophy that grew out of the Idealism of Plato.

Aedesius founded the so-called Pergamum school of philosophy, whose major concerns were theurgy (the magic practiced by some Neoplatonists who believed miracles could be worked by the intervention of divine and beneficent spirits) and the revival of polytheism. He was the pupil of Iamblichus and the teacher of Maximus, Chrysanthius, Priscus, and Eusebius Myndius. None of his writings have survived, but there is an extant biography by Eunapius.

Aedilberct (Old English personal name): see under Aethelberht.

aedile, Latin **AEDILIS**, plural **AEDILES** (from Latin *aedes*, "temple"), magistrate of ancient Rome who originally had charge of the temple and cult of Ceres. At first the aediles were two officials of the plebeians, created at the same time as the tribunes (494 BC), whose sanctity they shared. These magistrates were elected in the assembly of the plebeians. In 366 two curule ("higher") aediles were created. These were at first patricians; but those of the next year were plebeians and so on year by year alternately until, in the 2nd century BC, the system of alternation between classes ceased. They were elected in the assembly of the tribes, with the consul presiding. The privileges of the curule aediles included a fringed toga, a curule chair, and the right to ancestral masks—privileges perhaps extended to the plebeian aediles after 100 BC. Aediles ranked between

tribunes and praetors, a greater proportion of the curule ones attaining the consulship, but the office was not necessary for advancement in a senatorial career.

The functions of the aediles were threefold: first, the care of the city (repair of temples, public buildings, streets, sewers, and aqueducts; supervision of traffic; supervision of public decency; and precaution against fires); second, the charge of the provision markets and of weights and measures and the distribution of grain, a function for which Julius Caesar added two plebeian aediles called *ceriales*; third, organization of certain public games, the Megalesian and the Roman games being under the curule aediles and the Plebeian games as well as those of Ceres and Flora being under the plebeian. They had judicial powers and could impose fines.

Augustus transferred the care of the games and the judicial functions to the praetors and the care of the city to appointed boards and to the prefects of the watch and of the city. Under the imperial regime the office became a step in the senatorial career for plebeians until it disappeared after the reign of Alexander Severus in the 3rd century AD.

In Roman municipalities aediles were regular magistrates and are recorded as officials in associations and clubs.

Aedon, in Greek mythology, a daughter of Pandareus of Ephesus. According to Homer, she was the wife of Zethus, the king of Thebes. She had only two children and envied her sister-in-law, Niobe, who had many. She planned to murder Niobe's eldest son in his sleep, but by mistake killed her own son, Itylus, who was sharing his room. Zeus took pity on Aedon in her grief and changed her into a nightingale; her song was a lament for her dead son.

Aedui, Celtic tribe of central Gaul (occupying most of what was later Burgundy), chiefly responsible for the diplomatic situation exploited by Julius Caesar when he began his conquests in that region in 58 BC. The Aedui had been supported by Rome since 121 BC, but they were heavily defeated in about 61 BC by the Sequani and lost their revenue from tolls on the Arar (Saône) River. Appealing to Rome, they were rescued by Caesar, who made them his principal allies. Under Augustus they became a *civitas foederata* ("allied state"), and a new capital was built at Augustodunum (Autun). In AD 21 they joined the Treveri in a revolt but were quickly crushed by the Roman army. In AD 48 the Aedui became the first tribe of Gallia Comata to send senators to Rome.

AEG AG, formerly (1967–85) **AEG-TELEFUNKEN AG**, former German electronics and electrical-equipment company. It produced home and industrial electrical equipment, telecommunications equipment, industrial and electronics components, office machines, computers, and home appliances. Headquarters were in Frankfurt am Main.

The company was founded in Berlin in 1883 when the industrialist Emil Rathenau, with financial support from Siemens and Halske, another major German electrical company, founded the Deutsche Edison Gesellschaft für Angewandte Electricität ("German Edison Company for Applied Electricity"). In 1887 the company was renamed the Allgemeine Elektrizitäts Gesellschaft (AEG), which became largely responsible for installing Germany's first electrical system. It strung transmission lines and built electric trolley systems across Germany before 1900.

In 1941 AEG acquired Gesellschaft für Elektrische Unternehmungen AG, an electric holding company, thus tightening its grip on the German electrical market. In 1966 Telefunken AG, formerly an AEG subsidiary, was inte-

grated into AEG, changing the company name in 1967 to AEG-Telefunken.

In the latter part of the 20th century, AEG-Telefunken faced severe financial problems, which some analysts attributed to the company's decision to continue making high-priced consumer electronics goods (*e.g.*, stereos and television sets) long after Telefunken's prices had been undercut by foreign competitors. During 1983 most of the company's Telefunken operations were sold off, in 1984 the company was reorganized, and early in 1985 it was renamed simply AEG AG. In 1985 Daimler-Benz AG became the major shareholder in AEG. Swedish appliance and equipment manufacturer AB Electrolux began acquiring the AEG household appliance line from Daimler-Benz (as of 1998, DaimlerChrysler) in 1992. AEG brand appliances remained part of Electrolux's consumer durables division into the 21st century.

Aegadian Islands, Italian **AEGATES INSULAE**: see Egadi Islands.

Aegaeon (Greek mythology): see Briareus.

Aegean civilizations, the Bronze Age civilizations that flourished from about 3000 BC to about 1000 BC in the area of the Aegean Sea. Some authorities use the term more broadly, to refer also to the Neolithic civilizations that flourished there between about 7000 and 3000 BC.

A brief treatment of the Aegean civilizations follows. For full treatment, see **MACROPAEDIA: Greek and Roman Civilizations, Ancient**.

The Aegean area includes the island of Crete, the Cyclades and other islands, and the Greek mainland, including the Peloponnese, central Greece, and Thessaly. In addition, some authorities include Macedonia, Thrace, and the Aegean coast of Anatolia.

The Bronze Age civilization of Crete is called the Minoan civilization, after the legendary King Minos of Knossos, the principal city of the island. The first high civilization in Europe, with cities and great palaces, an extended trade network, and a writing system, developed on Crete in the late 3rd and early 2nd millennia BC. The Bronze Age civilizations of the Cyclades and some other islands of the Aegean are called Cycladic. The Bronze Age civilizations of the mainland are called Helladic, from *Hellas*, the Greek name for Greece. Early, middle, and late stages have been defined for each of these, with further subdivisions according to changes in the style of pottery and other artifacts that are associated with each culture. The civilization that arose on the mainland during the 16th century BC under Cretan influence is usually called Mycenaean, after the city of Mycenae, one of its most important centres; this period is sometimes called the Late Helladic. The term Mycenaean is sometimes used for the civilizations of the Aegean area as a whole from about 1400 to 1100 BC.

Aegean Sea, Greek **AIGAÍON PÉLAGOS**, Turkish **EGE DENİZ**, an arm of the Mediterranean Sea, located between the Greek peninsula on the west and Asia Minor on the east. About 380 miles (611 km) long and 186 miles (299 km) wide, it has a total area of some 83,000 square miles (214,000 square km). The Aegean is connected through the straits of the Dardanelles, the Sea of Marmara, and the Bosphorus with the Black Sea, while the island of Crete can be taken as marking its boundary on the south. The cradle of two of the great early civilizations, those of Crete and Greece, from which much of modern Western culture is derived, the Aegean Sea is also an important natural feature of the Mediterranean region, possessing several unique characteristics that make it of considerable scientific interest.

The Aegean has an intricate configuration and could well be considered as a bay within the eastern Mediterranean basin, to which it is connected by the straits to the west and east of Crete. It also has a good connection with the Ionian Sea to the west, through the strait lying between the Peloponnese peninsula of Greece and Crete. Virtually throughout the Aegean area, numerous islands large and small emerge from the clear blue waters. These are the mountain peaks of Aegeis, the name given to a now-submerged landmass. At the dawn of European history, these islands facilitated contacts between the people of the area and of three continents. Throughout the entire Aegean shoreline—that is, both the continental shores surrounding the Aegean Sea and those of the islands—bays, ports, and shelter creeks are also abundant. These also facilitated the task of seamen traveling in the Aegean Sea, making longer voyages possible at a time when shipbuilding was in its infancy. No other maritime area of the Mediterranean has such shoreline development when compared by its size.

The maximum depth of the Aegean is to be found east of Crete, where it reaches 11,627 feet (3,543 m). The rocks making up the floor of the Aegean are mainly limestone, though often greatly altered by volcanic activity that has convulsed the region in relatively recent geologic times. The richly coloured sediments in the region of the islands of Thera (Santorini, or Thira) and Melos (Milos), in the south Aegean, are particularly interesting. During the 1970s, Thera in particular became a topic of major international scientific importance, analysis of its surrounding sediments having been linked with a possible explanation of the ancient legend of the lost island of Atlantis.

North winds prevail in the Aegean Sea, although from the end of September to the end of May, during the mild winter season, these winds alternate with milder southwest-erlies. The tides of the Aegean basin seem to follow the movements of those in the eastern Mediterranean generally. The tide of Euripus (Evrípos)—a strait lying between continental Greece and the island of Euboea (Évvoia), in the heart of the Aegean—is, however, extremely important, because it displays a tidal phenomenon of international significance, to which it has, in fact, lent its name. The euripus phenomenon—characterized by violent and uncertain currents—has been studied since the time of Aristotle, who first provided an interpretation of the term. Aegean currents generally are not smooth, whether considered from the viewpoint of either speed or direction. They are chiefly influenced by blowing winds. Water temperatures in the Aegean are influenced by the cold-water masses of low temperature that flow in from the Black Sea to the northeast. In depths of up to about 1,600 feet (490 m), temperature fluctuates around 57°–64° F (14°–18° C), while it is practically steady at about 57° F at sea level.

The Aegean Sea, like the Mediterranean in general, is the most impoverished large body of water known to science. The nutrient content, as indicated by the amount of phosphates and nitrates in the water, is on the whole poor. The less saline waters coming from the Black Sea have a distinct ameliorative influence, but the role of their fertility in the Mediterranean in general has been little studied. Generally, marine life in the Aegean Sea is very similar to that of the northern area of the western basin of the Mediterranean. In view of its limpidity and as a result of its hot waters, it is not surprising that the Aegean Sea accommodates large quantities of fish at the time of their procreating maturity. Such fish enter the Aegean from other areas, notably from the Black Sea.

Geographically, the multitude of Greek islands in the Aegean can be arranged into seven principal groups, from north to south: (1) the Thracian Sea group, including Thásos, Samothrace (Samothráki), and Lemnos; (2) the east Aegean group, including Lesbos (Lésvos), Chios, Ikaría, and Sámos; (3) the Northern Sporades, including Skyros, a group lying off Thessaly; (4) the Cyclades, including Melos, Páros, Nákos, Thera, and Andros (Euboea, although technically an island, is considered a part of the Greek mainland and is connected to Boeotia by a bridge at Chalcis); (5) the Saronic Islands west of the Cyclades, lying 5 to 50 miles (8 to 80 km) from Piraeus and including Salamís, Aegina (Aiyina), Póros, Hydra (Ídhra), and Spétsai; (6) the Dodecanese, a group of 13 islands transferred to Greece by Italy after World War II, the principal island and capital of which is Rhodes; and (7) Crete and associated small islands. Geographically, Crete, Kárpáthos, and Rhodes form an arc of giant stepping-stones from Greece to the Turkish coast of Asia Minor. Together with Ikaría, Fournoi, and Sámos, the Dodecanese are also known as the Southern Sporades. The Greek *dhiamerisma* (region) of the Aegean Islands encompasses the *nomoi* (departments) of Cyclados, Dodecanese, Khíos, Lésvos, and Sámos.

So numerous are the islands of the Aegean that the name Archipelago was formerly applied to the sea. Structurally the Aegean islands are subject to frequent earthquakes. Although a number of the larger islands, such as Lesbos, Chios, Rhodes, and Crete, have fertile, well-cultivated plains, most of them are rocky and quite barren, with terraces to conserve the sparse soil. Characteristic of this landscape is the Cyclades group, the southernmost island of which, Thera, has a volcano that was last active in 1925. The northern islands are generally more wooded than are the southern, except Rhodes.

The chief products of the islands are wheat, wine, oil, mastic, figs, raisins, honey, vegetables, marble, and minerals; fishing is also important. Tourism generates increasing income, with visitors attracted to the villages of whitewashed houses and their handicrafts, as well as to the impressive monuments of the great prehistoric civilization that flourished here. Pop. (1991) Crete, 540,054; other Greek Aegean islands, 545,170.

Aegidius ROMANUS: see Giles of Rome.

Aegilops, genus of grasses (order Cyperales) that has become an agricultural contaminant. Members of the genus grow with wheat, mature at the same time, and, unless care is taken, are harvested along with it. One *Aegilops* species was an ancestor of bread wheat. Its origin was in southeastern Turkey, northern Iraq, and western Iran.

Aegina, Modern Greek AÍYINA, island, one of the largest in the Saronic group of Greece, about 16 miles (26 km) south-southwest of Piraeus. With an area of about 32 square miles (83 square km), it is an *eparkhia* ("eparchy") of the *nomós* (department) of Piraeus. The northern plains and hills are cultivated with vines and olive, fig, almond, and pistachio trees, while along the east coast stretches a ridge of light volcanic rock known as trachyte. The highest point is conical Mount Ayios Iliás (ancient Mount Pan Hellenion), at 1,745 feet (532 m). On the west coast the chief town and port, Aegina, lies over part of the ancient town of the same name.

Inhabited since Neolithic times (c. 3000 BC), the island became a leading maritime power after the 7th century BC because of its strategic position, and its silver coins became currency in most of the Dorian states. Aegina's economic rivalry with Athens led to wars and to its close collaboration with Persia, but at the Battle of Salamis (480 BC) the island sided

The temple of Aphaea, Aegina, Greece
Susan McCartney—Photo Researchers

with Athens and prevailed. The conspicuous bravery of the tiny Aeginetan contingent (only about 40 ships) was recognized by a prize for valour. Hostility with Athens was later resumed, and at the beginning of the Peloponnesian War the Athenians deported all of Aegina's population and replaced them with Athenian settlers (431 BC). The Spartans settled the refugees in the region of Thyreatis in northern Laconia. The remnants were allowed to return from exile in 404 BC after the defeat of Athens, but Aegina never recovered from the blow. It fell with the rest of Greece to Macedon and then to the Romans in 133 BC. It regained some prosperity under Venice (1451) but was eclipsed by a pirate raid in 1537. From that time, except for another Venetian interlude, the island remained in Turkish hands until 1826, by which time it was again a modestly successful commercial centre. It was chosen as the temporary capital of independent Greece (1826–28), but afterward the increasing concentration of business in Athens forced a gradual decay. Today it is a holiday and weekend resort for Athenians, and the ancient pottery trade is still carried on.

Aegina's period of glory was the 5th century BC, as reflected by the legacy of sculpture and the poetry of Pindar. A well-preserved 5th-century-BC temple to Aphaea, the ancient Aeginetan deity related to the Cretan Britomartis (Artemis), is situated on a wooded crest in the east of the island. Its Doric peripheral construction (having columns surrounding the building) of local gray limestone has been partially restored. Pop. (1991) 11,639.

Aegina, Gulf of (Greece): see Saronic Gulf.

aegirine, a pyroxene mineral, sodium and iron silicate ($\text{NaFe}^{+3}\text{Si}_2\text{O}_6$), that is commonly found in alkaline igneous rocks, particularly in syenites and syenite pegmatites. It also occurs in crystalline schists. Aegirine forms a continuous chemical series with aegirinaugite, in which calcium replaces sodium, and magnesium and aluminum replace iron. In this series, the name acmite is given to crystals with the composition $\text{NaFeSi}_2\text{O}_6$ as well as to the reddish brown or greenish black pointed

crystals approximating that composition. Aegirine generally is restricted to the dark green to greenish black, blunt crystals of the same composition. For detailed physical properties, see pyroxene (table).

aegis, also spelled **EGIS**, plural **AEGISES**, or **EGISES**, in ancient Greece, leather cloak or breastplate generally associated with Zeus, the king of the gods, and thus thought to possess supernatural power. Zeus's daughter Athena adopted the aegis for ordinary dress. Occasionally, another god used it—e.g., Apollo in the *Iliad*, where it provoked terror. As early as Homer the aegis was more than an ordinary goatskin cloak, for it was decorated with golden tassels. A stout hide of this sort could turn a blow, like a buffcoat, and thus it often appears as armour. Later, after improvised armour of this type went out of use, it was occasionally thought of as a metal corselet.

Aegithalidae, songbird family that includes the long-tailed tits (or titmice) of the Old World and the bushtits of North America. Both groups are sometimes considered subfamilies of the family Paridae (order Passeriformes). The eight species are small, arboreal insect eaters with long, narrow tails; tiny bills; and silky, plain plumage. The nest is a thick-walled, hanging pouch with a side entrance. The best-known species is the common, long-tailed tit (*Aegithalos caudatus*) of Eurasia. It is pinkish and black, with white head, and its

Long-tailed tits (*Aegithalos caudatus*)
Hans Reinhard—Bruce Coleman Ltd

tail makes up half of its 14-centimetre (6-inch) total length. One of the world's tiniest birds is the pygmy tit (*Psaltria exilis*) of Java, with head and body length of 7 cm.

Aegospotami, Battle of (405 BC), naval victory of Sparta over Athens, final battle of the Peloponnesian War. The fleets of the two Greek rival powers faced each other in the Hellespont for four days without battle, until on the fifth day the Spartans under Lysander surprised the Athenians in their anchorage off Aegospotami. Conon, the Athenian commander, escaped with only 20 of his 180 ships, and the 3,000–4,000 Athenians who were captured were put to death. The victory at Aegospotami enabled Lysander to proceed against Athens itself, forcing the Athenians to surrender in April 404.

Aehrenthal, Aloys, Count Graf Lexa von, in full **ALOYS LEOPOLD JOHANN BAPTIST, COUNT LEXA VON AEHRENTHAL** (b. Sept. 27, 1854, Gross-Skał, Bohemia [now Hrubá Skála, Czech Republic]—d. Feb. 17, 1912, Vienna, Austria-Hungary), foreign minister (1906–12)

of the Austro-Hungarian Dual Monarchy, whose direction of the latter's annexation of Bosnia and Hercegovina (1908) provoked an international crisis. (See Bosnian crisis of 1908.)

Entering the imperial foreign service as attaché in Paris (1877), Aehrenthal subsequently worked at the Austrian Foreign Office and later was appointed diplomatic counselor at St. Petersburg (1888), ambassador to Romania (1895), and ambassador to Russia (1899). In 1906 he replaced Count Agenor Goluchowski as foreign minister. As aggressive as his predecessor was restrained, he revived the dormant foreign policy of the empire.

Aehrenthal's proclamation of the annexation of Bosnia and Hercegovina (October 1908) raised the threat of war with Russia (whose foreign minister, Count Aleksandr Izvolsky, felt himself deceived in his negotiations with Aehrenthal), inflamed the Austrophobe passions of Serbia, and incurred international censure. He consistently opposed suggestions of preventive war against Italy and Russia, however, and sought to reestablish good relations with Italy, Austria's nominal ally, by supporting Italian imperialist ambitions in Libya (1911). The generally assertive course of his foreign policy also led to a cooling of relations with Germany.

Aeken, Jeroen van: see Bosch, Hiëronymus.

Aelfheah, SAINT, Aelfheah also spelled **ELPHEGE, ALPHAGE, or ALPHEGE**, also called **ELPHEGE THE MARTYR, or GODWINE** (b. 954, Gloucestershire?, Eng.—d. April 19, 1012, Greenwich, London; feast day, April 19), archbishop of Canterbury who was venerated as a martyr after his murder by the Danes.

Of noble birth, Aelfheah entered the Benedictine abbey of Deerhurst, Gloucestershire, and later became a hermit at Bath, Somerset, where followers elected him abbot. Aelfheah was a friend of Archbishop St. Dunstan of Canterbury, through whose influence he was named bishop of Winchester in 984. Aethelred II the Unready, king of the English, sent Aelfheah as ambassador to King Olaf I Trygvason of Norway, who in 994 entered Britain and whom Aelfheah confirmed and allegedly persuaded not to invade England again.

In 1005 he became the 29th archbishop of Canterbury and immediately went to Rome to receive the pallium (symbol of metropolitan jurisdiction) from Pope John XVIII. Back in England, he called the Council of Enham (1009?) in a futile effort to halt the social demoralization caused by the devastating Danish invasions. On Sept. 8, 1011, the Danes began their sack of Canterbury and seized Aelfheah. He was ill-treated and held seven months without ransom, which he refused to pay with money that the poor would have had to supply as taxes. Aelfheah thereupon was slain by the Danes, after first being pelted with ox bones remaining from their feast.

He was first buried at St. Paul's Cathedral, London, by order of King Canute of Denmark, England, and Norway; his body was removed to Canterbury in 1023 amid great splendour. From the earliest years after his death he was venerated as a martyr. The parish church of Greenwich is dedicated to him.

Aelfled (queen of Mercia): see Aethelflaed.

Aelfred (Old English personal name): see under Alfred.

Aelfric (fl. c. 955–c. 1010, Eynsham, Oxfordshire, Eng.), Anglo-Saxon prose writer, considered the greatest of his time. He wrote both to instruct the monks and to spread the learning of the 10th-century monastic revival. His *Catholic Homilies*, written in 990–992, provided orthodox sermons, based on the Church Fathers. He also wrote a Latin grammar, hence his nickname Grammaticus, and *Lives of the Saints*.

Aelia Capitolina, city founded in AD 135 by the Romans on the ruins of Jerusalem, which their forces, under Titus, had destroyed in AD 70. The name was given, after the Second Jewish Revolt (132–135), in honour of the emperor Hadrian (whose nomen, or clan name, was Aelius) as well as the deities of the Capitoline Triad (Jupiter, Juno, and Minerva). A sanctuary to Jupiter was built on the Temple Mount, and statues of Roman deities were erected in the city, in intentional violation of Old Testament law. The area was walled and a large foreign population imported; Jews were generally forbidden entrance to the city. The present walls of the Old City of Jerusalem follow the layout of the Roman walls. The name was used until Christianity became the official religion of the Roman Empire in the 4th century.

Aelian, Latin in full **CLAUDIUS AELIANUS** (b. c. 170, Praeneste, near Rome [now in Italy]—d. c. 235), Roman author and teacher of rhetoric, who spoke and wrote so fluently in Greek—in which language his works were written—that he was nicknamed “Meliglotos” (“Honey-tongued”).

Aelian was an admirer and student of the writings of Plato, Aristotle, Isocrates, Plutarch, Homer, and others, and his own works preserve many excerpts from earlier writers. Aelian is chiefly remembered for his *On the Nature of Animals*, curious stories of birds and other animals, often in the form of anecdote, folklore, or fable that points a moral. This work set a pattern that continued in bestiaries and medical treatises through the Dark Ages. His *Various History* relates anecdotes of men and customs and miraculous events. Fragments of other works survive.

Aelianus, also called **AELIANUS TACTICUS** (fl. early 2nd century AD), Greek military writer residing in Rome whose manual of tactics influenced Byzantine, Muslim, and post-15th-century European methods of warfare.

Probably written in AD 106, Aelianus' *Taktikē theōria* (“Tactical Theory”), based on the art of warfare as practiced by the Hellenistic successors of Alexander the Great, was an instruction manual on arming, organizing, deploying, and maneuvering an army in the field. Consulting previous authorities on the subject, Aelianus dealt with a force composed mainly of armoured infantry of the Greek hoplite type, with auxiliary light infantry and cavalry screens. His influence is evident in the military writings of the Byzantine emperor Leo VI (886–912); an Arab translation of the *Taktikē theōria* was made about 1350. Aelianus' detailed treatise became a valuable source of knowledge for European military writers of the 16th century, when infantry once again began to supersede cavalry as the decisive arm of the battlefield.

Aelius Donatus: see Donatus, Aelius.

Aelius Stilo: see Stilo Praeconinus, Lucius Aelius.

Aelle, also spelled **AELLA**, or **AELLI** (fl. late 5th century AD), Anglo-Saxon ruler who is credited with the foundation of the kingdom of the South Saxons, or Sussex. Aelle is said to have landed near Selsey Bill (in modern West Sussex, Eng.) in 477. He immediately made war on the Britons, and in 491 he and his son Cissa massacred a British garrison at the former Roman fort of Anderida (modern Pevensey, East Sussex). His subsequent fate is unknown, but the 8th-century historian Bede wrote that Aelle was the first king to be recognized as overlord of all the English peoples south of the Humber. Drawing on Bede, the 9th-century Anglo-Saxon Chronicle described Aelle as the first *bretwalda* (“ruler of Britain”).

Aelle, also spelled **AELLA**, or **AELLI** (d. 588/90), first king of Deira in northern England, whose people threw off the Bernician overlordship upon the death of Ida, king of Bernicia. Aelle became king in 559, while Ida's descendants continued to reign in the northern kingdom. On Aelle's death the Bernician king Aethelric again subdued Deira, but Aelle's son Edwin (*q.v.*) would return to rule as the most powerful English ruler of the age.

Aelred of RIEVAULX, **SAINT**, Aelred also spelled **AILRED**, **AETHELRED**, or **ETHELRED** (b. c. 1110, Hexham, Northumberland, Eng.—d. Jan. 12, 1167, Rievaulx Abbey, Yorkshire), writer, historian, and outstanding Cistercian abbot who influenced monasticism in medieval England, Scotland, and France.

Of noble birth, Aelred was reared at the court of King David I of Scotland, whose life story he later wrote and for whom he was royal steward. He entered the Cistercian abbey of Rievaulx in about 1134, and from 1143 to 1147 he was abbot of Revesby in Lincolnshire. In late 1147 he became abbot of Rievaulx.

An adviser to kings as well as to ecclesiastics, Aelred in 1162 persuaded King Henry II of England to ally with King Louis VII of France in support of Pope Alexander III against the Holy Roman emperor Frederick I Barbarossa. Despite poor health, Aelred led a severely ascetic life and made numerous visits to Cistercian houses in England, Scotland, and France. His spirituality, his Christocentric doctrine, and, in particular, his writings—considered among the finest produced in England during the European Middle Ages—highly influenced the Cistercians and earned him the title of “the Bernard of the north” (after the celebrated reformer Bernard of Clairvaux). By 1166 illness halted his missions. His feast day is celebrated by the Cistercians on February 3.

Aelred's surviving works deal with either devotion or history. *De spirituali amicitia* (“On Spiritual Friendship”), considered to be his greatest work, is a Christian counterpart of Cicero's *De amicitia* and designates Christ as the source and ultimate impetus of spiritual friendship. His historical works include the incomplete *Genealogia regum Anglorum* (“Genealogy of the English Kings”) and *Vita S. Eduardi Confessoris* (“Life of St. Edward the Confessor”), written in honour of the translation of St. Edward the Confessor's body in 1163, which he witnessed. His last work is *De anima* (“On the Soul”). *De spirituali* was translated in 1942 by Hugh Talbot, and in 1952 Talbot translated Aelred's *De anima* and various sermons.

BIBLIOGRAPHY. Aelred's life history written by Walter Daniel, a contemporary monk, was translated by F.M. Powicke as *The Life of Ailred of Rievaulx* (1950, reprinted 1978). Other studies are Aelred Squire, *Aelred of Rievaulx* (1969, reissued 1981); and Amédée Hallier, *The Monastic Theology of Aelred of Rievaulx* (1969).

Aemilian, Latin in full **MARCUS AEMILIUS AEMILIANUS** (b. Mauretania—d. 253, near Spolegium, Umbria [Italy]), Roman emperor for three months in 253.

Aemilian was a senator and served as consul before receiving the command of the army of Moesia (in present eastern Yugoslavia) during the reign of the emperor Gallus (reigned 251–253). After turning back an invasion by the Goths, Aemilian rebelled against the emperor in the summer of 253 and invaded Italy. When Gallus was killed by his own troops, Aemilian became his successor. A few weeks later the Roman forces of the Upper Rhine declared their commander, Valerian, emperor. Before the two sides came to battle, Aemilian was assassinated by his troops near Spolegium.

Aemilius Lepidus, Marcus: see Lepidus, Marcus Aemilius.

Aemilius Papinianus: see Papinian.

Aeneas, mythical hero of Troy and Rome, son of the goddess Aphrodite and Anchises. Aeneas was a member of the royal line at Troy and cousin of Hector. He played a prominent part in the war to defend his city against the Greeks, being second only to Hector in ability. Homer implies that Aeneas did not like his subordinate position, and from that suggestion arose a later tradition that Aeneas helped to betray Troy to the Greeks. The more common version, however, made Aeneas the leader of the Trojan survivors after Troy was taken by the Greeks. In any case, Aeneas survived the war, and his figure was thus available to compilers of Roman myth.

The association of Homeric heroes with Italy and Sicily goes back to the 8th century BC, and the Greek colonies founded there in that and the next century frequently claimed descent from leaders in the Trojan War. Legend connected Aeneas, too, with certain places and families, especially in Latium. As Rome expanded over Italy and the Mediterranean, its patriotic writers began to construct a mythical tradition that would at once dignify their land with antiquity and satisfy a latent dislike of Greek cultural superiority. The fact that Aeneas, as a Trojan, represented an enemy of the Greeks and that tradition left him free after the war made him peculiarly fit for the part assigned him, *i.e.*, the founding of Roman greatness.

It was Virgil who gave the various strands of legend related to Aeneas the form they have possessed ever since. The family of Julius Caesar, and consequently of Virgil's patron Augustus, claimed descent from Aeneas, whose son Ascanius was also called Iulus. Incorporating these different traditions, Virgil created his masterpiece, the *Aeneid*, the Latin epic poem whose hero symbolized not only the course and aim of Roman history but also the career and policy of Augustus himself. In the journeying of Aeneas from Troy westward to Sicily, Carthage, and finally to the mouth of the Tiber in Italy, Virgil portrayed the qualities of persistence, self-denial, and obedience to the gods that, to the poet, built Rome.

The *Aeneid* (written c. 29–19 BC) tells in 12 books of the legendary foundation of Lavinium (parent town of Alba Longa and of Rome) by Aeneas after he left the burning ruins of Troy to found under supernatural guidance a new city with a glorious destiny in the West.

When Troy fell to the Greeks, Virgil recounts, Aeneas, who had fought bravely to the last, was commanded by Hector in a vision to flee and to found a great city overseas. Aeneas gathered his family and followers and took the household gods (small images) of Troy, but, in the confusion of leaving the burning city, his wife disappeared. Her ghost informed him that he was to go to a western land where the Tiber River flowed. He then embarked upon his long voyage, touching at Thrace, Crete, and Sicily and meeting with numerous adventures that culminated in shipwreck on the coast of Africa near Carthage. There he was received by Dido, the widowed queen, to whom he told his story. They fell in love, and he lingered there until he was sharply reminded by Mercury that Rome was his goal. Guilty and wretched, he immediately abandoned Dido, who committed suicide, and Aeneas sailed on until he finally reached the mouth of the Tiber. There he was well received by Latinus, the king of the region, but other Italians, notably Latinus' wife and Turnus, leader of the Rutuli, resented the arrival of the Trojans and the projected marriage alliance between Aeneas and Lavinia, Latinus' daughter. War broke out, but the Trojans were successful and Turnus was killed. Aeneas then married Lavinia and founded Lavinium.

The death of Aeneas is described by Diony-

sus of Halicarnassus. After he had fallen in battle against the Rutuli, his body could not be found, and he was thereafter worshiped as a local god, *Juppiter indiges*, as Livy reports.

Aenesidemus (b. 1st century BC, Knossos, Crete), philosopher and dialectician of the Greek Academy who revived the Pyrrhonian principle of “suspended judgment” (*epoché*) as a practical solution to the vexing and “insoluble” problem of knowledge. In his *Pyrrhonian Discourses* Aenesidemus formulated 10 tropes in defense of Skepticism, four suggesting arguments that arise from the nature of the perceiver, two dealing with the thing perceived, and four concerning the relationship between the perceiver and the thing perceived.

aeolian: see under colian, except as below.

Aeolian harp (from Aeolus, the Greek god of the winds), stringed musical instrument played by the wind. It is made of a wooden sound box about 3 feet by 5 inches by 3 inches (1 m by 13 cm by 8 cm) that is loosely strung with 10 or 12 gut strings. These strings are all of the same length but vary in thickness and hence

Aeolian harp
The Mansell Collection

in elasticity. The strings are all tuned to the same pitch. In the wind they vibrate in aliquot parts (*i.e.*, in halves, thirds, fourths . . .) thus sounding the octave, 12th, second octave, and succeeding higher harmonics of the string's fundamental note.

The principle of natural vibration of strings by the pressure of the wind has long been recognized. According to legend, King David hung his *kinnor* (a kind of lyre) above his bed at night to catch the wind, and in the 10th century Dunstan of Canterbury produced sounds from a harp by allowing the wind to blow through its strings.

The first known Aeolian harp was constructed by Athanasius Kircher and was described in his *Musurgia Universalis* (1650). The Aeolian harp was popular in Germany and England during the Romantic movement of the late 18th and 19th centuries. Two attempts to devise a keyboard version using a bellows were the *anémocorde* (1789), invented by Johann Jacob Schnell, and the *piano éolien* (1837), by M. Isoard.

Aeolian Islands (Italy): see Eolie Islands.

aeolipile, steam turbine invented in the 1st century AD by Hero of Alexandria and described in his *Pneumatica*. The aeolipile was a hollow sphere mounted so that it could turn on a pair of hollow tubes that provided steam to the sphere from a cauldron. The steam escaped from the sphere from one or more

Aeolipile
EB Inc.

bent tubes projecting from its equator, causing the sphere to revolve. The aeolipile is the first known device to transform steam into rotary motion. Like many other machines of the time that demonstrated basic mechanical principles, the aeolipile was simply regarded as a curiosity or a toy and was not used for any practical purpose.

Aeolis, also called **AEOLIA**, group of ancient cities on the west coast of Anatolia, which were founded at the end of the 2nd millennium BC by Greeks speaking an Aeolic dialect. The earliest settlements, located on the islands of Lesbos and Tenedos and on the mainland between Troas (Troy) and Ionia, resulted from migrations during 1130–1000 BC. A second group of Aeolian settlements was colonized in the 7th century BC. At the end of the 6th century, Darius I incorporated Aeolis into one of the satrapies (provinces) of the Persian Empire.

Aeolus, in the works of Homer, controller of the winds and ruler of the floating island of Aeolia. In the *Odyssey* he gave Odysseus a favourable wind and a bag in which the unfavourable winds were confined. Odysseus' companions opened the bag; the winds escaped and drove them back to the island. Although he appears as a human in Homer, Aeolus later was described as a minor god.

Aeolus, in Greek mythology, mythical king of Magnesia in Thessaly, the son of Hellen (the eponymous ancestor of the true Greeks, or Hellenes) and father of Sisyphus (the "most crafty of men"). Aeolus' daughter Canace and son Macareus committed incest and then took their own lives. Their story provided the subject of Euripides' lost *Aeolus*. Aeolus gave his name to Aeolis, a territory on the western coast of Asia Minor.

aeon, also spelled **EON** (Greek: "age," or "lifetime"), in both Gnosticism and Manichaeism, one of the orders of spirits, or spheres of being, that emanated from the Godhead and were the attributes of the nature of the absolute; an important element in the cosmology that developed around the central concept of Gnostic dualism—the conflict between matter and spirit.

The first aeon was said to emanate directly from the unmanifest divinity and to be charged with a divine force. Successive emanations of aeons were charged with successively diminished force. Each Gnostic system explained aeons in its own way, but all concurred that aeons increased in number in proportion to their remoteness from the divinity and that lower aeons shared proportionately less in divine energy. At a certain level of remoteness, the possibility of error was said to invade the activity of aeons; in most systems, such error was responsible for the creation of the materi-

al universe. For many, Christ was the most perfect aeon, whose specific function was to redeem the error embodied in the material universe; the Holy Spirit was usually a subordinate aeon.

In certain systems, aeons were regarded positively as embodiments of the divine; in others, they were viewed negatively as vast media of time, space, and experience through which the human soul must painfully pass to reach its divine origin.

Aepinus, Franz Maria Ulrich Theodor Hoch (b. Dec. 13, 1724, Rostock, Mecklenberg-Schwerin—d. Aug. 10, 1802, Dorpat, Russia), physicist whose *Tentamen theoriae electricitatis et magnetismi* (1759; "An Attempt at a Theory of Electricity and Magnetism") was the first work to apply mathematics to the theory of electricity and magnetism.

Aepinus studied medicine before turning to physics and mathematics. His work in these new fields resulted in his election to the Berlin Academy of Sciences and, in 1757, led to a professorship of physics in St. Petersburg. He remained in St. Petersburg until his retirement in 1798.

Aepinus' experiments led to the design of the parallel-plate capacitor, a device used to store energy in an electric field. He also discovered the electric properties of the mineral tourmaline and investigated pyroelectricity, the state of electrical polarization that is produced in tourmaline and various other crystals by a change of temperature. In addition, Aepinus studied the relation between conductors and nonconductors, extended Benjamin Franklin's one-fluid theory of electricity, and explained virtually all electric induction in terms of the attraction, repulsion, and flow of electricity in conductors.

Aepinus improved the microscope, and his essay on the effects of parallax in the transit of a planet across the Sun's disk excited great general interest, for it was published in 1764, between the dates of two transits of Venus.

Aepyornis, extinct genus of giant flightless birds found as fossils in Pleistocene and post-Pleistocene deposits on the island of Madagascar. Remains of *Aepyornis* are abundant; of the several known species, most were massively constructed, with four-toed feet and relatively small wings useless for flight. Characteristically, the skull in *Aepyornis* was of small size; the neck was long and slim. Some forms of *Aepyornis* attained very large size; *Aepyornis titan* stood more than 3 metres (10 feet) high. The fossilized remains of *Aepyornis* eggs are relatively common, both fragmented and intact; sometimes they contain the bones of embryonic young. The eggs of the giant forms were also large. One of the largest intact egg specimens is almost one metre (about three feet) in circumference and probably had a capacity of about nine litres (more than two gallons).

Aepyornis occurs relatively late in the geologic record and its ancestry is uncertain. The rather late appearance of *Aepyornis* in Madagascar, however, may represent a relict situation; the genus was probably much more widespread during earlier geologic time. Fragmentary remains of bone and eggshell are known from the Eocene deposits of northern Africa (the Eocene Epoch began 54,000,000 years ago and lasted 16,000,000 years).

Aequi, ancient people of Italy originally inhabiting the region watered by the tributaries of the Avers River (modern Velino). Long hostile to Rome, they became especially menacing in the 5th century BC, advancing to the Alban Hills. Although repulsed by the Romans in 431, the Aequi were not completely subdued by Rome until the end of the Second Samnite War (304 BC), when they received *civitas sine suffragio* ("citizenship without voting

rights"). The establishment of the Latin colony of Carsoli (302 BC) and the extension of the Via Valeria through the territory of the Acqui aided the rapid Romanization of that people.

Aer Lingus Group, PLC, national airline of Ireland, initially comprising two government-owned companies, Aer Lingus Teoranta (incorporated in 1936) and Aerlinte Eircann Teoranta (incorporated in 1947); a 1990s reorganization merged them into one firm. In 1999 the Irish government announced that it was seeking to privatize the airline.

The airline's first route, inaugurated on May 27, 1936, extended from Dublin to Bristol and, in the same year, was extended to London. After World War II, service was inaugurated to Paris and Amsterdam and eventually expanded to other European cities. The first transatlantic routes, from Dublin through Shannon International Airport to New York and Boston, were inaugurated in 1958.

aerarium, treasury of ancient Rome, housed in the Temple of Saturn and the adjacent *tabularium* (record office) in the Forum. Under the republic (c. 509–27 BC) it was managed by two finance magistrates, the urban quaestors, and controlled by the Senate. In theory all revenues were paid into the *aerarium*, and all public payments were made from it. In practice, money was moved from the provinces to the *aerarium* only if the province, after paying the governor's allowance, produced a surplus. Conversely, money was paid out of the *aerarium* only if the provincial revenue did not cover expenses. All accounts, however, had to be balanced with the *aerarium*, which was thus a central clearinghouse.

Under the principate (27 BC–AD 305) the *aerarium* gradually lost importance as the emperors, under whose seal most of the public money was spent, drew funds from provincial depots (*fisci*) and did not account to the *aerarium*. In AD 6 the emperor Augustus founded a second treasury, the *aerarium militare* (the old treasury was thereafter known as *aerarium Saturni*, eventually becoming the municipal treasury of the city of Rome). The new treasury's function was to pay bounties to discharged veterans or purchase land for them. It was supplied with funds from taxes (sales, inheritance, and property) collected by the Emperor's procurators.

aerial perspective, also called **ATMOSPHERIC PERSPECTIVE**, method of creating the illusion of depth, or recession, in a painting or drawing by modulating colour to simulate changes effected by the atmosphere on the colours of things seen at a distance. Although the use of aerial perspective has been known since antiquity, Leonardo da Vinci first used the term aerial perspective in his *Treatise on Painting*, in which he wrote: "Colours become weaker in proportion to their distance from the person who is looking at them." It was later discovered that the presence in the atmosphere of moisture and of tiny particles of dust and similar material causes a scattering of light as it passes through them, the degree of scattering being dependent on the wavelength, which corresponds to the colour, of the light. Because light of short wavelength—blue light—is scattered most, the colours of all distant dark objects tend toward blue; for example, distant mountains have a bluish cast. Light of long wavelength—red light—is scattered least; thus, distant bright objects appear redder because some of the blue is scattered and lost from the light by which they are seen.

The intervening atmosphere between a viewer and, for example, distant mountains, creates other visual effects that can be mimicked by landscape painters. The atmosphere causes

distant forms to have less distinct edges and outlines than forms near the viewer, and interior detail is similarly softened or blurred. Distant objects appear somewhat lighter than objects of similar tone lying closer at hand, and in general contrasts between light and shade appear less extreme at great distances. All these effects are more apparent at the base of a mountain than at its peak, since the density of the intervening atmosphere is greater at lower elevations.

Examples of aerial perspective have been found in ancient Greco-Roman wall paintings. The techniques were lost from European art during the Dark and Middle Ages and were re-discovered by Flemish painters of the 15th century, after which they became a standard

mounted on aircraft, rockets, or Earth-orbiting satellites and other spacecraft.

For the mapping of terrestrial features, aerial photographs usually are taken in overlapping series from an aircraft following a systematic flight pattern at a fixed altitude. Each photograph depicts an area that includes several control points, the locations of which are determined by ground-surveying techniques. A technique known as photogrammetry (*q.v.*), which involves the simultaneous projection of the overlapping views, makes possible the preparation of contour maps or three-dimensional models of the terrestrial surface that has been photographed. Valuable data on topography, geology, hydrology, soil and vegetation, meteorology, ocean currents, and fish resources have become accessible with the use of satellite technology and expert interpretation. Views of cloud patterns obtained from orbit-

Essential to aerobatic technique is the ability to fly an aircraft inverted (upside down); this maneuver was first demonstrated on Sept. 1, 1913, by the Frenchman Adolphe Pégoud, test pilot for aviator Louis Blériot. Other aerobatic innovators include the Russian military pilot Petr Nesterov, who was the first pilot to "loop the loop," on Sept. 9 (Aug. 27, *Old Style*), 1913.

After World War I, former combat pilots, who had developed a range of aerobatic maneuvers for evading enemy airplanes, continued to refine their skills. The United States saw the evolution of the barnstormers—pilots who toured rural areas performing stunt-flying exhibitions—while in Europe the most proficient war pilots were employed by aircraft manufacturers, displaying their skills and the manufacturers' products at public air shows. Competitions between pilots ensued, and these led to the development of rules, notations, and judging criteria.

The aircraft most commonly used in competitive aerobatics for powered aircraft are piston-engined with reinforced construction and have a high power-to-weight ratio, a wing that develops lift in either upright or inverted flight, and fuel and oil systems that will also operate when inverted.

Competition aerobatics became organized on a worldwide basis in 1960, when the International Aerobatics Commission (CIVA) of the Fédération Aéronautique Internationale (FAI) was founded as the world governing body. The inaugural FAI World Aerobatic Championship was held in Bratislava, Czech., in August 1960.

In addition to aerobatic competitions for powered aircraft, the FAI's International Aerobatics Commission also organizes championships in glider aerobatics, for which specially designed aerobatically rated gliders are employed. (A.C.)

aerobics, system of physical conditioning developed to increase the efficiency of the body's intake of oxygen. Typical aerobic exercises (*e.g.*, walking, running, swimming, dancing, and cycling) stimulate heart and lung activity long enough to produce beneficial changes in the body. To be effective, aerobic training must include a minimum of three sessions per week. During each session, the exerciser's heart rate must be raised to his training level for at least 20 minutes. (*See exercise.*)

The concept of aerobics was pioneered by physician Kenneth H. Cooper and popularized in his books *Aerobics* (1968) and *The Aerobics Way* (1977). Cooper's system uses point charts to rate the aerobic value of various exercises for different age groups. As individuals progressively upgrade the quantity and quality of their exercise, they can gauge the improvement in their physical condition through the point system.

aerodynamics, branch of physics that deals with the motion of air and other gaseous fluids and with the forces acting on bodies passing through such a fluid. Aerodynamics seeks, in particular, to explain the principles governing the flight of aircraft, rockets, and missiles. It is also concerned with the design of automobiles, high-speed trains, and ships, as well as with the construction of such structures as bridges and tall buildings to determine their resistance to high winds.

Observations of the flight of birds and projectiles stirred speculation among the ancients as to the forces involved and the manner of their interaction. They, however, had no real knowledge of the physical properties of air, nor did they attempt a systematic study of those properties. Most of their ideas reflected a belief that the air provided a sustaining or impelling force. These notions were based to a large degree on the principles of hydrostatics (the study of the pressures of liquids) as they

element in the European painter's technical vocabulary. The 19th-century British landscape painter J.M.W. Turner made perhaps the boldest and most ambitious use of aerial perspective among Western artists. Aerial perspective was used with great sophistication and pictorial effectiveness by Chinese landscape painters from about the 8th century on. *See also perspective.*

aerial photography, technique of photographing the Earth's surface or features of its atmosphere or hydrosphere with cameras

ing satellites are valuable in weather forecasting. Aerial photography also has many vital military reconnaissance and intelligence-gathering applications.

aerobatics, maneuvers in which an aircraft is flown under precise control in unusual attitudes (the position of an aircraft determined by the relationship between its axes and a reference such as the horizon). A myriad of aerobatic maneuvers exist, some of the better known being rolls, loops, stall turns (hammerheads), and tailslides.

were then understood. Thus, in early times, it was thought that the impelling force of a projectile was associated with forces exerted on the base by the closure of the flow of air around the body. This conception of air as an assisting medium rather than a resisting force persisted for centuries, even though in the 16th century it was recognized that the energy of motion of a projectile was imparted to it by the catapulting device.

Near the end of the 15th century, Leonardo da Vinci observed that air offered resistance to the movement of a solid object and attributed this resistance to compressibility effects. Galileo later established the fact of air resistance experimentally and arrived at the conclusion that the resistance was proportional to the velocity of the object passing through it. In the late 17th century, Christiaan Huygens and Sir Isaac Newton determined that air resistance to the motion of a body was proportional to the square of the velocity.

Newton's work in setting forth the laws of mechanics marked the beginning of the classical theories of aerodynamics. He considered the pressure acting on an inclined plate as arising from the impingement of particles on the side of the plate that faces the airstream. His formulation yielded the result that the pressure acting on the plate was proportional to the product of the density of the air, the area of the plate, the square of the velocity, and the sine of the angle of inclination. This failed to account for the effects of the flow on the upper surface of the plate where low pressures exist and from which a major portion of the lift of a wing is produced. The idea of air as a continuum with a pressure field extending over great distances from the plate was to come much later.

Various discoveries were made during the 18th and 19th centuries that contributed to a better understanding of the factors influencing the movement of solid bodies through air. The relationship of resistance to the viscous properties of a fluid, for example, was perceived in part by the early 1800s, and the experiments of the British physicist Osborne Reynolds in the 1880s brought into clearer view the significance of viscous effects.

Modern aerodynamics emerged about the time that the Wright brothers made their first powered flight (1903). Several years after their historic effort, Frederick W. Lanchester, a British engineer, proposed a circulation theory of lift of an airfoil of infinite span and a vortex theory of the lift of a wing of finite span. The German physicist Ludwig Prandtl, commonly regarded as the father of modern aerodynamics, arrived independently at the same hypotheses as Lanchester and developed the mathematical treatment; their work comprises the Lanchester-Prandtl wing theory. Prandtl's work, refined and expanded by subsequent investigators, formed the theoretical foundation of the field. Among others who played a prominent role in the development of modern aerodynamics was the Hungarian-born engineer Theodore von Kármán, whose contributions led to major advances in such areas as turbulence theory and supersonic flight.

Aeroflot, in full AEROFLOT-RUSSIAN AIRLINES, Russian airline that was formerly the national airline of the Soviet Union.

The Soviet state airline was founded in 1928 under the name Dobroflot and was reorganized under the name Aeroflot in 1932. Dobroflot, or Dobrovolny Flot, grew out of two former airlines: Dobrolyot, founded in 1923, and Ukvozdukhput, or Ukrainian Airways, founded in 1925. By 1935 Aeroflot's routes spanned the Soviet Union from Leningrad (St. Petersburg) to Vladivostok, with a network also extending southward to the Black Sea, the Caucasus, and Central Asia.

Aeroflot, as suggested by its official name, "Main Civil Air Fleet Administration," was re-

sponsible for civil aviation in the Soviet Union, including passenger and freight transportation on the country's international and domestic routes as well as crop-spraying, aerial surveying, airborne rescue work, and flying ambulance services. Aeroflot used only aircraft made in the Soviet Union. It began the world's first civilian jet air service in 1956 (using Soviet Tu-104 aircraft) and helped develop the world's first supersonic airliner, the Soviet Tu-144, which first flew in 1968.

After the breakup of the Soviet Union in 1991, the renamed Aeroflot-Russian International Airlines in 1992 became the state-owned airline of the new Russian Federation, which remained a majority shareholder into the 21st century. Most domestic routes were assumed by regional airlines. In 1992 Aeroflot began flying foreign-made aircraft by manufacturers such as Airbus and Boeing. Assuming the name Aeroflot-Russian Airlines in 2000, the airline remained a leader in the provision of international flights from Russia to more than 40 countries.

aerofoil (aircraft): *see* airfoil.

aerophone, any of a class of musical instruments in which a vibrating mass of air produces the initial sound. The basic types include woodwind, brass, and free-reed instruments, as well as instruments that fall into none of these groups, such as the bull-roarer and the siren. Bagpipes and organs are hybrids with different kinds of pipes. The word aerophone replaces the term wind instrument when an acoustically based classification is desired. This classification also includes the chordophone (in which the initial sound is produced by vibration of a stretched string), the membranophone (produced by the vibration of a stretched membrane), the idiophone (produced by the vibration of a resonant solid material), and electrophone (produced or amplified by electronic means).

aeroplane: *see* airplane.

aerosol, a system of liquid or solid particles uniformly distributed in a finely divided state through a gas, usually air. Aerosol particles play an important role in the precipitation process, providing the nuclei upon which condensation and freezing take place. They participate in chemical processes and influence the electrical properties of the atmosphere.

True aerosol particles range in diameter from a few millimicrometres to about 1 micrometre (equal to 10^{-4} cm). When smaller particles are in suspension, the system begins to acquire the properties of a true solution; for larger particles, the settling rate is usually so rapid that the system cannot properly be called a true aerosol. Nevertheless, the term is commonly employed, especially in the case of fog or cloud droplets and dust particles, which can have diameters of over 100 micrometres.

In general, aerosols composed of particles larger than about 50 micrometres are unstable unless the air turbulence is extreme, as in a severe thunderstorm. Particles with a diameter of less than 0.1 micrometre are sometimes referred to as Aitken nuclei.

aerosol container, any package, usually a metal can or plastic bottle, designed to dispense its liquid contents as a mist or foam. This type of container was developed in 1941 by the American chemist Lyle D. Goodhue and others for dispensing insecticides. Since that time a wide variety of products ranging from disinfectants to whipping cream have been packaged in aerosol containers.

The most common type of aerosol container consists of a shell, a valve, a "dip tube" that extends from the valve to the liquid product, and a liquefied-gas propellant under pressure. The liquid product is generally mixed with the propellant. When the valve is opened, this solution moves up the dip tube and out the

valve. The propellant vaporizes as it is released into the atmosphere, dispersing the product in the form of fine particles. In foam packs, such as shaving cream, the propellant and product are present together as an emulsion. On release, the liquid vaporizes, whipping the whole into a foam.

Chlorofluorocarbons, often called Freons, were used extensively as propellants in aerosol-spray products manufactured in the United States until 1978, when the federal government banned most uses of those compounds because of their potentially harmful environmental effect. Scientific studies indicated that chlorofluorocarbons released into the air rise

Cross section of a typical spray aerosol container

From Kirk-Othmer Encyclopedia of Chemical Technology, vol. 1 (copyright 1963), by permission of John Wiley & Sons, Inc.

up to the stratosphere, where they catalyze the decomposition of ozone molecules. The stratospheric ozone helps shield animal life from the Sun's intense ultraviolet radiation, and it was feared that a significant reduction of atmospheric ozone by chlorofluorocarbons could lead to higher rates of radiation-induced skin cancer in humans.

In compliance with the federal ban, American and European manufacturers have substituted hydrocarbons and carbon dioxide for chlorofluorocarbons in most aerosol products. They also have developed aerosol containers that use air pressure produced by hand-operated pumps instead of a propellant.

aerospace engineering, also called AERONAUTICAL ENGINEERING, field of engineering concerned with the development, design, construction, testing, and operation of aircraft and space vehicles.

A brief treatment of aerospace engineering follows. For full treatment, *see* MACROPAEDIA: Engineering.

Aeronautical engineering traces its roots back to balloon flight, gliders, and airships. But the real expansion of activity came with the first mechanically powered and controlled flight of the Wright brothers' *Flyer* in December 1903 at Kitty Hawk in North Carolina.

During the 1960s the concept of aeronautical engineering was broadened to include all vehicles that operate above the surface of the Earth, in outer space as well as in the atmosphere. The term aerospace engineering thus came to denote this broadened discipline. In addition to space vehicles, all types of hovercraft are included in this field of engineering.

The principal technologies encompassed by

aerospace engineering are those of aerodynamics, propulsion, structures and stability, and control. The aerospace-engineering process begins in academic, industrial, and government research centres. Industrial designers, using the latest technological developments, propose an initial vehicle design calculated to satisfy the particular requirements specified. This initial design is followed by a long process, lasting months and sometimes years, in which the design and development of the many vehicle components are carried out by aerospace engineers. The design process precedes the construction and testing of one or more prototype vehicles. Satisfactory completion of flight testing of prototypes is followed by quantity production and operation. Aerospace engineers participate in all steps of these processes.

The history of aerospace engineering has been prone to revolutionary leaps in technology, coupled with the slower but continual evolutionary development of basic processes. The metal monocoque fuselage, the cantilevered monoplane wing, the jet engine, supersonic flight, and space flight are such examples. In fact, the post-World War II period was one of rapid change in aerospace engineering, as new knowledge in aerodynamics, structures, propulsion, stability, and control developed at increasing rates. Low-speed aerodynamics gave way to transonic, supersonic, and hypersonic aerodynamics; frame structures were replaced by thin, metallic shells that required the development of new aluminum, magnesium, titanium, and steel alloys; internal combustion engines were replaced by rocket and turbojet engines; and manual control developed into automatic control.

The practice of aerospace engineering rests upon principles fundamental to all flight vehicles—a propulsion system with high thermodynamic and propulsive efficiencies, a structure of minimum weight and maximum strength, an external shape that is stable in flight with maximum aerodynamic efficiency, a precision control and guidance system, and a suitable design compromise among all these elements that allows the vehicle to achieve the required performance. An understanding of these principles depends upon knowledge of the engineering sciences: materials science, solid and structural mechanics, thermodynamics, fluid mechanics, and electrical science. In turn, the engineering sciences rest upon the basic sciences of physics, chemistry, and mathematics.

To create a successful aircraft, the aerospace designer must blend the sciences of fluid mechanics and aerodynamics with the most advanced engineering techniques available. The aircraft's wing is perhaps the most difficult part of an aircraft to design because of the compromise that must be achieved between the air loads the wing must carry and the shape that it must have in order to produce lift and minimize drag. The location of an aircraft's power plants is also an important consideration for the designer, since the power plant must create sufficient thrust for the craft while itself producing minimal amounts of drag through the airstream. Stability, or the ability of an aircraft disturbed from its equilibrium to create forces and moments which tend to restore that equilibrium, is also important and is determined by the configuration and shape of the power plants, wings, fuselage, tail, and flaps. Structural considerations in aircraft design are dominated by the need to create airplane frames of minimum weight and maximum strength and rigidity.

The largest employers of aerospace engineers are the aircraft and aerospace industries and the supporting subcontractors associated with those industries. Aerospace engineers employed in such activities are engaged in a wide

variety of duties ranging from basic research on fundamental principles to hardware design and production.

The second largest employer in most countries is the government. Here the engineer's duties lie principally in research, development, and procurement. Aerospace engineers are also employed to a limited extent by universities and by commercial airlines. Important engineering functions must be carried out by the airlines in acquiring new equipment and in the maintenance and operation of equipment.

aerospace medicine, specialized branch of medical science concerned with those medical problems encountered in human flight in the atmosphere (aviation medicine) and beyond the atmosphere (space medicine).

The ultimate aim of this specialty is to promote the safety and effectiveness of humans while they are exposed to the stresses of aerospace flight, such as extreme temperatures, low atmospheric pressure, radiation, noise, vibrations, oxygen deprivation, and the strong forces of acceleration and deceleration. Other hazards of space flight include weightlessness, motion sickness, pilot fatigue, discomfort from hunger or sleepiness due to the absence of the Earth's day-and-night cycle, and psychological disturbances caused by confinement and isolation. These problems, however, are generally prevented by intensive preflight training in high-powered simulators and by careful design of equipment and spacecraft.

The 19th-century French physiologist Paul Bert is generally regarded as the father of modern aviation medicine. His classic observations of the effects of both high and low air pressure on balloonists were used extensively beginning in World War II and prompted a broad and vigorous program of research. In 1948 the first unit for space research in the world was established in the United States, and as major technological advances were made in space flight, space medicine became recognized as an important medical specialty.

Specialists in civil and military aerospace medicine establish and apply appropriate medical standards for the certification and selection of pilots and other flight personnel to assure that they have no physical limitations or medical conditions that could impair their performance. Physicians who are trained in aerospace medicine are known as flight surgeons.

Aerospace medical specialists plan and help to carry out flight-crew training in first aid and in the prevention of illness and injuries among passengers; they also assist in training paramedical personnel in the aerial transportation of patients. Such specialists also apply the principles of preventive medicine to avert the spread of disease by air travel. In addition, they conduct postflight medical evaluations of astronauts to identify any adverse effects of space flight on the body. During space flight, they monitor physiologic responses of astronauts and advise them on the management of in-flight medical problems. Beyond the scope of clinical medicine, they often help to develop the vehicles, emergency systems, and protective equipment for manned aerospace flight.

aerotitis: see ear squeeze.

Aeschbacher, Hans (b. Jan. 18, 1906, Zürich, Switz.—d. Jan. 27, 1980, Zürich), Swiss sculptor of severe and massive abstract forms.

Trained as a printer, Aeschbacher taught himself to draw and paint and began sculpting about the age of 30. His earliest pieces were figurative and were composed mainly from terra-cotta and plaster. By 1945 he was working essentially with stone, and his sculptures became increasingly abstract, geometrical, and austere. With "Abstract Faces" (1945)

Aeschbacher eliminated representational detail from his unified architectural stone volumes. His predominant use of porous lava rock in the mid-1950s relieved some of the rigidity of his forms. Though his sculptures of the late '50s were less austere, Aeschbacher soon returned to the massive scale (some pieces 15 feet [4.5 m] high) and stern geometry of his previous work. "Explorer I," placed at the Zürich-Kloten Airport, is exemplary.

Aeschines (b. 390 BC—d. c. 314 BC), Athenian orator who advocated peace with Philip II of Macedonia and who was a bitter political opponent of the statesman Demosthenes.

Aeschines was brought up in humble circumstances, and in the early part of his career he worked as a tragic actor and held minor posts in the state service. In 346 BC he, like Demosthenes, was a member of the embassies to Philip II that resulted in the peace of Philocrates between Athens and Macedonia. During the negotiations Aeschines had sought to reconcile the Athenians to Macedonia's expansion into Greece, and consequently, after the peace had been concluded, Demosthenes and Timarchus prepared to prosecute him for treason. In retaliation Aeschines successfully indicted Timarchus for gross immorality, and at his own trial in 343 he was acquitted by a narrow majority.

In 339, by provoking the council of the Amphictyonic League to declare a sacred war against the town of Amphissa, in Locris, Aeschines gave Philip a pretext on which to enter central Greece as the champion of the Amphictyonic forces. The eventual result was the establishment of Macedonian hegemony over central Greece (including Athens) after the Battle of Chaeronea (338). The bitter hostility between Aeschines and Demosthenes worsened. In 336 Aeschines brought suit against a certain Ctesiphon for illegally proposing the award of a crown to Demosthenes in recognition of his services to Athens. The case, tried in 330, concluded with the overwhelming defeat of Aeschines, largely, no doubt, because of Demosthenes' brilliant speech for Ctesiphon ("On the Crown"). Aeschines left Athens for Rhodes, where he is said to have taught rhetoric.

Three of his speeches are extant: (1) in accusation of Timarchus; (2) in defense of his own conduct on the embassies to Philip; and (3) in accusation of Ctesiphon. These appear to have been the only speeches he wrote, as opposed to those he delivered extempore. They show a tendency to forthright and forceful expression, free use of rhetorical figures, variety of sentence construction, fondness for poetical quotations, and ready wit.

Aeschylus (b. 525/524 BC—d. 456/455 BC, Gela, Sicily), first of classical Athens' great tragic dramatists, who raised that emerging art to great heights of poetry and theatrical power.

A brief treatment of Aeschylus follows. For full treatment, see MACROPAEDIA: Greek Dramatists, The Classical.

Aeschylus, the son of Euphorion, fought and was wounded at Marathon (490 BC), where Athens defeated the invading Persians, and he again fought against the Persians when they invaded Greece in 480. His first victory in Athens' major dramatic competition was in 484 BC, and 12 years later his earliest extant work, *Persai* (*Persians*), was performed.

After a visit to the court of Hieron I at Syracuse, Sicily, Aeschylus had a series of successes in the 460s and 450s with three trilogies of plays, only one of which trilogies, the *Oresteia*, has survived complete. It consists of *Agamemnon*, *Choephoroi* (*The Libation Bearers*), and *Eumenides* (*The Furies*). Aeschylus' other surviving tragedies are *Hepta epi Theobas* (*Seven Against Thebes*), *Hiketides* (*Suppliants*), and *Prometheus desmotes* (*Prometheus Bound*).

Aeschylus went again to Sicily, where he

died. Aeschylus lifted the art of tragedy from its dim origins as a choral and largely static recitative to fully developed drama. He added a second actor to the dramatic performance, developed the ensuing possibilities of dialogue, and thus enabled tragic drama to assume its characteristic function—the presentation of action. He was also the first-known writer to express in dramatic form that vision of life that is recognized as tragic. For Aeschylus, tragic events represented the gods' punishment for human sins and transgressions.

Aesculapius (Greek mythology): *see* Asclepius.

Aesir, Old Norse ÆSIR, singular ÁSS, in Scandinavian mythology, either of two main groups of deities, four of whom were common to the Germanic nations: Odin (*q.v.*), chief of the Aesir; Frigg (*q.v.*), Odin's wife; Tyr (*q.v.*), god of war; and Thor (*q.v.*), whose name was the Teutonic word for thunder. Some of the other important Aesir were Balder, Jörd, Heimdall, and Loki (*qq.v.*).

Aesop, the supposed author of a collection of Greek fables, almost certainly a legendary figure. Various attempts were made in ancient times to establish him as an actual personage. Herodotus in the 5th century BC said that

Aesop, with a fox, from the central medallion of a kylix, c. 470 BC; in the Gregorian Etruscan Museum, the Vatican

Alinari—Art Resource/EB Inc

he had lived in the 6th century and that he was a slave, and Plutarch in the 1st century AD made him adviser to Croesus, the 6th-century-BC king of Lydia. One tradition holds that he came from Thrace, while a later one styles him a Phrygian. An Egyptian biography of the 1st century AD places him on the island of Samos as a slave who gained his freedom from his master, thence going to Babylon as riddle solver to King Lycurgus, and, finally, meeting his death at Delphi. The probability is that Aesop was no more than a name invented to provide an author for fables centring on beasts, so that "a story of Aesop" became synonymous with "fable." The importance of fables lay not so much in the story told as in the moral derived from it.

The first-known collection of the fables ascribed to Aesop was produced by Demetrius Phalareus in the 4th century BC, but it did not survive beyond the 9th century AD. A collection of fables that relied heavily on the Aesop corpus was that of Phaedrus, which was produced at Rome in the 1st century AD. Phaedrus' treatment of them greatly influenced the way in which they were used by later writers, notably by the 17th-century French poet and fabulist Jean de La Fontaine.

Aesopus, Claudius, Claudius also spelled CLODIUS (fl. 1st century BC), most eminent of the Roman tragedians, contemporary and intimate friend of Cicero, whom he instructed

in elocution, and regarded by Horace as the equal of the great Roman comic actor Roscius. Aesopus became completely absorbed in his roles; the biographer Plutarch mentions that, while playing the part of Atreus deliberating revenge, Aesopus forgot himself and in the heat of the moment struck and killed another actor. Aesopus made a last appearance in 55 BC at the dedication of the Roman ruler Pompey's new theatre; Cicero mentions that Aesopus was advanced in years at that time.

Aestheticism, movement in Europe in the late 19th century that centred on the doctrine that art exists for the sake of its beauty alone.

The movement began in reaction to prevailing utilitarian social philosophies and to what was perceived as the ugliness and philistinism of the industrial age. Its philosophical foundations were laid in the 18th century by Immanuel Kant, who postulated the autonomy of aesthetic standards from morality, utility, or pleasure. This idea was amplified by J.W. von Goethe, J.L. Tieck, and others in Germany and by Samuel Taylor Coleridge and Thomas Carlyle in England. The movement was popularized in France by Madame de Staël, Théophile Gautier, and the philosopher Victor Cousin, who coined the phrase *l'art pour l'art* ("art for art's sake") in 1818.

In England, the artists of the Pre-Raphaelite Brotherhood, from 1848, had sown the seeds of Aestheticism, and the work of Dante Gabriel Rossetti, Edward Burne-Jones, and Algernon Charles Swinburne exemplified it in expressing a yearning for ideal beauty through conscious medievalism. The attitudes of the movement were also represented in the writings of Oscar Wilde and Walter Pater and the illustrations of Aubrey Beardsley in the periodical *The Yellow Book*. The painter James McNeill Whistler raised the movement's ideal of the cultivation of refined sensibility to perhaps its highest point.

Contemporary critics of Aestheticism included William Morris and John Ruskin and, in Russia, Leo Tolstoy, who questioned the value of art divorced from morality. Yet the movement focused attention on the formal aesthetics of art and contributed to the art criticism of Roger Fry and Bernard Berenson. It was unparochial in its affinities with the French Symbolist movement, fostered the Arts and Crafts Movement, and sponsored Art Nouveau, with its decisive impact on 20th-century art.

aesthetics, also spelled ESTHETICS, theoretical study of beauty and taste constituting a branch of philosophy. The term aesthetics, derived from the Greek word for perception (*aisthesis*), was introduced by the 18th-century German philosopher Alexander Baumgarten to denote what he conceived as the realm of poetry, a realm of concrete knowledge in which content is communicated in sensory form. The term was subsequently applied to the philosophical study of all the arts and manifestations of natural beauty.

A brief treatment of aesthetics follows. For full treatment, *see* MACROPAEDIA: Aesthetics.

Principal aims and approaches. Aesthetics is concerned with understanding beauty, particularly as it is manifested in art, and with its evaluation. For years philosophers and critics have sought to determine the most effective way of dealing with this problem. In the West, three broad approaches have been proposed.

One approach involves a study of the concepts and modes of argument used in discussing beauty (and related phenomena), and an analysis of the logical and ideological questions that those aesthetic concepts and arguments imply. This approach was adopted by Edmund Burke in his treatise *On the Sublime and Beautiful* (1756), where he attempted to draw the distinction between two such concepts and study the attitudes directed toward the qualities they denote.

A second approach to aesthetics calls for a philosophical study of certain states of mind (*e.g.*, attitudes and emotions) that are thought to be involved in the aesthetic experience. Such an approach focuses on the responses to manifestations of beauty. It is best exemplified by the studies on aesthetic phenomena undertaken by the Phenomenologists Mikel Dufrenne (*La Phénoménologie de l'expérience esthétique*, 1953; *The Phenomenology of Aesthetic Experience*) and Roman Ingarden (*Das literarische Kunstwerk*, 1931; *The Literary Work of Art*).

The third approach involves a philosophical study of aesthetic objects. Such objects belong to a special class of objects consisting chiefly of works of the fine arts, though works of the useful arts (crafts) and natural phenomena (*e.g.*, landscapes and the human face and body) may also be included insofar as they are deemed to have aesthetic value. The study of the aesthetic object is followed by an attempt to show its significance to those who selectively respond to it. This third approach is grounded in the conviction that the primary objective of aesthetics is to focus on the objects of aesthetic experience and description and to find in them the distinguishing features of the aesthetic realm. Accordingly, aesthetic experience is always described in terms of the objects, and aesthetic concepts are wholly determined by them. Variations of this approach to aesthetics are discernible in the theory of art as significant form proposed by the English critic Clive Bell and in the studies of the structuralists, who emphasize the detailed construction of the work of literary art and its resulting status as a "sign."

Major trends and concerns of modern aesthetics. Aesthetic thought of a distinctively modern bent emerged during the 18th century. The Western philosophers and critics of this time devoted much attention to such matters as natural beauty, the sublime, and representation—a trend reflecting the central position they had given to the philosophy of nature. Since that time, however, the philosophy of art has become ever more prominent and has begun to supplant the philosophy of nature. Various issues central to the philosophy of art have had a marked impact on the orientation of 20th-century aesthetics. Foremost among these are problems relating to the theory of art as form and to the distinction between representation and expression. Still another far-reaching question has to do with the value of art. Two opposing theoretical positions have been taken on this issue: one holds that art and its appreciation are a means to some recognized moral good, whereas the other maintains that art is intrinsically valuable and is an end in itself. Underlying this whole issue is the concept of taste, one of the basic concerns of aesthetics.

In recent years there has also been an increasing preoccupation with art as the prime object of critical judgment. Corresponding to the trend in contemporary aesthetic thought, critics have followed either of two approaches. In one, criticism is restricted to the analysis and interpretation of the work of art. In the other, it is devoted to articulating the response to the aesthetic object and to justifying a particular way of perceiving it.

Over the years, aesthetics has developed into a broad field of knowledge and inquiry. The concerns of contemporary aesthetics include such diverse problems as the nature of style and its aesthetic significance; the relation of aesthetic judgment to culture; the viability of a history of art; the relevancy of Freudian psychology and other forms of psychological study to criticism; and the place of aesthetic judgment in practical reasoning in the conduct of everyday affairs.

Aeterni Patris, an encyclical issued by Pope Leo XIII on Aug. 4, 1879, which strengthened the position of the philosophical system of the medieval Scholastic philosopher-theologian St. Thomas Aquinas and soon made Thomism the dominant philosophical viewpoint in Roman Catholicism.

Aethelbald, also spelled **ETHELBALD**, name of Anglo-Saxon rulers grouped below by country and indicated by the symbol ●.

MERCIA

● **Aethelbald** (d. 757, Seckington, Eng.), king of the Mercians from 716, who became the chief king of a confederation including all the Anglo-Saxon kingdoms between the River Humber and the English Channel. His predominance was made possible by the death of the strong king Wihtried of Kent (725) and the abdication of Ine of Wessex (726). During Aethelbald's reign, London passed from East Saxon to Mercian control. Although generous to the church, he was rebuked in a letter (746 or 747) from Boniface and other Anglo-Saxon missionary bishops in Germany for his loose living and his violation of ecclesiastical prerogatives. In 749 he freed churches from all public financial responsibilities except bridge repair and fortress building. His charters use the regnal style "king of Britain." He was murdered by his retainers.

WESSEX

● **Aethelbald** (d. 860), king of Wessex (from 855/856), the son of Aethelwulf, with whom he led the West Saxons to victory against the Danes at Aclea (851). He reportedly rebelled against his father either before (855) or on the latter's return from Rome in 856 and deprived him of Wessex, which he ruled until his death. On his father's death in 858 he married his stepmother, Judith.

Aethelberht, also spelled **ETHELBERHT**, or **AEDILBERCT**, name of Anglo-Saxon rulers grouped below by country and indicated by the symbol ●.

KENT

● **Aethelberht I** (d. Feb. 24, 616), king of Kent (560–616) who issued the first extant code of Anglo-Saxon laws, a code that established the legal position of the clergy and many secular regulations. Aethelberht's marriage to Bertha (or Berhta), daughter of Charibert, king of Paris, and a Christian, may account for the tolerant reception that he accorded Augustine and other missionaries dispatched to Kent by Pope Gregory I the Great in 597. Aethelberht gave them a dwelling at Canterbury and later accepted Christianity himself, though he did not force it on his subjects. According to the English historian and theologian Bede, his kingdom included all of England south of the Humber, but probably only at the end of his reign.

WESSEX

● **Aethelberht** (d. 865/866), king of the West Saxons, or Wessex, who succeeded to the sub-kingdom of Kent during the lifetime of his father Aethelwulf and retained it until the death of his elder brother Aethelbald in 860, when he became sole king of Wessex and Kent, the younger brothers Aethelred and Alfred renouncing their claim. He ruled these kingdoms for five years. His reign was marked by two serious attacks from the Danes, who destroyed Winchester in 860, in spite of the resistance of the ealdormen Osric and Aethelwulf. In 865 the Danes ravaged Kent.

Aethelflaed, also spelled **ETHELFLEDA**, or **AELFLED**, also called **LADY OF THE MERCIANS**

(d. June 12, 918, Tamworth, Eng.), Anglo-Saxon ruler of Mercia in England.

The daughter of King Alfred the Great, she helped her brother Edward the Elder, king of the West Saxons (reigned 899–924), in conquering the Danish armies occupying eastern England. Aethelflaed became the effective ruler of Mercia some years before the death (911) of her husband, Aethelred, ealdorman of the Mercians. While Edward fortified (910–916) the southeast Midlands, Aethelflaed was building fortresses around Mercia. By 917 she and Edward were ready to launch a massive joint assault on the Danish positions. Aethelflaed quickly captured Derby, and in 918 she occupied Leicester, but she died before the campaign was successfully completed. Edward then claimed his sister's kingdom and completed the subjugation of the Danes. Because Aethelflaed had extended her influence into Wales and Northumbria, Edward was able to assert his authority over these regions as well. Thus, almost all of England came under his control.

Aethelfrith, also spelled **ETHELFRITH** (d. 616), king of Bernicia (from 592/593) and of Deira, which together formed Northumbria.

Aethelfrith was the son of Aethelric and grandson of Ida, king of Bernicia, and his reign marks the true beginning of the continuous history of a united Northumbria and, indeed, of England. He married Acha, daughter of Aelle, king of Deira, whom his father succeeded in 588 or 590, expelling Aelle's son Edwin.

In 603 Aethelfrith repelled the attack of Aidan, king of the Dalriada Scots, at Deagsatan, defeating him with great loss. The appearance of Hering, son of Aethelfrith's predecessor, on the side of the invaders seems to indicate family quarrels in the royal house of Bernicia. Later in his reign, probably in 614, he defeated the Welsh in a great battle at Chester and massacred the monks of Bangor who were assembled to aid the Welsh by prayers. This war may have been due partly to Aethelfrith's persecution of Edwin, but it had a strategic importance in the separation of the North Welsh from the Strathclyde Britons. In 616 Aethelfrith was defeated and slain at the River Idle by Raedwald, king of East Anglia, whom Edwin had persuaded to take up his cause.

Aetheling, also spelled **ATHELING**, or **ETHELING**, in Anglo-Saxon England, generally any person of noble birth. Use of the term was usually restricted to members of a royal family, and in the Anglo-Saxon Chronicle it is used almost exclusively for members of the royal house of Wessex. It was occasionally used after the Norman Conquest to designate members of the royal family—e.g., William the Aetheling, son and heir of King Henry I.

The earlier part of the word formed part of the name of several Anglo-Saxon kings—e.g., Aethelbert, Aethelwulf, Aethelred—and was used obviously to indicate their noble birth.

Aethelred, also spelled **ETHELRED**, name of Anglo-Saxon rulers grouped below by country and indicated by the symbol ●.

MERCIA

● **Aethelred** (d. 716, Bardney, Eng.), king of Mercia, who was a benefactor of many churches in his several provinces and at last retired to a monastery.

He succeeded his brother Wulfhere (*q.v.*) in 674 and early on spent most of his time in warfare. In 676 he ravished Kent, taking Rochester. In 679, in a battle on the banks of the Trent, he defeated the Northumbrians, taking the province of Lindsey. Aelfwine, the brother of Ecgrith, king of Northumbria, was slain on this occasion, but at the intervention of Theodore, archbishop of Canterbury, Aethelred agreed to pay a wergild for the

Northumbrian prince and so prevented further hostilities. Aethelred abdicated in 704, choosing his nephew Cenred as his successor. He then became abbot of Bardney.

WESSEX

● **Aethelred I** (d. April 871), king of Wessex and of Kent (865/866–871), son of Aethelwulf of Wessex.

By his father's will he should have succeeded to Wessex on the death of his eldest brother Aethelbald (d. 860). He seems, however, to have stood aside in favour of his brother Aethelberht, king of Kent, to whose joint kingdoms he succeeded in 865 or 866. Aethelred's reign was one long struggle against the Danes. In the year of his succession a large Danish force landed in East Anglia, and in the year 868 Aethelred and his brother Alfred went to help Burgred of Mercia against this host, but the Mercians soon made peace with their foes. In 871 the Danes encamped at Reading, where they defeated Aethelred and his brother, but later in the year the English won a great victory at a place called "Aescdesun." Two weeks later they were defeated at Basing but partially retrieved their fortune by a victory at "Maeretun" (perhaps Marden in Wiltshire), though the Danes held the field. In the Easter of this year Aethelred died, perhaps of wounds received in the wars against the Danes, and was buried at Wimborne.

● **Aethelred II**: see Ethelred II.

Aethelred of RIEVAULX, SAINT: see Aelred of Rievaulx, Saint.

Aethelstan: see Athelstan; Guthrum.

Aethelweard, also spelled **ETHELWERD** (d. 998?), English chronicler and ealdorman of the western provinces (probably the whole of Wessex), a descendant of King Alfred's brother Aethelred. He wrote, in elaborate and peculiar Latin, a chronicle for his continental kinswoman, Matilda, abbess of Essen. In the printed version of the text, the chronicle stops in 975, but fragments of the burned manuscript show that it continued into the reign of Aethelred (978–1016). Up to 894 it is based on a version of the Anglo-Saxon Chronicle, more ancient than any now surviving; thereafter it is an independent authority. Aethelweard was the patron of Aelfric the homilist. The last certain mention of him is in 998.

Aethelwulf, also spelled **ETHELWULF** (d. 858), Anglo-Saxon king in England, the father of King Alfred the Great. As ruler of the West Saxons from 839 to 856, he allied his kingdom of Wessex with Mercia and thereby withstood invasions by Danish Vikings.

The son of the great West Saxon king Egbert (ruled 802–839), Aethelwulf ascended the throne four years after the Danes had begun

Aethelwulf, coin, 9th century; in the British Museum
Peter Clayton

large-scale raids on the English coast. In 851 he scored a major victory over a large Danish army at a place called Aclea in Surrey. Aethelwulf then married his daughter to the Mercian king Burgred (853), and in 856 he himself married the daughter of Charles II the Bald, king of the West Franks. Aethelwulf was deposed by a rival faction upon his return from a pilgrimage to Rome in 856, but he continued to rule Kent and several other eastern provinces until his death. In addition to Alfred the Great (ruled 871–899), three of Aethelwulf's other sons became kings of Wessex.

aether (physics): *see* ether.

Aethra, in Greek mythology, daughter of King Pittheus of Troezen, who married her to Aegeus, king of Athens. She became mother of Theseus by Aegeus or by Poseidon, who had ravished her in Troezen. (The two versions may reflect the ancient confusion of Aegeus with the sea god—*e.g.*, the Aegean Sea.)

Later she guarded Helen after she had been stolen from Sparta by Theseus; in retribution Aethra was carried to Sparta by the Dioscuri to be Helen's slave, thereafter following her to Troy. Freed after the 10 years' war, Aethra later killed herself in grief for her son.

Aëtius (fl. 4th century), Syrian bishop and heretic who, during the theological controversies over the Christian Trinity, founded the extreme Arian sect (*see* Arius) of the Anomoeans (*q.v.*). His name became a byword for radical heresy.

Originating probably near Antioch, Aëtius studied there under Arian masters while supporting himself as a goldsmith and a physician, rendering gratuitous service to the poor. As a student he wandered from one Syrian school to another and cultivated an acute facility in Aristotelian dialectical argument. Identifying theology with formal logic, Aëtius methodically provoked his disputants and then reduced them to silence with extremely stringent and subtle arguments. A contemporary Syrian theologian, Epiphanius, records that Aëtius expounded his doctrine in 300 close-knit syllogisms, 47 of which still exist.

Ordained a deacon at Antioch to teach Christian doctrine, Aëtius is said to have scandalized the faithful with his contention that from the aspect of divinity the Son was a totally different substance from the Father and was created from nothing. For this offense he was excommunicated. He then sought refuge with fellow Arians in Alexandria, Egypt, where he trained a disciple, Eunomius, also a bishop. Recalled to Antioch by the sympathetic Arian bishop Eudoxius, Aëtius nevertheless alienated the general membership of Arians by his extreme views and was condemned by some of his own heterodox colleagues at the church Council of Seleucia, near Antioch, in 359. The Arianizing Roman emperor Constantius II (337–361) thereupon exiled him to the wilderness of northeast Asia Minor. In 361 Aëtius was made a bishop by the emperor Julian the Apostate but never exercised territorial jurisdiction; he died in Constantinople *c.* 366.

Aetius, Flavius (b. Durostorum, Moesia Inferior—d. Sept. 21, 454), Roman general and statesman, the dominating influence over Valentinian III (emperor 425–455).

The son of a *magister equitum* ("master of the cavalry"), Aetius in his youth spent some time as a hostage with the Visigothic leader Alaric, and later with the Huns, thus acquiring valuable knowledge of the leading tribal peoples of his day. From 423 to 425 he supported the usurper John in Italy. After successful battles in Gaul against the Visigoths and the Franks, Aetius was appointed in 430 *magister utriusque militiae* ("master of both services"). On the death of his rival Bonifacius in 432, he quickly gained almost complete control over the young emperor Valentinian III. Aetius

thereby became the dominant personality in the Western Empire. He was consul three times (432, 437, 446), a unique distinction for a commoner, and it was said that envoys from the provinces were no longer sent to the Emperor, but to Aetius. He was given the title of patrician in 433, and for several years thereafter fought continuously and successfully in Gaul against rebels and hostile tribes. In 435–437 he mercilessly destroyed the Burgundian kingdom at Worms (an event remembered in the *Nibelungenlied*, a German epic poem written *c.* 1200) and in 437–439 checked the Visigoths at Toulouse. He returned to Italy in 440. In 451 he joined with the Visigoths in defeating Attila in the Battle of the Catalaunian Plains, but when Attila invaded Italy in the following year, Aetius could do little to oppose him. At the height of his power Aetius was murdered by Valentinian at the instigation of Petronius Maximus, the future emperor.

Aetna (volcano, Sicily): *see* Etna (Mount).

Aetolia, also spelled AITOLIA, district of ancient Greece, located directly north of the Gulf of Corinth and bounded by Epirus (north), Locris (east), and Acarnania (west). In modern Greece, Aetolia is linked with Acarnania in the department of Aitolía kai Akarnanía. Aetolia, particularly its cities Pleuron and Calydon, figures prominently in early legend. During the great migrations (1200–1000 BC) most of the region's early inhabitants were displaced; those tribes that remained still lived in open villages under petty kings in the 5th century BC and were dedicated to piracy. Their archers and slingers, however, repulsed an Athenian invasion in 426 BC, and by 367 they had organized into a federal state, the Aetolian League. In 27 BC Augustus incorporated Aetolia into the Roman province of Achaëa. In the 15th century AD it passed successively under the rules of Albania, Venice, and, in 1450, Turkey. In the War of Greek Independence (1821–29), it was the scene of fierce fighting, notably the sieges of Mesolóngion (Missolonghi).

Aetolia and Acarnania, Modern Greek AITOLÍA KAI AKARNANÍA, *nomós* (department)

The Achelous River, Aetolia and Acarnania *nomós*, Greece

Dimetri Papadimos

in west central Greece, with an area of 2,103 sq mi (5,447 sq km); the capital of the department is Mesolóngion on the Patraikós Kólpos (gulf) in Aetolia. The *nomós* produces tobacco, wheat, oats, wine, and caviar; some livestock is raised. Its chief centres

are Agrínion, Mesolóngion, Amfilokhía, and Návaktos, the last at the mouth of the Gulf of Corinth.

Most of Acarnania is a large, irregular peninsula, the base being formed by a line of lakes and lagoons from Amfilokhía on the Amvrakikós Kólpos (ancient Ambracia), its northern limit, to Mesolóngion; the western limit is the Ionian Sea, along which the barren, limestone Akarnaniká Óri (mountains) predominate. In ancient Greece the Achelous River was the boundary with Aetolia; today its fertile basin, together with that of the Évinos Potamós (river), is the agricultural and population centre of the *nomós*, hinging on Agrínion and Mesolóngion. Límni (lake) Trikhonís supports a fishing (caviar) industry. In contrast, northern and eastern Aetolia is a complex of almost barren limestone peaks rising in the frontier ranges of Timfristós, Oxiá, and Vardhoúsia to more than 7,000 ft (2,100 m); but agriculture is supported. Pop. (1991) *nomós*, 228,180.

Aetolian League, federal state or "sympolity" of Aetolia, in ancient Greece. Probably based on a looser tribal community, it was well-enough organized to conduct negotiations with Athens in 367 BC. It became by *c.* 340 one of the leading military powers in Greece. Having successfully resisted invasions by Macedonia in 322 and 314–311, the league rapidly grew in strength during the ensuing period of Macedonian weakness, expanding into Delphi (centre of the Amphictyonic Council) and allying with Boeotia (*c.* 300).

It was mainly responsible for driving out a major Gallic invasion of Greece in 279. About 270 it gained an alliance with Antigonos Gonatas, king of Macedonia, which lasted until his death (240 or 239). In 245 the league confirmed its influence in central Greece by the defeat of the Boeotians at Chaeronea. By the end of the 3rd century the league's power extended to Cephallenia and several Aegean islands; soon afterward, however, it lost ground to Macedonia.

From 239 to 229 the league joined Achaëa against Demetrius II of Macedonia, but the provinces of Thessaly that they seized on the death of Demetrius were promptly recovered by his successor, Antigonos Doson. Meanwhile, eastern Phocis and Boeotia detached themselves from the confederacy. Then Aetolian raids on Achaean territory (220) led to a war with Philip V of Macedonia and many members of Antigonos Doson's Greek League. Philip expelled the Aetolians from the Peloponnese and marched into Aetolia, sacking the federal capital of Thermum. He made peace with Aetolia in 217, but in 211 and 200–197 the Aetolians fought with Rome against Philip. When their cavalry prevailed at Cynoscephalae (197), the Romans handed over Dolopia, Phocis, and Eastern Locris to the Aetolians but withheld their former Thessalian possessions. Resentful, Aetolia attempted to fight Rome (192), soliciting the support of the Seleucid king Antiochus III; but Aetolian forces failed to hold Thermopylae and brought on the defeat of Antiochus at Magnesia. The Romans refused all compromises and in 189 BC restricted the league to Aetolia proper and assumed control of its foreign relations. The importance of the league as an independent state was at an end, and by the time of Sulla its functions were purely nominal.

The federal constitution of Aetolia, probably a model for that of the Achaean League, provided for two main ruling bodies: a primary assembly, composed of all adult male citizens and presided over by the annually elected general (*stratēgos*), which met at Thermum to elect officials and at various cities to transact other business; and a council (*boulē*)

or *synedrion*), to supervise administration, in which cities were represented in proportion to their populations. *Apoklētoi*, a small group of at least 30 who were assigned essential duties in wartime, assisted the *stratēgos*, who had complete control in the field. Leadership within the league was always kept in Aetolian hands, since the more distant states, which were linked to the confederacy by isopolity (potential citizenship), had full civil, but no political, rights.

Afan (Wales): see Port Talbot (district).

Afanasev, Aleksandr Nikolayevich (b. July 11 [July 23, New Style], 1826, Boguchar, Voronezh province [now in Russia]—d. Sept. 23 [Oct. 5], 1871), historian and scholar of Russian folklore known for his compilation of Russian folktales.

Afanasev studied law at Moscow University. His early work included a study of Russian satirical journals of the late 18th century (1859) and commentaries on contemporary Russian literature. During the period 1866–69 he brought out his *The Slav's Poetical Views of Nature* in three volumes, which provided the first synthesis of the theories of the Mythological school, a 19th-century Romantic literary movement that drew its inspiration from folklore. The Mythological school was grounded in the aesthetic philosophy of F.W. von Schelling and the brothers August Wilhelm and Friedrich von Schlegel, who saw in mythology a form of “natural religion.”

Afanasev is best remembered for his *Narodnye russkie skazki* (“Russian Popular Fairy Tales”), compiled between 1855 and 1864 and including over 600 tales. His *Narodnye russkie legendy* (“Russian Popular Legends”) was banned by the Soviet censor until 1914, and his *Lyubimye Skazki* (“Beloved Fairy Tales”) collection, which included children’s stories satirizing landowners and members of the clergy, was originally published anonymously in Geneva.

Afar, Amharic ADAL, Arabic DENAKIL, a people of the Horn of Africa who speak Saho, a language of the Eastern Cushitic branch of the Hamito-Semitic family. They live in northeastern Ethiopia and in Djibouti, where, with the Issas, they are the dominant people. It is thought that the Afars were the first of the present inhabitants of Ethiopia to elaborate their pastoral life into full-scale nomadism, descending from the highlands of southeast Ethiopia and migrating to the stony desert area of Denakil, the name used by surrounding tribes to identify them.

The Afars’ subsistence economy depends on livestock, especially goats, some camels, and, more rarely, cattle. There are some exceptions, such as fishermen in the coastal areas and agriculturalists in the Assau oasis. The Afars also mine and export salt.

Proud, highly individualistic, and much feared by outsiders, the Afars are organized in patrilineal kin groups. Cooperation in larger units such as subtribe or tribe is induced only by warfare against other tribes or neighbouring peoples. Two distinct classes, the Asaimara (“Red Men”) and the Adoimara (“White Men”), constitute the landowning, titled nobles and the lower-class tenants, respectively.

Age-set societies exist wherein people of the same age group are subject to a chief who settles disputes among them. Beyond this, legal procedure consists of the rules for compensation for adultery—a system of fines to the

Afar nomads in Ethiopia
Victor Englebert—De Wys Inc

injured husband or father—and revenge for homicide. Blood feuds are a principal, perennial, and costly occupation, except among the few sultanates, notably at Assau, in which despotic law is backed up with an army.

The Afars are nominally Muslim, but even a slight degree of orthodoxy in practice is attained only in the coastal regions and in the sultanates. The nomads of the interior are lax, and, though they hold Islām in great esteem, their own practices are imbued with the earlier Cushitic religion.

Afars and Issas, French Territory of the (Africa): see Djibouti.

affections, doctrine of the, also called DOCTRINE OF AFFECTS, German AFFEKTENLEHRE, theory of musical aesthetics, widely accepted by late Baroque theorists and composers, that embraced the proposition that music is capable of arousing a variety of specific emotions within the listener. At the centre of the doctrine was the belief that, by making use of the proper standard musical procedure or device, the composer could create a piece of music capable of producing a particular involuntary emotional response in his audience.

These devices and their affective counterparts were rigorously cataloged and described by such 17th- and 18th-century theorists as Athanasius Kircher, Andreas Werckmeister, Johann David Heinichen, and Johann Mattheson. Mattheson is especially comprehensive in his treatment of the affections in music. In *Der vollkommene Capellmeister* (1739; “The Perfect Chapelmaster”), he notes that joy is elicited by large intervals, sadness by small intervals; fury may be aroused by a roughness of harmony coupled with a rapid melody; obstinacy is evoked by the contrapuntal combination of highly independent (obstinate) melodies. Carl Philipp Emanuel Bach (1714–88) and the Mannheim school were exponents of the doctrine.

The contemplation of the emotional aspect of music is not limited to the Baroque era but may be found throughout the history of music. It is an essential part of ancient Greek musical theory (the doctrine of ethos), it takes on a particular importance in the Romantic movement of the 19th century, and it also occurs in such non-Western music as the Indian raga. It was in the Baroque era, however, that theorists, influenced by the Enlightenment’s tendency toward encyclopaedic organization of all knowledge, attempted to delineate music into affective categories.

affective disorder, mental disorder characterized by dramatic changes or extremes of mood. Affective disorders may include manic (elevated, expansive, or irritable mood with

hyperactivity, pressured speech, and inflated self-esteem) or depressive (dejected mood with disinterest in life, sleep disturbance, agitation, and feelings of worthlessness or guilt) episodes, and often combinations of the two. Persons with an affective disorder may or may not have psychotic symptoms such as delusions, hallucinations, or other loss of contact with reality.

In manic-depressive disorders, periods of mania and depression may alternate with abrupt onsets and recoveries. Depression is the more common symptom, and many patients never develop a genuine manic phase, although they may experience a brief period of overoptimism and mild euphoria while recovering from a depression. The most extreme manifestation of mania is violence against others, while that of depression is suicide. Statistical studies have suggested a hereditary predisposition to the disorder, which commonly appears for the first time in young adults.

Manic-depressive disorders were described in antiquity by the 2nd-century Greek physician Aretaeus of Cappadocia and in modern times by the German psychiatrist Emil Kraepelin. The current term is derived from *folie maniaco-mélancholique*, which was introduced in the 17th century. See also manic-depressive psychosis.

affective fallacy, according to the followers of New Criticism, the misconception that arises from judging a poem by the emotional effect that it produces in the reader. The concept of affective fallacy is a direct attack on impressionistic criticism, which argues that the reader’s response to a poem is the ultimate indication of its value.

Those who support the affective criterion for judging poetry cite its long and respectable history, beginning with Aristotle’s dictum that the purpose of tragedy is to evoke “terror and pity.” Edgar Allan Poe stated that “a poem deserves its title only inasmuch as it excites, by elevating the soul.” Emily Dickinson said, “If I feel physically as if the top of my head were taken off, I know that is poetry.” Many modern critics continue to assert that emotional communication and response cannot be separated from the evaluation of a poem. See also New Criticism.

Affenkappelle ware (German: “Monkey Orchestra”), a series of figures created by the Meissen porcelain factory in Saxony (now in Germany) about 1747 and imitated later. Believed to be a parody of the Dresden Court Orchestra, the set was modeled by the Ger-

Hurdy-gurdy-playing monkey derived from one of Johann Joachim Kändler’s Affenkappelle figures, Korniloff factory, St. Petersburg, mid-19th century; in the Victoria and Albert Museum, London

By courtesy of the Victoria and Albert Museum, London

man sculptors Johann Joachim Kändler and Peter Reinicke after fanciful *singerie* (monkeys in human costume) engravings by the French artists Jean-Antoine Watteau and Christophe Huet. Each musician, dressed in delicately coloured formal 18th-century costume, stands on a gilded scrollwork base of leaves and flowers; a male monkey conducts, four females sing, and each of the others plays a musical instrument. In 1753 Meissen supplied the Marquise de Pompadour with a "concert" of 19 players, which is the largest known surviving group, though there is evidence that a whole set might have numbered 25. The figures belong to the most brilliant period of Meissen porcelain, and Kändler's mastery of expression clearly transcends mere caricature. Among the many imitations that exist, most far less elegant than the original, are a set of five musical monkeys that were made in Chelsea (London) and sold there in 1756; figures from Fürstenberg (Germany) and Derby (England); and, 100 years later, a spirited hurdy-gurdy-playing monkey made by the Russian Korniloff factory and directly inspired by one of Kändler's figures.

affenpinscher, also called **MONKEY TERRIER**, breed of toy dog known since the 17th century. The affenpinscher stands 9.5 to 11.5 inches (24 to 29 cm) and weighs 7 to 8 pounds (3 to 3.5 kg). A sturdily built, terrier-like dog, it has small, erect ears, round black eyes, and a short, docked tail. Its wiry, preferably black coat is short on parts of the body but longer on the legs and face, where it produces the monkey-like expression for which the breed is named (*Affen* being the German for "monkeys").

affidavit, a written statement of fact made voluntarily, confirmed by the oath or affirmation of the party making it, and signed before an officer empowered to administer such oaths.

affirmation, in law, a promise by a witness concerning testimony, allowed in place of an oath (*q.v.*) to those who cannot, because of conscience, swear an oath. Members of the Society of Friends (Quakers), Jehovah's Witnesses, and other persons who have objections against taking an oath are allowed to make affirmation in any manner they may declare to be binding upon their consciences in confirmation of the truth of their testimony.

affirmative action, in the United States, an active effort to improve employment or educational opportunities for members of minority groups and women. Affirmative action began as a government remedy to the effects of historical discrimination against such groups and has consisted of policies, programs, and procedures that give preferences to minorities and women in job hiring, admission to institutions of higher education, the awarding of government contracts, and other social benefits. The typical criteria for affirmative action are race, disability, gender, ethnic origin, and age.

Affirmative action was initiated by President Lyndon Johnson's administration in order to improve opportunities for African Americans while civil-rights legislation was dismantling legal discrimination. The federal government began to institute affirmative action policies under the landmark Civil Rights Act in 1964 and an executive order in 1965. Businesses receiving federal funds were prohibited from using aptitude tests and other criteria that tended to discriminate against African Americans. Subsequently, affirmative action was broadened to cover women and Native Americans, Hispanics, and other minorities and was extended to colleges and universities and state and federal agencies.

By the late 1970s the use of racial quotas and minority set-asides led to court challenges of affirmative action as a form of "reverse discrimination." The first major challenge was *Regents of the University of California v.*

Bakke (1978), in which the United States Supreme Court ruled (5-4) that quotas may not be used to reserve places for minority applicants if white applicants are denied a chance to compete for those places. Although the court outlawed quota programs, it allowed colleges to use race as a factor in making admissions decisions. Two years later the court upheld a 1977 federal law requiring that 10 percent of funds for public works be allotted to qualified minority contractors.

The Supreme Court began to impose significant restrictions on race-based affirmative action in 1989. In several decisions that year, the court gave greater weight to claims of reverse discrimination, outlawed the use of minority set-asides in cases where prior racial discrimination could not be proved, and placed limits on the use of racial preferences by states that were stricter than those it applied to the federal government. In *Adarand Constructors v. Peña* (1995), the court ruled that federal affirmative-action programs were unconstitutional unless they fulfilled a "compelling governmental interest."

Opposition to affirmative action in California culminated in the passage in 1996 of the California Civil Rights Initiative (Proposition 209), which prohibited all government agencies and institutions from giving preferential treatment to individuals based on their race or sex. The Supreme Court effectively upheld the constitutionality of Proposition 209 in November 1997 by refusing to hear a challenge to its enforcement. Legislation similar to Proposition 209 was subsequently proposed in other states and was passed in Washington in 1998. The Supreme Court also upheld a lower-court ruling that struck down as unconstitutional the University of Texas' affirmative-action program, arguing in *Hopwood v. University of Texas Law School* (1996) that there was no compelling state interest to warrant using race as a factor in admissions decisions. In later years there were further legislative and electoral challenges to affirmative action in many parts of the country. In 2003 the U.S. Supreme Court issued two decisions involving the University of Michigan and its law school. The court reaffirmed the constitutionality of affirmative action but struck down the university's undergraduate admissions policy—which awarded points to prospective students based on race—ruling that race could not be the preeminent factor in such decisions.

affix, a grammatical element combined with a word, stem, or phrase to produce derived and inflected forms. There are three types of affixes: prefixes, infixes, and suffixes. A prefix occurs at the beginning of a word or stem (*submit*, *pre-determine*); a suffix at the end (*wonderful*, *depend-ent*); and an infix occurs in the middle. English has no infixes, but they are found in American Indian languages, Greek, Tagalog, and elsewhere. Examples of English inflectional suffixes are illustrated by the *-s* of "cats," the *-er* of "longer," and the *-ed* of "asked." See also morphology.

Affleck, Thomas (b. 1745, Aberdeen, Aberdeenshire, Scot.—d. 1795, Philadelphia, Pa., U.S.), American cabinetmaker considered to be outstanding among the Philadelphia craftsmen working in the Chippendale style during the 18th century. Works attributed to Affleck, showing the Marlborough-style leg (a straight, grooved type having a block foot) and elaborate carving characterizing his work, are in the Philadelphia Museum of Art; the Boston Museum of Fine Arts; and the Metropolitan Museum of Art, New York City.

Affre, Denis-Auguste (b. Sept. 28, 1793, Saint-Rome-de-Tarn, France—d. June 27, 1848, Paris), prelate, archbishop of Paris, and opponent of King Louis-Philippe, remembered for his brave attempt to end the June 1848 riots, in which he was accidentally slain.

Affre was ordained a priest in 1818 and became a Sulpician and a teacher of theology in 1819. He successively became vicar-general of the French dioceses of Luçon (1821), Amiens (1823), and Paris (1834) and in 1840 was named archbishop of Paris.

Affre, lithograph after a drawing by Krinowski, 19th century

By courtesy of the Bibliothèque Nationale, Paris

By 1827 Affre had become well known for his clerical reforms. His differences with Louis-Philippe began in 1843, and a long polemical debate over secondary education ensued in which Affre particularly defended academic freedom. He welcomed the establishment of the Second Republic in 1848 and the overthrow of Louis-Philippe on February 24 of that year. On the following June 23 the Parisian workers rose in an insurrection known as the June Days, which ended in bloodshed that grieved Affre. Led to believe that his personal intervention might restore order, he entered the barricades in the workers' Saint-Antoine district on June 25. He had scarcely begun to speak when confused firing broke out. Struck by a stray bullet, he died two days later.

Among Affre's several canonical and philosophical works are *Essai historique et critique sur la suprématie temporelle du pape* (1829; "Historical Essay on the Temporal Supremacy of the Pope") and *Introduction philosophique à l'étude du Christianisme* (1845; "Philosophical Introduction to the Study of Christianity"). He also edited the periodical *La France chrétienne*, which he helped found.

affreightment, contract for carriage of goods by water, "freight" being the price paid for the service of carriage. Such contracts are important to the world economy. See also charter party; lading, bill of.

affricate, also called **SEMPLOSIVE**, a consonant sound that begins as a stop (sound with complete obstruction of the breath stream) and concludes with a fricative (sound with incomplete closure and a sound of friction). Examples of affricates are the *ch* sound in English "chair," which may be represented phonetically as a *t* sound followed by *sh*; the *j* in English "jaw" (a *d* followed by the *zh* sound heard in French "jour" or in English "azure"); and the *ts* sound often heard in German and spelled with *z* as in "nazi."

Afghan carpet, stout, long-wearing floor covering handwoven by the Afghan tribe of Turkmens of Turkmenistan and Afghanistan. Afghan carpets are generally all wool or goat hair and are made with the Senna (Sehna) knot. Usually in dull colors, these carpets show less white than the products of other Turkmens. Their gul, or basic tribal motif, is a large, parti-coloured, scalloped octagon or near octagon, full of forms like arrowheads or trilobed figures that resemble shamrocks. The guls alternate with other motifs, usually clusters of dark blue, connected stars. The border may be a notched zigzag stripe.

A few "golden" Afghans, with a moderate use of yellow and orange, offer a contrast to their somber fellows. Small rugs are rarely

Octagonal motif, detail of an Afghan carpet from Russian Turkistan, late 19th century; in the Raoul E. Tschebull Collection

Collection of Raoul E. Tschebull photograph, Otto E. Nelson

seen except among an aniline-dyed recent Afghanistan production.

Afghan hound, breed of dog developed as a hunter in the hill country of Afghanistan. It was once thought to have originated several thousand years ago in Egypt, but there is no evidence for this theory. It was brought to Europe in the late 19th century by British soldiers returning from the Anglo-Afghan Wars.

The Afghan hound hunts by sight and, in its native Afghanistan, has been used to pursue leopard and gazelle. The animal is adapted to rough country by the structure of its high, wide hipbones. A long-legged dog, the Afghan stands 61 to 71 cm (24 to 28 inches) high and

Afghan hound
Sally Anne Thompson

weighs from 23 to 27 kg (50 to 60 pounds). It has floppy ears, a long topknot, and a long, silky coat of various but usually solid colours. It is especially heavy on the forequarters and hindquarters and carries its slim tail in an upright curve.

Afghan interlude (1722–30), the period in Iranian history that began with the

Afghan conquest of Iran and ended with the defeat and death of the Afghan ruler Ashraf.

In 1722 Maḥmūd, an Afghan notable and former vassal of the Ṣafavids, attacked and captured Eṣfahān, the Ṣafavid capital in Iran. The capture of Eṣfahān marked the eclipse of the Ṣafavid dynasty. Maḥmūd proclaimed himself ruler of Iran in 1722, and in 1723 he put to death Shāh Solṭān Ḥoseyn, the former Ṣafavid ruler. Maḥmūd consolidated his gains in southern and southeastern Iran, and in 1725 he was succeeded by his cousin Ashraf. Ashraf attempted to conciliate the Iranians, but was always regarded as an invader.

In the meantime, Peter I the Great of Russia, who had long contemplated establishing a trade route to India via the countries east of the Caspian Sea, invaded the north of Iran in 1722, ostensibly because of losses suffered by some Russian merchants during a tribal uprising there. At this the Ottomans moved into western and northwestern Iran to prevent the Russians from taking over Iranian territory next to Turkey. The confrontation threatened to blow up into war, but a settlement was negotiated in 1724. Russia held much of Iran's north and the Ottomans the west, with the northwestern regions partitioned between them; this was perhaps the first such imposition of precise boundaries by European powers on an Islāmic state. In the north, Ṭahmāsp II—the representative of the ousted Ṣafavid dynasty—controlled the provinces of Māzandarān and Gīlān. In 1727 Ashraf negotiated a treaty with the Ottomans, accepting their annexation of western Iran; in return the Ottomans recognized Ashraf as ruler of Iran. Also in 1727 Ṭahmāsp II was joined by Nādr Qolī Khān, a leader of the Afshār tribe. Nādr (later reigned in 1736–47 as Nādir Shāh) set out to expel the Afghans and to reunify the former Ṣafavid domains. A brilliant general, Nādr defeated the Afghans in a series of battles; Ashraf was killed, and Nādr installed Ṭahmāsp II as shah in Eṣfahān (1729). He continued operations against the Afghans until they were finally expelled from Iran in 1730.

Afghan War, in the history of Afghanistan, the internal conflict (1978–92) between anti-communist Muslim guerrillas and the Afghan communist government (aided in 1979–89 by troops of the Soviet Union). More broadly, the term also encompasses military activity within Afghanistan since 1992 involving domestic and foreign forces.

The roots of the war lay in the overthrow of the centrist government of President Mohammad Daud Khan in April 1978 by left-wing military officers. Power was thereafter shared by two Marxist-Leninist political groups, the People's (Khalq) Party and the Banner (Parcham) Party, which had earlier emerged from the People's Democratic Party of Afghanistan and had reunited in an uneasy coalition shortly before the coup. The new government, which had little popular support, forged close ties with the Soviet Union, launched ruthless purges of all domestic opposition, and began extensive land and social reforms that were resented by the devoutly Muslim and largely anticommunist population. Insurgencies arose against the government among both tribal and urban groups, and all of these—known collectively as the mujahideen (Arabic: *mujāhidūn*, "those who engage in jihad")—were Islāmic in orientation. These uprisings, along with internal fighting within the government, prompted the Soviets to invade the country in December 1979, toppling the presidency of People's leader Hafizullah Amin. The aim of the Soviet operation was to prop up their client state, headed by Banner leader Babrak Karmal, but the mujahideen rebellion grew, spreading to all parts of the country. The Soviets initially left the suppression of the rebellion to the Afghan army, but the latter remained largely ineffective.

The Afghan War quickly settled down into a stalemate, with about 100,000 Soviet troops controlling the cities, larger towns, and major garrisons. The mujahideen operated with relative freedom in the countryside and generally eluded attempts by Soviet troops to crush them. The Soviets attempted to eliminate the mujahideen's civilian support by bombing and depopulating the rural areas. These tactics sparked a massive flight from the countryside; by 1982 more than four million Afghans had sought asylum in Pakistan and Iran.

The mujahideen were fragmented into a handful of independent groups, and their military efforts remained uncoordinated. Their fighting ability improved, however, through experience and because of the large quantity of war matériel shipped to the rebels, via Pakistan, by the United States and other countries and by sympathetic Muslims abroad. (The mujahideen were able to neutralize Soviet air power, for example, with anti-aircraft missiles supplied by the United States.) In addition, a number of non-Afghan Muslim volunteers—termed "Afghan-Arabs," regardless of their ethnicity—joined the opposition.

The war in Afghanistan became a quagmire for the Soviet Union (some 15,000 Soviet troops were killed), and in 1988 the United States, Pakistan, Afghanistan, and the Soviet Union signed an agreement by which the Soviets would withdraw its troops. Afghanistan returned to nonaligned status. In April 1992 rebel groups and mutinous government troops overthrew the communist government.

A new coalition government proclaimed an Islāmic republic, but President Burhanuddin Rabbani, leader of a major mujahideen group, refused to leave office in accordance with the power-sharing arrangement reached by the new government. As a result other mujahideen groups surrounded and began to barrage the city with artillery and rockets. These attacks continued intermittently for several years as the countryside outside Kabul slipped into chaos. Partly as a response, the Taliban (*q.v.*; Persian: "Students"), a puritanical Islāmic group led by a former mujahideen commander, Mohammad Omar, emerged in 1994 and systematically seized control of the country, occupying Kabul in 1996. The Taliban—augmented by various Islāmic extremist groups sheltering in Afghanistan, many of whom were Afghan-Arabs from the earlier conflict—soon controlled all but a small portion of northern Afghanistan, which was held by a loose coalition of mujahideen forces known as the Northern Alliance. Fighting continued at a stalemate until 2001, when the Taliban refused demands by the U.S. government to extradite Saudi Arabian exile Osama bin Laden, the leader of an Islāmic extremist group, al-Qaeda, that had close ties with the Taliban and which stood accused of various acts of terrorism, including the September 11 attacks (*q.v.*). U.S. and allied forces, along with Northern Alliance fighters, drove the Taliban from power by early December.

It is estimated that some 1.5 million Afghans were killed before 1992. The casualty rate after 1992 is less precise. Many thousands were killed as a direct result of factional fighting, hundreds or thousands of prisoners and civilians were executed by their captors, and a large number of combatants—and some non-combatants—were killed during the U.S. offensive. Moreover, tens of thousands died of starvation or disease, and hundreds of thousands were killed or injured by the numerous land mines in the country. (Afghanistan remains one of the most heavily mined countries in the world.) The number of Afghan refugees living abroad fluctuated during the periods of fighting and reached a peak of some six million people in the late 1980s.

Afghan Wars (1839–42; 1878–80; 1919): see Anglo-Afghan Wars.

Afghanistan, officially ISLĀMIC REPUBLIC OF AFGHANISTAN, Persian JOMŪRĪ-YE ESLĀMĪ-YE AFGHĀN-ESTĀN, landlocked country of south-central Asia. The country extends about 600 miles (970 km) from north to south and about

Afghanistan

800 miles (1,300 km) from east to west, including the narrow Vākhān (Wākhān), a corridor 150 miles (241 km) long connecting Afghanistan with China to the northeast. Afghanistan is also bordered on the south and southeast by Pakistan, on the west by Iran, and on the north by Turkmenistan, Uzbekistan, and Tajikistan. The capital is Kabul. Area 249,347 square miles (645,807 square km). Pop. (2003 est.) 28,717,000.

A brief treatment of Afghanistan follows. For full treatment, see MACROPAEDIA: Afghanistan.

For current history and for statistics on society and economy, see BRITANNICA BOOK OF THE YEAR.

The land. Afghanistan has three distinctive regions. The northern plains are the major agricultural area. The southwestern plateau consists primarily of desert and semidesert landscape and includes the Rigestān desert. These regions are separated by the central highlands, an extension of the Himalayan mountain chain, which includes the Hindu Kush mountain range.

The Amu Darya (ancient Oxus River) forms a major portion of Afghanistan's northern border. The 715-mile- (1,150-kilometre-) long Helmand River provides most of the agricultural water needs of the southwestern plateau region. The central highlands have a subarctic climate (winters below freezing and cool, short summers), while most of the remainder is semiarid steppe (cold winters and hot summers) or desert. Annual precipitation varies from less than 3 inches (75 mm) in the southwestern desert to more than 50 inches (1,270 mm) in the Hindu Kush mountains.

Much of Afghanistan has thin, infertile mountain and desert soils, but the northern plains region has some of the best agricultural land in Asia. About one-eighth of the country's land area is arable, and approximately one-third of that area is irrigated. More than 80 percent of the country's crops are regularly produced on this irrigated area. Afghanistan has significant mineral resources, including huge deposits of high-grade iron ore, which remained virtually unexploited in the early 21st century. There are significant reserves of natural gas in the northern plains.

The people. About half the people are Pashtuns, and the rest are Tajiks, Uzbeks, and Hazāras. The Pashtuns mainly inhabit the southern and eastern parts of the country. Most Pashtuns are sedentary, though some remain nomadic. The Tajiks, mostly farmers and artisans, live predominantly in the northeast and in the west around Herāt. The Uzbeks are mainly farmers living north of the Hindu Kush. The Hazāras are nomads who inhabit the central mountains.

The official languages of the country are Pashto (Pushtu) and Persian (Dari), both

Indo-European languages. Pashto is spoken by about half the population. Dari is spoken by about a third of the population—mainly the Tajik, Hazāra, Chahar Aimak, and Kizilbash peoples. Uzbek and Turkmen both belong to the Altaic language family and are spoken in the north. Some three-fourths of the people are Sunnite Muslims, and about one-fourth are Shī'ite Muslims.

Afghanistan's birth and death rates are among the highest in the world. The country's population is relatively young—more than two-fifths of the people are less than 15 years of age—and life expectancy is short, 47 years for men and 45 years for women.

More than four-fifths of Afghanistan's population is rural, and nearly one-fifth is nomadic. Kabul is the largest city; other urban centres include Kandahār, Herāt, Mazār-e Sharif, Jalālābād, and Kondūz. Most urban settlements are situated along the major circular road of the country that runs from Kabul southwestward to Kandahār, then northwest to Herāt, northeast to Mazār-e Sharif, and south back to Kabul.

The economy. Afghanistan has an economy that is based largely on subsistence-level agricultural production. The gross national product (GNP) per capita is among the lowest in the world. The GNP originates primarily in agricultural output (about two-thirds of the total), followed by the combined category of mining, manufacturing, and public utilities, and then by trade.

Cereal grains, including wheat, corn (maize), rice, and barley, are grown on most of the cultivated land; vegetables, fruits, nuts, and cotton are also grown. Pistachios and other wild nuts grow in sufficient quantity to permit export. Arid rangeland and a small amount of good pasture occupy almost half of Afghanistan's total land area. Animal husbandry, yielding meat and dairy products for local consumption, as well as leather and skins and wool, is the predominant activity on these lands. Sheep and lambs are the most important livestock; cattle, goats, donkeys, horses, and camels are also raised. Almost three-fifths of the country's labour force is employed in agriculture and animal husbandry. Mining remains comparatively undeveloped.

Afghanistan's industrial products, based largely on agricultural and pastoral resources, include cotton textiles, wool, rayon, and acetate fabrics. Traditional handicrafts remain important; among them, woolen carpets are a major export.

Transportation is inadequately developed, and only about one-tenth of the road network is paved. There are two international airports and a number of airfields. The Afghan War, however, extensively damaged roads, bridges, airfields, and related structures, so that transportation, already poor, became worse.

Government and social conditions. The rule by Muslim militias and tribal groups after the overthrow of the communist government in 1992 ended when the Taliban (*q.v.*), the most extreme of these factions, was overthrown in 2001. A new constitution promulgated in 2004 established a government with a strong president, a bicameral legislature, and an independent judiciary.

Health care facilities are among the least adequate in the world because of a lack of equipment, medicine, and personnel. Only about one-third of Afghans are literate, though this proportion is much higher for men than women. Free and compulsory education was introduced in 1979 for children age 7 to 15, but subsequent warfare crippled the education system, and schooling for girls was discouraged by the Taliban. Since their ouster education conditions have improved incrementally.

History. Afghanistan is a meeting place of a variety of cultures. The area was part of the Persian Achaemenian Empire of Cyrus II the Great during the 6th century BC and was con-

quered in the 4th century BC by Alexander III the Great. After Alexander's death, part of the area came under Seleucid control and part under the Maurya empire of northern India. The Seleucid satrapy of Bactria (Balkh) forged its own kingdom and created a unique fusion of Greek and Indian cultures.

During the 2nd century BC, Afghanistan became part of the empire of the Kushān king Kaniška (c. AD 78–144). Hindu influence entered Afghanistan by way of the Hephthalites and the Sāsānians; during the rule of the Šaffārids, in about 870, Islām became firmly entrenched. The Mongols under Genghis Khan invaded Afghanistan in 1219. The dissolution of his empire resulted in the rise of independent principalities, and, until the 18th century, Afghanistan existed partly within the Mughal Empire of India and the Šafavid empire of Persia. In the early 1700s, the Persian leader Nādir Shāh took control of Afghanistan from the Mughals and was succeeded by his chief bodyguard, Aḥmad Khān Abdālī, who assumed the name Aḥmad Shāh Durrānī and is considered the founder of the country.

After Durrānī's death (1772), the empire foundered because of recurring tribal and family loyalties and the imperialist designs of Russia and Great Britain. The British sought to extend control over Afghanistan in a series of wars (1839–42; 1878–80; 1919), but they were unable to subdue the population, and Afghanistan retained its independence. From the 1930s a series of cautious and moderate governments under the Afghan monarchy brought political stability. Party politics became less stable in the 1970s, and a 1973 coup supported by the leftist Banner (Parcham) Party ended the monarchy and made Afghanistan a republic. The Banner and the People's (Khalq) Party joined to form the People's Democratic Party of Afghanistan (PDPA) in 1977, and together they seized control of the government in 1978. But friction arose between the two factions, and their Marxist reform programs sparked major rebellions in the countryside by 1979. Soviet troops invaded Afghanistan in 1979 to prevent their Afghan clients from being overthrown, but, in the war that followed, groups of Afghan rebels (*mujahideen*) seeking to overthrow the PDPA and expel the Soviets from their country were able to mount a successful guerrilla resistance. Millions of Afghan civilians fled into Pakistan and Iran to escape the destructive Soviet military campaigns against the *mujahideen*, who controlled most of the countryside, while the Soviet troops held the cities and those areas near local garrisons. After years of futile effort, the Soviet Union withdrew its troops from Afghanistan by 1989. In April 1992 several rebel factions succeeded in capturing Kabul, overthrowing the communist government, and establishing a provisional Islāmīc republic. Rival rebel groups fell out among themselves, however, and the country slowly slid into chaos. The Taliban seized power in 1996 and instituted a strict interpretation of Islāmīc law. The Taliban was overthrown in the aftermath of the September 11 attacks (2001) by a coalition of Afghan and foreign forces led by the United States.

'**Aflaq, Michel**, 'Aflaq also spelled AFLAK (b. 1910, Damascus, Syria, Ottoman Empire [now Syria]—d. June 23, 1989, Paris, Fr.), social and political leader who played a major role in the Arab nationalist movement during and after World War II (1939–45).

Aflaq first saw nationalism as centring upon the issue of imperialism; he especially resented the French, who after World War I (1914–18) held a mandate over Syria and Lebanon. In 1929–34, however, he studied at the University of Paris, and his political thinking took on a Marxist orientation. He came to believe that the nationalist struggle had to oppose both the native aristocracy and the foreign ruler. By 1940 he was ready to organize a political party, although he did not officially establish the Ba'th Party until 1946. 'Aflaq's role was that of teacher, theorist, and organizer; he seldom held public office.

'Aflaq's political thinking linked the themes of unity, freedom, and socialism. He saw the Ba'th Party's main goal, the unification of all the Arab states into a single socialist nation, as a regenerative process that would reform Arab society and as a vital creative force that would foster the emergence of a morally ideal society. He saw the final achievement of the Ba'th Party's goal as the product of a profound and nonviolent overthrow of the status quo.

Not until after 1955 did the Syrian political scene provide opportunity for the realization of 'Aflaq's dreams. With the conservative political parties fighting among themselves, 'Aflaq made a tactical alliance with the Communist Party and thus markedly increased the Ba'th's political influence. But he could not secure political dominance in the Syrian government, and he feared that the activities of the communists might provoke right-wing repressions. Accordingly, he initiated moves that led in 1958 to a merger of Syria and Egypt to form the United Arab Republic (U.A.R.).

'Aflaq had expected Gamal Abdel Nasser, the president of Egypt, to allow the Ba'th Party to dominate the Syrian province of the U.A.R. But by 1960 Nasser had reduced the Ba'th Party to political impotence by means of repressive policies. In 1961 Syria seceded from the U.A.R. 'Aflaq held himself and the Ba'th aloof from the ensuing violent criticism of Nasser and the conservative social and economic policies of the secessionist regime. That regime was overthrown in 1963, and a government dominated by the Ba'th took power. At the same time a Ba'thist group effected a coup in Iraq. 'Aflaq began to coordinate movements between the two governments and to hold unity talks with Nasser. He distrusted Nasser, however, and wanted to strengthen Ba'thist rule in Iraq and Syria by simply identifying with the Egyptian's enormous prestige. The talks brought no important results. 'Aflaq ceased to play an important role in Syrian politics after 1966 (when he moved to Lebanon) but continued to guide certain factions of the Ba'th Party in Iraq, Syria, and Lebanon.

Afonso, also spelled ALFONSO, name of rulers grouped below by country and indicated by the symbol •.

KONGO

• **Afonso I**, also called NZINGA MBEMBA (d. c. 1550), ruler of the Kongo Kingdom (in present Congo [Kinshasa] and Angola), the first of a line of Portuguese vassal kings that lasted until the early 20th century.

Nzinga Mbemba, who became the sixth *manikongo* (lord of the Kongo) in 1506 or 1507, encouraged the penetration of his country by the Portuguese that had begun under his predecessor, Nzinga Nkuwa. Becoming a Christian and adopting the Portuguese name Dom Afonso, he made an agreement (the *Regimento*, 1512) with Manuel I of Portugal by which the Kongo accepted Portuguese institutions, granted extraterritorial rights to Portuguese subjects, and supplied slaves to Portuguese traders.

• **Afonso I**, also called AFONSO HENRIQUES, byname AFONSO THE CONQUEROR, Portuguese AFONSO O CONQUISTADOR (b. 1109/11, Guimarães, Port.—d. Dec. 6, 1185, Coimbra), the first king of Portugal (1139–85), who conquered Santarém and Lisbon from the Muslims (1147) and secured Portuguese independence from Leon (1139).

Alfonso VI, emperor of Leon, had granted the county of Portugal to Afonso's father, Henry of Burgundy, who successfully defended it against the Muslims (1095–1112). Henry married Afonso VI's illegitimate daughter, Teresa, who governed Portugal from the time of her husband's death (1112) until her son Afonso came of age. She refused to cede her power to Afonso, but his party prevailed in the Battle of São Mamede, near Guimarães (1128). Though at first obliged as a vassal to submit to his cousin Alfonso VII of Leon, Afonso assumed the title of king in 1139.

By victory in the Battle of Ourique (1139) he imposed tribute on his Muslim neighbours; and in 1147 he further captured Santarém and, availing himself of the services of passing crusaders, successfully laid siege to Lisbon. He carried his frontiers beyond the Tagus River, annexing Beja in 1162 and Évora in 1165; in attacking Badajoz, he was taken prisoner but then released. He married Mafalda of Savoy and associated his son, Sancho I, with his power. By the time of his death he had created a stable and independent monarchy.

• **Afonso II**, byname AFONSO THE FAT, Portuguese AFONSO O GORDO (b. 1185?, Coimbra, Port.—d. March 25, 1223, Coimbra), the third king of Portugal (1211–23), under whom the reconquest of the south from the Muslims was continued.

Afonso II was the son of King Sancho I and Queen Dulcia, daughter of Ramón Berenguer IV of Barcelona. His obesity seems to have been caused by illness in his youth, and he was unable to lead his forces. However, they distinguished themselves in the victory of Afonso VIII of Castile at Las Navas de Tolosa (1212). This marked the decline of the Muslim Almohads, and Afonso II's army seized Alcácer do Sal in 1217.

Afonso II instituted inquiries into land titles, challenging the church and other landowners. This led to a long conflict with nobles and churchmen, and in 1219 the archbishop of Braga excommunicated king and court and placed the kingdom under an interdict. These actions were confirmed by the papacy, but Afonso resisted until his death. He was succeeded by his son, Sancho II.

• **Afonso III** (b. May 5, 1210, Coimbra, Port.—d. Feb. 16, 1279, Lisbon), fifth king of Portugal (1248–79), who supplanted his brother, King Sancho II, and completed the reconquest of the Algarve from the Muslims.

The younger son of Afonso II and Urraca, daughter of Alfonso VIII of Castile, Afonso emigrated and became, by marriage, count of Boulogne. His elder brother, Sancho II, was deposed by order of the pope, who granted Afonso the crown. He returned to Portugal and was welcomed by the towns and the church. He reconquered the district of Faro in 1249 and shared the former Muslim region of Algarve with Castile.

His reign saw the first meeting of the Portuguese Cortes (parliament) in which the commoners of the municipalities were represented. Despite the help that he received from the pope in becoming king, he took the same attitude as his predecessors about the repossession of church lands and was, like them, excommunicated. On his death, he was succeeded by his son Dinis.

• **Afonso IV**, by name AFONSO THE BRAVE, Portuguese AFONSO O BRAVO (b. Feb. 8, 1291,

Lisbon—d. May 28, 1357, Lisbon), seventh king of Portugal (1325–57).

Afonso IV was the son of King Dinis and of Isabella, daughter of Peter II of Aragon. Afonso resented his father's generosity toward two illegitimate sons and in 1320 demanded to be given power, remaining in open revolt until May 1322. His mother reconciled them, but the conflict broke out again. When Dinis died, Afonso succeeded to the throne, but the quarrel was transferred to Castile, which sheltered his half brother. However, when the Marinid sultan of Morocco invaded Spain in 1340, Afonso IV led a force that joined Alfonso XI of Castile in the victory of the Salado River near Tárfifa (Oct. 30, 1340).

In 1355 Afonso ordered the murder of Inês de Castro, the Galician mistress of his heir, the future Peter I, because he feared the influence of her family in Portugal. Peter rebelled, but Afonso finally was reconciled with him before his death.

• **Afonso V**, byname AFONSO THE AFRICAN, Portuguese AFONSO O AFRICANO (b. Jan. 15, 1432, Sintra, Port.—d. Aug. 28, 1481, Sintra), 10th king of Portugal (1438–81), known as the African from his campaigns in Morocco.

The son of King Edward (Duarte) and Queen Leonor, daughter of King Ferdinand I of Aragon, Afonso succeeded to the throne at the age of six. In 1440 his mother was deprived of the regency by his uncle Pedro, Duke de Coimbra, whose daughter Isabella Afonso married. The regent was in turn challenged by a half brother, the Duke de Bragança, and was forced to fight, dying at Alfarrobeira (May 1449). Afonso remained considerably under the influence of others, and he distributed his favours rashly. In North Africa he conquered Alcácer Ceguer in 1458, failed to take Tangier in 1463, took Arzila in 1471, and finally took Tangier.

A widower, he married the young daughter of Henry IV of Castile and espoused her cause against Isabella and Ferdinand. Although he assumed the title of king of Castile, he was defeated at Toro in 1476. He then sailed for France, hoping to enlist the aid of Louis XI. This was refused, and he informed his son (later King John II) that he would abdicate and become a hermit in France. He was persuaded to return to Portugal in November 1477, but he renounced his reign and signed the Treaty of Alcáçovas (1479) abandoning any claim to Castile. He died before the Cortes could meet to ratify his abdication.

• **Afonso VI** (b. Aug. 21, 1643, Lisbon—d. Sept. 12, 1683, Sintra, Port.), king of Portugal, whose reign was marked by internal disputes between his partisans and those of his brother Pedro.

Afonso succeeded his father, John IV, in 1656, but his mother acted as regent until 1662. His reign saw a series of victories against Spain, including the battles of Ameixal (1663), Castelo Rodrigo (1664), and Montes Claros (1665), which in 1668 led to Spanish recognition of Portuguese independence. When Afonso's wife left him, their marriage was annulled on grounds of his incapacity. She married his brother, the future Peter II. After surrendering the throne in 1667, Afonso was kept a virtual prisoner in the Azores and at Sintra until his death.

Afram River, river, in southern Ghana, western Africa. It rises 16 miles (26 km) northwest of Mampong and flows southeast into Lake Volta (formerly the Afram was a tributary of the Volta River). The Afram is about 55 miles (90 km) long. The river is important for fishing, despite its running dry from October to March, and it collects nearly all the drainage of the Kwahu Plateau. In the river valley the terrain is very flat and often flooded and swampy. Since the project to dam the Volta River

for hydroelectric power (begun 1961; finished 1965), the lower Afram has become a busy arm of the impounded Lake Volta, serving as an important waterway.

Afranius, Lucius (b. Picenum [Italy]—d. 46 BC, Africa province [now in Tunisia]), Roman general, a devoted adherent of Pompey the Great.

In 60 BC, chiefly by Pompey's support, Afranius was raised to the consulship, in which office he proved himself incompetent to manage civil affairs. In the following year, while governor of Cisalpine Gaul, he obtained a triumph; and, on the allotment of Spain to Pompey (55 BC), Afranius and Marcus Petreius were sent to govern it as legates.

On the rupture between Julius Caesar and Pompey, Afranius and Petreius were compelled, after a short campaign in which they were at first successful, to surrender to Caesar at Ilerda (49 BC). Caesar dismissed them on their promise not to serve again in the war. Afranius, however, went to join Pompey, and, at the Battle of Pharsalus (48 BC), he had charge of Pompey's camp. On Pompey's defeat, Afranius, despairing of pardon from Caesar, went to Africa, and he was present at the disastrous Battle of Thapsus (46 BC), at which Caesar defeated the supporters of Pompey and gained control of Roman Africa. Although he escaped from the field with a strong body of cavalry, Afranius was afterward taken prisoner and was killed (according to varying accounts) either by seditious soldiers or at the command of Caesar.

Afrasian languages: see Afro-Asiatic languages.

Africa, in ancient Roman history, the first North African territory of Rome, at times roughly corresponding to modern Tunisia. It was acquired in 146 BC after the destruction of Carthage at the end of the Third Punic War.

Initially, the province comprised the territory that had been subject to Carthage in 149 BC; this was an area of about 5,000 square miles (13,000 square km), divided from the kingdom of Numidia in the west by a ditch and embankment running southeast from Thabracca (modern Tabarqah) to Thaenae (modern Thinhah). About 100 BC the province's boundary was extended farther westward, almost as far as the present Algerian-Tunisian border.

The province grew in importance during the 1st century BC, when Julius Caesar and, later, the emperor Augustus founded a total of 19 colonies in it. Most notable among these was the new Carthage, which the Romans called Colonia Julia Carthago; it rapidly became the second city in the Western Roman Empire. Augustus extended Africa's borders southward as far as the Sahara and eastward to include Arae Philaenorum, at the southernmost point of the Gulf of Sidra. In the west he combined the old province of Africa Vetus ("Old Africa") with what Caesar had designated as Africa Nova ("New Africa")—the old kingdoms of Numidia and Mauretania—so that the province's western boundary was the Ampsaga (modern Rhumel) River in modern northeastern Algeria. The province generally retained those dimensions until the late 2nd century AD, when a new province of Numidia, created in the western end of Africa, was formally constituted under the emperor Septimius Severus. A century later Diocletian, in his reorganization of the empire, formed two provinces, Byzacena and Tripolitania, from the southern and eastern parts of the old province.

The original territory annexed by Rome was populated by indigenous Libyans who lived in small villages and had a relatively simple culture. In 122 BC, however, an abortive attempt by Gaius Sempronius Gracchus to colonize Africa aroused the interest of Roman farmers

and investors. In the 1st century BC Roman colonization, coupled with Augustus' successful quieting of hostile nomadic movements in the area, created conditions that led to four centuries of prosperity. Between the 1st and 3rd century AD, private estates of considerable size appeared, many public buildings were erected, and an export industry in cereals, olives, fruit, and hides flourished. Substantial elements of the urban Libyan population became Romanized, and many communities received Roman citizenship long before it was extended to the whole empire (AD 212). Africans increasingly entered the imperial administration, and the area even produced an emperor, Septimius Severus (reigned AD 193–211). The province also claimed an important Christian church, which had more than 100 bishops by AD 256 and produced such luminaries as the Church Fathers Tertullian, Cyprian, and St. Augustine of Hippo. The numerous and magnificent Roman ruins at various sites in Tunisia and Libya bear witness to the region's prosperity under Roman rule.

By the end of the 4th century, however, city life had decayed. The Germanic Vandals under Gaiseric reached the province in 430 and soon made Carthage their capital. Roman civilization in Africa entered a state of irreversible decline, despite the numerical inferiority of the Vandals and their subsequent destruction by the Byzantine general Belisarius in 533. When Arab invaders took Carthage in 697, the Roman province of Africa offered little resistance.

Africa, second largest continent on Earth, embracing one-fifth of its land area. From north to south, the continent is divided almost equally by the Equator, but, because of the bulge formed by western Africa, the greater part of Africa's territory lies northward. The continent is bounded on the north by the Mediterranean Sea, on the west by the Atlantic Ocean, on the east by the Red Sea and the Indian Ocean, and on the south by the confluence of the Atlantic and Indian oceans off the Cape of Good Hope. In the northeast, Africa was joined to Asia by the Sinai Peninsula until the construction of the Suez Canal. There are a number of islands associated with Africa; the largest of these, lying to the southeast, is Madagascar. Area 11,724,300 square miles (30,365,700 square km). Pop. (1994 est.) 683,021,000.

A brief treatment of Africa follows. For full treatment, see MACROPAEDIA: Africa; African Arts.

Land. Africa is composed largely of a rigid platform of ancient rocks that underlies vast plateau regions in the interior. The plateaus drop along local escarpments to form the continent's generally narrow coastal plains. The coastal lowlands widen inland at the Mozambique Lowland in the southeast, at the Mauritania-Senegal basin in the northwest, at the Qattara Depression in the north, and at the Benadir Lowland along the Horn of Africa in the east. The continent's average elevation is about 2,200 feet (670 m), but the range of relief in Africa is nearly 20,000 feet (6,100 m), ranging from 19,340 feet (5,895 m) above sea level at Kilimanjaro in Tanzania to 515 feet (157 m) below sea level at Lake Assal in Djibouti.

The East African Rift System constitutes the most striking and distinctive relief feature of the continent; it is composed of a western branch (the Western Rift Valley) and an eastern branch (the Eastern Rift Valley). Extending north to south for practically the length of the continent, the rift system forms the Red Sea basin, borders the Ethiopian Plateau (rising to heights of nearly 15,000 feet [4,600 m] and constituting the continent's most extensive mountain system), and encompasses the extensive volcanic formations of the Virunga

Mountains, before exiting into the Indian Ocean near the mouth of the Zambezi River in Mozambique.

The Ruwenzori (Rwenzori) Range, rising to more than 16,000 feet (4,900 m) in east-central Africa, and the Drakensberg Range, rising to more than 11,000 feet (3,350 m) along the southeastern coast, are among the continent's more dramatic highlands. Apart from the Atlas Mountains, which rise along the northwestern coast to more than 13,000 feet (4,000 m), the northwestern third of the continent seldom exceeds 3,000 feet (900 m) in elevation and generally lies between 500 and 1,000 feet (150 and 300 m). The Sahara, the world's largest contiguous desert, is roughly coincident with this lowland region and occupies more than one-fourth of Africa's total land area. The other major desert areas, the Namib and the Kalahari, lie in the southwestern portion of the continent.

Africa's hydrology is dominated by the Nile (northward from the Equator) and the Congo (central Africa) river basins, which together drain nearly one-fourth of the continent's land area. Lying south of the divide between these two great watersheds are some of the world's largest freshwater lakes. Island-studded Lake Victoria, the largest lake in Africa, is the chief reservoir of the Nile. Lakes Tanganyika and Nyasa (Malaŵi) are the largest of a string of lakes formed within the deep valleys of Africa's great rift system. The Niger River in western Africa and the Zambezi and Orange rivers in the south, along with their tributaries, account for much of the remaining external drainage area of the continent. Lake Chad in the north and the Okavango Swamp in the south lie within Africa's two major interior basins.

Africa's climate is greatly affected by its position astride the Equator. Temperatures are high for most of the year, but they are modified by elevation in the mountains and by the influence of ocean currents on the coasts—e.g., the cooling Benguela Current (southwest) and the warming Mozambique Current (southeast).

Only about 6 percent of the African continent is arable while nearly one-fourth is forested or wooded. The continent is well known for its wide variety of animal life. Big-game animals are found roaming the savanna regions of the south and east and, to a lesser extent, in the savanna areas to the north. Some of the world's finest national parks were established as game reserves in Kenya, Uganda, Tanzania, Zambia, South Africa, and other countries.

Africa's share of some of the world's major mineral reserves is estimated to include about 8 percent of all petroleum, some 27 percent of all bauxite, 29 percent of all uranium, and 20 percent of all copper. The continent also has about two-thirds of the world's phosphorites and substantial reserves of iron ore, manganese, chromium, cobalt, platinum, and titanium.

People. The peoples inhabiting Africa probably speak more separate and distinct languages than those of any other continent. The most homogeneous region, in terms of language, is North Africa, where Arabic is predominant from Egypt to Mauritania, as well as in The Sudan. Within the Maghrib, along the Mediterranean coast, reside Berber-speaking peoples, concentrated in Morocco and Algeria, but Arabic is also widely used.

The languages spoken by the sub-Saharan peoples are more numerous. With the exception of the Khoisan language family of southwestern Africa, the largest area of the sub-Sahara is inhabited by peoples speaking a number of languages known collectively as Bantu, the major subgroup of the Benue-Congo group of the Niger-Congo language

family. Between the Arabic-dominated northern region and Bantu-speaking central and southern Africa reside groups speaking other languages of the Niger-Congo family. Close proximity to the Arabic culture of the Sahara has influenced black western Africans, and in a number of countries Islām is the predominant religion.

Nilo-Saharan peoples inhabit the Chad basin (Saharan and Maba speakers), the Blue Nile basin (Koma speakers), and the upper-middle Niger River region (Songhai speakers). Nilo-Saharan speakers also reside along the middle Nile River, the White Nile, and the East African lakes. The forest-dwelling Pygmies, inhabiting various parts of central Africa, form a distinct ethnic and cultural group but have no distinctive language of their own. The Berbers of North Africa pursue a mixed agricultural and pastoral way of life. The vast majority of those who speak Bantu and other languages of the Niger-Congo family in western and central Africa are sedentary horticulturalists. Among the Bantu-speaking peoples of eastern and southern Africa, cattle raising plays an important economic role. Many Nilotic peoples in East Africa are sedentary horticulturalists.

In the southernmost parts of the continent, peoples of European descent are found. Dutch (Boer) migrations began in the mid-17th century. The English first settled in what is now Zambia, Zimbabwe, and the East African Highlands in the 19th century. The Portuguese settled in Angola and Mozambique, while Germans settled in what is now Namibia.

Africa's overall population density is low by world standards, because much of its vast desert area is uninhabitable. The population per unit of arable land, however, is near the world average. Wide variations in density occur from country to country and within countries. The continent is a developing region with all the associated demographic and social problems. Africa's efforts to achieve sustained economic growth have been plagued by the region's high fertility levels, which negate most of the relatively modest economic growth that has been achieved by local economies. However, what had been a high growth rate on the continent has declined since the mid-1990s because of the spread of HIV/AIDS, though it has still been higher than Africa's real economic growth. Birth and death rates, the major factors in population growth, have varied widely from region to region. Death rates have risen dramatically in areas most affected by the AIDS epidemic, notably southern Africa, where birth and growth rates were already low, and also western Africa, which typically has much higher growth rates.

The economy. Africa as a whole is a developing region; it may be divided into subregions consisting of the more-developed Mediterranean North African countries and Nigeria; the partly developed nations, including Côte d'Ivoire, Gabon, Réunion, Kenya, Congo (Kinshasa), Cameroon, Ghana, Zimbabwe, Namibia, and Mauritius; and the remaining, less-developed nations. South Africa, which alone has an almost fully developed economy, is the major exception to this pattern.

Agriculture is the most important sector of the economy in most countries and employs about two-thirds of the total labour force. Traditional farming still predominates, though mechanization is slowly increasing. The leading cash crops include sugarcane, tomatoes, peanuts (groundnuts), bananas, oranges, cotton, grapes, coconuts and palm oil, olives, pineapples, coffee, tea, and cacao. Subsistence crops include cassava, corn (maize), plantains, sorghum, millet, wheat, rice, sweet potatoes, potatoes, barley, watermelons, onions, and dry beans. Temperate and subtropical crops are

grown primarily in northern and southern Africa and in the highlands of East Africa, while tropical crops dominate in central and western Africa. Nigeria, Egypt, South Africa, Ethiopia, and Congo (Kinshasa) are the leading crop producers. Many countries do not produce adequate domestic crops for national needs and must import food.

Rangeland and pastures occupy more than one-fourth of Africa's area, but they are marginal near the deserts of the north and south and overgrazed in the Sahel. Lower-elevation pastures in central Africa suffer from tsetse fly infestation. Cattle, sheep, goats, and pigs are the main livestock; in northern and eastern Africa, camels, donkeys, and water buffalo are widely used for transport and agricultural work. Dairying is limited overall, and most African countries must import dairy products; most North African countries also import meat.

Most of the wood cut in Africa's vast forests is used as fuelwood. Forestry has been developed mainly in South Africa, Côte d'Ivoire, and Gabon, which lead in exports. Northern Africa lacks forests and must import nearly all wood supplies.

In the coastal states of the continent and in those states with reservoirs, fishing has developed into an important commercial industry and a source of exports. However, because Africa has little continental shelf and there is a sharp drop to ocean depths, there are few prospects of large-scale commercial fisheries such as those that have developed off northwestern Europe or eastern Asia.

Manufacturing contributes only a small share to the economies of most African countries. The main exceptions are the partly industrialized nations of South Africa, Zimbabwe, Swaziland, Mauritius, and Senegal.

Congo (Kinshasa), South Africa, and Botswana produce half of the world's diamonds; South Africa, Ghana, and Zimbabwe produce nearly half of the gold. Petroleum and natural gas are produced in large quantities by Nigeria, Libya, Algeria, and Egypt.

Tourism is important to many African nations, and countries with well-developed tourist facilities include Tunisia, Morocco, Egypt, South Africa, Botswana, Kenya, Zimbabwe, Algeria, and Côte d'Ivoire.

Africa receives developmental aid from a great variety of sources, largely determined by the individual countries' political orientation and international memberships.

Much of Africa suffers from inadequate transportation facilities; landlocked mid-continent countries are particularly affected. Although many countries have railway systems, problems arise from differing track gauges and from political hostilities. The principal rivers are navigable for long stretches and are an important part of the transportation network. Only a small proportion of Africa's roads are paved.

Most African countries have negative trade balances; those with positive balances are generally major producers of petroleum, natural gas, or minerals. The principal exports are petroleum and natural gas, food, beverages, tobacco, and raw materials, sent mainly to the countries of the European Union (EU), the United States, and Japan. The principal imports are machinery and transport equipment, miscellaneous manufactured goods, food, beverages, tobacco, and petroleum and natural gas, mainly obtained from the EU, the Organization of Petroleum Exporting Countries (OPEC) of the Middle East, the United States, and Japan.

Government and social conditions. Most governments in Africa are controlled or perennially staffed by a single party or clique. Democracy has been limited even in those states with multiparty institutions—though pressures for greater democracy have been growing. Some African island territories re-

main under the control of European countries: Réunion and Mayotte (France), St. Helena (the United Kingdom), the Canary Islands (Spain), and the Madeira Islands (Portugal).

Many present-day African legal systems are based on the laws introduced by European powers during the colonial era, though the countries of North Africa derive many of their laws from the tenets of Islām.

African leaders seek to develop a pan-African approach to the continent's political and military problems through the Organization of African Unity (OAU). Although classic colonial rule in Africa has ended, external powers continue to seek political and military influence there. African countries receive large amounts of economic and military aid from the world powers.

Most African countries have yet to develop comprehensive systems of social-welfare benefits. The more-developed systems are found in South Africa and the North African countries of Egypt, Tunisia, and Algeria.

Health and sanitary conditions in Africa are generally poor, particularly outside the major metropolitan centres having doctors and hospitals. Africans in many parts of the continent suffer from starvation or malnutrition; the most prevalent diseases include AIDS, malaria, dysentery, tuberculosis, whooping cough, typhoid fever, and gonorrhoea. South Africa, Réunion, Mauritius, Libya, and Algeria are perhaps the only countries in Africa that do not have a serious shortage of doctors. High infant mortality is prevalent throughout much of the continent, many countries having the world's highest levels. Life expectancies, which for long were rising throughout Africa, have declined in many countries to as low as 40 years or less where HIV/AIDS is prevalent; conversely, they have exceeded 70 years and increased where the infection rate is low.

Most African countries do not have compulsory education and usually lack enough trained teachers and adequate facilities. However, the number of countries with high primary enrollment rates (more than 90 percent) has grown, as have literacy rates.

The news media in most African countries are government-controlled. Freedom of the press (in varying degrees) is found in Egypt, Kenya, Morocco, Nigeria, Côte d'Ivoire, Mauritius, Senegal, and South Africa.

Cultural life. The sociocultural traditions of northern Africa are both Arabic and Islāmic. The area is noted for its traditional arts of weaving, embroidery, metal engraving, and leatherwork. The dominant geometric and arabesque designs are presented in the stucco and tiles of the many mosques found throughout North Africa. Musical styles are basically Arabic and rely upon improvisation and embellishment of melody. To the traditional Arabic literary genres—poetry, essays, and historiography—have been added forms inspired by Middle Eastern and Western literary models.

In sub-Saharan Africa, dance, drama, and sculpture are among the more exciting and original of the area's many art forms; the dance in particular can be fiercely beautiful or tenderly expressive. Most of sub-Saharan Africa also has an active literary life, and authors and playwrights write in either the language of the former colonial power (to reach a wider audience) or in one of the vernacular languages. Works in the vernacular are particularly extensive in Swahili, Yoruba, and the Bantu languages of South Africa. Popular music is also vigorous, with many traditions represented. Many African performers are well-known throughout Europe and North America.

African American English: *see* Ebonics.

African American literature, the body of literature written by Americans of African descent.

A brief treatment of African American literature follows. For full treatment, see MACROPAEDIA: African American literature.

The African-born poet Phillis Wheatley and Olaudah Equiano, whose *The Interesting Narrative of the Life of Olaudah Equiano or Gustavus Vassa, the African, Written by Himself* (1789) pioneered the slave narrative (q.v.), are generally considered to be the founders of African American literature. The early 19th-century writer David Walker, who warned of the consequences of slavery, was a precursor of literary black nationalism. Maria Stewart called for black women in the North to agitate for civil rights. In support of the growing abolition movement, slave narratives were produced by many individuals, including Frederick Douglass, William Wells Brown, Harriet Jacobs, and Sojourner Truth. Brown is also distinguished for having produced the first African American novel, *Clotel; or, The President's Daughter* (1853), and the first African American play, *The Escape; or, A Leap for Freedom* (1858). Frances Ellen Watkins Harper's short story "The Two Offers" and Harriet E. Wilson's autobiographical novel *Our Nig*, both published in 1859, were the first fiction offerings by African American women. These and other works of the anti-slavery era were nourished by a powerful African oral tradition in story and song, which lent strength to the achievements of generations of individual writers.

For African Americans, the American Civil War and the resulting end to slavery as a way of life brought new issues to the fore. At the turn of the 20th century, Booker T. Washington and W.E.B. Du Bois drafted very different approaches to these problems. In the second and third decades of the century, a decided flowering of the arts known as the Harlem Renaissance (q.v.) produced a number of excellent writers, among them Claude McKay, Langston Hughes, Countee Cullen, Rudolph Fisher, Jean Toomer, Wallace Thurman, Nella Larsen, and Zora Neale Hurston. However, as the Great Depression spread throughout the country, African American critics called for a literature that was more politically engaged. One of the best known writers of this genre was Richard Wright, who dominated the two following decades with his gritty urban realism. The early 1940s were also a period of modernist experimentation, as seen in the writings of Melvin B. Tolson, Robert Hayden, and Gwendolyn Brooks. Ralph Ellison's award-winning novel *Invisible Man* (1952), James Baldwin's first novel, *Go Tell It on the Mountain* (1953), and Lorraine Hansberry's drama *A Raisin in the Sun* (produced 1959) were the landmark works of the 1950s.

As the civil rights movement gained ground and urban unrest grew, writers such as Amiri Baraka (LeRoi Jones) emerged to voice the frustrations of African Americans. The writers—mostly poets and playwrights—of what was called the Black Arts movement sought to redefine the role of the artist in the African American community. In the 1970s a rebirth of women's writing occurred, signaled by the publication in 1970 of Toni Morrison's *The Bluest Eye*. It included prose by Toni Cade Bambara, Gloria Naylor, and Alice Walker; poetry by Audre Lorde, June Jordan, and Rita Dove; and drama by Ntozake Shange, as well as prose and poetry by Maya Angelou. Morrison herself later went on to win the Nobel Prize for Literature.

In the last decades of the 20th century and the first years of the 21st, a number of noteworthy plays were produced. Perhaps the most impressive of the playwrights of these years was August Wilson, whose series of critically acclaimed dramas presented a slice of life from each decade of the 20th century.

African ant bear: see aardvark.

African arts, the literary, performing, and visual arts of native Africa, particularly of sub-Saharan, or black, Africa. All the familiar media—sculpture, painting, textiles and other fabrics, costume, jewelry, architecture, music, dance, drama, and poetry—are found.

A brief treatment of African arts follows. For full treatment, see MACROPAEDIA: African Arts.

What gives art in Africa its special character is the generally small scale of most of its traditional societies, in which one finds a more immediate interrelationship between art and other social forms and its bewildering variety of styles, each developed in its own particular ecological, historical, and social circumstances. The contemporary artist in Africa, living and working in a modern, urban environment, has, of course, all the richness of these cultural traditions to draw upon, even though he may employ different techniques and enjoy a different kind of patronage than did his traditional counterpart.

It is usual, but mistaken, to equate art in Africa with sculpture. The earliest evidence of art is provided by the engravings and paintings on rock surfaces in the Sahara spanning a period of about 5,000 years to the present day. In the area in which Islām and Oriental Christianity linked Africa to the rest of the world in precolonial times, architecture predominates among the visual arts. Included here are parts of western and eastern Africa, taking in the magnificent mosques, built of mud, of Djenné and Mopti in Mali, the rock-hewn churches of Ethiopia, and the Islāmic monuments of coastal eastern Africa. In areas where pastoral cultures predominate, stress in the visual arts is laid upon personal adornment and upon the aesthetic values of cattle. This is also the area in which rock art is mainly to be found. Pastoral cultures extend from the Sudanic region just south of the Sahara to the grasslands of eastern and southern Africa. Among the agricultural peoples of western and central Africa, who share the great river systems of the Niger and Congo, sculpture dominates the visual arts.

Knowledge of the history of visual arts in Africa is very fragmentary. The earliest-known sculptures are the pottery heads and figures of the Nok culture of Nigeria (500 BC to AD 200). This also provides the earliest evidence for ironworking in sub-Saharan Africa, where the Iron Age directly follows the Stone Ages. The earliest evidence for the use of copper and its alloys comes from the Igbo village of Igbo-Ukwu, also in Nigeria, where sites of the 9th century AD have revealed cast bronze regalia among other works of art. These bear no relationship in style either to the famous brass castings of the Yoruba city of Ife (11th–15th century) or to those of Benin (15th–19th century), both in Nigeria. Other examples of antique pottery sculpture include the heads from Lydenburg in South Africa dated to about AD 500. Sculptures in stone are known from Sierra Leone, probably the work of Sherbro carvers and datable to no later than the 16th century, and from the Kongo peoples of the area near the mouth of the Congo river. In the 16th century, ivory was being carved with extraordinary skill at Benin and by the Sherbro of Sierra Leone. The earliest-known sculptures in wood may be certain portrait statues of kings of the Kuba, central Congo (Kinshasa), thought to date from the 17th century. Some of the finest sculptures in wood date, however, only from the 1920s: for example, the works of Yoruba masters such as Olowe of Ise (d. 1939) and Areogun of Osi-Ilorin (c. 1880–1954). The earliest-known textiles in sub-Saharan Africa are the bast fibre fragments from Igbo-Ukwu (9th century AD) and the cloth found in the Tellem caves of the Bandiagara region of Mali (11th century and earlier). None of these artistic manifestations represents a beginning of any kind: each appears as fully developed in

style. In addition to textiles (usually made by men in contemporary Africa), other visual arts include pottery-making (usually by women) and personal decoration, including scarification or cicatrization (the cutting of skin to produce patterned scars).

The performing arts—dance, drama, and music—are at least as pervasive in African culture as the visual arts. Perhaps the most distinctive features of African music are the complexity of rhythmic patterning achieved by a great variety of drums and the relationship between melodic form and language tone structure. Without this the text of a song is rendered meaningless; but, even in purely instrumental music, melodic pattern is likely to follow speech tone.

At the outset of the 21st century, perhaps music was the fastest growing African art form on the international scene. Beginning in the 1980s, when Ladysmith Black Mambazo (South Africa) first performed outside of Africa, artists such as Papa Wemba (Congo [Kinshasa]); Ali Farka Toure (Mali), and Francis Bebey (Cameroon) have garnered large followings in Europe and North America.

The literary arts are probably the most universal and the most highly regarded of arts in Africa. They include myths, folktales, spells, proverbs, and, above all, poetry. These are the arts most inaccessible to outsiders, which probably explains why comparatively little attention has yet been paid to them. Most of these forms are oral, but written literatures have existed for several centuries in Hausa, Swahili, and Amharic. In the 20th century written literatures in other African languages, as well as English, French, and Portuguese, had developed.

In many parts of Africa most people have some practical familiarity with techniques of manufacture and performance. Wherever there are professional artists, however, attitudes toward them vary considerably. The esteem an artist enjoys may have as much to do with the cultural role of art in that community as with his ability.

The masquerade is a complex art form employing all the other media. Masquerades may entertain, cure disease, be consulted as oracles, initiate boys to manhood, impersonate ancestors, judge disputes, or execute criminals. The mask is essentially a dramatic device enabling the performer to stand apart from his everyday role in the community. The complexity of masquerade and its related public festivities suggests that it is the sub-Saharan's principal art form.

African Development Bank (ADB), French BANQUE AFRICAINE DE DÉVELOPPEMENT, African organization established in 1964 and operational beginning in 1966 and dedicated to financing the economic and social development of its African member countries. Its membership includes 53 African states and 24 non-African countries. ADB headquarters are in Abidjan, Côte d'Ivoire.

The ADB group of financing bodies includes the African Development Fund, which grants interest-free loans to impoverished African countries, and the Nigeria Trust Fund. The ADB has five associated institutions through which public and private capital is channeled: the African Import-Export Bank (Afreximbank), the Africa Reinsurance Corporation (Africa-Re), the Société Internationale Financière pour les Investissements et le Développement en Afrique (SIFIDA), the Association of African Development Finance Institutions (AADFI), and Shelter-Afrique.

African Games, also called PAN-AFRICAN GAMES, or ALL-AFRICAN GAMES, international athletics (track-and-field) competition sponsored by the International Amateur Athletics

Federation (IAAF), and contested by athletes representing the nations of Africa. The African Games were first held in 1965, in Brazzaville, Congo, and consisted of contests in athletics (track-and-field) sports exclusively. Attempts to hold such African games date back to the 1920s; and in the early 1960s "friendship" games were held, but only among formerly French-governed countries. The second African Games were held in 1973 in Lagos, Nigeria, and the number of participating countries rose from 29 to 35. The third games were held in Algiers, Alg., in 1978. The games were not held again until 1987, and thereafter they were quadrennial.

African horse sickness (AHS), also called EQUINE PLAGUE, or PERDESIEKTE, infectious, noncontagious viral disease of Equidae (horses, mules, donkeys, and zebras) caused by an orbivirus called AHSV (family Reoviridae) that is transmitted by arthropods, notably biting midges (*Culicoides imicola*). The disease, which is not usually fatal to indigenous zebra herds, is often fatal in horses. Dogs have also been fatally infected after eating virally contaminated horse meat.

Symptoms of the disease occur within 10 days of viral invasion and include three main forms—pulmonary, cardiac, and fever—and usually edema. The acute, or pulmonary, form results in severe pulmonary edema and death. The subacute form affects the heart and causes widespread subcutaneous edema and often heart failure. The fever form, in which fever is the sole symptom, is usually mild. The disease persists in southern and equatorial Africa, and outbreaks have also occurred in the Iberian Peninsula, North Africa, and parts of the Middle East. There is no cure for the disease, but annual vaccination provides immunity.

African hunting dog, also called CAPE HUNTING DOG, or HYENA DOG (*Lycan pictus*), wild African carnivore that differs from the rest of the members of the dog family (Canidae) in having only four toes on each foot. Its coat is short, sparse, and irregularly blotched with yellow, black, and white. The African hunting dog is about 76–102 cm (30–41 inches) long, exclusive of its 31–41-centimetre tail, stands about 60 cm (24 inches) at the shoulder, and weighs about 16–23 kg (35–50 pounds).

African hunting dogs (*Lycan pictus*)

© Mark N Boulton/Photo Researchers

The African hunting dog is long-limbed with a broad, flat head, short muzzle, and large, erect ears. It hunts in packs of 15 to 60 or more and is found in most of Africa south and east of the Sahara, particularly in grasslands. It usually preys on antelopes and some larger game but has been hunted in settled regions for the damage it sometimes does to domestic livestock. The average number of young per litter appears to be about six; gestation periods of about 60 and 80 days have been noted.

African International Association: see Association Internationale Africaine.

African languages, languages indigenous to sub-Saharan Africa that belong to the Niger-

Congo, Nilo-Saharan, Khoisan, and Afro-Asiatic language families. The number of African languages has been estimated to be from 800 to more than 1,000. Important sub-Saharan languages include Fulani, Yoruba, Igbo, and Zulu of the Niger-Congo family; Kunama, Shilluk, Dinka, and Nuer of the Nilo-Saharan family; and Galla, Somali, and Hausa of the Afro-Asiatic languages (*q.v.*). Lingua francas that incorporate Arabic and European loan-words include Swahili, Lingala, Fanagalo, and Sango.

A brief treatment of the African languages follows. For full treatment, see MACROPAEDIA: Languages of the World.

Since the mid-19th century, linguists have been facing the challenge of classifying African languages. In addition to the problems of searching for features that would demonstrate genetic relationships between languages and then substantiating chosen methods of classification, their task has been complicated because Africa is the most polyglot continent and the borders between linguistic families are in some places very complex and indistinct. As a result, many different systems of grouping the languages were devised and, more often than not, rejected.

In 1963, however, the American linguist Joseph Greenberg revised an earlier thesis and proposed a system of classification with which most linguists agree. According to Greenberg, all the native languages of Africa may be divided into four large families, or stocks, which are considered to be independent of each other and which can be further divided into subgroups, member languages, and dialects. These four stocks are: Niger-Kordofanian (including Niger-Congo); Nilo-Saharan (including Chari-Nile), Khoisan, and Afro-Asiatic (formerly Hamito-Semitic). Not included in this division is the language spoken in Madagascar, which belongs to the Austronesian family of languages.

The Niger-Kordofanian family consists of two branches of very disproportionate size: the small Kordofanian group in The Sudan and the vast Niger-Congo family, which covers almost all of western Africa south of the Sahara, as well as most of the Congo River basin and eastern and southern Africa.

The Niger-Congo family includes some 900 member languages and thousands of dialects. Fulani, the most widely spoken member language of the West Atlantic group (one of the six subgroups that make up the Niger-Congo family), is also the most grammatically complex. The 26 member languages that comprise the Mande subgroup are the most divergent from the rest, so that the fundamental division within Niger-Congo is between Mande and all other groups. The roughly 80 languages spoken in Burkina Faso (formerly Upper Volta) and parts of neighbouring states are known as the Voltaic (Gur) subgroup; and, of these, Mossi is the most important. The fourth subgroup, Kwa, includes Ga, Yoruba, Igbo, and some 70 other member languages. Not much is known about the approximately 100 languages that make up the Adamawa-Eastern subgroup, spoken mainly in the Central African Republic and parts of Cameroon and Zaire. Swahili, Kongo, Zulu, and some 550 other languages belong to the Benue-Congo subgroup, which includes the extremely large Bantu subdivision.

Nilo-Saharan is divided into six branches of unequal size and importance: Songhai, spoken in Mali and Niger along the Niger River; the Saharan group, comprising Kanuri, a language of Nigeria, Teda, spoken over a considerable part of the central Sahara, and Zaghawa of Chad and The Sudan; Maba, a small group of languages spoken in Chad; Koma, a group of little-known languages spoken in a relatively restricted portion of the Ethiopian-Sudan border area; Fur, a language of Darfur province of

The Sudan; and by far the largest of the six branches, Chari-Nile, the family of languages spoken in areas surrounding the Nile and Chari rivers. Chari-Nile is further subdivided into four branches: Kunama, Berta, Central Sudanic, and Eastern Sudanic.

The Khoisan family of languages comprises approximately 12 languages that are spoken by the San (Bushmen) and Khoikhoi (Hottentots) of southern Africa. These languages are characterized by click sounds found elsewhere only among the Lardil of Australia. Sandawe and Hadza, spoken in Tanzania, are usually included in the Khoisan family.

Afro-Asiatic covers all of northern Africa, while its Semitic branch extends into the adjoining areas of Asia. It is divided into five branches: Berber, of Morocco, Algeria, and parts of the Sahara; Ancient Egyptian, no longer in existence; Semitic, including Arabic, the Ethiopian Semitic languages, and Tigrinya, the language of Eritrea; Cushitic, consisting of five groups of languages spoken in northeastern Africa; and Chadic, those languages spoken in and around northern Nigeria.

Although the languages of these four independent stocks differ greatly from one another in structure, certain common features can be discerned. Most sub-Saharan African languages are tonal: a change in pitch, for example, is often the only means of distinguishing two words that would sound exactly alike in all other circumstances. Tones are based on pitch levels, usually two or three in number.

Many West African languages have noun classes: nouns are divided into classes, each marked by a pair of affixes (prefixes, suffixes, or both), one for the singular and one for the plural. For example, in Swahili, a Bantu language, the sentence "One sharp knife has been lost" would read "Ki-su ki-kali ki-moja ki-me-pota." Su ("knife") has ki- as its class prefix, and this is repeated before every word agreeing with su. The prefix vi- takes the place of ki- when "knives" is plural: "Vi-su vi-kali vi-nane vi-me-potea" ("Eight sharp knives have been lost").

Contact between people who do not speak the same language has necessitated the development of lingua francas—*i.e.*, languages that allow diverse groups to communicate with one another—such as Swahili in East Africa, Lingala in the Congo River basin, Sango in the Central African Republic, and Arabic in large areas of The Sudan.

African lion dog: see Rhodesian ridgeback.

African Methodist Episcopal Church, black Methodist church in the United States, formally organized in 1816. It developed from a congregation formed by a group of blacks who withdrew in 1787 from St. George's Methodist Episcopal Church in Philadelphia because of restrictions in seating; blacks had been confined to the gallery of the church. Those who withdrew formed the Free African Society, the forerunner of the African Methodist Episcopal Church, and built Bethel African Methodist Church in Philadelphia. In 1799 Richard Allen (*q.v.*) was ordained its minister by Bishop Francis Asbury of the Methodist Episcopal Church. In 1816 Asbury consecrated Allen bishop of the newly organized African Methodist Episcopal Church, which accepted Methodist doctrine and discipline. The church speaks of Richard Allen, William Paul Quinn, David A. Payne, and Henry M. Turner as the "Four Horsemen" instrumental in the establishment of the church.

Confined to the Northern states before the American Civil War, the church spread rapidly in the South after the war.

The church is Methodist in church government, and it holds a general conference every four years. In 1991 the church claimed 3,500,000 members and 8,000 congregations. Its headquarters are in Washington, D.C.

African Methodist Episcopal Zion Church, black Methodist church in the United States, organized in 1821; it adopted its present name in 1848. It developed from a congregation formed by a group of blacks who in 1796 left the John Street Methodist Church in New York City because of discrimination. They built their first church (Zion) in 1800 and were served for many years by white ministers of the Methodist Episcopal Church. In 1821 a conference attended by representatives of six black churches and presided over by a white Methodist minister elected a black bishop, James Varick.

After the American Civil War the church grew rapidly in the North and the South. Foreign-mission programs were established in South America, Africa, and the West Indies.

The church is Methodist in doctrine and church government; a general conference is held every four years. In the early 21st century the church reported more than 1,500,000 members and more than 3,000 congregations. Its headquarters are in Charlotte, N.C.

African National Congress (ANC), originally (until 1923) SOUTH AFRICAN NATIVE NATIONAL CONGRESS, South African political party and black nationalist organization. Founded in 1912 as the South African Native National Congress, it had as its main goal the maintenance of voting rights for Coloureds (persons of mixed race) and black Africans in the Cape Province. It was renamed the African National Congress in 1923. From the 1940s it spearheaded the fight to eliminate apartheid, the official South African policy of racial separation and discrimination. It was banned from 1960 to 1990 by the white South African government; during these three decades it operated underground and outside South African territory. When the ban was lifted in 1990, Nelson Mandela (*q.v.*), the president of the ANC, became president in South Africa's first multiethnic government in 1994.

In the late 1920s the ANC's leaders split over the issue of cooperation with the Communist Party (founded in 1921), and the ensuing victory of the conservatives left the party small and disorganized through the 1930s. In the 1940s, however, the ANC revived under younger leaders who pressed for a more militant stance against segregation in South Africa. The ANC Youth League, founded in 1944, attracted such figures as Walter Sisulu, Oliver Tambo, and Mandela, who galvanized the movement and challenged the moderate leadership. Under the presidency of Albert Luthuli, the ANC after 1952 began sponsoring nonviolent protests, strikes, boycotts, and marches against the apartheid policies that had been introduced by the National Party government that came to power in 1948. Party membership grew rapidly. A campaign against the pass laws and other government policies culminated in the Defiance Campaign of 1952. In the process ANC leaders became a target of police harassment: in 1956 many of its leaders were arrested and charged with treason (the Treason Trial, 1956–59).

In 1960 the Pan-African Congress (PAC), an ANC split-off, organized massive demonstrations against the pass laws, and police killed 69 unarmed demonstrators at Sharpeville (south of Johannesburg). At this point the National Party outlawed both the ANC and the PAC. Denied legal avenues for political change, the ANC first turned to sabotage and then began to organize abroad for guerrilla warfare. In 1961 an ANC military organization, Umkhonto we Sizwe ("Spear of the Nation"), with Mandela as its head, was formed to carry out acts of sabotage as part of its campaign against apartheid. Mandela and other ANC leaders were sentenced to life imprisonment in 1964 (the Rivonia Trial). Surviving ANC cadres kept the organization alive

in Tanzania and Zambia under Tambo's leadership. The ANC began to revive inside South Africa toward the end of the 1970s, following the Soweto uprising in 1976; in their response to the uprising, the police and army had killed more than 600 people, many of them children. The ANC's campaign of guerrilla warfare was basically ineffective, owing to stringent South African internal security measures, but about 1980 the banned black, green, and gold tricolour flag of the ANC began to be seen inside South Africa.

South Africa descended into virtual civil war during the 1980s. In 1990 the administration of F.W. de Klerk lifted the ban on the ANC, and its leaders were released from prison or allowed to return to South Africa and conduct peaceful political activities. Nelson Mandela, the most important of the ANC's leaders, succeeded Oliver Tambo as president in 1991. Mandela led the ANC in negotiations (1992–93) with the government over transition to a government elected by universal suffrage. In April 1994 the party swept to power in the country's first such election, winning more than 60 percent of the vote for seats in the new National Assembly. Mandela was inaugurated as South Africa's first black president on May 10, 1994, heading a government of national unity. After the withdrawal of the National Party from the government in 1996, the ANC entered into an alliance with its previous rival, the Inkatha Freedom Party, led by Mangosuthu Buthelezi. Mandela stepped down as ANC president in 1997, and in June 1999 under his successor, Thabo Mbeki, the ANC increased its share of the vote to 66 percent in new national elections.

African polecat: *see* zorille.

African swine fever, also called WARTHOG FEVER, highly contagious and usually fatal viral disease of swine that is characterized by high fever, lesions, leukopenia (abnormally low count of white blood cells), elevated pulse and respiration rate, and death within four to seven days after the onset of fever.

The virus responsible for African swine fever is classified as an iridovirus. It is physically, chemically, and antigenically distinct from the togavirus that causes hog cholera (swine fever). African swine fever virus can survive heat, putrefaction, smoking, partial cooking, and dryness and lives up to six months in chilled carcasses. The incubation period is from 5 to 15 days.

The disease was first identified in 1910 in Kenya, where it was noted in domestic swine after contact with forest pigs and warthogs. It was confined to certain parts of Africa until 1957, when the disease spread—perhaps by means of processed pork products—to Portugal, Spain, Italy, Brazil, and other countries.

African swine fever is difficult to distinguish from acute classical hog cholera. Both diseases produce high fevers that last for about four or five days. Once the fever has subsided, however, African swine fever virus characteristically causes death within two days (as opposed to seven days for hog cholera). Although immunization has been effective in the prevention of hog cholera, no immunization measures have been shown to be effective in the prevention of African swine fever, nor is there any effective treatment of the disease. The prohibition of pigs and pig products from countries in which the disease exists has prevented its further spread.

African Union (AU), formerly ORGANIZATION OF AFRICAN UNITY (OAU), intergovernmental organization that was created to promote unity and solidarity among African states, first as the OAU (May 25, 1963) and from July 10, 2002, as the AU.

Headquartered at Addis Ababa, Eth. (as is the AU), the OAU operated principally through the annual assembly of heads of state and gov-

ernment. Between summit conferences, policy decisions were in the hands of a council of ministers, composed of foreign ministers of member states. The OAU worked to eliminate all forms of colonialism from Africa and to promote international cooperation. Its activities included diplomacy (especially in support of African liberation movements), mediation of boundary conflicts and civil wars, research in economics and communications, and other affairs.

In the 1990s African leaders grew increasingly disenchanted with the OAU as its successes began to be outweighed by its failures. In 2000 Libyan leader Colonel Muammar al-Qaddafi spearheaded the process to transform the OAU into the AU, which had also been proposed by Kwame Nkrumah (first president of independent Ghana) in the 1960s. A special OAU summit in Sirte, Libya, established the new body in March 2001.

Modeled after the European Union, the AU was envisioned as an organization that would bring the African continent together. Besides a common currency and a court system, it was ultimately hoped that the continent would have a common governmental system as well.

The African Union was formally launched on July 8, 2002, in Durban, S.Af., with South African president Thabo Mbeki as its first chairman. Because of controversial election results in December 2001, Madagascar's political leadership was not recognized by most African countries, and they were not invited to the Durban meeting.

African violet, flowering plant of the genus *Saintpaulia* (family Gesneriaceae), especially *S. ionantha*. The genus consists of 12 species native to higher elevations in tropical eastern Africa. The plants are small, hairy, usually stemless herbs with crowded, long-stalked leaves.

African violet (*Saintpaulia ionantha*)
Maunce B. Cook

African violet flowers are bilaterally symmetrical and violet, white, or pink in colour; they bloom throughout most of the year. Hundreds of horticultural varieties have been developed for their various flower colours and shapes, including half-sized miniatures.

Africanus, Sextus Julius (b. c. AD 180, Jerusalem—d. c. 250), first Christian historian known to produce a universal chronology.

His life is not well documented, but evidence

indicates that Africanus traveled considerably in Asia, Egypt, and Italy and later lived chiefly at Emmaus, in Palestine, where he served as prefect. He was named regional ambassador to Rome about 222, when he became a protégé of the emperor Severus Alexander. Africanus' greatest work was *Chronographiai* (221), a five-volume treatise on sacred and profane history from the Creation (which he placed at 5499 BC) to AD 221. Relying on the Bible as the basis of his calculations, he incorporated and synchronized Egyptian and Chaldaean chronologies, Greek mythology, and Judaic history with Christianity. His work raised the prestige of early Christianity by placing it within a historical context. He also wrote a critical work on genealogies of Christ as found in Matthew and Luke.

Afrīdī, Pashtun tribe inhabiting the hill country from the eastern spurs of the Safid Range to northern Pakistan. The Afrīdīs, whose territory straddles the Khyber Pass, are of uncertain origin.

Fighting between the Afrīdīs and the troops of the Mughal dynasty of India occurred frequently in the 16th and 17th centuries. In the 18th century the Afghan ruler Ahmad Shāh Durrānī employed Afrīdīs in his armies, and his grandson Shāh Shojā' (reigned 1803–09) received both support and asylum from them.

British encounters with the Afrīdīs began during the first Anglo-Afghan War (1839–42), notably when General George Pollock fought against them during his march to Kabul. After the British annexation of the Punjab in 1849, various methods were tried to keep the Khyber Pass open, including allowances, punitive expeditions such as those of 1878 and 1879 against the Kohāt and Khyber Afrīdīs, and the use of tribal militia (the Khyber Rifles). In 1893 the Afrīdīs of the Khyber region came under control by the Durand Line, which divided the tribal region between Afghanistan and British India.

During the 1930s the Indian Congress Party enlisted Afrīdī support for the militant anti-British Red Shirt Movement, an amalgam of pan-Islāmism and Indian nationalism. With independence, the Afrīdī lands in the North-West Frontier Province became a part of Pakistan, which thereafter faced an Afghan-supported movement for an independent Pakhtunistan, or Pashtun state.

Afrikaans language, also called CAPE DUTCH, West Germanic language of South Africa, developed from 17th-century Netherlandic (Dutch) by the descendants of European (Dutch, German, and French) colonists, indigenous Khoisan peoples, and African and Asian slaves in the Dutch colony at the Cape of Good Hope. Afrikaans and English are the only Indo-European languages among the many official languages of South Africa. Although Afrikaans is very similar to Netherlandic, it is clearly a separate language, differing from Standard Netherlandic in its sound system and its loss of case and gender distinctions.

Afrikaans was adopted for use in schools in 1914 and in the Dutch Reformed Church in 1919. A distinct Afrikaans literature has evolved during the 20th century, and the first complete translation of the Bible into Afrikaans was published in 1933. *See also* Netherlandic language.

Afrikaner, a South African of European descent whose native language is Afrikaans. They are descendants of the Boers. *See* Boer.

Afrikaner Bond (Afrikaans: "Afrikaner League"), the first political party of Cape Colony, southern Africa, founded by S.J. du Toit in 1880. In 1883 it amalgamated with J.H. Hofmeyr's Boeren Beschermings Vereeniging ("Farmer's Protection Associa-

tion"). Du Toit attempted to create a pan-Afrikaner nationalist Bond with affiliated branches outside the Cape, but this effort foundered, and the unity of Afrikaners in the late 1890s owed more to British imperial intervention in southern Africa than to Bond policies. Under Hofmeyr's leadership, the Bond advocated a broader nationalism that included the British. Although he never formed a Cabinet, Hofmeyr, as the majority leader in the Cape House of Assembly, was able, through the judicious support of the English-speaking politicians, to protect Afrikaner interests and keep Cape Colony neutral during the South African War (1899–1902). In 1910 the Bond joined with other Afrikaner parties in the rest of South Africa to form the South African National Party (later renamed the South Africa Party) and dissolved itself in 1911.

Afro-Asiatic languages, also called AFRASIAN LANGUAGES, formerly called HAMITOSEMITIC, SEMITO-HAMITIC, or ERYTHRAEAN LANGUAGES, a family of genetically related languages that developed from a common parent language which presumably existed about the 6th–8th millennium BC and was perhaps located in the present-day Sahara. The Afro-Asiatic group is the main language family of northern Africa and southwestern Asia and includes such languages as Arabic, Hebrew, Amharic, and Hausa.

A brief treatment of the Afro-Asiatic languages follows. For full treatment, *see* MACROPAEDIA: Languages of the World.

The languages belonging to the Afro-Asiatic family are commonly subdivided into five branches—Semitic, Egyptian, Berber, Cushitic, and Chadic—which represent what were dialects of the original parent language. Despite the work of several scholars, only an approximate, provisional reconstruction of the parent-language forms of the Afro-Asiatic family has been made. More has been done in comparing the language typologies.

Afrocentrism, also called AFRICENTRISM, cultural and political movement whose mainly African American adherents regard themselves and all other blacks as syncretic Africans and believe that their worldview should positively reflect traditional African values. The terms Afrocentrism, Afrology, and Afrocentricity were coined in the 1980s by the African American scholar and activist Molefi Asante.

Beliefs. Afrocentrism argues that for centuries Africans and other nonwhites have been dominated, through slavery and colonization, by Europeans, and that European culture is at best irrelevant—and at worst diametrically opposed—to efforts by non-Europeans to achieve self-determination. For this reason, according to Afrocentrism, people of African descent need to develop an appreciation of the achievements of traditional African civilizations; indeed, they need to articulate their own history and their own system of values.

According to Afrocentrism, African history and culture began in ancient Egypt, which was the birthplace of world civilization. Egypt presided over a unified black Africa until its ideas and technologies were stolen and its record of accomplishments obscured by Europeans. Afrocentrists assert that traditional African culture contrasts with European culture in being more informed by its history ("circular" rather than "linear"); more cooperative; more intuitive; and more closely integrated with the spiritual world of gods and ghosts. Renewed attention to this culture, they argue, can benefit African Americans psychologically by reminding them that their own culture, which was long devalued by Americans of European descent, has a rich and ancient heritage. In addition to emphasizing the past, Afrocentrism encourages the preservation and elevation of contemporary African-American expressive culture as manifested in

language, cuisine, music, dance, and clothing.

History. Afrocentrism was influenced by several earlier black nationalist movements, including Ethiopianism (*q.v.*) and Pan-Africanism. The latter became a major presence in the United States and elsewhere with the emergence of the Jamaican activist Marcus Garvey (*q.v.*), who promoted the idea of an African diaspora and called for a separate African state for black Americans. Garvey's bitter enemy, W.E.B. Du Bois (*q.v.*), who helped to found the integration-minded National Association for the Advancement of Colored People (*q.v.*) in 1909, was also interested in Pan-Africanism and organized world conferences on the subject from 1919 to 1927. Other antecedents included the Negritude (*q.v.*) literary movement, launched in France in the 1930s by Francophone-African intellectuals such as Leopold Senghor, and the Nation of Islam, whose leaders—including Elijah Muhammad and Malcolm X, (*qq.v.*)—preached not only the need for a black homeland but also the cultural and genetic superiority of blacks. Equally important to Afrocentrism were figures such as the African American scholar Maulana Karenga, whose work resulted in the creation of the Afrocentric holiday of Kwanzaa (*q.v.*) in 1966; the Senegalese scientist Cheikh Anta Diop, who wrote about the cultural unity of Africa, the African nature of Egyptian civilization, and the "theft" of African civilization by Europeans; and the African American historian Carter G. Woodson (*q.v.*), who emphasized the teaching of African history as a way of counteracting feelings of inferiority inculcated in black Americans through centuries of subordination by whites.

Afrocentrism gained significant legitimacy in the United States from the 1960s as a result of the civil rights movement, the multicultural movement, and the immigration of large numbers of nonwhites. Its following increased dramatically during the 1980s, when African Americans generally felt alienated from the "conservative revolution" of President Ronald Reagan but were simultaneously attracted by the conservatives' call for a return to traditional values. The Afrocentrists' complicated reaction to the conservative revival both reflected and reinforced conservative elements in Afrocentric thinking.

Criticism of Afrocentrism. The central historical claims of Afrocentrism were prominently supported by the white historian Martin Bernal in his book *Black Athena: The Afroasiatic Roots of Classical Civilization*, 2 vol. (1987–91). Since that time, however, Afrocentrism has encountered significant opposition from mainstream scholars who charge it with historical inaccuracy, scholarly ineptitude, and racism. In her book *Not Out of Africa: How Afrocentrism Became an Excuse to Teach Myth as History* (1996), the American classicist Mary Lefkowitz attempted to refute most of the assertions made by Bernal, Diop, and others. Public disputes between Lefkowitz and Tony Martin, an Afrocentrist colleague, have created strife between black and Jewish intellectuals and made Afrocentrism vulnerable to charges of anti-Semitism. Critics further argue that Afrocentrism's search for exclusively African values sometimes comes perilously close to reproducing racial stereotypes. Afrocentrism's supporters maintain that it is a valuable worldview and a spur to cultural and political activism by African Americans. (G.Ea./Ed.)

AFSC: *see* American Friends Service Committee.

Aftenposten (Norwegian: "Evening Post"), morning and evening daily newspaper published in Oslo. It is one of the leading newspapers in Norway and in all Scandinavia.

It was established in 1860 by Christian Schibsted, and it played a significant role in devel-

opening a sense of Norwegian nationhood. Noted from its founding for the strength of its coverage of local and, increasingly, national news, *Aftenposten* has generally taken an editorial stance that is moderately conservative. It was an early voice warning Norwegians of the dangers of Adolf Hitler's Germany.

When the Nazis invaded Norway in 1940, the paper's elevator operator, who had been a member of the "fifth column" of the traitorous Major Vidkun Quisling, took over *Aftenposten* from its editor, and, for the remainder of World War II, the paper was a Nazi propaganda organ. During the Nazi occupation, more than 60 editors of Norwegian newspapers were executed and 3,000 sent to concentration camps.

In the postwar era, *Aftenposten* won wide note for the strength of its coverage of international news while retaining its outstanding strength in local and national affairs.

afterburner, also called REHEAT, second combustion chamber in a turbojet (*q.v.*) or turbofan engine, immediately in front of the engine's exhaust nozzle. The injection and combustion of extra fuel in this chamber provide additional thrust for takeoff or supersonic flight. In most cases the afterburner can nearly

American Zion Commonwealth, a land-development organization, and was the first planned urban settlement of Jewish Palestine. The city is situated at the junction of two main roads leading to Galilee and the north. One is the coastal road from Tel Aviv-Yafo; the other is the hill road from Jerusalem via Nābulus and Janīn. The latter route is largely in the West Bank territory.

At its foundation, most of the city's natural hinterland was occupied by collective or cooperative settlements. These were economically and socially independent of 'Afula, and most of them also rejected urban society ideologically. As a result, the development of 'Afula as a quasi-metropolitan centre was hindered. Only after 1948 did the population begin to grow, owing to the settlement of large numbers of Jewish immigrants. A new section, 'Afula 'Illit ("Upper 'Afula"), was built on the slopes of Mount Ha-More, about 3 miles (5 km) from the old central business district. In 1972 'Afula received municipality status.

'Afula has a large sugar-refining plant, textile mills, and a nylon-socking factory. The Plain of Esdraelon's large regional hospital is there, as are a teachers' college and numerous government offices. Pop. (1994 est.) 33,000.

double the thrust of a turbojet engine. Since the jet nozzle must be larger when using the afterburner, an automatic, adjustable nozzle is an essential component of the afterburner system. Because the afterburner sharply increases fuel consumption and is generally less effective at subsonic speeds, its use is for the most part restricted to supersonic military aircraft.

afterpiece, supplementary entertainment presented after full-length plays in 18th-century England. Afterpieces usually took the form of a short comedy, farce, or pantomime, and were intended to lighten the solemnity of Neoclassical drama and make the bill more attractive to audiences. Long theatre programs that included interludes of music, song, and dance developed in the first 20 years of the 18th century, promoted primarily by John Rich at Lincoln's Inn Fields in order to compete with the Drury Lane. The addition of afterpieces to the regular program may also have been an attempt to attract working citizens, who often missed the early opening production and paid a reduced charge to be admitted later, usually at the end of the third act of a five-act play.

Before 1747, afterpieces were generally presented with old plays, but after that date, almost all new plays were accompanied by afterpieces as well. Although farce and pantomime were the most popular forms of afterpiece, other kinds included processions, burlettas or burlesques, music, and ballad operas, which gained popularity after the success of John Gay's *Beggar's Opera* in 1728.

aftosa: see foot-and-mouth disease.

'Afula, largest city of the Plain of Esdraelon, or Valley of Jezreel (Hebrew: 'Emeq Yizre'el), northern Israel. Named for the Arab village of Al-'Affūla formerly at that site, it is sometimes called 'Ir Yizre'el ("City of Jezreel"). It was founded in 1925 on lands acquired by the

Afyon, formerly AFYON KARAHISAR, AFYONKARAHISAR, or KARAHISAR-İ SAHİP, city, western Turkey. It lies along the Akar River at an elevation of 3,392 feet (1,034 m). In ancient times the town was known as Acroënus. It fell to the Seljuq Turks in the 13th century and was renamed Karahisar ("Black Fortress") after the ancient fortress situated atop a cone of volcanic rock 660 feet (201 m) above the town. The word *afyon* ("opium") was subsequently prefixed to the town's name as a reflection of the region's chief product. The town came under Ottoman rule briefly in 1392-1402 and then conclusively in 1428-29. It was heavily damaged in the Turkish War of Independence (1919-22), when it was occupied twice by Greek forces. Historical monuments in Afyon include the partly ruined fortress (the landmark of the town), the 13th-century Ulu Cami ("Great Mosque"), and the Altıgöz Bridge built by the Seljuqs. The local

City of Afyon, Turkey, overlooked by a cone of volcanic rock

Paul Kenward, AA Photo Library

archaeological museum is housed in an old theological school. An important railway junction on the İzmir-Ankara line, Afyon is also well-served by highways and air service linking it to all the major towns in Turkey.

The region surrounding the city has traditionally been the leading opium-poppy-producing area in Turkey. Its other agricultural products include wheat, barley, potatoes, sugar beets, and livestock. Industry is confined to mohair, wool, carpets, cement, and marble. Pop. (1990) 95,643.

AG catalog, German in full ASTRONOMISCHE GESELLSCHAFT KATALOG (AGK; "Astronomical Society Catalog"), compilation of the positions of all stars brighter than the ninth magnitude, compiled by the Astronomische Gesellschaft of Germany. Friedrich W.A. Argelander, founder of the society, proposed the star catalog in 1867, after completing the *Bonner Durchmusterung* ("Bonn Survey"). The massive project gave each participating observatory responsibility for mapping a specific zone of declination, and observatories around the world took part in the work.

The first version of the *Astronomische Gesellschaft Katalog* (AGK1) covered the sky north of 18° south declination and was completely published by 1912. A second (AGK2), based on photographs rather than direct observations, was begun in 1924 and published in 1951-58; a third catalog (AGK3) included the stars' proper motions (the rates at which their apparent positions change) and became available in 1969.

aga, also spelled AGHA, Turkish AĞA, in Turkey, person of high rank or social position, especially during the era of the Ottoman Empire. Combined with the names of military units or administrative departments, it formed the official titles borne by the chief officers of the Janissaries and of the cavalry, by the principal members of the imperial household, and by the eunuchs who controlled the sultan's harem. Later it was applied to officers of lower rank and, socially, as a term of respect, to heads of families and villages and to landowners. In republican Turkey the official title disappeared, the social use of the word surviving only among the lower classes.

As a title of respect, aga has also been used for Islāmic religious leaders, notably for the leader of the Nizārī Ismā'īlite sect of the Shī'ite Muslims.

Aga-Buryat, also spelled AGIN-BURYATIYA, or AGIN-BURIATIYA, autonomous *okrug* (district), Chita *oblast* (province), southeastern Russia. It is situated along the left bank of the lower Onon River, a headstream of the Amur. Aga-Buryat was formed in 1937 for an exclave group of the Buryat people, who live chiefly east and south of Lake Baikal, although by the late 20th century they constituted only about half of the population (the remainder being mostly Russian). The western half of the *okrug* is forested hilly country, and the eastern half is steppe lowland. There are no towns, but there are several urban districts, including Aginskoye, the administrative centre. Large herds of cattle and sheep are kept, and spring wheat and oats are grown. Area 7,300 square miles (19,000 square km). Pop. (1995 est.) 79,400.

Aga Khan, also spelled AGHA KHĀN, or ĀQĀ KHĀN, title of imams, or spiritual leaders, of the Nizārī Ismā'īlite sect of the Shī'ite Muslims, grouped below chronologically and indicated by the symbol ●.

● **Aga Khan I**, personal name ḤASAN 'ALĪ SHĀH (b. 1800—d. April 1881), imam, or spiritual leader, of the Nizārī Ismā'īlite sect of the Shī'ite Muslims. He claimed to be directly descended from 'Alī, the son-in-law of

the Prophet Muḥammad, and 'Alī's wife Fāṭimah, Muḥammad's daughter, and also from the Fāṭimid caliphs of Egypt.

He was the governor of the Iranian province of Kerman and was high in the favour of Fath 'Alī Shāh. The title Aga Khan (chief commander) was granted him in 1818 by the shah of Iran. Under Moḥammad Shāh, however, he felt his family honour slighted and rose in revolt in 1838 but was defeated and fled to India. He helped the British in the first Anglo-Afghan War (1839–42) and in the conquest of Sindh (1842–43) and was granted a pension. After he had settled in Bombay, he encountered some opposition from a minority of his followers, who contested the extent of his spiritual authority and in a lawsuit challenged his control over the community's funds, but he won his case (1866).

• **Aga Khan II**, personal name 'ALĪ SHĀH (d. August 1885, Poona, India), eldest son of the Aga Khan I. In 1881 he succeeded his father as imam, or spiritual leader, of the Nizārī Ismā'īlīte sect of Shi'ite Muslims, and, during his short imamate, sought to improve the conditions of the community.

• **Aga Khan III**, personal name SULTAN SIR MOḤAMMED SHĀH (b. Nov. 2, 1877, Karāchi, India [now in Pakistan]—d. July 11, 1957, Versoix, Switz.), only son of the Aga Khan II. He succeeded his father as imam of the Nizārī Ismā'īlīte sect in 1885.

Under the care of his mother, a daughter of the ruling house of Iran, he was given an education not only Islāmic and Oriental but also Western. In addition to attending diligently to the affairs of his own community, he rapidly acquired a leading position among India's Muslims as a whole. In 1906 he headed the Muslim deputation to the viceroy, Lord Minto, to promote the interests of the Muslim minority in India. The Morley-Minto reforms of 1909 consequently provided for separate Muslim electorates. He served as president of the All-India Muslim League during its early years and initiated the fund for raising the Muslim college at Aligarh to university status, which was effected in 1920.

When World War I broke out, the Aga Khan supported the Allied cause, but at the subsequent peace conference he urged that Turkey should be leniently treated. He played an important part in the Round Table conferences on Indian constitutional reform in London (1930–32). He also represented India at the World Disarmament Conference in Geneva in 1932 and at the League of Nations Assembly in 1932 and from 1934 to 1937. He was appointed president of the League in 1937. During World War II he lived in Switzerland and withdrew from political activity.

The Aga Khan was also well-known as a successful owner and breeder of Thoroughbred racehorses.

• **Aga Khan IV**, personal name KARIM AL-HUSSAIN SHĀH (b. Dec. 13, 1937, Geneva, Switz.), elder son of Prince Aly Khan by his first wife, the daughter of the 3rd Baron Churston. Educated in Switzerland and at Harvard University, he was chosen as successor to the imamate of the Nizārī Ismā'īlīte sect by his grandfather, the Aga Khan III, whom he succeeded in 1957.

The new Aga Khan initiated visits to his scattered Ismā'īlīte peoples in the first year of his reign. He became a strong leader, ordering his followers to become citizens of the countries in which they resided and to leave countries where they faced trouble and persecution. He was known for his business acumen, and his extensive private holdings included hotels, airlines in Italy and Spain, and newspapers in Kenya. Through organiza-

tions such as the Aga Khan Foundation, the imamate funded aid agencies offering educational, health, and housing services in South Asia and East Africa. The Aga Khan Fund for Economic Development (AKFED) invested in development programs to promote manufacturing, tourism, and financial services. He also continued his family's extensive horse-breeding enterprise.

Agadez, also spelled AGADES, town, central Niger, at the southern edge of the Air massif. Agadez is a market town at a crossroads, 460 miles (740 km) northeast of Niamey, the national capital. Once the seat of a Tuareg sultanate (dating from the 15th century), the town remains the centre for Tuareg pastoralists, who still wander over the arid plateau.

The surrounding region receives less than 12 inches (300 mm) of annual rainfall and

Mosque in Agadez, Niger
Picturepoint

lies above the northern limit of nonirrigated cultivation in Niger. The general elevation of this vast landscape of sandy basins, low lateritic plateaus, isolated hills, and sandstone bluffs varies from 1,000 to 3,000 feet (300 to 1,000 m). Elevations in the Air massif, a 200-mile (325-kilometre) Precambrian granite mountain range to the north, reach 6,600 feet (2,000 m). Cassiterite (tin) and coal are mined near Agadez. Tuareg and Fulani nomads traditionally meet annually in August at I-n-Gall some 68 miles (110 km) to the west of Agadez. Agadez handles their livestock and hides as well as some grains and vegetables in the marketplace. The School of Mines of the Air opened in Agadez in 1976, and uranium mining has become important. There is an airstrip. Pop. (1988 prelim.) 50,164.

Agadir, city, Atlantic port, southwestern Morocco. The city lies 6 miles (10 km) north of the mouth of the Sous Wadi. Possibly the site of the ancient Roman Portus Risadir, the city was occupied by the Portuguese from 1505 to 1541, when it fell to the Sa'dian king of Sūs (Sous).

After the Moroccan crisis of 1911, when the German gunboat *Panther* appeared offshore "to protect German interests," the city was occupied by French troops (1913). Modern growth began with the construction of the port (1914), development of the Sous plain, exploitation of inland mineral resources, and the fishing and fish-canning industries. In 1960 the city was virtually destroyed by two earthquakes, a tidal wave, and fire, which killed about 12,000 people. A new central city was built to the south of the old town. The city is linked by road with Safi and Marrakech; it also has an international airport.

The region that surrounds Agadir is composed of the plain of the east-west-trending Sous Wadi, which itself is enclosed between the Haut Atlas and Anti-Atlas mountains. Cereals (primarily barley), citrus fruits, olives, sheep, goats, and cattle are raised on the ir-

rigated Sous plain, and sheep and goats are grazed in the mountains. Pop. (1994) 155,240.

Agadir Incident, event involving a German attempt to challenge French rights in Morocco by sending the gunboat *Panther* to Agadir in July 1911. The action incited the Second Moroccan Crisis (see Moroccan crises).

Agaié, town and traditional emirate, Niger state, west-central Nigeria. The town lies at the intersection of roads from Bida, Baro, Tagagi, Lapai, and Ebba. Originally inhabited by the Dibo (Ganagana, Zitako), a people associated with the Nupe, it fell under the sway of Malam Baba, a Fulani warrior, in 1822. After Baba had extended his territory south to the Niger River, he requested the emir of Gwandu, the Fulani empire's overlord of the western emirates, to establish a new emirate; in 1832 Baba's son Abdullahi was inaugurated as the first emir of Agaié. Shortly after the chiefs of Agaié emirate had given military aid to Bida (the adjacent Fulani emirate to the west) in its campaign of 1897 against the Royal Niger Company, Agaié was occupied by the British. In 1908 the emirate, a 737-square-mile (1,909-square-kilometre) area, became part of a newly created administrative unit. Its present population, still predominantly Nupe, is mainly engaged in farming.

Agaié town is a market centre (yams, sorghum, millet, rice, shea nuts, cotton, and peanuts [groundnuts]). Swamp rice, an especially important cash crop south and west of the town in the Niger's floodplains, is cultivated both on small farms and at the government's irrigated rice project at Loguma, 20 miles (32 km) south. Pop. (1991 prelim.) local government area, 85,280.

Agaja, also spelled AGADJA (b. c. 1673—d. 1740, Allada, Dahomey [now Benin]), third ruler of the West African kingdom of Dahomey (1708–40), who was able to extend his kingdom southward to the coast and who consolidated and centralized it through important administrative reforms.

The first part of Agaja's reign was by far the more successful. From 1708 to 1727 he carried out a series of expansionist wars, culminating in the takeover of the kingdom of Allada in 1724 and of the important coastal trading state of Whydah (Ouidah) in 1727. In the second half of his reign, however, he was subject to the invasions of the powerful Oyo kingdom to the northeast.

The Oyo first invaded Dahomey in 1726, easily defeating Agaja's forces and burning his capital, Abomey, before returning home. They invaded Dahomey again in 1728, 1729, and 1730. Agaja and his men retreated or hid as the Oyo burned and pillaged. Finally, in 1730, Agaja was forced to come to terms and pay tribute. He also gave up his opposition to the slave trade, though he did insist on a royal monopoly. From 1730 until his death he maintained his capital at Allada, south of his former capital; once his territory seemed secure he concentrated on administrative reform, especially the creation of a bureaucracy under royal control. Internal dissension developed after 1735, however, partly because of the chiefs' resentment over the royal monopoly of the slave trade, and in 1737 this trade became free. Meanwhile, Agaja was evidently not able to keep up the annual tribute to the Oyo, who invaded his kingdom once more the year before his death.

Agalega Islands, two island dependencies (North Island and South Island) of Mauritius, in the western Indian Ocean. They lie about 600 miles (1,000 km) north of Mauritius and have a total land area of 27 square miles (70 square km). Copra and coconut oil are produced and exported, and some poultry and cattle are raised and vegetables grown for subsistence. The main village, Sainte Rita on South Island, has a school and a small hospital. There

are some roads but few motor vehicles. Pop. (2000) 289.

Agam, Yaacov, original name JACOB GIPSTEIN (b. May 11, 1928, Rishon le-Zion, Palestine [now Rishon LeZiyyon, Israel]), pioneer and leading exponent of optical and kinetic art, best known for his three-dimensional paintings and sculptures.

Agam was the son of a Russian rabbi. He grew up in an early Jewish settlement and

Agam, 1972
Michele Vishny

did not begin his formal schooling until age 13. Having learned to draw at an early age, he studied art in Jerusalem (1947–48), Zürich (1949–51), and Paris (1951) and had his first one-man exhibition in 1953 in Paris, where he settled. Eventually his body of work grew to include vibrating and tactile elements, and he began to create manipulable sculptures as well.

Agam's relief paintings, with their shifting, merging geometric forms, demonstrate his concern with time, movement, and viewer involvement. The viewer becomes a participant in the transformation—in a sense, the creation—of Agam's works by moving in front of them, by rotating the work, or by manipulating various elements of the works. Examples of Agam's works include "Three Times Three Interplay" (1970–71) and "The Thousand Gates" (1972) in the gardens of Israel's presidential palace in Jerusalem. He also designed an enormous musical fountain situated in the Quartier de la Défense, Paris (1975).

agama (genus *Agama*), any of about 30 species of lizards belonging to the family Agamidae (suborder Sauria). They are rather unspecialized lizards about 30 to 45 cm (12 to 18 inch-

Hardun (*Agama stellio*)
John Markham

es) long exhibiting little development of crests or dewlaps. They inhabit rocky desert areas throughout Africa, southeastern Europe, and central India.

Although they are usually brown or gray,

males undergo a conspicuous colour change during mating season, turning bright red, blue, and shades of yellow; in some species females are known to court males. Agamas, which lay from 2 to 20 eggs per clutch, may hatch several clutches in one year.

Agama agama, a common gray lizard with a red or yellow head, is well adapted to gardens and to the bush and grasslands. The hardun, *A. stellio*, which is common in northern Egypt, has a tail ringed with spiked scales, giving it a ferocious appearance.

agama, Sanskrit ĀGAMA ("tradition, received teachings"), post-Vedic scriptures conveying ritual knowledge that are considered to have been revealed by a personal divinity. Śaivite scriptures, dating probably to the 8th century, are particularly so designated, in contrast to the Vaishnava *saṁhitās* and Shakta tantras. Many passages are written in the form of a dialogue between Śiva (Shiva) and his wife Pārvatī.

For convenience, scholars discuss the texts according to the four Śaivite branches that follow the agamic tradition. These are the Sanskrit school of Śaiva-siddhānta, the Tamil Śaivas, the Kashmir Śaivas, and the Liṅgāyats, who are also known as the Viraśaivas. The *agamas* provide a considerable amount of information on the earliest codes of temple building, image making, and religious procedure.

Agamemnon, in Greek legend, king of Mycenae or Argos. He was the son (or grandson) of Atreus, king of Mycenae, and his wife Aërope and was the brother of Menelaus. After the murder of Atreus by a nephew, Aegisthus (son of Thyestes), Agamemnon and Menelaus took refuge with Tyndareus, king of Sparta, whose daughters, Clytemnestra and Helen, they respectively married. By Clytemnestra, Agamemnon had a son, Orestes, and three daughters, Iphigeneia (Iphianassa), Electra (Laodice), and Chrysothemis. Menelaus succeeded Tyndareus, while Agamemnon recovered his father's kingdom.

After Paris (Alexandros), son of King Priam of Troy, carried off Helen, Agamemnon called on the princes of the country to unite in a war of revenge against the Trojans. He himself furnished 100 ships and was chosen commander in chief of the combined forces. The fleet assembled at the port of Aulis in Boeotia but was prevented from sailing by calms or contrary winds that were sent by the goddess Artemis because Agamemnon had in some way offended her. To appease the wrath of Artemis, Agamemnon was forced to sacrifice his own daughter Iphigeneia.

After the capture of Troy, Cassandra, the daughter of Priam, fell to Agamemnon's lot in the distribution of the prizes of war. On his return he landed in Argolis, where Aegisthus, who in the interval had seduced Agamemnon's wife, treacherously carried out the murder of Agamemnon, his comrades, and Cassandra. The Greek poet Aeschylus, however, had Clytemnestra do the actual killing. The murder was avenged by Orestes, who returned to slay both his mother and her paramour.

Agamidae, lizard family (suborder Sauria) composed of about 350 species in about 50 genera. Agamids typically have scaly bodies, well-developed legs, and a moderately long tail; average body size ranges from 10 to 15 cm (4 to 6 inches), and the tail is 20 to 30 cm long, though the family varies widely.

Agamids inhabit tropical rainforests and mountain forests as well as deserts and steppes throughout most of the Old World, but they are found primarily in Australia, southern Asia, and Africa. There are both ground-dwelling and arboreal species. For more information on some noteworthy members, see agama, *Chlamydosaurus* (frilled lizard), *Draco* (flying lizard), and moloch.

Agana, former name of HAGĀTÑA, capital of the unincorporated U.S. outlying territory of Guam. (The Chamorro name Hagātña replaced the name Agana in 1998.) Hagātña is situated at the centre of the west coast of the island on a sandy beach surrounding Hagātña Bay at the mouth of the small Hagātña River. A town of 10,000 inhabitants in 1940, it was completely destroyed in World War II. Reconstruction has been hindered by the difficulty of determining ownership of many plots of land. The Roman Catholic Dulce Nombre de María Cathedral Basilica was rebuilt after World War II. Adjoining the cathedral is the Plaza de España and the Azotea (back porch), one of a few parts of the original Spanish governor's palace still standing. Close by is Latte Stone Park, with latte stones (pillars that supported houses of the prehistoric Latte culture).

Tamuning, just northeast of Hagātña, and Piti, to the southwest, have become major business centres at the expense of the capital. Hagātña usually enjoys a mild climate but is often struck by typhoons. Pop. (2000) 1,122.

A list of the abbreviations used in the MICROPAEDIA will be found at the end of this volume

agape, Greek AGAPĒ, in the New Testament, the fatherly love of God for mankind, and mankind's reciprocal love for God. The term necessarily extends to the love of one's fellow man. The Church Fathers used agape to designate both a rite (using bread and wine) and a meal of fellowship to which the poor were invited. The historical relationship between the agape, the Lord's Supper, and the Eucharist is uncertain. Some scholars believe the agape was a form of the Lord's Supper and the Eucharist the sacramental aspect of that celebration. Others interpret agape as a fellowship meal held in imitation of gatherings attended by Jesus and his disciples; the Eucharist is believed to have been joined to this meal later but eventually to have become totally separated from it. The possibility that Jesus may have given a new significance to Jewish ritual gatherings of his day has complicated the problem of interpretation.

Agapetus, also spelled AGAPITUS, name of two Roman Catholic popes, grouped below chronologically and indicated by the symbol ●.

● **Agapetus I**, SAINT (b. Rome—d. April 22, 536, Constantinople [now Istanbul, Tur.]; feast days April 22, September 20), pope from 535 to 536. Of noble birth, he was an archdeacon at the time of his election (May 13, 535). At the urging of the Ostrogothic king Theodahad, he headed an unsuccessful mission to Constantinople to deter the emperor Justinian I from his plans to reconquer Italy. While there he secured the election of, and consecrated, Mennas as successor to the patriarch Anthimus I, whom he deposed for his Monophysite beliefs (that Christ had but one nature). Agapetus' remains were brought back from Constantinople, where he died, and were buried in Rome.

● **Agapetus II** (b. Rome—d. December 955, Rome), pope from 946 to 955. Elected on May 10, 946, he was a wise and pious administrator who endeavoured to restore ecclesiastical discipline. The chief events of his pontificate included the spread of Christianity in Denmark, the settlement of the dispute over the see of Reims, and the German king Otto I's first success in Italy (951).

Agar (mother of Ishmael): see Hagar.

agar, also called AGAR-AGAR, gelatin-like product made primarily from the algae *Ge-*

(Top to bottom) A mushroom growing in groups or tufts, *Mycena leaiiana* has a sticky cap and stalk; the oyster cap (*Pleurotus ostreatus*), which usually has a sessile growth habit (lacking a stem), grows in clumps that may weigh a pound (454 grams) or more; *Russula mariae*, which grows on soil or humus

(Top) William Cibula, (centre) Hal H. Harrison from Grant Heilman, (bottom) Larry C. Moon—Tom Stack & Associates

lidium and *Gracilaria* (red seaweeds). Best known as a solidifying component of bacteriological culture media, it is used also in canning meat, fish, and poultry; in cosmetics, medicines, and dentistry; as a clarifying agent in brewing and wine making; as a thickening agent in ice cream, pastries, desserts, and salad dressings; and as a wire-drawing lubricant. Agar is isolated from the algae as an amorphous and translucent product sold as powder, flakes, or bricks. It is produced chiefly in Japan, New Zealand, Australia, the United States, and Russia. Although agar is insoluble in cold water, it absorbs as much as 20 times its own weight. It dissolves readily in boiling water; a dilute solution is still liquid at 42° C (108° F) but solidifies at 37° C into a firm gel. In the natural state, agar occurs as a complex cell-wall constituent containing a complex carbohydrate (polysaccharide) with sulfate and calcium.

Agaricales, also called GILL FUNGI, a large and important order of fungi (division Mycota) in the class Basidiomycetes (*q.v.*). The group contains about 16 families and 4,000 species. The best known family, Agaricaceae, has spore-bearing cells (basidia) located on thin sheets called gills. The familiar commercially grown mushroom is a representative example: its fruiting structure (the mushroom proper) typically consists of a stalk (stipe) and a cap (pileus), which bears the gills on its underside. Best known of the agarics is the genus *Agaricus* (*Psalliota*), with some 60 species (see mushroom). The most prominent of the agarics are the edible meadow or field mushroom *A. campestris* and the common cultivated mushroom *A. bisporus*. The family Amanitaceae contains many species which are poisonous (see Amanita).

Among the remaining families, the following members are of interest. *Clitocybe* is a cosmopolitan genus and contains with the poisonous *C. illudens*, the jack-o-lantern, which glows in the dark. This orange-yellow fungus of woods and stumps resembles the sought after edible species of *Cantharellus*, the chanterelle; the similarity emphasizes the need for careful identification by the mushroom gatherer. *Russula* has 275 species, many with caps of red, orange, yellow, or green. *Lactarius* has milky (hence the name) or bluish juice; the genus contains the edible *L. deliciosus* as well as several poisonous species. *Coprinus*, the ink caps, characteristically grow in clumps at the sides of roads and at the base of old stumps. They are characterized by bullet-shaped caps, black spores (which make the gills appear black), and their habit of liquefying when mature, leaving an inky mass. The majority are edible, a few are somewhat poisonous, and some are mildly toxic only when alcoholic beverages are consumed with the mushrooms.

Armillaria is a genus of about 40 cosmopolitan species. *A. mellea*, the edible honey mushroom, causes root rot in trees. Its yellowish clusters are often found at the bases of trees and stumps, and black shoe-string-like fungal filaments can be found in the decaying wood. *Armillaria ponderosa*, an edible mushroom with an interesting cinnamon flavor, is found in Northwest coastal forests; it is avidly collected by Japanese-Americans, who call it matsutake, after the matsutake of Japan (*Tricholoma matsutake*). *Tricholoma* also contains a number of inedible forms, including the very poisonous *T. pardinium*. *Pholiota* is found almost exclusively on wood. Some species are known to cause heartwood rot in trees. The cap and stalk of *P. squarrosa*, an edible mushroom, are covered with dense, dry scales. Among the shelf or bracket fungi growing from tree trunks is the oyster cap, *Pleurotus ostreatus*, so called because of its appearance. It is edible when young, but, as with most shelf and bracket fungi, it tends to become hard or leathery with

(Top to bottom) *Cortinarius cinnamomeus* occurs singly or in small groups under conifers; the shaggy parasol (*Lepiota rhacodes*) appears in humus and compost piles; *Lactarius* grows on soil; usually small, some *Psilocybe* species grow in dung

(Top to bottom) Larry C. Moon—Tom Stack & Associates, G.E. Hyde from the Natural History Photographic Society, Ervin Hillhouse, Ellen Trueblood

age. The small *Marismium oreades* appears frequently in lawns (see fairy ring mushroom).

Agartala, town, capital of Tripura state, northeastern India, lying near the Bangladesh border in an intensively cultivated plain. Situated astride the Haroa River amid numerous villages, it is the commercial centre of the area. A maharaja's palace, a temple, and four colleges affiliated with the University of Calcutta are located there. Pop. (1991) 157,358.

Agarwālā, important mercantile caste in India, belonging to that group of merchants, bankers, landowners, and shopkeepers that are called Bania in northern and western India. According to caste tradition, its members are descended from a *nāga*, or snake goddess; hence, they do not molest snakes, and they observe a special form of snake worship that is peculiar to them. The caste goddess is Lakṣmī (Lakshmi), goddess of good fortune, who is thought to have blessed the original union of the snake goddess. The Gauda branch of northern Indian Brahmins act as priests for the Agarwālās, who tend to be orthodox in their conduct and diet. The majority are Vaiṣṇavas, worshippers of the god Vishnu, but about 14 percent of the caste members follow the Jaina religion.

Agassiz, Alexander (Emmanuel Rodolphe) (b. Dec. 17, 1835, Neuchâtel, Switz.—d. March 27, 1910, at sea), marine zoologist, oceanographer, and mining engineer who made important contributions to systematic zoology, to the knowledge of ocean beds, and to the development of a major copper mine.

Son of the Swiss naturalist Louis Agassiz, he joined his father in 1849 in the U.S., where he studied engineering and zoology at Harvard University. His early research on echinoderms (e.g., starfish) resulted in his most significant work in the area of systematic zoology, the *Revision of the Echini* (1872–74).

From 1866 to 1869 Agassiz was the superintendent of a copper mine near Lake Superior, at Calumet, Mich.; he eventually became president of the mine, retaining that position until his death, by which time he had changed an initially unprofitable operation into the world's foremost copper mine. Agassiz instituted modern machinery and safety devices, pension and accident funds for miners, and

sanitary measures for surrounding communities. He donated large sums to the Harvard Museum, of which he was curator from 1874 to 1885, and to other institutions engaged in advancing the study of biology.

Agassiz opened a private biological laboratory at Newport, R.I., soon after closing his father's experimental school of biology on Penikese Island, off the coast of Massachusetts, following the death of Louis Agassiz (1873). On a trip along the west coast of South America (1875), he discovered a coral reef 3,000 feet above sea level, an observation that appeared to contradict Charles Darwin's theory of coral-reef formation, in which he postulated a rate of coral formation identical with the rise of sea level. He continued his marine and coral-reef studies for more than 25 years, making expeditions in various waters, including the Caribbean, the South Pacific, and the Great Barrier Reef of Australia.

Agassiz, Elizabeth Cabot, née CARY (b. Dec. 5, 1822, Boston—d. June 27, 1907, Arlington Heights, Mass., U.S.), U.S. naturalist and educator who was the first president of Radcliffe College, Cambridge, Mass.

Her early career was in association with her husband, the Swiss naturalist Louis Agassiz, whom she married in 1850. Together they travelled on scientific expeditions, wrote scholarly works, and founded the Anderson School of Natural History, a marine laboratory on Penikese Island in Buzzard's Bay, Mass.

After her husband's death in 1873, Elizabeth Agassiz became interested in the idea of a college for women to be taught by the Harvard University faculty; a coordinate college would give women access to previously male-dominated educational resources. In 1879 she helped open the "Harvard Annex" in Cambridge and was named president when it was incorporated in 1882 as the Society for the Collegiate Instruction of Women. In 1894 the Annex became Radcliffe College. Agassiz served as president until 1899. She then became honorary president until 1903. Her writings include *A First Lesson in Natural History* (1859); with Louis Agassiz, *A Journey in Brazil* (1867); and *Louis Agassiz: His Life and Correspondence*, 2 vol. (1885).

Agassiz, Lake, largest of the ice-marginal lakes that once covered what are now parts of Manitoba, Ontario, and Saskatchewan in Canada, and North Dakota and Minnesota in the United States. It was present in the Pleistocene Epoch (a geological period dating back more than 2,000,000 years) during the last two phases of the Wisconsin Glacial Age, when the Laurentide Ice Sheet blocked the drainage of the northern Great Plains into what is today Hudson Bay. As a result, the waters of the Saskatchewan and other rivers backed up, forming the 700-mi- (1,100-km-) long by 200-mi-wide Lake Agassiz and the smaller lakes of Souris and Saskatchewan, which drained through various outlets (depending upon their water level) either into the Mississippi River (via the Minnesota River) or Lake Superior. With the retreat of the ice sheet, after nearly 1,000 years, a channel to the north (now the Nelson River) drained the 110,000-sq-mi (285,000-sq-km) Lake Agassiz into Hudson Bay, leaving lakes Winnipeg, Winnipegosis, and Manitoba, and Lake of the Woods (qq.v.) as remnants. The fine claylike silt that accumulated on the bottom of Agassiz is responsible for the fertility of the valleys of the Red and Souris rivers. The lake was named in 1879 after the Swiss-born naturalist and geologist Louis Agassiz, who conducted extensive studies on the movement of glaciers.

Agassiz, (Jean) Louis (Rodolphe) (b. May 28, 1807, Motier, Switz.—d. Dec. 14, 1873, Cambridge, Mass., U.S.), Swiss-born U.S. naturalist, geologist, and teacher who made revolutionary contributions to the study of nat-

ural science with landmark work on glacier activity and extinct fishes. He achieved lasting fame through his innovative teaching methods, which altered the character of natural science education in the United States.

Early life. Agassiz was the son of the Protestant pastor of Motier, a village on the shore of Lake Morat, Switzerland. In boyhood he attended the gymnasium in Bienne and later the academy at Lausanne. He entered the universities of Zürich, Heidelberg, and Munich and took at Erlangen the degree of doctor of philosophy and at Munich that of doctor of medicine.

As a youth he gave some attention to the ways of the brook fish of western Switzerland, but his permanent interest in ichthyology began with his study of an extensive collection of Brazilian fishes, mostly from the Amazon River, which had been collected in 1819 and 1820 by two eminent naturalists at Munich. The classification of these species was begun by one of the collectors in 1826, and when he died the collection was turned over to Agassiz. The work was completed and published in 1829 as *Selecta Genera et Species Piscium*. The study of fish forms became henceforth the prominent feature of his research. In 1830 he issued a prospectus of a *History of the Fresh Water Fishes of Central Europe*, printed in parts from 1839 to 1842.

The year 1832 proved the most significant in Agassiz's early career because it took him first to Paris, then the centre of scientific research, and later to Neuchâtel, Switz., where he spent many years of fruitful effort. While in Paris he lived the life of an impecunious student in the Latin Quarter, supporting himself and helped at times by the kindly interest of such friends as the German naturalist Alexander von Humboldt—who secured for him a professorship at Neuchâtel—and Baron Cuvier, the most eminent ichthyologist of his time.

Louis Agassiz, between 1855 and 1865

By courtesy of the Museum of Comparative Zoology Harvard University

Already Agassiz had become interested in the rich stores of the extinct fishes of Europe, especially those of Glarus in Switzerland and of Monte Bolca near Verona, of which, at that time, only a few had been critically studied. As early as 1829 Agassiz planned a comprehensive and critical study of these fossils and spent much time gathering material wherever possible. His epoch-making work, *Recherches sur les poissons fossiles*, appeared in parts from 1833 to 1843. In it, the number of named fossil fishes was raised to more than 1,700, and the ancient seas were made to live again through the descriptions of their inhabitants. The great importance of this fundamental work rests on the impetus it gave to the study of extinct life itself. Turning his

attention to other extinct animals found with the fishes. Agassiz published in 1838–42 two volumes on the fossil echinoderms of Switzerland, and later (1841–42) his *Études critiques sur les mollusques fossiles*.

From 1832 to 1846 he served as professor of natural history in the University of Neuchâtel. In Neuchâtel he acted for a time as his own publisher, and his private residence became a hive of activity with numerous young men assisting him. He now began his *Nomenclator Zoologicus*, a catalog with references of all the names applied to genera of animals from the beginning of scientific nomenclature, a date since fixed at Jan. 1, 1758.

In 1836 Agassiz began a new line of studies: the movements and effects of the glaciers of Switzerland. Several writers had expressed the opinion that these rivers of ice once had been much more extensive and that the erratic boulders scattered over the region and up to the summit of the Jura Mountains were carried by moving glaciers. On the ice of the Aar Glacier he built a hut, the "Hôtel des Neuchâtelois," from which he and his associates traced the structure and movements of the ice. In 1840 he published his *Études sur les glaciers*, in some respects his most important work. In it, Agassiz showed that at a geologically recent period Switzerland had been covered by one vast ice sheet. His final conclusion was that "great sheets of ice, resembling those now existing in Greenland, once covered all the countries in which unstratified gravel (boulder drift) is found."

Activities in the United States. In 1846 Agassiz visited the United States for the general purpose of studying natural history and geology there but more specifically to give a course of lectures at the Lowell Institute in Boston. The lectures were followed by another series in Charleston and, later, by both popular and technical lectures in various cities. In 1847 he accepted a professorship of zoology at Harvard University; and in 1850, after his first wife's death, he married Elizabeth Cabot Cary of Boston, who was well known as a writer and a promoter of women's education.

In the United States his chief volumes of scientific research were the following: *Lake Superior* (1850); *Contributions to the Natural History of the United States* (1857–62), in four quarto volumes, the most notable being on the embryology of turtles; and the *Essay on Classification* (1859), a brilliant publication, which, however, failed to grasp the fact that zoology was moving away from the doctrine of special creation toward the doctrine of evolution. Besides these extensive contributions there appeared a multitude of short papers on natural history and especially on the fishes of the U.S. His two expeditions of most importance were, first, to Brazil in 1865 and, second, to California in 1871, the latter trip involving both shores of South America. *A Journey in Brazil* (1868), written by Mrs. Agassiz and himself, gives an account of their experiences. His most important paper on U.S. fishes dealt with the group of viviparous surf fishes of California.

Agassiz was deeply absorbed in his cherished plan of developing at Harvard a comprehensive museum of zoological research. This institution, which was established in 1859 and ultimately grew into the present museum of comparative zoology, enjoyed his fostering care during the rest of his lifetime. In the U.S., Agassiz's industry and devotion to scientific pursuits continued, but two other traits now assumed importance. Quite possibly he was the ablest science teacher, administrator, promoter, and fund raiser in the U.S. in the 19th century. In addition, he was devoted to his students, who were in the highest sense co-workers with him.

Agassiz's method as teacher was to give contact with nature rather than information. He discouraged the use of books except in detailed research. The result of his instruction at Harvard was a complete revolution in the study of natural history in the U.S. The purpose of study was not to acquire a category of facts from others but to be able, through active contact with the natural world, to gather the needed facts. As a result of his activities, every notable teacher of natural history in the U.S. for the second half of the 19th century was a pupil either of Agassiz or of one of his students.

In the interests of better teaching and of scientific enthusiasm, he organized in the summer of 1873 the Anderson School of Natural History at Penikese, an island in Buzzards Bay. This school, which had the greatest influence on science teaching in America, was run solely by Agassiz. After his death it vanished.

Agassiz and Darwin. Because Agassiz was beyond question one of the ablest, wisest, and best informed of the biologists of his day, it may be asked why his attitude toward Darwin's *Origin of Species*, published in 1859, was cold and unsympathetic. It is likely that Agassiz's lifelong view of nature determined his attitude toward the new doctrine of evolution. Although Agassiz was quite familiar with the factual evidence concerning environmental change, variability, and hereditary modification on which Darwin built his arguments, he held that the organic world represented repeated interventions by the Supreme Being. Ordinary physical events on which Darwin relied, such as climatic and geologic change, and even glaciers, could bring about extinctions but not new species. The sequence in the fossil record from simple animals and plants in the ancient, deeper strata to the more complex, recent forms found near the surface represented a progressive development, Agassiz agreed, but these different animals and plants did not arise because of interactions between populations and external environmental changes, as Darwin argued. Agassiz maintained that since organisms arose by a series of independent and special creations, there could be no hereditary continuity between different types of organisms. Each species of plant and animal was a "thought of God," and homologies or anatomical similarities were "associations of ideas in the Divine Mind." Agassiz's view of nature was historically derived from the thought of Plato, for whom the unseen world had more reality than the world of sense experience. Agassiz, therefore, could not accept Darwin's conceptual view of nature, in which environmental events could evoke organic change.

(D.S.J.)

BIBLIOGRAPHY. The definitive biography is Edward Lurie, *Louis Agassiz: A Life in Science* (1960; abridged ed., 1967), a substantial, documented analysis of his scientific thought. It contains an extensively annotated bibliography relating to earlier biographical materials and particular aspects of his scientific career.

agate, common semiprecious silica mineral, a variety of chalcedony (*q.v.*) that occurs in

Banded agate
B M Shaub

bands of varying colour and transparency. Agate is essentially quartz, and its physical properties are in general those of that mineral. See silica mineral (table).

Agate is found throughout the world. In the United States it is produced in several western states; Oregon, Washington, Idaho, and Montana are the chief sources of gemstones. Most agates occur in cavities in eruptive rocks or ancient lavas. These agates have a banded structure, successive layers being approximately parallel to the sides of the cavity. It is probable that they have been formed as follows. During cooling of the lava, steam and other gases form bubbles. The bubbles overtaken by solidification are frozen in, forming cavities. Long after the rock has solidified, water—carrying silica (*q.v.*) in solution, probably as alkali silicate—penetrates into the bubble and coagulates to a silica gel. Soluble components of the iron-bearing rock diffuse into the silica gel and produce the regular layers of iron hydroxide. Finally the whole mass gradually hardens with loss of water and crystallization of much of the silica as quartz or chert. During crystallization, the coloured bands are not disturbed. Varieties of agate are characterized by peculiarities in the shape and colour of the bands, which are seen in sections cut at right angles to the layers. In riband agate the bands appear as straight lines in cross section. Such agate, with white bands alternating with bands of black, brown, or red, is called onyx (*q.v.*). A ring or eye agate has concentric circular bands of different colours. A variety having included matter of a green colour, embedded in the agate and disposed in filaments and other forms suggestive of vegetable growth, is known as moss agate (*q.v.*).

The agate-working industry grew up centuries ago in the Idar-Oberstein district of Germany, where agates were abundant. After 1900 most agates were supplied by Brazil and Uruguay. Most commercial agate is artificially stained so that stones unattractive because of their dull-gray tints become valuable for ornamental purposes.

Agate, James (Evershed) (b. Sept. 9, 1877, Pendleton, Lancashire, Eng.—d. June 6, 1947, London), drama critic for the London *Sunday Times* (1923–47), book reviewer for the *Daily Express*, novelist, essayist, diarist, and raconteur. He is remembered for his wit and perverse yet lovable personality, the sparkle and fundamental seriousness of his dramatic criticism, and his racy, entertaining diary, called, characteristically, *Ego*, 9 vol. (1935–49).

Educated at the Giggleswick and Manchester grammar schools, Agate went to London to become a journalist, working as drama critic for several papers. During World War I he served as an army officer. Between 1917, when, as he said, he "stormed London" with a lively account of an uneventful war, and 1949, 44 volumes of his drama, book, and film reviews, essays, novels, and surveys of the contemporary theatre for 1923–26 and 1944–45 had been published, not counting the nine volumes of *Ego*. He was perhaps one of the last of a long line of English dramatic critics to take for granted his position as arbiter of taste and was also one of the last outstanding journalists of a great age of English journalism.

Agate Fossil Beds National Monument, natural "depository" of an extinct animal community, on the Niobrara River, Sioux County, northwestern Nebraska, U.S., 40 mi (64 km) north of Scottsbluff. The beds were laid down as sedimentary deposits about 20,000,000 years ago (Miocene Epoch) and bear the remains of prehistoric mammals including the Diceratherium (two-horned rhinoceros), the Moropus (7 ft [2m] at the shoulders with a horselike head), and the Dinohyus (a large piglike beast). The site, named because of its proximity to rock formations containing agates, lies in the Carnegie and University

hills. Established as a national monument in 1965, it covers an area of 2,269 ac (918 ha). Capt. James W. Cook was the first white man to discover the fossil bones c. 1878.

agateware, in pottery, 18th-century ware of varicoloured clay, with an overall marbled effect. It was sometimes called solid agate to distinguish it from ware with surface marbling. Agateware was probably introduced about 1730 by Dr. Thomas Wedgwood of Rowley's Pottery, Burslem, Staffordshire, Eng. The random mingling of coloured clays, such as red and buff, gave a broad veining to domestic

Agateware sauceboat, Whieldon type, Staffordshire, England, c. 1750; in the Victoria and Albert Museum, London

and ornamental pieces. The English potter Thomas Whieldon greatly improved agateware in the 1740s by using white clays stained with metallic oxides. Repeated mixing of different layers of brown, white, and green or blue clay yielded a striated marbling throughout the substance; the clay "cake," difficult to manipulate without blurring, was shaped in two-part molds, polished after firing, and glazed. A typical golden-yellow glaze is on early ware, but after about 1750 it is transparent or blue gray, being tinted by the cobalt in the blue-stained clay. Whieldon's agateware commenced with snuffboxes and knife shafts; and Josiah Wedgwood used the process at Etruria for classical onyx or pebbled vases closely imitating natural agate. Other makers of agateware were Thomas Astbury and Josiah Spode. It was an unsuitable medium for human figures but proved felicitous in models of cats or rabbits and for tableware. Its manufacture ceased in about 1780. Some agateware was made at continental factories—e.g., Aprey près Langre (Haute Marne).

Agatha, SAINT (fl. 3rd century AD?, Sicily; feast day February 5), legendary Christian saint and martyr, cited in the martyrology of St. Jerome, the Calendar of Carthage (c. 530), and other works. Palermo and Catania both claim to be her birthplace.

The traditional particulars of her martyrdom are of no historical value; according to them she resisted the advances of a Roman prefect sent by the emperor Decius to govern Sicily and was thereupon brutally tortured, her breasts being cut off (a condition reflected in her iconography). She was sent to the stake, but, according to some versions, as soon as the fire was lighted, an earthquake occurred, causing the people to insist upon her release; she then allegedly died in prison.

Agathias (b. c. 536, Myrina, Aeolis, Asia Minor—d. c. 582), Byzantine poet and author of a history, covering part of Justinian I's reign.

After studying law at Alexandria, he completed his training at Constantinople and practiced in the courts as an advocate. He wrote a number of short love poems in epic metre, called *Daphniaca*, and compiled an anthology of epigrams by earlier and contemporary poets, including his own. About 100 epigrams by Agathias have been preserved in the *Greek Anthology*. After the death of Justinian I (565),

he began a history of his own times. This unfinished work in five books stands as the chief authority for the period 552–558.

Agathis, the genus of the dammar pines, pinelike plants of the family Araucariaceae. *Agathis* species range from the Philippines to Australia and New Zealand. Elsewhere some are grown as ornamental plants in warm areas or in greenhouses. Several species yield hard resins or gums (including kauri copal, Manila copal, and dammar resin) used primarily in making varnishes and other products such as patent leather and sealing wax.

Agatho, SAINT (b. c. 577, Sicily—d. Jan. 10, 681; feast day January 10), pope from 678 to 681. A cleric at Rome, he was elected pope in June 678. He judged that St. Wilfrid, bishop of York, had been unjustly deprived and ordered his restoration, and he received the submission of Exarch Theodore of Ravenna, whose predecessors had aspired to autonomy.

Through legates, he participated in the sixth ecumenical council (680–681), in Constantinople, which condemned Monothelitism (belief that Christ had only one will) and accepted his definition of two wills, divine and human, in Christ. Agatho prevailed upon the Byzantine emperor Constantine IV to abolish the tax formerly exacted at the consecration of a newly elected pope. Agatho died during a plague that ravaged Rome.

Agathocles (b. 361 BC, Thermae Himeracae, Sicily—d. 289), tyrant of Syracuse, in Sicily, from 317 to c. 304 and self-styled king of Sicily after c. 304. A champion of Hellenism, he waged war unsuccessfully against Carthage.

Agathocles moved from his native town to Syracuse about 343 and served with distinction in the army. Twice banished for attempting to overthrow the oligarchical party, he returned in 317 with an army, banished or murdered about 10,000 citizens (including the oligarchs), and set himself up as tyrant.

Agathocles then embarked on a long series of wars. His first campaigns (316–c. 313), against the other Sicilian Greeks, brought a number of cities, including Messana, under his control. Carthage, however, fearing for its own possessions in Sicily, sent a large force to the island. Thus the struggle that had gone on between the Sicilian Greeks and Carthage intermittently since the 6th century was renewed. In 311 Agathocles, defeated and besieged in Syracuse, saved himself by breaking through the blockade and attacking his enemy's homelands in Africa with considerable success until his defeat in 307. The peace he concluded in 306 was not unfavourable, for it restricted Carthaginian power in Sicily to the area west of the Halycus (Platani) River. Agathocles continued to strengthen his rule over the Greek cities of Sicily. By c. 304 he felt secure enough to assume the title king of Sicily, and he extended his influence into southern Italy and the Adriatic.

Agathocles' reign as king was peaceful, allowing him to enrich Syracuse with many public buildings. Dissension among his family about the succession, however, caused him in his will to restore liberty to the Syracusans, and his death was followed by a recrudescence of Carthaginian power in Sicily.

Agathon (b. c. 445 BC—d. c. 400 BC, Macedonia), an Athenian tragic poet whose first victory at the festival of the Great Dionysia, in which plays were presented and judged, was gained in 416 BC. The event is made, by Plato, the occasion for his dialogue *Symposium*, and the banquet, which is the setting of the dialogue, is placed in Agathon's house. Aristotle, in the *Poetics*, ascribes to Agathon two innovations. He wrote a play, possibly *The Flower*, in which the characters, instead of being derived from the stock of Greek mythology, were his own invention, and he

changed the traditional function of the choral lyrics so that they became musical interludes in the action of the play instead of offering comment upon it. Aristophanes, in his play *The Thesmophoriazusae*, includes a parody of Agathon, but in another of his plays, *The Frogs*, calls him "a good [agathos] poet sorely missed by his friends." Agathon spent his last years at the court of Archelaus of Macedonia. Only some 40 lines of his writing are extant.

Agau, also spelled AGAW, an ancient people that settled in the northern and central Ethiopian Plateau; they are associated with the development of agriculture and animal husbandry in the area. The term Agau also refers to any of several contemporaneous groups that are either culturally similar or linked by a Cushitic language base. The Jewish Falasha (or "Black Jews") are believed to have descended from the Agau, and they retain some of the old Agau words in their religious vocabulary. Agau dialects are spoken in the mountainous region of Simen northeast of the City of Gonder and in the area southeast of Gonder. Awiya, a dialect spoken south of Lake Tana, is believed to contain the strongest similarities of any of the dialects to the ancient Agau language. Amharic also has many Agau elements and influences.

Agavaceae, the agave family of the flowering plant order Liliales, consisting of about 22 genera and at least 720 species of short-stemmed, often woody plants distributed throughout tropical, subtropical, and temperate areas of

Century plant (*Agave americana*)

Jim Annan

the world. Members of the family have narrow, lance-shaped, sometimes fleshy or toothed leaves that are clustered at the base of each plant. Most species have large flower clusters containing many flowers. The fruit is a capsule or berry.

Plants of the genus *Agave* are important primarily for the fibres obtained from their leaves. Sisal hemp, from *A. sisalana*, is the most valuable hard fibre. Henequen fibre is obtained from *A. fourcroyoides* and cantala, or Manila-Maguey fibre, from *A. cantala*. Some species of *Agave* contain a sap that is fermented to produce a cheesy-smelling, intoxicating drink. The century plant (*A. americana*) of southwestern North America is widely cultivated both indoors and outdoors for its 1.5- to 1.8-metre (5- to 6-foot) spiny leaves and 7.5- to 12-m flower cluster. The stemless plant produces its branched, yellow flower spike after 10 to 15 years and then dies, leaving small plants growing about its base. Many species of the genus *Yucca* are popular as ornamentals for their woody stems and spiny leaves. Some species of *Nolina* and *Dasylyrion*, similar to yuccas except for taller flower clusters and narrow leaves, also are cultivated. Sotol (*Dasylyrion acotrichum*), a short-stemmed plant, and

Nolina recurvata, the base of which is swollen and bottle-shaped, are the most common ornamentals. Red-leaved and broad-veined varieties of the tropical species *Cordyline indivisa*, *C. australis*, and *C. terminalis* are popular greenhouse and indoor pot plants. Other ornamentals of the family belong to the genera *Dracaena* and *Sansevieria*. Tuberose (*Polygonum tuberosum*) is cultivated for its volatile oil and has spikes of white flowers.

Agazzari, Agostino (b. Dec. 2, 1578, Siena [Italy]—d. April 10, 1640, Siena), Italian composer famous for his treatise, *Del sonare sopra il basso* ("Concerning Sound Above the Bass"), one of the earliest instruction books for performing from the thoroughbass.

Agazzari held positions in Rome and in 1630 became chapelmaster at Siena cathedral. He composed in both the *stile antico* ("old style") of the late Renaissance and the *stile moderno* of the early Baroque.

In his thorough bass treatise (1607) he distinguishes between "melody" and "fundamental" instruments. The significance of that distinction lies in its recognition that, whereas usually in Renaissance music all voices of a composition were equally important, in the developing Baroque music upper (melody) and lower (bass) parts alternated in dominance, with relatively neutral, improvised inner parts.

Agboville, town, southeastern Côte d'Ivoire (Ivory Coast). It lies along the Abidjan-Ouagadougou railway and the Agnéby River. The chief trading centre for an agricultural region inhabited mainly by the Abe (Abbe) people, it ships coffee, bananas, cocoa, and timber (mahogany, sipo) by rail and road to Abidjan, 45 miles (72 km) south-southeast, for export. At the handicraft centre in Agboville, Chinese instructors have taught Ivoirian apprentices to make furniture from rattan, bamboo, and other tropical forest growths. Agboville has a government hospital (1963). Pop. (1988) 46,355.

Agdistis (religion): see Great Mother of the Gods.

Age, The, daily newspaper published in Melbourne and widely considered to provide some of the finest news coverage in Australia. It is highly regarded for its dedication to accuracy.

Originally established as an eight-page weekly in 1854 by the brothers John and Henry Cooke, it became a daily after being sold to Ebenezer and David Syme in 1856. Under David Syme's leadership the paper grew with the state of Victoria and became noted for its serious tone and liberal orientation.

The Age has consistently given particular attention to politics and economics. It has not hesitated to attack political leaders, among them Prime Minister Sir Robert Menzies (1894–1978), who nonetheless termed *The Age* his favourite paper.

age-area hypothesis, in anthropology, theory holding that the age of culture traits (elements of a culture) may be determined by examining their distribution over a large geographic area. The hypothesis states that widely distributed traits are older than those more narrowly distributed. It is based on the assumption that traits tend to diffuse outward in a circle from a single centre. Traits at the periphery are believed to have left the centre earlier than those closer to it and are therefore characteristic of an earlier period of the centre.

There are several problems with this hypothesis. Diffusion may be more rapid in one direction than in another. Modification in traits may make it difficult to determine the point of origin. Population movements may also disturb the distribution of traits. Some elements

(e.g., sociopolitical units) may be more subject to ecological adaptive pressure than others. In several cases in which historical data are available, the data contradict reconstructions based on the age-area hypothesis. At best, the hypothesis may be used in a delimited and historically unified area to determine the probability, rather than the certainty, of historic developments.

age distribution, also called AGE COMPOSITION, in population studies, the proportionate numbers of persons in successive age categories in a given population. Age distributions differ among countries mainly because of differences in the levels and trends of fertility. A population with persistently high fertility, for instance, has a large proportion of children and a small proportion of aged persons. A population, such as that of France, in which fertility has been low for a long time, has a smaller proportion of children and a larger proportion of aged persons. Changes in fertility have an immediate effect on numbers of children, but many years must pass before the change affects the numbers above childhood. Thus, a population that has experienced a recent decline in fertility tends to have relatively small numbers both of children and of aged persons and a large proportion of adults in the middle ages.

Age distributions have also been influenced in varying ways by migrations, war losses, and differences in mortality—though these effects are generally less important than the influence of variations in fertility. Yet the migration of young adults, who bring children with them or soon have children in the area to which they move, is likely to swell the number both of adults in the middle ages and of children in the receiving country, while the proportion of aged persons remains low—with reverse effects on the population of an area from which there is a large net out movement.

age set, a formally organized group consisting of every male (or female) of comparable age. In those societies chiefly identified with the practice, a person belonged, either from birth or from a determined age, to a named age set that passed through a series of stages, each of which had a distinctive status or social and political role. Each stage is usually known as an age grade.

Among the Nuer of the southern Sudan, the age sets (formed among males only) constituted a system of social stratification in which there was equality among members of the same age set and deference and subordination between junior and senior age sets. The sets were formed at about 10-year intervals by initiation ceremonies that marked the passage from boyhood to manhood, and each individual remained for the rest of his life in the age set into which he had been initiated. The Nuer had no system of age grades apart from the original transition from boyhood to manhood, and there were no clearly defined activities assigned to each age set; a particular set advanced slowly to a position of acknowledged seniority as older sets died out.

In other tribal societies, age grades were found having a more specific allocation of activities to age sets in each grade; thus, the age-grade system might provide for the military training of the young and the organization of military expeditions. The Nandi tribe of Kenya had seven male age sets—two of boys, one of warriors, and four of elders. The warrior set, which was responsible for warfare and for tribal government, retained its position for about 15 years, after which it moved up to become one of the sets of elders, and the government was handed over to the next age set below it.

Among five of the Plains Indians tribes of North America (Blackfoot, Atsina [Gros Ventre], Arapaho, Mandan, Hidatsa), there were ceremonial societies organized on the age-

grading principle. It has been suggested that the prominence of age grading in these tribes (contrasted with its absence among other Plains Indians) may be partly attributable to the absence of any extensive division of labour or economic inequality in these tribes. Whereas such tribes as the Crow had large numbers of horses (in a warring and buffalo-hunting culture that demanded horses) and made their possession the chief basis of individual wealth and social status, the five tribes were relatively poor in horses, and age grades provided the basis of social stratification.

This idea is useful in considering the differences between tribal societies and other forms of society, including modern societies. In the last-named—though age differences are recognized, particularly in youth movements and organizations—there is no formal and elaborate organization of the population in age sets and grades. It may thus be that social classification mainly in terms of gender and age belongs to an early period of social development, when obvious "natural" differences provide a means of differentiation, and that these factors lose their prominence with the more extensive division of labour and the growth of economic inequality.

Agee, James (b. Nov. 27, 1909, Knoxville, Tenn., U.S.—d. May 16, 1955, New York, N.Y.), American poet, novelist, and writer for and about motion pictures. One of the most influential American film critics in the 1930s and '40s, he applied rigorous intellectual and aesthetic standards to his reviews, which appeared anonymously in *Time* and signed in *The Nation*.

Agee grew up in Tennessee's Cumberland Mountain area, attended Harvard University, and wrote for *Fortune* and *Time* after he graduated in 1932. *Permit Me Voyage*, a volume of poems, appeared in 1934. For a proposed article in *Fortune*, Agee and the photographer Walker Evans lived for about six weeks among sharecroppers in Alabama in 1936. The article never appeared, but the material they gathered became a book, *Let Us Now Praise Famous Men* (1941), illustrated by Evans and accompanied by lyrical prose in which Agee dealt with both the plight of the people and his subjective reaction to it.

From 1948 until his death, Agee worked mainly as a film scriptwriter, notably for *The African Queen* (1951) and *The Night of the Hunter* (1955). His novel *A Death in the Family* (1957), which is about the effect of a man's sudden death on his six-year-old son and the rest of his family, and his novella *The Morning Watch* (1951), on the religious experiences of a 12-year-old boy, are both autobiographical. *A Death in the Family* was adapted for the stage as *All the Way Home* (1960; filmed 1963). His other works include *Agee on Film* (1958), collected reviews; *Agee on Film II* (1960), consisting of five film scripts; and *Letters to Father Flye* (1962), which is a collection of his letters to a former teacher and lifelong friend.

Agekoyo (people): see Kikuyu.

Agen, town, capital of Lot-et-Garonne département, Aquitaine région, southwestern France. It lies along the Garonne River at the foot of Ermitage Hill (530 feet [162 m]), northwest of Toulouse. Mentioned by Julius Caesar as Aginnum, capital of the Nitiobriges people, it was captured by the Frankish king Clovis (509) and was the centre of the countship of Agenais (q.v.). SS. Faith (Foy) and Caprasius were martyred there in 303 under Diocletian. The Cathedral of Saint-Caprais has a 12th-century apse, and Notre-Dame-des-Jacobins is an example of 13th-century Dominican construction. The museum occupies a group of Renaissance mansions. A network of narrow medieval streets contrasts with wide modern boulevards. Agen was the home of the

Agen, Fr., on the Garonne River
Editions "La Cigogne"—Hachette

Scaligers, eminent medieval scholars, and of Jacques Jasmin, the barber-poet. The town is an agricultural market centre, noted for fruits and vegetables. Industries include food processing, pharmaceuticals, and shoes. Pop. (1990) 30,553.

Agenais, also spelled **AGENOIS**, former province of France, of which Agen was the centre and to which the modern *département* of Lot-et-Garonne nearly corresponds.

In ancient Gaul, Agenais was the country of the Nitiobriges, then a Gallo-Roman *civitas*, whose limits became those of the diocese of Agen. Having in general shared the fortunes of Aquitaine during the Merovingian and Carolingian periods, Agenais eventually became a hereditary countship. From the middle of the 10th century it was part of the demesne of the counts of Bordeaux, dukes of Gascony, from whom it passed in 1036 to Eudes of Poitiers, later Duke of Aquitaine. After Eleanor of Aquitaine married Henry Plantagenet (later Henry II of England) in 1152, Agenais became the possession of the English kings; it later reverted to the personal possession of the French crown (1249), but the English king Edward I recovered it by the Treaty of Amiens (1279). The "general court of Agenais," first attested in the late 12th century, was one of the earliest representative institutions of the European Middle Ages.

The English and French kings alternately controlled Agenais during the Hundred Years' War (1337–1453) until the final retreat of the English gave the province to the French crown. In 1578 the countship was given to Margaret of France (Marguerite de Valois) in part settlement of the dowry due on her marriage to Henry of Navarre (the future Henry IV of France). On her death (1615) it was finally reunited to the French crown. In the last years of the ancien régime, Agenais was a *sénéchaussée* within the *gouvernement* of Guyenne and the intendance of Bordeaux.

Since the late Middle Ages the country has been agriculturally rich, subject, however, to alternating phases of depopulation and immigration.

Agence France-Presse (AFP), French cooperative news agency, one of the world's great wire news services. It is based in Paris, where it was founded under its current name in 1944, but its roots go to the Bureau Havas, which was created in 1832 by Charles-Louis Havas, who translated reports from foreign papers and distributed them to Paris and provincial newspapers. In 1835 the Bureau Havas became the Agence Havas, the world's first true news agency. Stressing rapid transmission of the news, Agence Havas established the first telegraph service in France in 1845.

Between 1852 and 1919 the agency worked in close collaboration with an advertising firm, the Correspondance General Havas. Staff correspondents for the agency were stationed in many world capitals by the late 1800s.

The German occupation of France suppressed Agence Havas in 1940, and many of its personnel were active in the underground. After the liberation of Paris in 1944, underground journalists emerged to set up Agence France-Presse as a wire-service voice for liberated France. The postwar French government gave AFP the assets of Agence Havas, including the Paris building that became its headquarters. AFP quickly joined Reuters (United Kingdom), Tass (U.S.S.R.; later, of Russia), and the U.S. agencies Associated Press (AP) and United Press International (UPI) as one of the world's leading news agencies. In addition to having bureaus in major French cities, it has bureaus and correspondents in important world capitals. Besides having contracts with AP, Reuters, and Tass for exchange of news reports, it sells a domestic French news report to most of the world's news agencies and provides its worldwide report to many of them. Within France it has a leased-wire circuit and distributes news to its foreign clients from Paris through radioteletypewriter. AFP also has a photo service and a number of specialized news reports, several concerned with African matters.

agency, in law, the relationship that exists when one person or party (the principal) engages another (the agent) to act for him—*e.g.*, to do his work, to sell his goods, to manage his business.

A brief treatment of agency follows. For full treatment, see *MACROPAEDIA: Business Law*.

Early precedents for agency date back to Roman law, when slaves (though not true agents) were considered to be extensions of their masters and could make commitments and agreements for them. This was an outgrowth of the preference in Roman law to have relations between principals as direct as possible. Through the European Middle Ages, legal writers in continental European civil-law countries attempted to change the concept with little success. It was in Anglo-Norman England in about 1200, under the system of common law, that two special figures were created, greatly advancing the notion of agency. The *ballivus* and *attornatus* began as close relatives of the master-servant relationship. The *ballivus* handled commercial transactions and became in time a nearly independent land administrator for the principal. The *attornatus* represented parties in litigation and became the principal's sole representative before the court.

The servant-master aspect of agency relationships predominated for many centuries and still has a place. Technically speaking, an employee of an individual or of a business stands in a "servant" relationship to the employer and is considered an agent. The matter becomes a legal problem when the agent injures or wrongs a third party. A doctrine called *respondeat superior*, devised in 17th-century England, provides for the injured third party to hold the master or employer liable for the agent's actions, the rationale being that the employer controls the employee's behaviour and must thus assume some responsibility for the employee's actions. This liability is usually limited to acts occurring while the agent is acting "within the scope of his employment."

The great increase in shipping, banking, insurance, and mercantile transactions generally, which occurred in the later 18th and early 19th centuries, brought another kind of agency relationship to the fore. Ship's captains, insurance brokers, bank managers, factors, and salesmen were agents whose relationships to principals could not aptly be defined as servant to master. Legal scholarship of the 19th century, primarily in Europe, came to deem that the authority to effect legal transactions resides in certain agents independent of the specific contracts made with individual principals. This is a primary feature of modern agency laws in many countries. The relationship is seen in two parts. Its internal aspect is the bilateral agreement, the contract of agency, existing between agent and principal, which protects the rights of the principal to (1) receive the benefits of the agent's services and (2) be assured that only certain actions will be carried out. The external aspect is a unilateral act of "authorization" bestowed on agents according to their specified positions within a given legal system.

There is some variety among systems relating to this external relationship. In some countries, like France, Spain, Portugal, and Brazil, the agent's authorization is seen to be direct and not independent of the mandate given by the principal. This mandate, more closely akin to the servant-master relationship, often requires a certain degree of formality, such as written authorization, for its verification. The Scandinavian countries, Germany, Japan, Poland, Italy, and others take the more modern view that an agent's authority exists independent of a specific written mandate from the principal. Under such circumstances, an agent, given a general charge, has more flexibility to act for the principal's benefit; and, in systems in which complicated laws make access difficult to laymen, such flexibility is useful. For example, minors can exercise many rights through agency that are not available to them in person. Anglo-American law is of this latter school of legal thought.

The range of agency roles is broad in both continental European and Anglo-American systems. The "commercial agent" in continental countries may possess varying authority. A commission agent sells goods upon which a principal has basic claim, minus the agent's commission, but the agent may handle transactions any way he likes. A commercial agent handles the negotiation of contracts and can conclude them for the principal. A broker provides services of employment or placement on an entirely independent basis from the principal, and the salesman has a dependent relationship to the principal, who stands as a direct employer. In the Anglo-American system, agents known as factors and brokers manage transactions involving personal property. Brokers differ in never having physical possession of the property, only contract to it. Real-estate agents can represent the principal

in property-sale negotiations but cannot transact deals affecting ownership. A large group of agents are those who manage businesses—administrators and managers. Their powers can be extensive. On an executive level, corporate directors determine entire policies for stockholder principals. Legal representatives, lawyers, use their extensive training to do whatever they can for the benefit of a client, the principal.

agenesis, in human physiology, failure of all or part of an organ to develop during embryonic growth. Many forms of agenesis are consistently lethal, as when the entire brain is absent (anencephaly), but agenesis of one of a paired organ may create little disruption of normal function. Agenesis of the kidney, bladder, testicle, ovary, thyroid, and lung are known. Agenesis of the long bones of the arms or legs also may occur, called variously meromelia (absence of one or both hands or feet), phocomelia (normal hands and feet but absence of the long bones), and amelia (complete absence of one or more limbs).

Agenesis often occurs because the embryonic tissue that gives rise to the affected organ, or an adjacent embryonic tissue, is missing. At many stages in development, one structure induces the formation of another; removing the first structure causes agenesis of the second. Other cases of agenesis have been associated with chemical exposure in the womb, as in the association between the drug thalidomide and phocomelia. Agenesis syndromes are frequently associated with other congenital anomalies. In renal agenesis, or Potter's syndrome (absence of one or both kidneys), the ureters also are usually absent, and sex organs may be abnormal. Affected children have wide-set eyes, large, low-set ears, and flattened nose.

Agenois (French county): *see* Agenais.

Agent Orange, mixture of herbicides that U.S. military forces sprayed in Vietnam from 1962 to 1971 during the Vietnam War for the dual purpose of (1) defoliating forest areas that might conceal Viet Cong and North Vietnamese forces and (2) destroying crops that might feed the enemy. The defoliant, sprayed from low-flying aircraft, consisted of approximately equal amounts of the unpurified butyl esters of 2,4-dichlorophenoxyacetic acid (2,4-D) and 2,4,5-trichlorophenoxyacetic acid (2,4,5-T). Agent Orange also contained small, variable proportions of 2,3,7,8-tetrachlorodibenzo-*p*-dioxin—commonly called “dioxin”—which is a by-product of the manufacture of 2,4,5-T and is toxic even in minute quantities. About 50 million litres (13 million gallons) of Agent Orange—containing about 170 kg (375 pounds) of dioxin—were dropped on Vietnam. Agent Orange was one of several herbicides used in Vietnam, the others including Agents White, Purple, Blue, Pink, and Green. The names derived from colour-coded bands painted around storage drums holding the herbicides.

Among the Vietnamese, exposure to Agent Orange is considered to be the cause of an abnormally high incidence of miscarriages, skin diseases, cancers, birth defects, and congenital malformations (often extreme and grotesque) dating from the 1970s.

Many U.S., Australian, and New Zealand servicemen who suffered long exposure to Agent Orange in Vietnam later developed a number of cancers and other health disorders. Despite the difficulty of establishing conclusive proof that their claims were valid, U.S. veterans brought a class-action lawsuit against seven herbicide makers that produced Agent Orange for the U.S. military. The suit was settled out of court with the establishment of a \$180,000,000 fund to compensate some 250,000

claimants and their families. Separately, the U.S. Department of Veterans Affairs awarded compensation to about 1,800 veterans.

Ageo, city, Saitama *ken* (prefecture), Honshu, Japan. Ageo lies on the terrace between the Ara River (west) and the Ayase River (east). A former post town between Tokyo and Maebashi, it was connected to Tokyo (25 miles [40 km] southeast) in 1883. Ageo remained the market centre of the neighbouring agricultural region until 1955, when machinery, rubber, and metallurgy industries were developed in the city. Pop. (2004 est.) 218,838.

ageratum, any of about 45 species of annual herbs making up the genus *Ageratum* (family Asteraceae), and native to tropical South America. They have toothed, oval leaves that are opposite each other on the stem; compact clusters of blue, pink, lilac, or white flowers; and small, dry fruits.

Ageratum houstonianum
Syndication International—Photo Trends

Dwarf varieties of the common garden ageratum (*A. houstonianum*) are used as edging plants. Some ageratums are variously known as flossflower and pussy-foot.

Agésilus II (b. c. 444 BC—d. 360, Cyrene, Cyrenaica [now in Libya]), king of Sparta from 399 to 360 who commanded the Spartan army throughout most of the period of Spartan supremacy (404–371) in Greece. An excellent military tactician, he is usually cited as the embodiment of the aggressive Spartan spirit that sought to further Spartan interests at the expense of Hellenic unity.

Agésilus was born into the Eurypontid house (one of the two royal families of Sparta) and was the son of King Archidamus II. He succeeded Agis II with aid from Lysander. At the time that he assumed power, Sparta, which had defeated Athens in 404, was at war with Persia in Asia Minor. Sailing to Ephesus in 396, Agésilus made a three months' truce with the Persians; during this interim he shook off Lysander's control over him. Agésilus then raided Phrygia in 396 and 394 and Lydia in 395. Meanwhile, a coalition of Thebes, Athens, Argos, and Corinth engaged Sparta in the Corinthian War (395–387). Agésilus was recalled to fight in Greece (394), but he had been unable to prevent the formation of the huge Persian fleet that, after his departure, overwhelmingly defeated the Spartan navy at Cnidus. The Spartan king scored a minor victory over the coalition in 394 and fought near Corinth in 391–390 and in Acarnania in 389.

The Peace of Antalcidas (387), which ended the war, included a clause guaranteeing the Greek cities their independence. Agésilus used this clause as an excuse to force the dissolution of Thebes's Boeotian League. In two sieges (378 and 377) he reduced Thebes to near starvation. By refusing to allow the

Thebans, at the peace conference of 371, to sign the treaty on behalf of all Boeotia, he precipitated the war with Thebes that began with the severe defeat of the other Spartan king, Cleombrotus, at the Battle of Leuctra in 371. This disaster signified the end of Spartan ascendancy and the beginning of a decade of Theban supremacy in Greece. Sparta was put on the defensive. Agésilus twice rescued the city from attacks by the Theban commander Epaminondas but took no part in the subsequent Battle of Mantinea.

In 361 Agésilus was abroad serving Tachos (also known as Zedhor), king of Egypt, but he quarreled with the king and joined a revolt against him. Agésilus died at age 84 on his way home to Greece.

Agfa-Gevaert NV, German and Belgian corporate group established in 1964 in the merger of Agfa AG of Leverkusen, then in West Germany, and Gevaert Photo-Producten NV of Mortsel, Belg. The merger established twin operating companies, one German (Agfa-Gevaert AG) and one Belgian (Gevaert-Agfa NV, which in 1971 became Agfa-Gevaert NV). Agfa sells photographic film and photofinishing equipment, medical imaging technology, microfilm and motion picture film, document management systems, digital photography systems, and commercial prepress services such as the preparation of graphics for product labels, billboards, magazines, and newspapers.

Agfa, an abbreviation for Aktiengesellschaft für Anilinfabrikation (“Corporation for Aniline Manufacture”), was founded as a dye company in 1867 at Rummelsburger See near Berlin; it began producing photographic film in 1908. From 1925 to 1945 it was part of the German cartel IG Farben; in 1951 it became a partly owned subsidiary of Bayer AG, one of the successors to IG Farben.

Gevaert was founded in 1890, when Lieven Gevaert (1868–1935) started manufacturing photographic paper in Antwerp. In 1920 the company he founded became Gevaert Photo-Producten NV.

Two of the group's principal factories—in Leverkusen and Mortsel—produce photographic film and equipment, audiotape, and photocopying and duplicating systems. The group also has subsidiaries and production plants in other western European countries, the United States, Latin America, Japan, China, Australia, and New Zealand. Bayer held controlling interest in the group from 1981 until 1999, when Agfa's stock shares were publicly listed. Bayer sold its remaining 30 percent interest in the company in 2002.

Aggada (Judaism): *see* Haggada.

Aggeus, The Prophecy of (Old Testament): *see* Haggai, The Book of.

agglomerate, large, coarse, rock fragments associated with lava flow that are ejected during explosive volcanic eruptions. Although they closely resemble sedimentary conglomerates, agglomerates are pyroclastic igneous rocks that consist almost wholly of angular or rounded lava fragments of varying size and shape. Fragments are usually poorly sorted in a tuffaceous matrix, or appear in lithified volcanic dust or ash.

Depending on the specific context, some geologists prefer to sort agglomerates into either bombs, blocks, or breccia. Bombs and blocks are generally larger than 32 mm (1.25 inches) in size; although bombs are ejected in a molten state (becoming rounded upon solidification), blocks are erupted as solid angular or subangular fragments. Upon accumulation, blocks form breccia, which are solid angular fragments larger than 64 mm.

agglutinate, pyroclastic igneous rock formed from partly fused volcanic bombs. *See* bomb (volcanology).

agglutination, a grammatical process in which words are composed of a sequence of morphemes (word elements), each of which represents not more than a single grammatical category. This term is traditionally employed in the typological classification of languages. Turkish, Finnish, and Japanese are among the languages that form words by agglutination. The Turkish term *ev-ler-den* "from the houses" is an example of a word containing a stem and two word elements; the stem is *ev-* "house," the element *-ler-* carries the meaning of plural, and *-den* indicates "from." In Wishram, a dialect of Chinook (a North American Indian language), the word *ačim-luda* ("He will give it to you") is composed of the elements *a-* "future," *-č-* "he," *-i-* "him," *-m-* "thee," *-l-* "to," *-ud-* "give," and *-a* "future."

Agglutinating languages contrast with inflecting languages, in which one word element may represent several grammatical categories, and also with isolating languages, in which each word consists of only one word element. Most languages are mixtures of all three types.

agglutinin, substance that causes particles to congeal in a group or mass, particularly a typical antibody that occurs in the blood serums of immunized and normal human beings and animals. When an agglutinin is added to a uniform suspension of particles (such as bacteria, protozoa, or red cells) that contains the specific surface structure (antigen) with which the agglutinin reacts, the suspended objects adhere to each other, form clumps, fall to the bottom, and leave the suspending diluent clear. This phenomenon of agglutination is a typical antigen-antibody reaction—highly specific, reversible, and involving small reacting groups on the surface of each.

A particular antibody is usually in greatest amount (titre) in individuals who have been immunized with the specific antigen by infection or by other active immunizing procedures. For this reason, agglutination is used as an indirect test for past or present infection or immunization with the specific antigen, as indicated by the presence of agglutinins in the serum. Conversely, serums containing agglutinins to known antigens can be used to identify various bacteria, red cells, and other particulate materials containing the specific antigen.

Isohemagglutinins, substances that agglutinate the red blood cells of others of the same species, are also found in humans. Thus, there are four main blood groups, which differ with respect to two antigens, A and B, in the red blood cells and two isohemagglutinins, anti-A and anti-B, in the serum. Thus, in humans, type O has neither antigen but both agglutinins, type A has A antigen and anti-B agglutinin, type B has B antigen and anti-A agglutinin, and type AB has both antigens but neither agglutinin. *See also* blood typing.

aggregate, in building and construction, material used for mixing with cement, bitumen, lime, gypsum, or other adhesive to form concrete or mortar. The aggregate gives volume, stability, resistance to wear or erosion, and other desired physical properties to the finished product. Commonly used aggregates include sand, crushed or broken stone, gravel (pebbles), broken blast-furnace slag, boiler ashes (clinkers), burned shale, and burned clay. Fine aggregate usually consists of sand, crushed stone, or crushed slag screenings; coarse aggregate consists of gravel (pebbles), fragments of broken stone, slag, and other coarse substances. Fine aggregate is used in making thin concrete slabs or other structural members and where a smooth surface is desired; coarse aggregate is used for more massive members.

aggression, in international relations, an act or policy of expansion carried out by one state at the expense of another by means of

an unprovoked military attack. For purposes of reparation or punishment after hostilities, aggression has been defined in international law as any use of armed force in international relations not justified by defensive necessity, international authority, or consent of the state in which force is used. Numerous treaties and official declarations since World War I, including the Covenant of the League of Nations (article 10) and the Charter of the United Nations (article 39), have sought to prohibit acts of aggression to ensure collective security among nations. Since World War I the acceptance by most states of obligations to refrain from the use of force has often made it necessary for international forums to consider the problem of aggression in hostilities that have occurred. In such cases the League of Nations and the United Nations have usually followed the procedure of ordering a cease-fire and have considered a government an aggressor only if it failed to observe that order.

Such cease-fire orders marked the ending of hostilities between Turkey and Iraq in 1925, between Greece and Bulgaria in 1925, between Peru and Colombia in 1933, between Greece and its neighbours in 1947, between The Netherlands and Indonesia in 1947, between India and Pakistan in 1948, between Israel and its neighbours in 1949, between Israel, Great Britain, France, and Egypt in 1956, and between Israel, Jordan, and Egypt in 1970. None of these states was at the time declared an aggressor. On the other hand, Japan was found to be an aggressor in Manchuria in 1933, Paraguay in the Chaco area in 1935, North Korea and mainland China in Korea in 1950 and 1951, and the Soviet Union in Hungary in 1956, because they refused to observe cease-fire orders.

Other instances of military intervention have been widely considered aggression by opponents although not pronounced such by an international forum. These include the U.S.-supported Bay of Pigs invasion of Cuba in 1961, U.S. military intervention in the Dominican Republic in 1965, U.S. actions in Vietnam, North Vietnamese actions in South Vietnam and elsewhere in Indochina, and the invasion of Czechoslovakia in 1968 by the Soviet Union and its east European allies.

aggressive behaviour, any action of an animal that serves to injure an opponent or prey animal or to cause an opponent to retreat.

A brief treatment of aggressive behaviour follows. For full treatment, *see* MACROPAEDIA: Behaviour, Animal.

Animals develop their aggressive tendencies over time. Young animals often engage in play fighting with each other, mimicking adults in all but the final—and hurtful—steps. A kitten playing with an inanimate object is another example of a young animal rehearsing for more serious activity to come.

Sexual maturity is brought on by the secretion of sex hormones within the body, some of which are also associated with aggressive behaviour. Although many females are capable of aggression—to protect their young and to hunt—male sex hormones (androgens) are more closely associated with aggression. For example, red deer stags given the androgen testosterone at any time of the year will return to their regular mating grounds and will lose the velvet covering on their antlers in preparation for territorial battles, even in the absence of females.

An aggressive act may be caused by various stimuli. Within its own group, an animal must display aggressive postures to maintain its position within the hierarchy. The mere threat—manifested by ruffled feathers or teeth revealed in a snarl—is usually sufficient to maintain an already established social order. The pecking order of chickens is a well-known example of a hierarchy maintained where many animals share the same territory. If family groups are

smaller, the boundaries of neighbouring territories may be established by bird calls or scent marking, but these would be insufficient if they could not be reinforced with a physical threat to keep out intruders.

Conspecific hostility (fighting with a member of one's own species) is also found just before the mating season, when males win their choice of females and territory. As in juvenile play fighting, the interests of the species are not served by actual combat, so that most animals in conspecific disputes have developed distinct postures that signify submission. The exposed throat of a dog, for example, will immediately inhibit attack; among some baboons, a male will indicate submission by assuming the receptive posture of a female in heat. Humans also have signs of submission, ranging from weeping in the face of an enemy to the formal presentation of one's neck to a sovereign's sword, but none of these measures brings about an instinctive halt to aggression as it does with other animals.

aggressive mimicry, a form of similarity in which a predator or parasite gains an advantage by its resemblance to a third party. This model may be the prey (or host) species itself, or it may be a species that the prey does not regard as threatening. An example in which the prey itself serves as the model can be seen in the mimicry used by female fireflies of the genus *Photuris*. These insects imitate the mating flashes of the fireflies of the genus *Photinus*; the unlucky *Photinus* males deceived by the mimics are eaten. Another example is found in the brood parasitism practiced by the European cuckoo (*Cuculus canorus*). The eggs of this species closely resemble those of several kinds of small birds, in whose nests the cuckoo lays its clutch. The hosts accept the eggs as their own and hatch and rear the young cuckoos.

Aggressive mimicry in which the predator resembles a nonthreatening third party is exemplified by the American zone-tailed hawk, whose resemblance to certain nonaggressive vultures enables it to launch surprise attacks against small animals. In other examples, the aggressor may even mimic the prey of its intended prey. Anglerfish, for example, possess a small, mobile, wormlike organ that can be waved on a slender rod in front of other fish; lured in by this organ, which they mistake for their own natural prey, smaller fish are eaten by the anglerfish.

āghā (title): *see* aga.

Agha Khān: *see* Aga Khan.

Āghā Mirak (Persian painter): *see* Āqā Mirak.

Āghā Moḥammad Khān (b. 1742, Gorgān, Iran—d. 1797, near Shusha), founder and first ruler of the Qājār dynasty of Iran. Following the disintegration of the Šafavid empire in 1722, Qājār tribal chieftains became prominent in Iranian affairs.

At the age of six Āghā Moḥammad was castrated on the orders of 'Adīl Shāh to prevent him from becoming a political rival, but this disability did not hinder his career. In 1757 he became the de facto governor of the Azerbaijan province of northern Iran; the next year he succeeded his father as chief of the Qavānlū clan of the Qājārs. In 1762 he was captured by a rival chieftain and sent as a prisoner to Shīrāz, where he spent the next 16 years as a political hostage. In 1779 Āghā Moḥammad escaped and fled to Astarābād, the centre of Qavānlū authority. By 1785, when Tehrān was made the capital, he was the dominant political figure in northern Iran.

In 1796 Āghā Moḥammad led a successful expedition against the Christian Kingdom of

Georgia, which was then reincorporated into Iran. Crowned the same year as *shāhanshāh* ("king of kings"), he conquered Khorāsān, the last centre of resistance to his authority; its blind ruler, Shāh Rokh (the grandson of Nāder Shāh), was tortured to death.

The civil war that led to the establishment of the Qājār dynasty, followed by Āghā Moḥammad's conquests, had serious consequences for the prosperity and economy of Iran. Many cities, such as Kermān, were completely sacked. In monetary matters Āghā Moḥammad was tightfisted. The extraordinary cruelty of his reign was in part a means to deter rebellion. During his reign his capital city of Tehrān grew from a village to a city of about 15,000 people. While leading a second expedition into Georgia, Āghā Moḥammad was assassinated by two of his servants. The major legacies of his reign were a unified Iran and a dynasty that ruled it until 1925.

Aghlabid DYNASTY, also called *BANU AL-AGHLAB*, Arab Muslim dynasty that ruled Ifriqiyah (Tunisia and eastern Algeria) from AD 800 to 909. The Aghlabids were nominally subject to the 'Abbāsīd caliphs of Baghdad but were in fact independent. Their capital city was Kairouan (al-Qayrawān), in Tunisia. The most interesting of the 11 Aghlabid emirs were the energetic and cultured Ibrāhīm ibn al-Aghlab (reigned 800–812), founder of al-Abbāsiyya (2 miles [3 km] south of Kairouan); Ziyādat Allāh I (817–838), who broke the rebellion of the Arab soldiery and sent it to conquer Sicily (which remained in Arab hands for two centuries); and Abū Ibrāhīm Aḥmad (856–863), who commissioned many public works. During the 9th century the brilliant Kairouan civilization evolved under their rule. The Aghlabid emirs maintained a splendid court, though at the cost of oppressive taxes; their public works for the conservation and distribution of water, however, contributed to the prosperity of a country that was on the whole peaceful. Their fleet was supreme in the central Mediterranean.

Agin-Buryatiya (Russia): see *Aga-Buryat*.

Agincourt, Battle of (Oct. 25, 1415), decisive victory of the English over the French in the Hundred Years' War.

In pursuit of his claim to the French throne, Henry V of England and an army of about 11,000 men invaded Normandy in August 1415. They took Harfleur in September, but by then half their troops had been lost to disease and battle casualties. Henry decided to move northeast to Calais, whence his diminished forces could return to England. Large French forces under the constable Charles I d'Albret blocked his line of advance to the north, however.

The French force, which totaled 20,000 to 30,000 men, many of them mounted knights in heavy armour, caught the exhausted English army at Agincourt (now Azincourt in Pas-de-Calais *département*). The French unwisely chose a battlefield with a narrow frontage of only about 1,000 yards of open ground between two woods. In this cramped space, which made large-scale maneuvers almost impossible, the French virtually forfeited the advantage of their overwhelming numbers. At dawn on October 25, the two armies prepared for battle. Three French divisions, the first two dismounted, were drawn up one behind another. Henry had only about 5,000 archers and 900 men-at-arms, whom he arrayed in a dismounted line. The dismounted men-at-arms were arrayed in three central blocks linked by projecting wedges of archers, and additional masses of archers formed forward wings at the left and right ends of the English line.

Henry led his troops forward into bowshot range, where their long-range archery provoked the French into an assault. Several small French cavalry charges broke upon a line of pointed stakes in front of the English archers. Then the main French assault, consisting of heavily armoured, dismounted knights, advanced over the sodden ground. At the first clash the English line yielded, only to recover quickly. As more French knights entered the battle, they became so tightly bunched that some of them could barely raise their arms to strike a blow. At this decisive point, Henry ordered his lightly equipped and more mobile English archers to attack with swords and axes. The unencumbered English hacked down thousands of the French, and thousands more were taken prisoner, many of whom were killed on Henry's orders when another French attack seemed imminent.

The battle was a disaster for the French. The constable himself, 12 other members of the highest nobility, some 1,500 knights, and about 4,500 men-at-arms were killed on the French side, while the English lost less than 450 men. The English had been led brilliantly by Henry, but the incoherent tactics of the French had also contributed greatly to their defeat.

aging, progressive physiological changes in an organism that lead to senescence, or a decline of biological functions and of the organism's ability to adapt to metabolic stress.

A brief treatment of aging follows. For full treatment, see *MACROPAEDIA: Growth and Development, Biological*.

Many debilitating changes associated with old age in both humans and animals are now attributed to disease processes, such as atherosclerosis or Alzheimer's disease, which occur more frequently with advancing age, rather than to the natural aging process itself. Some deterioration of bodily functions, however, accompanies normal aging.

There are many theories about why senescence occurs, most postulating that small alterations in cellular functions accumulate to the point that they impair the function of the organism as a whole. It has been suggested that mutations occur with age in working cells, so that the proteins produced by the cells are no longer capable of normal functions. Insoluble substances called age pigments are also believed to build up in cells over time, eventually interfering with the cells' metabolism, and individual cells eventually wear out, causing breakdowns in organ function. Laboratory experiments have demonstrated that cells from complex organisms go through only a limited number of cell divisions before they die off, supporting the idea that cellular events can produce senescence. On the other hand, the effects of age on the organism as a whole are generally greater than on its component cells.

Aging in all organisms appears related to the reproductive cycle. In plants and animals that reproduce once, near the end of the life span, senescence is precipitous once the reproductive act has been completed. In organisms that reproduce several times, senescence is more gradual, beginning during the reproductive phase and continuing until death.

A major manifestation of senescence in mammals is the loss of lean body mass, often accompanied by increases in fat and body water. As part of this process, muscle tissue is steadily lost throughout adult life; thus, older individuals are often weaker and less able to exert themselves physically. As lean body mass decreases, the basal metabolic rate (the rate at which the body converts food into energy while at rest) also decreases.

Other significant changes take place in the connective tissues. In humans, aging causes a loss of calcium from the bones, increasing the fragility of the skeleton and slowing the rate of healing of fractures; this process, called

osteoporosis, is particularly pronounced in women past the age of menopause. All mammals experience a general stiffening of connective tissues with age. Collagen, a fibrous protein found in bones, skin, and tendons, is constantly produced early in life as a soluble molecule that is converted to a sturdier, insoluble form of collagen. As an organism grows older, the production of new collagen ceases, so that connective tissue consists increasingly of the stiffer, insoluble form. This increased stiffness reduces the permeability of connective tissue to nutrients, hormones, and other substances, and contributes to reduced elasticity in the skin, causing wrinkle formation and increased skin fragility in elderly persons.

Similar changes occur in elastin, another fibrous protein found in the walls of the blood vessels. Stiffening of the elastin in blood vessels may contribute to high blood pressure by resisting blood flow, increasing the workload on a heart that has already been weakened by the loss of muscle mass.

Changes in the nervous system associated with aging chiefly reflect the inability of nerve cells to renew themselves once the animal reaches adulthood. In humans the number of peripheral nerve fibres declines during adult life, and cells from the cerebral cortex may also be lost. The total number of nerve cells, however, is so great that these losses may not have functional effects.

Tissues that do retain the ability to renew themselves through most of life begin to lose that ability with age. These tissues contain fewer proliferative cells to replace dying cells, and the rate of cell division in those proliferative cells that remain may be reduced. Effects of this decline include reduced ability to heal wounds, to replenish blood cells lost to injury or disease, and to produce immune cells to combat infection. The declining proliferative capacity of reproductive cells may also end the reproductive life of females (menopause) and reduce the reproductive ability of males.

Plants also undergo senescence, exhibiting structural as well as functional deterioration. The characteristics altered by age include: leaf structure (*e.g.*, simple to compound), growth habit (*e.g.*, vining to treelike), stem composition (*e.g.*, soft to woody, thorny to smooth), and bark surface (*e.g.*, smooth to furrowed).

Aginskoye, also spelled *AGINSKOJE*, administrative centre of Aga-Buryat autonomous *okrug* (district), Chita *oblast* (province), Russia, in the Aga River valley. The village was founded in 1811. It has small food-processing industries. Pop. (1994 est.) 9,300.

Agis I (fl. 11th century BC?), early Spartan king, traditionally held to be the son of Eurysthenes (in legend, one of the twins who founded Sparta). Because the Agiad line of kings was named after him, Agis was perhaps a historical figure. The 4th-century-BC Greek historian Ephorus attributes to Agis the capture of the city of Helos in Laconia and the reduction of its people to helot (serf) status.

Agis II (d. 400 or 398 BC), king of Sparta after about 427 BC who commanded all operations of the regular army during most of the Peloponnesian War (431–404) against Athens.

In 418, while the inconclusive Peace of Nicias (421–415) was still in effect, Agis invaded the territory of Athens' ally Argos but inexplicably made a truce and withdrew after cutting the Argive army off from its city. He escaped heavy penalties for his failure to press his advantage by promising more successful enterprises. He restored Spartan prestige a few weeks later when he defeated the Argive alliance at Mantinea.

In 413, after the war with Athens was formally resumed, Agis led the force that occupied Decelea in Attica. The historian Thucydides stressed the influence Agis exerted from there over Spartan policy. Though this occu-

pation caused great hardship to Athens, it was Lysander's naval victory for Sparta that ended the war in 404. Agis took no part in the subsequent settlement at Athens. In 402 (or 400) war broke out between Sparta and Elis. Agis forced Elis' surrender in the spring of 400 (or 398) but died shortly afterward.

Agis III (d. 331 BC, near Megalopolis, Arcadia [Greece]), Spartan king (338–331) who rebelled unsuccessfully against Alexander the Great.

A member of the Eurypontid house (one of the two royal families of Sparta), Agis succeeded to the throne of his father, Archidamus III. While Alexander was invading Anatolia, Agis, profiting from the Macedonian general's absence from Greece, led the Greek cities in revolt. With Persian money and 8,000 Greek mercenaries, he tried to hold Crete against Alexander. In 331 he raised a coalition in the Peloponnese and laid siege to Megalopolis. Alexander's regent, Antipater, made peace with the Thracians (with whom he had been warring), marched south, and won a hard-fought battle near Megalopolis (331). Agis was killed, and Spartan resistance was broken.

Agis IV (b. c. 263 BC—d. 241), Spartan king (244–241) who failed in his attempt to reform Sparta's economic and political structure.

Agis succeeded his father, Eudamidas II, at the age of 19. Drawing upon the tradition of the Spartan lawgiver Lycurgus, Agis sought to reform a system that distributed the land and wealth unequally and burdened the poor with debt. He proposed the cancellation of debts and the division of the Spartan homeland into 4,500 lots for citizens. By this time the number of full citizens had dwindled to 700. Full citizenship was to be extended to many perioeci (voteless freemen) and foreigners, and 15,000 lots were to be distributed to the remaining perioeci. In addition to pursuing these reforms, Agis sought the restoration of the Lycurgan system of military training.

Agis was supported by his wealthy mother and grandmother, who surrendered their property; by his uncle Agesilaus; and by Lysander, who was an ephor (magistrate with the duty of limiting the power of the king) in 243. When the rich, led by the other king, Leonidas II, defeated these proposals, Leonidas was deposed. The ephors of 242 tried to restore him to his throne, but they were replaced by a board headed by Agesilaus.

Agis then began to carry out the cancellation of debts while delaying the redistribution of land. He was called away from Sparta (241) when Aratus of Sicyon, temporarily Sparta's ally, requested aid in one of his wars. Upon his return, Agis found his supporters discontented with Agesilaus' rule and disillusioned by the delay of the reforms. Leonidas had regained power, supported by mercenaries. Rather than engage in war with Leonidas, Agis took sanctuary but was enticed out, summarily tried, and executed along with his mother and grandmother.

agitprop (from Russian *agitatsiya propaganda*, "agitation propaganda"), communist political strategy in which the techniques of agitation and propaganda are used to influence and mobilize public opinion.

The twin strategies of agitation and propaganda were originally elaborated by the Marxist theorist Georgy Plekhanov, who defined propaganda as the promulgation of a number of ideas to an individual or small group, and agitation as the promulgation of a single idea to a large mass of people. Expanding on these notions in his pamphlet *What Is to Be Done?* (1902), Vladimir I. Lenin stated that the propagandist, whose primary medium is print, explains the causes of social inequities such as unemployment or hunger, while the agitator, whose primary medium is the spoken word, seizes on the emotional aspects of these issues

to arouse his audience to indignation or action. Agitation is thus the use of political slogans and half-truths to exploit the grievances of the masses and thereby mold public opinion and mobilize public support. Propaganda, by contrast, is the reasoned use of historical and scientific arguments to indoctrinate the educated and enlightened members of society, and it includes in its sphere the political education and training of party members.

The term *agitprop* itself originated as a shortened form of the Agitation and Propaganda Section of the Central Committee Secretariat of the Communist Party in the U.S.S.R. This department of the Central Committee was established in the early 1920s with the functions of determining the content of all official information, overseeing political education in schools, watching over all forms of mass communication, and mobilizing public support for party programs. Every unit of the Communist Party in the Soviet Union, from the republic level to the local-party level, had an agitprop section; at the local level, agitators (party-trained spokesmen) were the chief points of contact between the party and the masses.

The word *agitprop* is used in English to describe such departments and, by extension any work, especially in the theatre, that aims to educate and indoctrinate the public. It typically has a negative connotation, reflecting Western distaste for the overt use of drama and other art forms to achieve political goals.

AGK (in astronomy): *see* AG catalog.

Aglauros, in Greek mythology, eldest daughter of the Athenian king Cecrops. Aglauros died with her sisters by leaping in fear from the Acropolis after seeing the infant Erichthonius, a human with a serpent's tail. The Roman poet Ovid, however, related that Aglauros was turned to stone by the god Mercury in retribution for her attempt to frustrate his abduction of Herse, Aglauros' youngest sister. Aglauros and her sisters (Herse and Pandrosos) were apparently at first fertility deities. Aglauros had a sanctuary on the Acropolis in which young men of military age swore an oath to her as well as to Zeus and to other deities. The honour, however, may have stemmed from another legend—that Aglauros had sacrificed herself for the city during a protracted war.

Aglipayan Church: *see* Philippine Independent Church.

Agnano, volcanic crater, Napoli *provincia*, Campania *regione*, southern Italy. It is situated in the Campi Flegrei volcanic region just west of Naples. The crater, about 4 miles (6 km) in circumference, was known to the Greeks and Romans for its hot springs and the six-story Thermae Anianae ("Thermal Baths") built for visitors. However, in the Middle Ages a lake formed in the crater, and this was not drained until 1866. Water draining from the crater still creates numerous mineral springs of various temperatures that are utilized by a large spa at Agnano Terme on the crater's south rim.

Agnatha, class of primitive, jawless fishes that contains the lampreys and hagfishes (collectively, cyclostomes) and some extinct groups.

A brief treatment of the Agnatha follows. For full treatment, *see* MACROPAEDIA: Fishes.

Living species of the Agnatha lack true jaws, paired appendages, and body scales, and their skeletons are cartilaginous. They breathe oxygen with paired gills and have muscular, nervous, sensory, circulatory, and excretory systems similar to those of lower fishes. The body of a lamprey is elongated and eel-like. It has developed eyes, a nostril on the top of its head, a low dorsal fin, and a low caudal fin that extends around its tail. Lampreys use a disk of rasplike teeth to attach themselves to larger bony fish and feed off them parasitically. An anticoagulant released in their saliva aids in digestion. Breeding occurs in fresh wa-

ter. Each egg hatches into a wormlike larva called an ammocoete, which burrows into the silt of the streambed and feeds on microscopic plants from the water. After three years the ammocoete undergoes metamorphosis, and upon reaching maturity the lamprey returns to marine waters to repeat the life cycle.

The hagfish also has a long, eel-like body. It lacks a dorsal fin, but the caudal fin extends to the dorsal and ventral sides of the body. Hagfishes have covered vestigial eyes and a nostril above their mouths; they seek food entirely by scent. They have a rasping tongue, but the mouth is surrounded by short tentacles rather than a sucker.

Hagfishes usually burrow with their tails into sea bottoms, leaving only their heads protruding to scent prey; they generally feed on dead fish or soft-bodied invertebrates. The gonads of hagfishes contain both ovary and testes, but these fish are not hermaphroditic—only one of these organs will function. The eggs laid by the female hatch into small hagfishes.

Fossil orders include Osteostraci, Anaspida, Heterostraci, and Coelolepida. Osteostraci had a flatter body than that of the lamprey or hagfish and a heavy bone shield around its head and gills. The body of anaspids was laterally compressed, suggesting that they were free-swimming rather than burrowing fish. The heterostracans were heavily armoured, with nostrils at each mouth corner, rather than the single nostril of lampreys and hagfishes. Little is known of the Coelolepida, an order that flourished in the Late Silurian Epoch (421 to 408 million years ago).

Agnelli, Giovanni (b. Aug. 13, 1866, Villar Perosa, Piedmont, Italy—d. Dec. 16, 1945, Turin), founder of the Fiat (Fabbrica Italiana Automobili Torino) automobile company and the leading Italian industrialist of the first half of the 20th century.

Agnelli attended the military school at Modena, but he quit the army in 1892. In 1899 he was one of the prime movers in creating Fiat, which soon became an internationally renowned automobile manufacturer. During World War I, Fiat ran its huge Turin plants at full speed, supplying the Italian military forces with armaments. The company employed a workforce of more than 30,000 in the production of streetcars, airplanes, railroad cars, tractors, and diesel engines.

In 1921 workers seized the Fiat plants and hoisted the red flag of communism over them. Agnelli responded by quitting the company, retiring to private life, and letting the workers try to run Fiat. In short order, 3,000 of them paraded to his office and asked him to return to the helm—a request to which he acquiesced. A supporter of Benito Mussolini, he was named to the Senate by the Fascist dictator in 1923. Agnelli also established the ball- and roller-bearing industry in Italy (1907), and he was a chief mobilizer of the Italian war industry before and during World War II. In April 1945, however, the Italian Committee of National Liberation removed him—along with other top executives—from control of Fiat. Control did not return to the Agnelli family until 1966.

Agnes, SAINT (fl. early 4th century, Rome [Italy]; feast day January 21), virgin and patron saint of girls, who is one of the most celebrated Roman martyrs.

According to tradition, of uncertain value, Agnes was a beautiful girl, about 13 years old, who refused marriage, stating that she could have no spouse but Jesus Christ. Her suitors revealed her Christianity, and in punishment she was exposed in a brothel. Awed by her presence, all but one of the Roman youths left her untouched; in his attempt to violate her, the sole attacker was struck blind, where-

upon she healed him with prayer. Suffering no harm, she was later murdered during the persecution of the Christians by the Roman emperor Diocletian and was buried beside the Via Nomentana. On her feast day two lambs are blessed in the Church of Santa Agnese in Rome, and from their wool are made the pallia sent by the pope to archbishops as tokens of jurisdiction.

Agnesi, Maria Gaetana (b. May 16, 1718, Milan, Habsburg crown land [now in Italy]—d. Jan. 9, 1799, Milan), Italian mathematician and philosopher, considered to be the first woman in the Western world to have achieved a reputation in mathematics.

Agnesi was the daughter of the professor of mathematics at the University of Bologna. She was an extremely precocious child who at an early age mastered Latin, Greek, Hebrew, and several modern languages. When she was only nine years old, her Latin discourse in defense of higher education for women was printed. In 1738 appeared her *Propositiones philosophicae* ("Propositions of Philosophy"), a series of essays on natural philosophy and history, based upon discussions before a scientific group meeting in her father's house. Her best-known work, *Instituzioni analitiche ad uso della gioventù italiana* ("Analytical Institutions for the Use of Italian Youth"), was published in 1748. This work's two huge volumes provided a comprehensive and systematic treatment of algebra and analysis, including such relatively new developments as integral and differential calculus. The *Instituzioni analitiche* enjoyed great popularity and was translated into several languages. In this text is found a discussion of the Agnesi curve, a cubic, and the *versiera*, or versed sine curve, which, through a misunderstanding, (*versiera* means "witch" in Italian), became known in English as the Witch of Agnesi.

In 1750 Agnesi was appointed professor at the University of Bologna by Pope Benedict XIV (though she never actually lectured). She was always deeply religious and, after the death of her father in 1752, devoted herself almost exclusively to charitable work and religious studies. In 1771 she was appointed director of a Milanese charitable institution, the Pio Albergo Trivulzio.

Agnew, Spiro T., in full SPIRO THEODORE AGNEW (b. Nov. 9, 1918, Baltimore, Md., U.S.—d. Sept. 17, 1996, Berlin, Md.), 39th vice president of the United States, elected in 1968 and 1972 on the Republican ticket headed by Richard M. Nixon. He was historically the second person to quit the nation's second highest office (John C. Calhoun was the first, in 1832) and the only one to resign under duress.

The son of a Greek immigrant who had shortened his name from Anagnostopoulos, Agnew studied law at the University of Baltimore and in 1947 began practicing law in a Baltimore suburb. In 1962 he was elected Baltimore county executive. Elected governor of Maryland in 1967, he secured a graduated income tax, a strong antipollution law, the first open-housing law south of the Mason and Dixon Line, and repeal of the state's 306-year-old antimiscegenation law. Although he was little known to the American public at the time of his nomination for the vice presidency in 1968, Agnew won national recognition soon after his election to office for his speeches attacking Vietnam War protesters and network television news coverage.

Agnew's downfall began in the summer of 1973, upon being investigated in connection with accusations of extortion, bribery, and income-tax violations relating chiefly to his tenure as governor of Maryland. On Oct. 10, 1973, faced with federal indictments, Agnew

resigned the vice presidency. That same day Agnew appeared in U.S. District Court in Baltimore, where he pleaded nolo contendere to a single federal count of failing to report on his income-tax return \$29,500 in income that he had received in 1967, while governor of Maryland. Acknowledging that he knew that the plea amounted to a felony conviction, Agnew declared that he was resigning the vice presidency because it was in the national interest. The judge fined Agnew \$10,000 and sentenced him to three years of unsupervised probation.

Agnew's *Go Quietly... or Else* (1980) is a defense of his political career and an attack on officials of the Nixon administration. After the state of Maryland disbarred him in 1974, he turned to private business, becoming a consultant to foreign business concerns.

Agni (people): see Anyi.

Agni (Sanskrit: "Fire"), fire-god of the Hindus, second only to Indra in the Vedic mythology of ancient India. He is equally the fire of the sun, of lightning, and of the hearth that men light for purposes of worship. As the divine

Agni with characteristic symbol of the ram, wood carving; in the Guimet Museum, Paris

Giraudon—Art Resource

personification of the fire of sacrifice, he is the mouth of the gods, the carrier of the oblation, and the messenger between the human and the divine orders. Agni is described in the scriptures as ruddy-hued and having two faces—one beneficent and one malignant. He has three or seven tongues, hair that stands on end like flames, three legs, and seven arms; he is accompanied by a ram. In the Rigveda he is sometimes identified with Rudra, the forerunner of the later god Śiva. Though Agni has no sect in modern Hinduism, his presence is invoked in many ceremonies, especially by Agnihotri Brahmans, and he is the guardian of the southeast.

Agnihotri, Shiv Narayan (b. 1850, near Kānpur, India—d. 1923, Lahore [now in Pakistan]), Hindu founder of an atheistic society called Deva Samaj ("Society of God").

At the age of 16 Agnihotri entered the government-sponsored Thompson Engineering College in Roorkee and in 1873 took a position as a drawing master in the Government School of Lahore. He and his wife became active members of the Brahma Samaj (literally, "Society of Brahmā," also translated

as "Society of God"), a Hindu reform movement founded in Bengal. In 1882 Agnihotri resigned his teaching position to work full-time for the Brahma Samaj.

Agnihotri's imperious nature and arrogance, however, irritated other members, and he finally resigned to form a new society, the Deva Samaj, which he ruled as *deva guru* ("divine teacher"). The Deva Samaj was at first a theistic society; but later it reemerged as an atheistic society, emphasizing ethical conduct and confession of sins but denying the existence of gods.

Agnihotri believed that a man must rise to the higher life and that, when he reaches a determined level, he is placed beyond spiritual danger. He himself was recognized by his followers as on the highest plane possible and was accorded many of the honours commonly paid to a deity.

Agnolo, Baccio d': see Baccio d'Agnolo.

Agnon, S.Y., in full SHMUEL YOSEF AGNON, pseudonym of SHMUEL YOSEF HALEVI CZACKES (b. July 17, 1888, Buczac, Galicia, Austria-Hungary [now Buchach, Ukraine]—d. Feb. 17, 1970, Rehovot, Israel), Israeli writer who was one of the leading modern Hebrew novelists and short-story writers. In 1966 he was the corecipient, with Nelly Sachs, of the Nobel Prize for Literature.

Born of a family of Polish Jewish merchants, rabbis, and scholars, Agnon wrote at first (1903-06) in Yiddish and Hebrew, under his own name and various pseudonyms. Soon after settling in Palestine in 1907, however, he took the surname Agnon and chose Hebrew as the language in which to unfold his dramatic, visionary, highly polished narratives.

Agnon's real literary debut was made with *Agunot* (1908; "Forsaken Wives"), his first "Palestinian" story. His first major work was the novel *Hakhnasat kalah*, 2 vol. (1919; *The Bridal Canopy*). Its hero, Reb Yudel Hasid, is the embodiment of every wandering, drifting Jew in the ghettos of the tsarist and Austro-Hungarian empires. His second novel, *Ore'ah Nata' Lahun* (1938; *A Guest for the Night*), describes the material and moral decay of European Jewry after World War I. His third and perhaps greatest novel, *Tinol shilshom* (1945; "The Day Before Yesterday"), examines the problems facing the westernized Jew who immigrates to Israel. This is neither a realistic story (like some of the early tales) nor a symbolic autobiography, yet it can be understood only in the light of Agnon's own actual and spiritual experience.

Agnon

By courtesy of the Nobel Foundation, Stockholm

All Agnon's works are the final result of innumerable Proust-like revisions, as is shown by the many manuscripts in existence and by

the variety of the printed texts. Already there are two widely different versions of his collected works, one in 11 volumes (*Kol sipurav shel Sh. Y. Agnon*, vol. i–vi, Berlin, 1931–35; vii–xi, Jerusalem and Tel Aviv, 1939–52) and one in 8 volumes (Tel Aviv, 1953–62). The archaic structure of his prose presents great difficulties for the translator, yet even in translation his power is unmistakable.

Agnon edited an anthology of folktales inspired by the High Holidays of the Jewish year, *Yamin nora'im* (1938; *Days of Awe*, 1948), and a selection of famous rabbinic texts, *Seser, sofer, vesipur* (1938). An autobiographical sketch appeared in 1958. Translations of his works include *In the Heart of the Seas* (1948; *Bilvav yamim*) and *Two Tales* (1966; *Edo ve'Enam*).

agnosticism (from Greek *agnōstos*, “unknowable”), strictly speaking, the doctrine that man cannot know the existence of anything beyond the phenomena of his experience. The term has come to be equated in popular parlance with skepticism (*q.v.*) about religious questions in general, and in particular with the rejection of traditional Christian beliefs under the impact of modern scientific thought.

A brief treatment of agnosticism follows. For full treatment, see MACROPAEDIA: Religious and Spiritual Belief, Systems of.

Agnosticism both as a term and as a philosophical position gained currency through its espousal by Thomas Huxley, who seems to have coined the word agnostic (as opposed to “gnostic”) in 1869 to designate one who repudiated traditional Judeo-Christian theism and yet disclaimed doctrinaire atheism, transcending both in order to leave such questions as the existence of God in abeyance.

From this definition and from the way the word has been used in ordinary speech it is evident that there are two related but nevertheless distinct viewpoints suggested by the term agnosticism. It may mean no more than the suspension of judgment on ultimate questions because not all the evidence has come in or because not all the evidence can ever come in. As doubt has been a path to faith in the thought of men such as St. Augustine, Pascal, and Kierkegaard, so agnosticism in this sense may be applied to the biblical interpretation of man's relation to God.

But Huxley's own elaboration on the term makes clear that this very biblical interpretation of man's relation to God was the intended polemic target of agnosticism. The suspension of judgment on ultimate questions for which it called was thought to invalidate Christian beliefs about “things hoped for” and “things not seen.” Huxley's role in the struggle over the teachings of Charles Darwin helped to establish this connotation as the primary one in the definition of agnosticism. When such prominent defenders of the Darwinian hypothesis as Clarence Darrow likewise labelled themselves as agnostics, the writers of popular apologetic pamphlets found it easy to equate agnosticism with hostility to conventional Christian tenets.

By the second half of the 20th century, however, the field of the battle had shifted. Not the question of Christian evidences but the problem of evidence and verification as such had become the central issue among philosophers. Thus logical positivism, which bore certain resemblances to agnosticism in its refusal to speculate about ultimate and unknowable questions, also went beyond the agnosticism of Huxley.

Agnostus, genus of trilobites (an extinct group of aquatic arthropods) found as fossils in rocks of Early Cambrian to Late Ordovician age (between 430,000,000 and 570,000,000 years old). The agnostids were generally small, with only two thoracic segments and a large tail segment. *Agnostus* itself was only about 6 millimetres (0.25 inch) long and lacked eyes. The

similarity of the anterior and posterior regions frequently makes the agnostids difficult to differentiate.

Agnus Dei (Latin), English LAMB OF GOD, designation of Jesus Christ in Christian liturgical usage. It is based on the saying of John the Baptist: “Behold, the Lamb of God, who takes away the sin of the world!” (John 1:29). In the Roman Catholic liturgy the Agnus Dei is employed in the following text: “Lamb of God, who takest away the sin of the world, have mercy upon us! Lamb of God, who takest away the sin of the world, have mercy upon us! Lamb of God, who takest away the sin of the world, grant us peace!” It comes between the Lord's Prayer and the Communion and sounds the themes of sacrifice and of adoration. Thus, it unites the sacrifice of the liturgy to the sacrifice of Christ on the Cross as the Lamb of God and calls to mind the sacrifice of the lamb in the cultus of the Old Testament. Both Anglican and Lutheran liturgies have retained the Agnus Dei in their eucharistic rites. It also appears as part of many of the litanies.

The name is also applied to figures of Christ as the Lamb of God, especially to waxen disks impressed with this figure and blessed by the pope.

Agobard, SAINT (b. 769/779, Spain—d. June 6, 840, Lyon; feast day June 6), archbishop of Lyon from 816, who was active in political and ecclesiastical affairs during the reign of the emperor Louis I the Pious. He also wrote theological and liturgical treatises.

Moving from Spain to southern Gaul in 782, he went to Lyon in 792 and was ordained priest in 804. As archbishop, he was frequently in conflict with the secular powers, opposing their interference in ecclesiastical elections, and attempting to free church lands from lay control. Having written a public justification of the deposition of Louis the Pious in 833, he lost his see when Louis was restored to his throne, but was reinstated at Lyon in 838.

Agobard wrote against the Adoptionist heresy (that Jesus was not the son of God by nature but by adoption) of Felix of Urgel (who was confined at Lyon from 800 to 818) and against the Jews. His zeal for reform led him to attack trial by ordeal and image worship, and his critical ability led him to deny the verbal inspiration of the Bible and to object to the invocation of saints.

agon, debate or contest between two characters in Attic comedy, constituting one of several formal conventions in these highly structured plays. The Old Comedy of Greece, introduced into Dionysian festivals in 487 BC

and surviving in the works of Aristophanes, adhered to a rigid structure within which some variation was allowed. The plays begin with a *prologos*, which outlines the dilemma of the plot, followed by the *parados*, or chorus entrance, which in Aristophanic comedies often revealed the chorus dressed as animals. Next, a debate, or *agon*, develops between an actor and the chorus or between two actors, each supported by half the chorus. Representing opposing principles, the actors argue in a fashion similar to the dialectical dialogues of Plato. In Aristophanes' *The Clouds*, for example, the *agon* concerns right and wrong logic. Following the debate is the *parabasis*, or “coming forward,” at which time the chorus steps forward to address the audience directly, speaking in the name of the poet and often haranguing the audience by attacking prominent people or social and political principles.

The probable source of the *agon* and the other elaborate conventions of Old Comedy is the mimetic ritual from which comedy evolved, namely ancient fertility rituals in which men attempted to imitate the life cycles of regeneration and rebirth.

agonism, also called AGONISTIC BEHAVIOUR, survivalist animal behaviour that includes aggression, defense, and avoidance. The term is favoured by biologists who recognize that the behavioral bases and stimuli for approach and fleeing are often the same, the actual behaviour exhibited depending on other factors, especially the distance to the stimulus.

Ethologists believe that the most general and probably the primary function of agonistic behaviour is to allow members of a species to regulate the spatial distribution of that species. It also may regulate access to both food supplies and mates.

In human societies, where verbal explanation is possible, agonistic behaviour can serve as a tool to bring about constructive activity as well as distinct antisocial, destructive acts. Some ethologists have suggested that many seemingly irrational human behaviours, such as war and murder, reflect the same instinctual mechanisms (territorial defense, for example) that leads to aggressive acts in many non-humans.

The view of human motivation as having instinctual components serves as a cornerstone for the controversial science of sociobiology. Agonistic behaviour, according to the sociobiologist, tends to occur only in those contexts where it improves the chances of the survival of an individual's genes, either through the individual's own efforts or those of his or her relatives. Thus, human competition may lead to the acquisition of more material resources which, in turn, may make a person a more desirable mating partner.

Agonistic behaviour, in both humans and non-humans, is greatly influenced by learning according to the general principles of classical and operant conditioning; agonistic behaviours are commonly learned through social modelling. See also social learning.

agora, in ancient Greek cities, an open space that served as a meeting ground for various activities of the citizens. The name, first found in the works of Homer, connotes both the assembly of the people as well as the physical setting; it was applied by the classical Greeks of the 5th century BC to what they regarded as a typical feature of their life: their daily religious, political, judicial, social, and commercial activity. The agora was located either in the middle of the city or near the harbour, which was surrounded by public buildings and by temples. Colonnades, sometimes containing shops, or stoae, often enclosed the space, and statues, altars, trees, and fountains adorned it. The general trend at this time was

to isolate the agora from the rest of the town. Earlier stages in the evolution of the agora

Plaster model of the Agora, Athens, as it might have appeared in the 2nd century AD
American School of Classical Studies at Athens

have been sought in the East and, with better results, in Minoan Crete (for instance, at Ayia Triádfa) and in Mycenaean Greece (for instance, at Tiryns).

In the 5th and 4th centuries BC two kinds of agora existed. Pausanias, writing in the 2nd century AD, calls one type archaic and the other Ionic. He mentions the agora of Elis (built after 470 BC) as an example of the archaic type, in which colonnades and other buildings were not coordinated; the general impression created was one of disorder. The agora of Athens was rebuilt to this type of design after the Persian Wars (490–449 BC). The Ionic type was more symmetrical, often combining colonnades to form either three sides of a rectangle or a regular square; Miletus, Priene, and Magnesia ad Maeandrum, cities in Asia Minor, provide early examples. This type prevailed and was further developed in Hellenistic and Roman times. In this later period the agora influenced the development of the Roman forum and was, in turn, influenced by it. The forum, however, was conceived in a more rigid manner than the agora and became a specific, regular, open area surrounded by planned architecture.

The use of the agora varied at different periods. Even in classical times the space did not always remain the place for popular assemblies. In Athens the ecclesia, or assembly, was moved to the Pnyx (a hill to the west of the Acropolis), though the meetings devoted to ostracism were still held in the agora, where the main tribunal remained.

A distinction was maintained between commercial and ceremonial agoras in Thessaly and elsewhere (Aristotle, *Politics*, vii, II, 2). In the highly developed agora, like that of Athens, each trade or profession had its own quarter. Many cities had officials called *agoranomoi* to control the area.

The agora also served for theatrical and gymnastic performances until special buildings and spaces were reserved for these purposes. In Athens respectable women were seldom seen in the agora. Men accused of murder and other crimes were forbidden to enter it before their trials. Free men went there not only to transact business and to act as jurors but also to talk and idle—a habit often mentioned by comic poets. In exceptional circumstances a tomb in the agora was granted as the highest honour for a citizen.

Agostino di Duccio (b. 1418, Florence—d. 1481?, Perugia, Papal States), early Renaissance sculptor whose work is characterized by its linear decorativeness. His early work shows the influence of Donatello and Michelozzo, whom he assisted in adorning SS. Annunziata in Florence.

Agostino's name is associated mainly with the wealth of sculptured decoration for the

Tempio Malatestiano at Rimini, a building designed by L.B. Alberti. The only work in the Tempio with which he can certainly be associated is the Arca degli Antenati, and it is likely that his share was limited to the

sculptures in the chapels of S. Sigismondo, the Sibyls, and the Infant Games and to some decorative carvings. Whether or not he also carved the much-superior reliefs in the chapels of the Planets and the Liberal Arts, he was profoundly influenced by the Neo-Attic style on which these were based. Agostino's other major work was the series of reliefs he executed for the facade of the Oratory of S. Bernardino at Perugia (c. 1457–61). His style—with its linear emphasis, curvise

Musician Angels, relief by Agostino di Duccio; in the Oratorio di San Bernardino, Perugia, Italy
SCALA—Art Resource/EB Inc

drapery, and flat, schematic forms—lacks the fundamentally naturalistic intention of most Florentine sculpture of his time and owes its mannerisms largely to the Humanist environment of Rimini.

Agostino di Giovanni (fl. first half of 14th century), late Gothic sculptor, best known for his work, with Agnolo di Ventura, on the tomb of Guido Tarlati.

Agostino is first heard of in Siena in 1310 and again lived there in 1340–43. After 1320 he was active with Agnolo at Volterra, where they executed a number of scenes from the lives of SS. Regulus and Octavian. The work of the two sculptors cannot be clearly differentiated. Between 1329 and 1332 they were

jointly employed in the cathedral at Arezzo on the tomb of Tarlati. It displays a proficient technique, but its figures are stiff, heavy, and sometimes awkward. It is primarily important as a social document, delighting in the commonplaces of medieval life.

Agostino and Agnolo also were active as architects, and a number of buildings in Siena, including the Porta Romana and the church of S. Francesco, are conjecturally ascribed to them.

Agou, Mont (Togo): see Baumann, Pic.

Agoult, Marie (-Catherine-Sophie) de Flavigny, comtesse d' (countess of), pseudonym DANIEL STERN (b. Dec. 31, 1805, Frankfurt am Main—d. March 5, 1876, Paris), writer famous for her position in Parisian society in the 1840s and for her liaison with the composer Franz Liszt.

Mme d'Agoult was the daughter of the émigré Comte de Flavigny. In 1827 she married Col. Charles d'Agoult, 20 years her senior. She had early shown strength of will and enthusiasm for justice and freedom, and her marriage disappointed her expectations. Meeting Franz Liszt, she decided in 1834 to run away with him. Their relationship lasted till 1839, when Liszt felt that his musical career prevented a settled life. Their separation became permanent in 1844. Their daughter Cosima was the second wife of the composer Richard Wagner.

Returning to Paris in 1839, Mme d'Agoult began her career as a writer and in 1846 published a largely autobiographical novel, *Nélida*. She was a close friend of George Sand, whose views on morals, politics, and society she shared and in whose house she had lived for a time with Liszt. She also became the leader of a salon where the ideas that culminated in the Revolution of 1848 were discussed by the outstanding writers, thinkers, and musicians

Madame d'Agoult, detail of a portrait by Henri Lehmann; in a private collection
J.E. Bulloz

of the day. Her own writings included *Lettres républicaines* (1848); *Histoire de la révolution de 1848* (1850–53); a play, *Jeanne d'Arc* (1857); a dialogue, *Dante et Goethe* (1866); and *Mes Souvenirs 1806–1833* (1877), supplemented by *Mémoires, 1833–1854* (1927), interesting for the light they throw on the social, literary, and musical circles of her time.

agouti (*Dasyprocta*), any of about half a dozen species of tropical American rodents belonging to the family Dasyproctidae (order Rodentia). Agoutis are 40 to 60 centimetres (16 to 24 inches) long. They have long bodies, small ears, vestigial tails, and slender feet with long, hooflike claws. The wiry fur is reddish brown to blackish, with the individual hairs banded in what is called the agouti pattern. Agoutis eat roots, leaves, and fruit, and occasionally damage sugarcane and banana plants. Two to four young are produced, after a gestation period of about three months, in a burrow among boulders or roots on the forest floor. Agoutis are swift, shy animals; their flesh is prized as food by the Indians.

The name agouti is also applied to the

Agouti (*Dasyprocta*)
Warren Garst—Tom Stack & Associates

acouchis (*Myoprocta*) of South America. Acouchis resemble agoutis, but are smaller and have short, white-tipped tails.

Āgra, city, west-central Uttar Pradesh state, north-central India, on the Yamuna (Jumna) River. Founded by Sikandar Lodī in the early 16th century, it was the Mughal capital during some periods of their empire. In the late 18th century the city fell successively to the Jāts, the Marāthās, the Mughals, and the ruler of Gwalior and, finally, to the British in 1803. It was the capital of Āgra (later North-Western) province from 1833 to 1868.

Āgra is best known as the site of the Taj Mahal (17th century). Other monuments include a 16th-century fort built by the emperor Akbar that contains the 17th-century Pearl Mosque (Motī Masjid), constructed of white marble, and a palace, the Jahāngīrī Mahal. Also in Āgra are the Jāmī Masjid, or Great Mosque, and an elegant tomb noted for its architectural style. To the northwest, at Sikandra, is the tomb of Akbar.

Āgra is a major road and rail junction and a commercial and industrial centre. Āgra University (1927) and six of its affiliated colleges are located in the city; the state mental hospital and Dayalbāgh, a colony of the Rādhā Soāmi sect, are in the suburbs.

The region around Āgra consists almost entirely of a level plain, with hills in the extreme southwest. The region is watered by the Yamuna River and the Āgra Canal; millet, bar-

The Pearl Mosque (Motī Masjid) and the fort at Āgra, Uttar Pradesh, India

ley, wheat, and cotton are among the crops grown. The deserted Mughal city of Fatehpur Sikri is 23 miles (37 km) southwest of Āgra city. Pop. (2001 prelim.) city, 1,259,979; metropolitan area, 1,321,410.

Agramonte y Simoni, Aristides (b. June 3, 1868, Camagüey, Cuba—d. Aug. 19, 1931, New Orleans, La., U.S.), physician, pathologist, and bacteriologist, a member of the Reed Yellow Fever Board of the U.S. Army that discovered (1901) the role of the mosquito in the transmission of yellow fever.

Agramonte was the son of a prominent

physician who had been killed while serving in the Cuban Army of Liberation. Brought up in New York City, Agramonte received an M.D. in 1892 from the College of Physicians and Surgeons of Columbia University. After he had served his internship, he conducted research in pathology and bacteriology at Bellevue Hospital and with the New York City Department of Health. He was appointed an assistant surgeon with the U.S. Army from 1898 to 1902.

As professor of bacteriology and experimental pathology at the University of Havana (from 1900), member of the government board of infectious diseases, cabinet secretary of health and charities, and medical practitioner for many of the Americans who lived in Havana, Agramonte was an influential leader of scientific medicine in Cuba. In 1931 he was appointed to head the new department of tropical medicine at a medical school in Louisiana, but he died while preparing to assume the position.

agranulocytosis, also called **AGRANULOCYTIC ANGINA**, acute infection characterized by severe sore throat, fever, and prostration and associated with an extreme reduction of the white blood cells (leukopenia), particularly the cell types known as neutrophils (neutropenia).

In most cases, agranulocytosis appears to develop as a result of sensitization to certain drugs and chemicals; infection then follows as a consequence, not as a cause, of the profound neutropenia. First observed as a reaction to the coal-tar product aminopyrine, agranulocytosis is now known to be triggered by a variety of pain relievers, tranquilizers, antihistamines, anticonvulsants, sulfonamide derivatives, and antithyroid drugs. It affects only a small number of susceptible individuals. Treatment consists of the immediate and permanent withdrawal of the offending drug and control of the infection with antimicrobial medication.

Agrarian League, German **BUND DER LANDWIRTE**, extraparliamentary organization active under the German empire from 1893. Formed to combat the free-trade policies (initiated in 1892) of Chancellor Leo, Graf von Caprivi, the league worked for farmers' subsidies, import tariffs, and minimum prices. Caprivi's successor promised to increase wheat tariffs; but by 1900 the Agrarian League had increased to 250,000 members, 50,000 more than its mid-1890s membership. By then it had largely captured the Conservative Party, which in the Reichstag (parliament) merely represented the economic self-interest of Germany's landed class. In 1902 another new chancellor restored agricultural tariffs (partly in return for support for legislation in naval expansion) to their 1892 levels, though this was insufficient for the league. In 1921 it became the Reichslandbund, or State Land League.

Agre, Peter (b. Jan. 30, 1949, Northfield, Minn., U.S.), American doctor, corecipient of the Nobel Prize for Chemistry in 2003 for his discovery of water channels in cell membranes. He shared the award with Roderick MacKinnon of the United States.

Agre earned an M.D. degree from Johns Hopkins University School of Medicine in 1974. In 1981, following postgraduate training and a fellowship, he returned to Hopkins, where in 1993 he advanced to professor of biological chemistry. In 2000 he was elected to the National Academy of Sciences.

First mentioned by scientists in the mid-1800s, water channels are specialized openings that allow water to flow in and out of cells and are essential to living organisms. In 1988 Agre was able to isolate a type of protein molecule in the cell membrane that he later came to realize was the long-sought water channel. His research included comparing how cells with and without the protein in their membranes

responded when placed in a water solution. He discovered that cells with the protein swelled up as water flowed in, while those lacking the protein remained the same size. He named the protein aquaporin, and researchers subsequently discovered a whole family of the proteins in animals, plants, and even bacteria. Two different aquaporins were later found to play a major role in the mechanism by which human kidneys concentrate urine and return the extracted water to the blood.

Agreda, María de, also called **SISTER MARÍA DE JESÚS**, original name **MARÍA FERNÁNDEZ CORONEL** (b. April 2, 1602, Agreda, Spain—d. May 24, 1665, Agreda), abbess and mystic. In 1620 she took her vows as a Franciscan nun and in 1627 became abbess of a Franciscan monastery in Agreda, retaining this office, except for a brief period, until her death.

Her virtues and holy life were universally acknowledged, but controversy arose over her mystical writings, her political influence, and her missionary activities. Her best-known work is *The Mystical City of God* (1670), a life of the Virgin Mary ostensibly based on divine revelations granted to María. It was placed on the *Index Librorum Prohibitorum* in 1681, but the ban was lifted in 1747; Spanish theologians maintained from the start that most of the opposition arose from a misunderstanding of the Spanish text. Despite the book's evident historical, geographic, and chronological errors, scholars value it as an ascetic and mystical treatise.

In 1643 King Philip IV of Spain visited María, initiating a correspondence that was maintained until her death. Their letters dealt with spiritual and political matters and form a rich source for historians on Philip's reign.

María was noted for her encouragement of missionary activity, especially among the Franciscans. She frequently repeated that God had revealed to her his desire to convert the North American Indians and had assured the missionaries the reward of becoming apostles. Some thought her words fanciful, but many others accepted her assurances of success and took up mission work; among them was Junípero Serra, founder of California missions.

Where the same name may denote a person, place, or thing, the articles will be found in that order

Āğrı, formerly **KARAKÖSE**, city, in the highlands of eastern Turkey. It lies 5,380 feet (1,640 m) above sea level in the valley of the Murat River, a tributary of the Euphrates River. The town is a centre for trade in livestock and livestock products and is a transit station on the main highway from Turkey to Iran.

Āğrı is named after Mount Ararat (Turkish: Āğrı Dağı), situated to the east near the frontier with Iran. Stock raising and agriculture are the main activities of the region. Kurds constitute a large proportion of the population of the countryside. Pop. (2000 prelim.) 79,764.

Āğrı Dağı (Turkey): *see* Ararat, Mount.

agribusiness, agriculture regarded as a business; more specifically, that part of a modern national economy devoted to the production, processing, and distribution of food and fibre products and by-products.

In highly industrialized countries, many activities essential to agriculture are carried on separately from the farm. These include the development and production of equipment, fertilizers, and seeds; in some countries the processing, storage, preservation, and delivery of products have also been separated from basic farming. In consequence, farming itself has become increasingly specialized and busi-

nesslike. Some business firms even raise crops, as in the case of a winery that operates its own vineyards or a large commercial producer of fast-frozen or canned vegetables that maintains its own farm. Many of these farms use extensive mechanization and computer technology to increase production.

In recent years, conglomerate companies that are involved in nonagricultural businesses have entered agribusiness by buying and operating large farms. Some food-processing firms that operate farms have begun to market fresh produce under their brand names.

Agricola, Alexander (b. 1446, Flanders—d. 1506, Valladolid, Spain), composer of the late Burgundian polyphonic school.

Agricola was educated in the Netherlands and entered the service of Charles VII of France. He later went to Milan and in 1474 was at the court of Lorenzo de' Medici. The same year he returned to the Netherlands. In 1500 he became chaplain and chanter to Philip the Fair of Burgundy, whom he accompanied to Spain. His works appear widely in contemporary printed music books and are noted for their rhythmic ingenuity. They include masses, motets, French chansons, and Italian carnival songs.

Agricola, Georgius (Latin), German GEORG BAUER (b. March 24, 1494, Clauchau, Saxony—d. Nov. 21, 1555, Chemnitz), German scholar and scientist known as "the father of mineralogy." While a highly educated classicist and humanist, well regarded by scholars of his own and later times, he was yet singularly independent of the theories of ancient authorities. He was indeed among the first to found a natural science upon observation, as opposed to speculation. His *De re metallica* dealt chiefly with the arts of mining and smelting; his *De natura fossilium*, considered the first mineralogy textbook, presented the first scientific classification of minerals (based on their physical properties) and described many new minerals, their occurrence and mutual relationships.

Life. Agricola was born of obscure parentage. From 1514 to 1518 he studied classics, philosophy, and philology at the University of Leipzig, which had recently been exposed to the Humanist revival. Following the custom of the times, he latinized his name to Georgius Agricola. After teaching Latin and Greek from 1518 to 1522 in a school in Zwickau, he returned to Leipzig to begin the study of medicine but found the university in disarray because of theological quarrels. A lifelong Catholic, he left in 1523 for more congenial surroundings in Italy. He studied medicine, natural science, and philosophy in Bologna and Padua, finishing with clinical studies in Venice.

Georgius Agricola, portrait from Joannes Sambucus' *Icones veterum aliquot ac recentium medicorum philosophorumque* . . . ; Antwerp, 1574

By courtesy of the Museum National d'Histoire Naturelle, Paris

For two years he worked at the Aldine Press in Venice, principally in preparing an edition of Galen's works on medicine (published in 1525). In this task he collaborated with John Clement, who had been Thomas More's secretary during the writing of *Utopia*. More's book may well have influenced Agricola to concern himself later with the laws and social customs of the Saxon mining district. In Italy he also met and won the friendship of the great scholar Erasmus, who encouraged him to write and later published several of his books. (Erasmus wrote an introduction to Agricola's first book, the mineralogical treatise *Bermannus*. Agricola shared that honour with More and only three other scholars.)

In 1526 he returned to Saxony, and from 1527 to 1533 he was town physician in Joachimsthal, a burgeoning mining town in the richest metal-mining district of Europe. Partly in the hope of finding new drugs among the ores and minerals of his adopted district (a hope eventually to be disappointed), he spent all his spare time visiting mines and smelting plants, talking to the better educated miners, and reading classical authors on mining. These years shaped the rest of his life and provided the subject matter for most of his books, beginning with *Bermannus; sive, de re metallica* (1530), a treatise on the Erzgebirge mining district. There are indications that he owned a share in a silver mine.

He appears not to have been particularly distinguished as a physician, though in this pursuit he made use of direct observation rather than of received authority. He introduced the practice of quarantine into Germany, and his books make many references to miners' occupational diseases. In 1533 he became town physician in Chemnitz, where he remained to the end of his life.

In 1546 Duke Maurice, elector of Saxony, appointed Agricola burgomaster (mayor) of Chemnitz. He also served as an emissary in the Protestant ruler Maurice's ambiguous negotiations with Charles V, the Holy Roman emperor. The religious wars of the period rapidly eroded the tolerance that had hitherto prevailed in the Protestant German states, a tolerance from which Agricola had benefitted.

Apart from his diplomatic role, Agricola took only limited interest in politics. His youthful "Turkish Speech" of 1529, a vigorous call to the Holy Roman emperor Ferdinand I to undertake a war against the Turks, was a patriotic hymn to Germany and a call to political and religious unity. It made a great impression on the public and was often reprinted.

Chief works. Agricola's magnum opus, for which the treatise *Bermannus* was a prelude, was *De re metallica*, published posthumously in 1556. In it, among other things, Agricola surveys historical and classical allusions to metals and assesses the content and distribution of metal mines in antiquity. He treats the pattern of ownership and the system of law governing Saxon mines, together with the details of their day-to-day labour management. He was mainly concerned, however, with mining and metallurgy, and he discussed the geology of ore bodies, surveying, mine construction, pumping, and ventilation. There is much on the application of waterpower. He describes the assaying of ores, the methods used for enriching ores before smelting, and procedures for smelting and refining a number of metals; and he concludes with a discussion of the production of glass and of a variety of chemicals used in smelting operations.

In *De natura fossilium* (the book on which rests his right to be regarded as the father of mineralogy), Agricola offers a classification of minerals (called "fossils" at that time) in terms of geometrical form (spheres, cones, plates). He was probably the first to distinguish between "simple" substances and "compounds." In Agricola's day, chemical knowledge was almost nonexistent, and there was no proper

chemical analysis (other than analysis of ores by the use of fire), so the classification of ores was necessarily crude.

In several other books, notably *De natura eorum quae effluunt ex terra* (1546) and *De ortu et causis subterraneorum* (1546), Agricola describes his ideas on the origin of ore deposits in veins and correctly attributes them to deposition from aqueous solution. He also describes in detail the erosive action of rivers and its effect in the shaping of mountains. His readiness to discard received authority, even that of classical authors, such as Aristotle and Pliny, is impressive.

Agricola's scholarly contemporaries regarded him highly. Erasmus prophesied in 1531 that he would "shortly stand at the head of the princes of scholarship." Later Goethe was to liken him to Francis Bacon. Melancthon praised his "grace of presentation and unprecedented clarity." The mining engineer Herbert Hoover (later U.S. president), who translated *De re metallica* into English in 1912, regarded Agricola as the originator of the experimental approach to science, "the first to found any of the natural sciences upon research and observation, as opposed to previous fruitless speculation." (R.W.C.)

BIBLIOGRAPHY. No detailed life of Agricola has been published in English. A German biography is H. Hartmann, *Georg Agricola, 1494-1555* (1953). The most important source is the work published by the East German Academy of sciences on the occasion of the 400th anniversary of his death, *Georgius Agricola, 1494-1555, zu Seinem 400. Todestag 21. Nov. (1955)*, which contains a number of essays on Agricola's life and work, including his diplomatic activity. F.D. Adams, *The Birth and Development of the Geological Sciences* (1938), is informative on Agricola's contribution to geology. Of his books, only *De re metallica* and *De natura fossilium* have as yet been translated into English.

Agricola, Gnaeus Julius (b. June 13, AD 40, Forum Julii, Gallia Narbonensis—d. Aug. 23, 93), Roman general celebrated for his conquests in Britain. His life is set forth by his son-in-law, the historian Tacitus.

After serving as military tribune under Suetonius Paulinus, governor in Britain (59-61), Agricola became, successively, quaestor in Asia (64), people's tribune (66), and praetor (68). In the civil war of 69 he took the side of Vespasian, who appointed him to a command in Britain. He was granted patrician status upon his return to Rome in 73 and served as governor of Aquitania (74-77). Appointed consul in 77, he was made governor of Britain.

Agricola was in Britain from 77/78 to 84. After conquering portions of Wales, including the island of Mona (now Anglesey), he completed the conquest of what is now northern England. By the end of the third campaigning season, he had advanced into Scotland, establishing a temporary frontier of posts between the firths of the Clota and Bodotria (Clyde and Forth) rivers. The Romans crossed the Forth in 83 and defeated the Caledonians in a decisive battle at Mons Graupius. Agricola's permanent occupation of Scotland reached the fringe of the highlands, where he blocked the main passes with forts and placed a legionary fortress at Inchtuthil (near Dunkeld in Perthshire). Recalled to Rome after his victory, the general lived in retirement, refusing the proconsulship of Asia.

Agricola, Johann, original name JOHANN SCHNEIDER, Schneider also spelled SCHNITZER, Latin SARTOR (b. April 20, 1494, Eisleben, Saxony—d. Sept. 22, 1566, Berlin), Lutheran Reformer, friend of Martin Luther, and advocate of antinomianism, a view asserting that Christians are freed by grace from the need to obey the Ten Commandments. At Wittenberg, Agricola was persuaded by Luther to change his course of study from medicine to theology. Increasingly under Luther's influence, Agricola accompanied him as recording

secretary to his Leipzig debate of 1519 with the scholar Johann Eck.

In 1525 Agricola helped introduce Lutheranism to Frankfurt and, in the same year, became head of the Latin school at Eisleben. There, he began to assert his antinomianism (Greek *anti*, "against"; *nomos*, "law"), condemning the law as an unnecessary carry-over from the Old Testament and as too similar to the Roman Catholic stress on good works: "The Decalog (Ten Commandments) belongs in the courthouse, not in the pulpit. . . . To the gallows with Moses!" In 1527 he became more forceful, attacking the Reformer Philipp Melancthon, an associate of Luther, for Lutheran inclusion of the law in Reformation theology. The conflict was enlarged when Agricola returned to Wittenberg in 1536, and Luther responded with five disputations and the treatise "Against the Antinomians." Under persecution for his attacks on Luther's position, in 1540 Agricola went to Berlin, where he retracted his views and in the same year was made court preacher by the Protestant prince Joachim II of Brandenburg. Shortly afterward he returned to Saxony but found himself no longer in Luther's trust.

In 1548, following Charles V's victory over the Protestants in his effort to unify the Holy Roman Empire, Agricola was selected by the emperor as one of three theologians to draft a provisional religious settlement between Protestants and Roman Catholics, a document that became known as the Augsburg Interim. His role earned Agricola the hatred of staunch Protestants, but he defended strict Lutheranism in other controversies and toward the end of his life considered himself to have won a substantial victory for Luther's views. Although criticized by some as vain and too morally weak to shun court favours, Agricola was a gifted theologian and administrator.

Agricola, Martin, original name MARTIN SORE, OF SOHR (b. Jan. 6, 1486, Schwiebus, Silesia [now in Poland]—d. June 10, 1556, Magdeburg, Archbishopric of Magdeburg [Germany]), composer, teacher, and writer on music, one of the first musicians to concern himself with the needs of the Reformed churches and to publish musical treatises in the vernacular.

Agricola was self-taught, called to music "from the plough," as his chosen surname suggests. He worked at Magdeburg from about 1510 and in 1524 taught at the first Protestant school there. He published several treatises on music theory, most notably his *Musica instrumentalis deudsch* (1529). Much of the German musical vocabulary that he invented is still in use. His books give a valuable picture of the musical life of his time, particularly his descriptions of early 16th-century musical instruments. Most of his unpublished compositions are lost. His printed volumes include sacred music and many instrumental pieces that are transcriptions of vocal part-songs.

Agricola, Rodolphus, original name ROELOF HUYSMAN (b. 1443/44, Baflo, Groningen [now in The Netherlands]—d. Oct. 27, 1485, Heidelberg, Palatinate [Germany]), Dutch humanist who, basing his philosophy on Renaissance ideas, placed special emphasis on the freedom of the individual and the complete development of the self, from both an intellectual and a physical standpoint. His ideas influenced Desiderius Erasmus, another Dutch humanist. Agricola studied in Groningen, Erfurt, Cologne, and Louvain, graduating from Louvain in 1465. While in his early 30s, he started to write, producing an oration in praise of philosophy (1476) and a biography of Petrarch (1477), the Italian poet and scholar. During the following five years, he traveled between universities in northwestern Germany and the Netherlands. In 1484 he accepted an invitation from the bishop of Worms, Johann von

Dalberg, to lecture on classical literature in Heidelberg. In the same year he wrote *De formando studio*, a book on education.

Agricultural Adjustment Administration (AAA), in American history, major New Deal program to restore agricultural prosperity by curtailing farm production, reducing export surpluses, and raising prices. The Agricultural Adjustment Act (May 1933) was an omnibus farm-relief bill embodying the schemes of the major national farm organizations. It established the Agricultural Adjustment Administration under Secretary of Agriculture Henry Wallace to effect a "domestic allotment" plan that would subsidize producers of basic commodities for cutting their output. Its goal was the restoration of prices paid to farmers for their goods to a level equal in purchasing power to that of 1909–14, which was a period of comparative stability. In addition, the Commodity Credit Corporation, with a crop loan and storage program, was established to make price-supporting loans and purchases of specific commodities.

Although benefit payments to farmers totaled \$1,500,000,000 by 1936, a rise in commodity prices was attributable mainly to severe drought conditions in 1933–36. In spite of its limited achievements, the early AAA program was favoured by most farmers. The Supreme Court declared the act unconstitutional in 1936, and Congress passed new agricultural legislation two years later based on the soil-conservation concept. While farmers' cash income doubled between 1932 and 1936, it took the enormous demands of World War II to reduce the accumulated farm surpluses and to increase farm income significantly.

agricultural economics, the study of the allocation, distribution, and utilization of the resources used by and commodities produced by farming. The system of economic relations involved in agriculture includes the livelihoods of more than half the people on earth; in some areas, the proportion is as much as three-quarters of the general populace. Agricultural economics plays a role in the economics of development, for a continuous level of farm surplus is one of the wellsprings of technological and commercial growth.

A brief treatment of agricultural economics follows. For full treatment, see MACROPAEDIA: Farming and Agricultural Technology.

The peasant farms of the past were largely self-sufficient, producing just enough foodstuffs for their cultivators, with perhaps a small surplus for the local market. Typically, a farmworker produced enough to feed three other people, two of whom were of the household. The excess might be used for rent or to buy supplies smallholders could not make for themselves. An average farmer planted small quantities of many different crops, thus ensuring that the members of the household were not completely dependent on the harvest of any one of them.

This description was true for the United States until the middle of the 19th century, and it still holds for many areas in the developing world, from Asia to Africa. Such farms are not, in any important way, connected to market economies. They are also not very productive, mostly because they are usually neither fertilized nor irrigated adequately, and the soil is frequently exhausted from decades of intense cultivation without replenishment. Production increases in underdeveloped regions arise only from increases in the amount of land tilled or the amount of labour employed per area of cropland. As the population grows, crops requiring more labour usually take the place of less-labour-intensive crops. With low yields, peasant farmers are ever subject to famine and thus are reluctant to take risks on innovative methods.

However, given convincing demonstrations of the virtues of new methods or seed stocks,

even the most traditional farmers will change their ways, as was shown in the 1960s by the rapid adoption of many improved agricultural techniques throughout the world. With investment in the fertilizers, insecticides, herbicides, irrigation systems, machinery, and high-yielding varieties of food crops that have been developed in the past century, yields per unit of land can be increased enormously. For instance, high-yield varieties of rice were not introduced in Bangladesh (then East Pakistan) until the 1968–69 growing season, yet one year later a fourth of the total crop came from the new strains.

The substitution of mechanical power for animal power and the increased use of fertilizers reduces the need for labour and land. In 1910 feeding the horses and mules that pulled farmers' plows required the output of more than one-fourth of the world's cropland, and nearly one-tenth of the work on farms involved caring for draft animals. Mechanizing agriculture ends farmers' dependence on these resources. By making land more productive, fertilizers also remove additional pressure to expand the amount of cultivation.

Rising harvests yield ever greater surpluses for the market, while the decreasing need for human labour pushes people out of the countryside and into the cities. The surplus enables other types of development to take place while drawing farmers into the larger market economy. Unlike peasant cultivators, farmers in developed nations are vulnerable to outside economic conditions. Farm prices are notoriously volatile, rising or falling by as much as one-third or one-half from year to year. Part of the reason for this extreme variability is the consumer's low level of response to agricultural price changes. To increase sales for other products, it is often necessary only to reduce the price; in agriculture, however, large price reductions stimulate very little added demand. In addition, even if changes in demand do occur, farmers have limited ability to respond to them. They must plant on the basis of expectations; if their expectations are not borne out, they cannot do anything about it until the next harvest.

Dependent on the market, such farmers are caught between relatively high fixed costs—machinery, fertilizer, feedstocks, interest, and so on—and fluctuating income. As a result, farm incomes throughout the world still tend to be lower than incomes from nonfarm pursuits. Governments have tried a number of methods to make farming more rewarding. Among these are direct payments, limitations on production, tariffs and levies on food imports, and taking agriculture out of the market system altogether. In the United States farmers are frequently paid not to grow particular crops, thus preventing soil exhaustion and keeping the market from being glutted. Price supports are also offered for major crops including wheat, rice, cotton, and tobacco; if the market price falls below certain levels, the Commodity Credit Corporation (CCC) will buy farmers' crops, which are then usually distributed in economic aid programs.

The European Community (EC) has a complex agricultural policy for its member nations. The EC exacts levies on farm imports, driving their prices up until they reach the domestic levels. Farmers operating within this system have been able to keep grain prices, for example, 60 to 90 percent higher than prevailing levels in North America. During most of the Soviet era, collective farming was practiced in the Soviet Union and a number of other communist nations. Markets were abolished, and each farm was simply required to produce an assigned quota, for which the state paid a set price. Before 1953, the year of Joseph Stalin's death, the Soviet state paid

very low prices, and farm incomes were low, providing in effect a subsidy for industrialization. In the post-Stalin period prices were raised significantly, and cultivators fared better. Following the disintegration of the Soviet Union in 1990/91, collective farming was de-emphasized.

The effects of these various policies are mixed. Although they have raised productivity, they have not always benefited farmers. It is apparent that real income from agriculture has less to do with governmental policies than with the local level of economic development. Rising farm prices have frequently been offset by an increase in the number of farmers and in the acreage put to the plow; rising prices also frequently have the consequence of inducing farmers to spend more on fertilizers, machinery, and other items, thus lowering their net income. The problem of maintaining growth in productivity, guarding the natural resources of the land, and adequately rewarding cultivators for their work in societies with advanced agricultural practices has not yet been fully solved.

agricultural sciences, the sciences dealing with farm production, including soil cultivation, water control, crop growing and harvesting, animal husbandry, the processing of plant and animal products, engineering, economics, and other related matters. The agricultural industry that is the focus of study includes farming, concerned with production; service industries, concerned with making or supplying machinery, buildings, fertilizers, and pesticides; and the first purchasers of farm products, such as processors, distributors, and marketing boards.

A brief treatment of agricultural sciences follows. For full treatment, see **MACROPAEDIA: Agricultural Sciences**.

In prehistoric times, religion and farming were closely allied. When agriculture was invented (about 8000–6000 BC), the first agricultural teachers were the priests. Apart from references in some ancient inscriptions, the first recorded instruction book was the *Works and Days* of Hesiod (probably 8th century BC). Like that of the priests, his instruction was largely seasonal and based on predictable astronomic events, thus: "Then after the Pleiades and the Hyades and the strength of Orion have set, then remember again to begin your seasonal ploughing."

By the 16th century AD the link between religion or astronomy and agriculture had weakened, and the advent of printing led to many secular printed books, such as Thomas Tusser's *Points of Husbandry* (1557) and works on agronomy by Bernard Palissy (1510–89). In the 18th century, progressive landowners started early versions of the "field trials" of today. There was, however, no formal agricultural education or research until 1796, when a special academy was founded at Keszthely, Hung.; and professorships of agriculture and rural economy were founded at the universities of Edinburgh (1790) and Oxford (1796) in Great Britain. Meanwhile, in France and Germany, Albrecht Thaer, S.F. Hermstädt, Jean-Baptiste Boussingault, and, in particular, Justus von Liebig were laying the foundations of agricultural research. In England, Rothamsted Experimental Station, the oldest research centre in continuous operation, and the Royal Agricultural College at Cirencester started before 1850. But probably the key date in the history of agricultural research and education is 1862, when the U.S. Congress set up the Department of Agriculture and provided for colleges (many now incorporated in state universities) of agricultural and mechanical arts in each state. This legislation heralded a movement that spread across the world from the

second half of the 19th century onward; after World War II, it gathered increasing momentum.

Today most sovereign countries have practical courses and extension (*i.e.*, farmers' advisory) services and at least one university with a faculty of agriculture, teaching such subjects as biochemistry, physics and agrometeorology, soil science, engineering, botany, crop physiology, animal physiology and nutrition, genetics, entomology, plant and animal pathology, farming systems and production methods, human nutrition, and food processing. Applied statistics and operational mathematics (*e.g.*, linear programming of least-cost livestock rations) are essential research tools for these disciplines and permit a quantitative intellectual rigour that enables agricultural science to contribute to the basic natural and social sciences as much as it receives from them.

agriculture, the science or art of cultivating the soil, growing and harvesting crops, and raising livestock. The art of making land more productive is practiced throughout the world—in some areas by methods not far removed from the conditions of several thousands of years ago and in other areas, with the aid of science and mechanization, as a highly commercial type of endeavour. Agriculture still drafts into its service more of the world's aggregate manpower than all other occupations combined.

Agriculture is treated in a number of articles in the **MACROPAEDIA**. For the history and principal treatments of the subject, see **Agriculture, History of; Farming and Agricultural Technology; Food Processing**. For the academic and technological discipline, see **Agricultural Sciences**.

For a description of the place of agriculture in the circle of learning and for a list of both **MACROPAEDIA** and **MICROPAEDIA** articles on the subject, see **PROPAEDIA: Part Seven, Division III**.

For statistical data on farming and on crop and livestock production, see **BRITANNICA BOOK OF THE YEAR**.

Agrigento, formerly (until 1927) **GIRGENTI**, Greek **ACRAGAS**, Latin **AGRIGENTUM**, capital of Agrigento *provincia*, near the southern coast of Sicily, Italy. It lies on a plateau encircled by low cliffs overlooking the junction of the Drago (ancient Hypsas) and San Biagio (Acragas) rivers and is dominated from the north

The Temple of Hera, Agrigento, Sicily
V. Dia—SCALA from Art Resource

by a ridge with twin peaks. Agrigento was a wealthy ancient city founded about 581 BC by Greek colonists from Gela. It was ruled 570–554 BC by the notorious tyrant Phalaris, who was reputed to have had men roasted alive in a brazen bull, and it reached its peak in 480 when the tyrant Theron, in alliance with Syracuse, won the decisive Battle of Himera over the Carthaginians. In 470 the tyranny was replaced by a democracy. Agrigento was the birthplace of the philosopher-politician Empedocles. Under the tyranny it was a considerable centre of the arts. The city was neutral in the struggle between Athens and Syracuse but was ravaged by the Carthaginians in 406 BC, a disaster from which it never really

recovered. Refounded by the Greek general and statesman Timoleon in 338, it achieved some local importance in the early 3rd century BC but was sacked by the Romans (262) and the Carthaginians (255) before falling finally to Rome in 210 BC. Under Roman rule its agricultural wealth and the exploitation of the nearby sulfur mines ensured a modest prosperity. In late antiquity its inhabitants withdrew to the relative security of the medieval hilltop town of Girgenti, the nucleus of modern Agrigento. Occupied and colonized by the Saracens in 828, Girgenti was captured in 1087 by the Norman conqueror of Sicily, Count Roger I, who established a Latin bishopric.

The plateau site of the ancient city is extraordinarily rich in Greek remains. A wall, with remnants of eight gates, can be traced from the two northern peaks (the Rock of Athena and the hill of Girgenti) to the ridge that carried the south line of the city's defenses. An almost continuous sacred area along this ridge has been excavated to reveal Agrigento's most famous remains, its seven Doric temples. The best preserved are two very similar peripteral, hexastyle temples conventionally, though wrongly, attributed to the goddesses Hera and Concordia; the latter temple, which lacks little but the roof, owes its remarkable preservation to having been converted into a church in AD 597.

The Temple of Zeus, in front of which stood a huge altar, was one of the largest and most original of all Doric buildings; it was still unfinished in 406 BC. Its ruins were quarried in 1749–63 to build the jetties of Porto Empedocle, and very little is now standing. The Sanctuary of Demeter and Persephone (formerly known as the Temple of Castor and Pollux) is notable for many remains of archaic cult buildings. There is a pre-Hellenic cave sanctuary at the foot of the cliffs where the Temple of Demeter, underlying the Church of San Biagio, is found. There are also ruined temples of Hephaestus and Asclepius (Aesculapius); the "tomb of Theron," a late Hellenistic funerary monument; and the "Oratory of Phalaris," a *heroon* ("heroic shrine") of the 1st century AD adjoining the 13th-century Church of San Nicola. A short distance to the east of the latter a considerable quarter of the Greek and Roman town has been excavated, but, apart from extensive remains of aqueducts and cisterns, little is known of the Greek civil or domestic architecture. Earlier classical cemeteries lie beyond the walls.

Notable buildings of the medieval and modern city include the 14th-century cathedral, the 13th-century Churches of Santo Spirito and Santa Maria dei Greci (overlying remains of a Doric temple), Baroque churches and palaces, and the rich archaeological museum. Illegal construction and landslides have resulted in damage to some local monuments, however.

Agrigento's economy is based on sulfur and potash mining, agriculture, and tourism. It is served by Porto Empedocle, 9 miles (15 km) southwest, the best harbour on the southwest coast of Sicily and Italy's principal sulfur port. Pop. (1990 est.) mun., 56,372.

Agrihan, formerly **GRIGAN**, or **AGRIGAN**, one of the Mariana Islands, part of the U.S. Commonwealth of the Northern Mariana Islands. It lies in the western Pacific Ocean, 350 miles (563 km) north of Guam. An active volcano that last erupted in 1917, it has a total land area of 18 square miles (47 square km) and rises to 3,166 feet (965 m), the highest point in the commonwealth. Agrihan was the site of the last stand the indigenous Chamorro people made against the Spaniards, who had occupied the Marianas late in the 17th century. In 1810, colonists from the United States and Hawaii established plantations, but they were expelled by the Spanish administration. Agrihan has

some fertile highlands and phosphate deposits. It has been uninhabited since the mid-1990s.

agrimony, any plant of the genus *Agrimonia*, of the rose family (Rosaceae). The name particularly denotes *A. eupatoria*, an herbaceous, hardy perennial that is native to Europe but is widespread in other northern temperate regions, where it grows in hedge banks and the borders of fields. *A. eupatoria* grows to about

Agrimony (*Agrimonia gryposepala*)

B.M. Shaub

120 cm (4 feet) tall and has alternate feather-formed leaves that yield a yellow dye. The oval leaflets, about 2–6 cm (0.8–2.4 inches) long, have toothed margins. The small, stalkless yellow flowers are borne in a long terminal spike. The fruit is a bur about 0.6 cm in diameter and bears a number of hooks that enable it to cling easily to clothing or the coat of an animal. *A. gryposepala*, a similar species, is widespread in the United States.

Agrinion, chief town of the *nomós* (department) of Aetolia and Acarnania, west-central Greece. It lies 4 miles (6 km) northwest of Lake Trikhonís, about midway between the Ionian Sea and the Gulf of Patras. Formerly called Vrakhóri (an abbreviation of Evrekori, "Town of the Jews"), it has reverted to the name of an ancient Aetolian centre on the Achelous River that was just northwest of the present town. In 314 BC Agrinion received the assistance of the Macedonian king Cassander, who helped the Acarnanians reorganize their defense league against Aetolian aggression. Modern Agrinion, rebuilt after a destructive earthquake in 1887, is a tobacco-growing and processing centre. Pop. (1991) 40,934.

Agrionia (from Greek *agrios*, "wild," or "sav- age"), Greek religious festival celebrated annually at Orehomenus in Boeotia and elsewhere in honour of the wine god Dionysus. The tradition is that the daughters of Minyas, king of Orchomenus, having despised the rites of the god, were driven mad by Dionysus and ate the flesh of one of their children; as punishment they were turned into bats or birds. At this festival it was originally the custom for the priest to pursue and kill a woman of the Minyan family at night.

Agrippa (fl. 1st or 2nd century AD), ancient Greek philosophical skeptic. He is famous for his formulation of the five tropes, or grounds for the suspension of judgment, that summarize the method of argument of Greek skeptics generally.

Agrippa's five arguments held that (1) there is a clash of opinions, both in daily life and in the debates of philosophers; (2) nothing is self-evident, because that which is called a proof is merely a second proposition itself in need of demonstration, and so on ad infinitum; (3) both perception and judgment are relative in a double sense: each is relative to a subject, and each is affected by concomitant

perceptions; (4) dogmatic philosophers seeking to avoid the infinite regression merely offer hypotheses that they cannot prove; and (5) philosophers are caught in the double bind by trying to prove the sensible by the intelligible and the intelligible by the sensible. Doubting both the evidence of the senses and the possibility of understanding, Agrippa concluded that human beings have no starting point for obtaining knowledge. Agrippa's 5 arguments seem to have been based in part on the 10 tropes of the earlier skeptic Aenesidemus, but Agrippa's skepticism is more thorough and is not limited to the sense perceptions that Aenesidemus questioned.

Agrippa, Marcus Vipsanius (b. 63 BC?—d. March, 12 BC, Campania [Italy]), powerful deputy of Augustus, the first Roman emperor. He was chiefly responsible for the victory over Mark Antony at the Battle of Actium in 31 BC, and during Augustus' reign he suppressed rebellions, founded colonies, and administered various parts of the Roman Empire. Of modest birth but not a modest man, Agrippa was disliked by the Roman aristocracy. In his own interest he scrupulously maintained a subordinate role in relation to Augustus, but he felt himself inferior to no one else.

Virtually nothing is known of his early life until he is found as the companion of Octavian (the future emperor Augustus) at Apollonia, in Illyria, at the time of Julius Caesar's murder in 44. Octavian, the adopted son of Caesar, returned with Agrippa to Italy to make his political claim as Caesar's heir. In 43 Agrippa is thought to have held the office of tribune of the plebs; presumably in this capacity he prosecuted the tyrannicide Cassius, then absent in the East.

In the struggle for power after Julius Caesar's death, Agrippa served as one of Octavian's key military commanders. In 41–40 he fought against Mark Antony's brother Lucius. In 40 he held the post of praetor urbanus (magistrate mainly in charge of administration of justice at Rome) and was a major figure in negotiating a settlement between Octavian and Antony at Brundisium. During the next two years he was away on campaigns in Aquitania and on the Rhine River. When he returned to Italy, he conspicuously refused to celebrate a triumph for his successes in the north, but in 37 he held the office of consul. In the spring of 37 Octavian and Antony came to an agreement at Tarentum, and it must have been then that Antony arranged the marriage of Agrippa to the daughter of Titus Atticus, a wealthy friend of Cicero.

Octavian's efforts to resist at sea the son of the republican general Gnaeus Pompey, Sextus Pompeius, had not met with success. Agrippa therefore took charge of the operations. He constructed a fine harbour at Puteoli in the Bay of Naples and then won, in

Marcus Vipsanius Agrippa, marble portrait bust, early 1st century BC; in the Louvre, Paris

Cliche Musées Nationaux Paris

36, two decisive naval victories (at Mylae and Naulochus), ending the threat from Pompeius. For this achievement Agrippa was awarded a golden crown. In 35–34 Octavian waged a vigorous campaign in Dalmatia, and in this Agrippa had a distinguished military role. In 33 Agrippa served as curule aedile (magistrate of public buildings and works) at Rome, even though it was a much lower post than the consulate that he had already held. He used the opportunity to win favour for Octavian by spending his own funds lavishly on building baths, cleaning sewers, and improving the water supply. When Octavian and Antony finally came into direct conflict at the Battle of Actium in 31, Agrippa commanded the fleet and was primarily responsible for Octavian's victory.

During Octavian's absence from Rome after Actium, Agrippa managed affairs in the city together with Maecenas, the great patron of poets. In 29–28 Agrippa and Octavian jointly conducted a census and carried out a purge of the Senate; in 28 and 27 Agrippa held the consulate again, both times with Octavian (from 27, Augustus) as his colleague. In 23, a year of constitutional crisis, Augustus fell ill and presented his signet ring to Agrippa, who seemed thus to be designated the emperor's successor. Agrippa took Augustus' daughter Julia as his wife after divorcing a niece of Augustus (Marcella the Elder), who had replaced Atticus' daughter as his wife some four or five years previously.

Agrippa went immediately to Mytilene on the island of Lesbos, from which he administered affairs in the East. The nature of Agrippa's constitutional power (*imperium*) at this time is controversial. It has been argued whether the Senate in 23 gave him an *imperium* greater than that of any other provincial governor in the East (*imperium majus*). After Augustus' death Roman historians claimed that Agrippa's sojourn at Mytilene was a kind of exile as a result of Augustus' preference for his own nephew Marcellus. This appears implausible. Agrippa was soon back in Rome to act on behalf of the emperor, who himself left for the East in 22. Before Augustus' return, in 19, Agrippa had left for Gaul and Spain. In Spain he finally subdued the recalcitrant Cantabri-ans.

Returning to Rome in 18, Agrippa received the power of a tribune (*tribunicia potestas*), which Augustus also possessed. Perhaps, too, he received an *imperium majus*, if he had not been granted it in 23. He participated in Augustus' celebration of the Secular Games at Rome in 17, after which he returned to the East as vicegerent of the emperor. In 15 he accepted an invitation from Herod I the Great to visit Judaea; while in the East, he established colonies of veterans at Berytus and Heliopolis, in Lebanon. He next settled an uprising in the Bosporan kingdom on the Black Sea and set up the cultivated dynast Polemo as king. Herod led a fleet to support Agrippa in the Bosporan affair, and, when it was over, the two traveled together along the coast of western Asia Minor.

In 13 Agrippa's *tribunicia potestas* was renewed, and at this time without doubt he received (or had renewed) a grant of *imperium majus*. Troubles in Pannonia required his presence, but the rigours of the winter of 13–12 caused a fatal illness; he died in March of 12 BC. Augustus delivered a funeral oration in honour of his colleague; a fragment of that oration, in Greek translation, has recently come to light.

Agrippa deserved the honours Augustus heaped upon him. It is conceivable that without Agrippa, Octavian would never have become emperor. Rome remembered him for his generosity in attending to aqueducts, sewers,

and baths; and in the mid-20s he completed the celebrated Pantheon. One of Agrippa's five children by Julia, Agrippina the Elder, was the mother of one emperor (Caligula) and the grandmother of another (Nero). Agrippa's autobiography is lost, but an extensive geographical commentary that he wrote influenced the extant works of the geographer Strabo and of Pliny the Elder. (G.W.Bo.)

BIBLIOGRAPHY. The best full-length study of Agrippa is Meyer Reinhold, *Marcus Agrippa* (1933). There is also an important account of him in Sir Ronald Syme's classic work, *The Roman Revolution* (1939). On problems arising from the new fragment of Augustus' funeral oration on Agrippa, see E.W. Gray, "The Imperium of M. Agrippa," *Zeitschrift für Papyrologie und Epigraphik*, 6:227-238 (1970).

Agrippa von Nettesheim, Heinrich Cornelius (b. Sept. 14, 1486, Cologne—d. Feb. 18, 1535, Grenoble, Fr.), court secretary to Charles V, physician to Louise of Savoy, exasperating theologian within the Catholic Church, military entrepreneur in Spain and Italy, acknowledged expert on occultism, and philosopher. His tempestuous career also included teaching at Dôle and Pavia universities, appointment as orator and public advocate at Metz (until denounced for defending an accused witch), banishment from Germany in 1535 (after battling with the inquisitor of Cologne), and imprisonment in France (for criticizing the Queen Mother).

Agrippa's *De occulta philosophia* added impetus to Renaissance study of magic and injected his name into early Faust legends. In this book he explained the world in terms of cabalistic analyses of Hebrew letters and Pythagorean numerology and acclaimed magic as the best means to know God and nature. About 1530 Agrippa outraged Charles V by publishing a scathing attack on occultism and all other sciences ("Of the Vanitie and uncertainty of artes and sciences," trans. 1569) and thus served the Renaissance revival of Skepticism. Agrippa was jailed and branded as a heretic. After scuttling every type of scientific

Agrippa von Nettesheim, engraving by an unknown artist, 1527

Archiv für Kunst und Geschichte, West Berlin

knowledge, he found peaceful refuge in a simple biblical piety.

Agrippina THE ELDER (b. c. 14 BC—d. Oct. 18, AD 33, the island of Pandateria, in the Tyrrhenian Sea), granddaughter of the emperor Augustus and a major figure in the succession struggles in the latter part of the reign of Tiberius (ruled AD 14-37).

Agrippina was married to Germanicus Caesar (great-nephew of Augustus and nephew and adopted son of Tiberius). She accompanied her husband to Germany and to the East, where he died at Antioch in AD 19. When the death of Tiberius' son Drusus in 23 brought her sons into direct line for the succession, she became the object of attacks by Sejanus, Tiberius' adviser, who had his own designs. Finally, in 29 she was exiled to Pandateria, where she died, either self-starved or, according to some, starved at Tiberius' order. Of her nine children by Germanicus, one son and three daughters survived her, the son becoming Tiberius' successor as the emperor Gaius Caligula (37-41). The most famous of her daughters was Agrippina, the mother of the emperor Nero. Several fine portraits of Agrippina have been preserved, the most famous being in the Capitoline Museum, Rome.

Agrippina THE YOUNGER (b. AD 15—d. 59), mother of the Roman emperor Nero and a powerful influence on him during the early years of his reign (54-68).

Agrippina was the daughter of the elder Agrippina, sister of the emperor Gaius, or Caligula (37-41), and wife of the emperor

Agrippina the Younger, bust by an unknown artist; in the Museo Archeologico Nazionale, Naples

Anderson—Mansell

Claudius (41-54). She had been exiled in 39 for taking part in a conspiracy against Gaius but was allowed to return to Rome in 41. Her first husband, Gnaeus Domitius Ahenobarbus, was Nero's father. She was accused of poisoning her second husband, Passienus Crispus, in 49. She married Claudius, her uncle, that same year and induced him to adopt Nero as heir to the throne in place of his own son. She also protected Seneca and Burrus, who were to be Nero's tutors and advisers in the early part of his reign.

In 54 Claudius died, perhaps after being poisoned by Agrippina. Because Nero was only 16 when he succeeded Claudius, Agrippina at first attempted to play the role of regent. Her power gradually weakened, however, as Nero came to take charge of the government. As a result of her opposition to Nero's affair with Poppaea Sabina, the Emperor decided to murder his mother. Inviting her to Baiae, he had her set forth on the Bay of Naples in a boat designed to sink, but she swam ashore. Eventually she was put to death on Nero's orders at her country house.

agroikoi (ancient Greek social class): see geōmoroi.

agrostology, the branch of botany concerned with the study of grasses, especially their classification. In 1708 the German botanist Johann

Scheuchzer wrote *Agrostographiae Helveticae Prodrromus*, a taxonomic paper on grasses that some authors consider to mark the birth of agrostology. Many systems of classification followed this brief beginning. The earliest were based purely on external morphology of the plant, but later systems take into consideration the results of cellular, embryological, physiological, and histological studies.

Modern agrostologists investigate living populations of grasses to determine their genetic inheritance and adaptations to specific habitats. Biochemical studies are another promising tool in determining evolutionary relationships between groups of grasses.

Aguadilla, town and municipality, northwestern Puerto Rico. The town is a port on a wide bay formed on the south by the hills of Punta Higüero (Jiguera) and on the north by Punta Borinquen, the northwestern corner of the island. It was established as a town in 1775 and elevated to the royal rank of *villa* in 1861. The town is a processing and trading centre for a prosperous agricultural hinterland; products include cigars and straw hats. The town has a regional college of the University of Puerto Rico.

The municipality, with an area of 36 sq mi (93 sq km), has seven urban or partly urban and nine rural barrios (wards). It is an agricultural area producing sugar, coffee, fruits, tobacco, and cotton. Coastal roads link Aguadilla municipality with Mayagüez and San Juan, the capital, to which it also has a rail link. Aguadilla town has an airport. Pop. (2000) town, 16,776; mun., 64,685.

Aguán River, Spanish RÍO AGUÁN, river in northern Honduras, 150 mi (240 km) in length. After rising in the central highlands west of Yoro, it descends to the northeast between the Cerros de Cangreja and the Sierra de la Esperanza to the coastal lowlands, on which it forms a maze of channels and empties into the Caribbean Sea near the towns of Santa Rosa de Aguán and Limón. The lands along the river, although periodically devastated by banana diseases, floods, and hurricanes (particularly Fifi in 1974), were restored to banana cultivation with new disease-resistant varieties in the late 1970s. In the lower river valley, agricultural cooperatives shifted to raising citrus fruits, corn (maize), rice, and African palm for oil. Flood control works were started after the river burst its levees in 1977. A new highway links the river valley to the ports at Tela, La Ceiba, Trujillo, and Puerto Cortés. The railway paralleling the lower and middle valley of the Aguán, damaged by natural disasters, was restored to service and extended to Puerto Castilla in the late 1970s.

Aguarico River, Spanish RÍO AGUARICO, river, northeastern Ecuador, rising south of

The Aguarico River in the rain forests of El Oriente region, Ecuador

Tulcán, capital of Carchi province, in the Andes mountains near the Ecuador–Colombia border, and flowing east-southeast for approximately 230 mi (370 km) to its juncture with the Río Napo at Pantoja. It is navigable for smaller boats. The Rio de Janeiro Protocol of 1942 fixed the lower course of the Aguarico (Rich Water) as part of the long-disputed Ecuador–Peru frontier. Although Ecuador unilaterally denounced the protocol in 1960, it has in practice observed its general provisions.

Aguascalientes, state, central Mexico. One of the country's smallest states (2,112 sq mi [5,471 sq km]), it occupies part of the central plateau between 3,300 and 10,000 ft (1,000 and 3,000 m) above sea level, extending from two spurs of the Sierra Madre eastward and southward to rolling fertile plains. It is well watered and has a mild, healthful climate, with light rainfall. The name, from the Spanish for "hot waters," stems from the many thermal springs in the vicinity.

Explored by Spaniards in the 16th century, Aguascalientes was a colonial mining centre. During the revolution of 1910–20 it was the scene of bitter fighting and was occupied by successive factions in the struggle. Since 1950, irrigation projects have greatly increased productivity of the land. The fertile valleys of the north and west are devoted to agriculture, and the plains to livestock raising. Corn (maize), cattle, horses, mules, and hides are exported to neighbouring states. Aguascalientes also grows excellent wines and fruits and is noted for its production of zinc, copper, gold, silver, and other minerals. The state has good rail and highway connections with all parts of Mexico. There is an airport at Aguascalientes (*q.v.*) city, the state capital. Pop. (2000 prelim.) 943,506.

Aguascalientes, city, capital of Aguascalientes state, central Mexico. It stands on the central plateau at 6,194 ft (1,888 m) above sea level, on the left bank of the Río de Aguas-

La Parroquia church, Aguascalientes City, Mex.
Walter Aguilar—EB Inc

calientes. Founded as a mining settlement in 1575 and designated a town in 1661, Aguascalientes was named capital when the state was created during the 1850s. It is sometimes called La Ciudad Perforada (The Perforated City) because of a labyrinth of tunnels excavated beneath it in pre-Columbian times by an unknown tribe. Aguascalientes is the centre of a fruit- and vegetable-growing region. It has important railroad repair shops, cotton and other textile factories, potteries, tobacco

factories, distilleries, and other industries. The most notable of the city's many fine churches are San Juan de Dios, San Francisco, and La Parroquia, each of which possesses outstanding examples of colonial religious art. The city can be reached by rail, highway, or air. The Autonomous University of Aguascalientes was founded in 1973. Pop. (2000 prelim.) 594,056.

ague tree: *see* sassafras.

Aguesseau, Henri-François d' (b. Nov. 27, 1668, Limoges, Fr.—d. Feb. 5, 1751, Paris), jurist who, as chancellor of France during most of the period from 1717 to 1750, made important reforms in his country's legal system.

The son of Henri d'Aguesseau, intendant (royal agent) of Languedoc, he was advocate general to the Parlement (high court of justice) of Paris from 1690 until 1700. As attorney general in that Parlement from 1700 to 1717, he opposed papal intervention in the affairs of the French Roman Catholic Church and resisted (though unsuccessfully) the promulgation in France of the bull *Unigenitus* (1713), which condemned the Jansenist faction in the church.

Philippe II, duc d'Orléans, regent for young King Louis XV (ruled 1715–74), made him chancellor and keeper of the seals in 1717, but Aguesseau's opposition to the government's financial policies caused the Duc to exile him to Fresnes in the following year. Recalled in 1720, Aguesseau reversed himself and helped promote acceptance of *Unigenitus*. Nevertheless, he again forfeited the chancellorship when Cardinal Guillaume Dubois became chief minister in 1722. In 1727 Aguesseau was reinstated as chancellor by the new chief minister, Cardinal André-Hercule de Fleury, who instructed him to continue the codification of French law begun under King Louis XIV (ruled 1643–1715).

Hence between 1731 and 1747 he obtained from Louis XV three important ordinances on donations, testaments, and successions. The Parlements prevented Aguesseau from extending the scope of his work, but he did improve court procedures and achieve greater uniformity in the execution of the laws.

Agui (Chinese general): *see* A-Kuei.

Aguilar, Grace (b. June 2, 1816, London—d. Sept. 16, 1847, Frankfurt am Main), poet, novelist, and writer on Jewish history and religion, best known for her numerous sentimental novels of domestic life. The most popular, *Home Influence* (1847), was the only one published during her lifetime. Although they evinced strong religious feeling, her novels were free of sectarian bias. In *The Spirit of Judaism* (1842) she attacked contemporary Judaism for its formalism and traditionalism.

Aguinaldo, Emilio (b. March 23, 1869, near Cavite, Luzon, Phil.—d. Feb. 6, 1964, Manila), Filipino leader who fought first against Spain and later against the United States for the independence of the Philippines.

Born of Chinese and Tagalog parentage, he completed his education at the University of Santo Tomás, Manila. In August 1896 he was mayor of Cavite Viejo and was the local leader of the Katipunan, a revolutionary society that fought bitterly and successfully against the Spanish. In December 1897 he signed an agreement called the Pact of Biacna-Bató with the Spanish governor general. He agreed to leave the Philippines and to remain permanently in exile on condition of a substantial financial reward from Spain coupled

with the promise of liberal reforms. While in Hong Kong and Singapore he made arrangements with representatives of the American consulates and of Commo. George Dewey to return to the Philippines to assist the United States in the war against Spain.

Aguinaldo
Brown Brothers

Aguinaldo returned to the Philippines May 19, 1898, and announced renewal of the struggle with Spain. The Filipinos, who declared their independence of Spain on June 12, 1898, proclaimed a provisional republic, of which Aguinaldo was to become president; and in September a revolutionary assembly met and ratified Filipino independence. However, the Philippines, along with Puerto Rico and Guam, were ceded by Spain to the United States by the Treaty of Paris, Dec. 10, 1898.

Relations between the Americans and the Filipinos were unfriendly and grew steadily worse. On Jan. 23, 1899, the Malolos Constitution, by virtue of which the Philippines was declared a republic and which had been approved by the assembly and by Aguinaldo, was proclaimed. Aguinaldo, who had been president of the provisional government, was elected president.

On the night of February 4 the inevitable conflict between the Americans and Filipinos surrounding Manila was precipitated. Morning found the Filipinos, who had fought bravely, even recklessly, defeated at all points. While the fighting was in progress, Aguinaldo issued a proclamation of war against the United States, which immediately sent reinforcements to the Philippines. The Filipino government fled northward. In November 1899 the Filipinos resorted to guerrilla warfare, with all its devastating features.

After three years of costly fighting the insurrection was finally brought to an end when, in a daring operation led by Gen. Frederick Funston, General Aguinaldo was captured in his secret headquarters at Palanan in northern Luzon on March 23, 1901. Aguinaldo took an oath of allegiance to the United States, was granted a pension from the U.S. government, and retired to private life.

In 1935 when the commonwealth government of the Philippines was established in preparation for independence, Aguinaldo ran for president but was decisively beaten. He returned to private life until the Japanese invaded the Philippines in 1941. The Japanese used Aguinaldo as an anti-American tool. They caused him to make speeches, to sign articles, and to address a radio appeal to Gen. Douglas MacArthur on Corregidor to surrender in order to spare the flower of Filipino youth.

When the Americans returned, Aguinaldo was arrested and, together with others accused of collaboration with the Japanese, was held for some months in Bilibid Prison until released by presidential amnesty. As a token vindication of his honour, he was appointed

by President Elpidio Quirino as a member of the Council of State in 1950. In the later years of his life, he devoted his major attention to veterans' affairs, the promotion of nationalism and democracy in the Philippines, and the improvement of relations between the Philippines and the United States.

Aguirre, Lope de (b. c. 1518, Oñate, Spain—d. Oct. 27, 1561, El Tocuyo, Viceroyalty of Peru [now in Venezuela]), Spanish adventurer who is known chiefly for his role in the murders of the explorers Pedro de Ursúa and Fernando de Guzmán.

Nothing is known of Aguirre's life prior to 1544, when he arrived in Peru and took part in the Spanish suppression of Indian rebellions and in the wars that continually broke out between the Spanish conquerors. On Sept. 26, 1560, he joined an expedition led by Ursúa to find the legendary kingdom of Eldorado, which was thought to be located at the headwaters of the Amazon River, in what is now western Brazil. Upon reaching the headwaters, Aguirre incited a rebellion in which Ursúa was killed. He then killed Guzmán, who had succeeded Ursúa, and took command of the expedition.

It was said that Aguirre had all those members of the expedition who had opposed his plans, including several priests, put to death. He is then thought to have raided several towns in what is now Venezuela before he was finally caught and executed by the Spaniards. It is also believed that he killed his own daughter immediately prior to his capture.

Aguirre was considered to be a thoroughly disreputable character, and his name in colonial Spanish America practically became synonymous with cruelty and treachery.

Agulhas, Cape, cape that is the southernmost point of the African continent, located 109 miles (176 km) southeast of Cape Town, S.Af. Its name, Portuguese for "needles," refers to the rocks and reefs that have wrecked many ships. A lighthouse was established there in 1849. The Agulhas Banks are excellent for trawling. The cape's meridian (20° E) is the official boundary between the Indian and Atlantic oceans.

Agulhas Current, surface oceanic current that is part of the westward-flowing South Equatorial Current, which turns southward along the east coast of Africa and then eastward to join the flow from Africa to Australia. A small part of Agulhas water may, however, continue westward around the Cape of Good Hope into the Atlantic. The Mozambique Current, between Madagascar and Africa, also feeds the Agulhas Current. Only 60 miles (100 km) wide, the Agulhas Current is estimated to flow at an average rate of 0.4 to 1.2 knots, its velocity depending on seasonal variations in South Equatorial Current velocity. One of the fastest-flowing currents in any ocean, it reaches an estimated top speed of 5 knots off the southeast coast of South Africa. Because it is fed from lower latitudes, the Agulhas Current is warm, ranging in temperature from 57° to 79° F (14 to 26° C) at the surface.

agunah, Hebrew 'AGUNA ("deserted woman"), plural AGUNAHS, 'AGUNOT, or AGUNOTH. in Orthodox and Conservative Judaism, a woman who is presumed to be widowed but who cannot remarry because evidence of her husband's death does not satisfy legal requirements. The plight of the agunah has generated voluminous and complex treatment in Halakhic literature. Although religious courts are not empowered to grant remarriage without indisputable evidence of the spouse's death, human considerations have led to a de facto relaxation of the law of evidence. The testimony of a single witness has thus been accepted as sufficient

proof of death even when the body of the presumed deceased has not been recovered from, for example, a battlefield, the sea, or a disaster area.

An effort to solve the still vexing problem facing agunahs has, in some places, led to the introduction of a custom whereby soldiers sign a document authorizing a rabbinic court to grant a divorce should the soldier be officially declared missing in action and presumed dead.

Women who are victims of willful desertion are also called agunahs inasmuch as they are forbidden to remarry without a religious divorce that cannot be granted unilaterally to the wife by a religious court. Because of the severity of the biblical injunction against adultery and the possibility that a husband who was presumed dead might suddenly reappear, various proposed solutions to the problems of agunahs have enjoyed but limited acceptance. Even the great emergencies created by Jewish mass migrations at the beginning of the 20th century and the development of the vast number of missing persons after the two World Wars and the Nazi Holocaust have not led to universally accepted modifications of existing laws and practices.

Agung (d. 1645), third sultan of the Mataram dynasty of central Java who brought his domain to its greatest territorial and military power.

In the early years of Sultan Agung's reign, he consolidated the sultanate by subduing the autonomous trade-based coastal states of Padang and Tuban in 1619; Banjarmasin, Kalimantan, and Sukadana in 1622; Madura in 1624; and Surabaya in 1625. Because the country's economy was based on agriculture, Agung, who was openly contemptuous of trade, maintained no significant naval forces. Dutch troops had conquered Jacatra (now Jakarta) in 1619 and established there a base they named Batavia. In 1629 the sultan's forces attacked the city in an effort to drive out the Europeans, but superior Dutch naval forces maintained the Dutch position. This was the last major threat to the Dutch position in Java until after World War II.

After failing to conquer Batavia, Agung turned against the Balinese, then controlling Balambangan in East Java, in a "holy war" against infidels. His campaign was successful in Java, but he was unable to extend his power to the island of Bali itself. Bali thus retained its identity as a Hindu state in the midst of the predominantly Muslim states of the archipelago. Internally Agung introduced reforms to bring the judicial system more in line with Qur'anic precepts and reformed the tax system. By the mid-18th century, however, the Dutch were sufficiently strong to put an end to Mataram supremacy by bringing about a division of the realm into two lesser kingdoms centring on Surakarta and Jogjakarta.

Agung, Abulfatah (d. 1692), ruler of the powerful Javanese sultanate of Bantam from 1651 to 1683.

Agung encouraged English and French trade but successfully opposed Dutch expansion into the area in the early part of his reign. In the 1670s, however, when he attempted to change the succession to his throne from his older son Sultan Haji to his younger son, Haji revolted and with Dutch help seized the throne. Haji had to pay war costs and grant a trade monopoly to the Dutch. Agung ended his days in captivity, and Bantam came under Dutch domination.

Agung, Mount, Indonesian GUNUNG AGUNG ("Great Mountain"), Dutch PIEK VAN BALI ("Peak of Bali"), volcano, northeastern Bali, Indonesia. The highest point in Bali and the object of traditional veneration, it rises to a height of 9,888 feet (3,014 m). In 1963 it erupted after being dormant for 120 years;

some 1,600 people were killed and 86,000 left homeless.

According to one Balinese myth, the deities made mountains for their thrones and placed the highest, Mount Agung, in Bali. According to another myth, the deities found the island of Bali unstable and wobbling and, to still it, set down upon it the holy mountain of Hinduism, Mahameru, renamed Gunung Agung. To the Balinese the mountain became the "Navel of the World," and in every Balinese temple a shrine is dedicated to its spirit. Such religious items as temple offerings and cremation mounds are shaped in the form of mountains out of reverence for the volcano. The mother temple of Bali, Pura Besakih, lies on the slopes of Mount Agung.

Agusan River, longest river in Mindanao, Philippines. It rises in the southeast and flows northward for 240 miles (390 km) to enter Butuan Bay of the Bohol Sea. The river forms a fertile valley 40 to 50 miles (65–80 km) wide between the Central Mindanao Highlands (west) and the Pacific Cordillera (east). Important population centres are clustered around the bay and include Butuan, Cabañbaran, and Buenavista.

Despite early Spanish contacts and missionary activities in the 17th century, most of the valley has remained sparsely settled by the Magahat, Mamanua, Manobo, Higahon, Mandaya, and Bagobo peoples. With the advent of logging and immigrant labourers, many of these groups have moved farther inland. Until the early 1960s, when a road was completed linking Butuan with Davao City to the south, the Agusan, which is navigable for 160 miles (260 km) by small craft, was the only access route to the interior.

The productive forest industry is concentrated along the Agusan's swampy middle course. Lumberjacks, merchants, and traders live on huge log rafts anchored to giant trees. Vast plantations of coconut, rice, bamboo, and various fruits lie along its lower course. Rice is the leading food crop, and coconut is the main cash crop. Farming and subsistence fishing are other economic activities.

Agustín I: see Iturbide, Agustín de.

Agustini, Delmira (b. Oct. 24, 1886, Montevideo, Uruguay—d. July 6, 1914, Montevideo), one of the most important poets of South America.

Agustini was the first woman in Latin-American literature to deal boldly with the themes of sensuality and passion, and her poems have a force lacking from most Modernist poetry of the period. Her life ended tragically when she was murdered by her estranged husband. Her chief works are *El libro blanco* (1907; "The White Book"), *Cantos de la mañana* (1910; "Morning Songs"), *Los cálices vacíos* (1913; "Empty Chalices"), *El rosario del Eros* (1924; "Eros' Rosary"), and *Obras completas* (1924; "Complete Works").

Ah Kin (Mayan: "He of the Sun"), the regular clergy of the Yucatec Maya in pre-Columbian times. The Ah Kin are best known historically for their performance in the ritual sacrifice of victims, whose hearts were offered to the Mayan gods. The chief priest (Ah Kin Mai) served in the various capacities of administrator, teacher, healer, astronomer, adviser to the chief, and diviner. Priests specializing in prophecy were known as Chilans, but it is likely that Ah Kins and Chilans performed many of the same functions. Prophecy was aided by readings from hieroglyphic books and, possibly, by drug-induced visions. Couples contemplating marriage as well as civic leaders consulted the Ah Kin on the prospects of their undertakings. The office of Ah Kin was hereditary, passing from priests to their sons, but training was also extended to the sons of the nobility who showed inclinations toward the priesthood.

Aha OF SHABHA. Aha also spelled AHAI (b. c. 680, probably at Shabha, near Basra, Iraq—d. c. 752), prominent Babylonian Talmudist who is the first rabbinical writer known to history after the close of the Talmud.

Aha's *She'eltot* ("Questions," or "Theses"), published in Venice in 1546, was an attempt to codify and explicate materials contained in the Babylonian Talmud. Written in Aramaic and unique in its organization, the text connects decisions of the Oral Law with those of the Written Law. The connections, many of them original, are concerned not only with ritualistic laws but also with ethical obligations. *She'eltot* itself came to be regarded as a literary model and was widely copied.

Ahab, also spelled ACHAB (fl. 9th century BC), seventh king of the northern kingdom of Israel (reigned c. 874–c. 853 BC), according to the Old Testament, and son of King Omri.

Omri left to Ahab an empire that comprised not only territory east of the Jordan River, in Gilead and probably Bashan, but also the land of Moab, whose king was tributary. The southern kingdom of Judah, if not actually subject to Omri, was certainly a subordinate ally. And Ahab's marriage to Jezebel, daughter of Ethbaal of Sidon, revived an alliance with the Phoenicians that had been in abeyance since the time of Solomon.

Throughout Ahab's reign, however, a fierce border war was waged with Syria in which Israel, in spite of occasional victories, proved the weaker, and in the meantime Meshah, king of Moab, successfully revolted and occupied the southern portions of the territory of Gad. The forces of Israel retained enough strength to contribute the second-largest contingent of soldiers (and the largest force of chariots) to the combined armies that, under the leadership of Ben-hadad I of Damascus, checked the westward movement of Shalmaneser III of Assyria at Karkar. After the Assyrians were repulsed, however, the alliance broke up, and Ahab met his death fighting the Syrians in a vain attempt to recover Ramoth-Gilead.

Domestically, contact with a wider world and, especially, the alliance with Phoenicia had far-reaching consequences for the kingdom of Israel itself. Jezebel attempted to introduce into religion and government elements that were common enough elsewhere in the ancient world but strange in Israel. She tried to set up the worship of the Canaanite god Baal in the capital city of Samaria and to maintain the familiar Oriental principle of the absolute despotic power and authority of the sovereign. This roused the bitter hostility of that conservative party which clung to the sole worship of the national god, Yahweh, and at the same time held to those democratic conceptions of society that the Hebrews had brought with them from the wilderness and had consistently maintained. The spirit of this party found expression in the prophet Elijah, who protested against both the establishment of the Baal priests and Ahab's judicial murder of Naboth. Elijah and his successors seem to have been able to eliminate the foreign worship, though in the end their purpose was achieved only by a bloody revolution, but they were powerless to stem the tide of social and moral deterioration. To the reign of Ahab may be traced the beginning of that sapping of the national life which led to the condemnations of the 8th-century prophets and to the downfall of Samaria.

Ahad Ha'am (Hebrew: "One of the People"), original name ASHER GINZBERG (b. Aug. 18, 1856, Skvira, near Kiev, Russian Empire [now in Ukraine]—d. Jan. 2, 1927, Tel Aviv, Palestine [now in Israel]), Zionist leader whose concepts of Hebrew culture had a definitive influence on the objectives of the early Jewish settlement in Palestine.

Reared in Russia in a rigidly Orthodox Jewish family, he mastered rabbinic literature but

soon was attracted to the rationalist school of medieval Jewish philosophy and to the writings of the Haskala ("Enlightenment"), a liberal Jewish movement that attempted to integrate Judaism with modern Western thought.

At the age of 22, Ahad Ha'am went to Odessa, the centre of the Jewish nationalist movement known as Hovevei Ziyon ("Lovers of Zion"). There he was influenced both by Jewish nationalism and by the materialistic philosophies of the Russian nihilist D.I. Pisarev and the English and French positivists. After joining the central committee of Hovevei Ziyon, he published his first essay, "Lo ze ha-derekh" (1889; "This Is Not the Way"), which emphasized the spiritual basis of Zionism.

Ahad Ha'am

By courtesy of the Central Zionist Archives, Jerusalem

In 1897, after two visits to Palestine, he founded the periodical *Ha-Shiloah*, in which he severely criticized the political Zionism of Theodor Herzl, the foremost Jewish nationalist leader of the time. Ahad Ha'am remained outside the Zionist organization, believing that a Jewish state would be the end result of a Jewish spiritual renaissance rather than the beginning. He called for a renaissance of Hebrew-language culture, and to that end he did urge the creation of a Jewish national homeland in Palestine as the centre and model for Jewish life in the Diaspora (i.e., the settlements of Jews outside Palestine).

Ahad Ha'am was an intimate adviser to the Zionist leader Chaim Weizmann during the time that Weizmann was playing a leading role in eliciting from the British government its Balfour Declaration of 1917, a document supporting a Jewish homeland in Palestine. His last years were spent in Palestine, editing his *Iggerot Ahad Ha'am*, 6 vol. (1923–25; "Letters of Ahad Ha'am"). Further letters, principally from the last phase of his life, and his memoirs were published in *Ahad Ha'am: Pirque zikhronot ve-iggerot* (1931; "Collected Memoirs and Letters"). His essays comprise four volumes (1895, 1903, 1904, and 1913).

While stressing the rational and moral character of Judaism, Ahad Ha'am believed that the goal of re-creating Jewish nationhood could not be achieved by purely political means but rather required spiritual rebirth. The clarity and precision of his essays made him a major Hebrew-language stylist and an influential force in modern Hebrew literature.

Ahaggar, also spelled HOGGAR, large plateau in the north centre of the Sahara, on the Tropic of Cancer, North Africa. Its height is above 3,000 feet (900 m), culminating in Mount Tahat (9,573 feet [2,918 m]) in southeastern Algeria. The plateau, about 965 miles (1,550 km) north to south and 1,300 miles (2,100 km) east to west, is rocky desert composed of black volcanic (basalt) necks and of flows rising above a pink granite massif. The main caravan route to Kano in northern Nigeria passes along the plateau's western margin through the important oasis town of Tamanrasset, Alg., which is about 1,200 miles (1,900 km) south of Algiers. Natural-gas deposits have been found northwest of the plateau.

ahankara, Sanskrit AHANKĀRA ("I-saying," or "I-making"), in the dualist and evolutionist Sāṃkhya school of Hindu philosophy, the second stage of development of the prakriti, the original stuff of material nature, which evolves into the manifest world.

Ahankara follows the stage of buddhi (intelligence, or perception), in which the purusha (soul, or self)—once in a state of pure consciousness, i.e., without an object of contemplation—becomes focused on the prakriti, on existence outside of itself. From the "this-awareness" of the buddhi level evolves the ahankara, or ego-consciousness (an "I-this awareness"). Ahankara is thus the mistaken assumption of personality or individuality. It is mistaken because the soul is incapable of acting; it is rather the prakriti, the essential matter, that acts. Ahankara in turn gives way to other stages in the transmigration of the soul. See also Sāṃkhya.

Ahaz, also spelled AHAZ, Assyrian JEHOAH-AZ (fl. 8th century BC), king of Judah (c. 735–720 BC) who became an Assyrian vassal (2 Kings 16; Isaiah 7–8).

Ahaz assumed the throne of Judah at the age of 20 or 25. Sometime later his kingdom was invaded by Pekah, king of Israel, and Rezin, king of Syria, in an effort to force him into an alliance with them against the powerful state of Assyria. Acting against the counsel of the prophet Isaiah, Ahaz appealed for aid to Tiglath-pileser III, king of Assyria, to repel the invaders. Assyria defeated Syria and Israel, and Ahaz presented himself as a vassal to the Assyrian king. Not only was Judah's political situation unimproved but Assyria exacted a heavy tribute and Assyrian gods were introduced into the Temple at Jerusalem.

Ahenobarbus, Gnaeus Domitius (d. 31 BC), Roman general who became one of the chief partisans of Mark Antony after Antony defeated the assassins of Julius Caesar.

With his father, Lucius Domitius Ahenobarbus, he had been a member of the party that in 49 made an unsuccessful attempt to prevent Caesar from seizing power. After the assassination of Caesar in 44 by a group led by Marcus Junius Brutus and Gaius Cassius Longinus, Ahenobarbus sided with the assassins and commanded their fleet. When they were defeated by the forces of Antony and Octavian (later the emperor Augustus) at Philippi in Macedonia in 42, Ahenobarbus held out as a privateer until he was reconciled with Antony in 40. From 40 until about 35 he served Antony as governor of Bithynia. He was consul at Rome in 32, when the final breach occurred between Antony and Octavian. Ahenobarbus then left Italy to join Antony in the east, but he opposed the Egyptian queen Cleopatra's dominance over Antony and deserted to Octavian shortly before Octavian defeated Antony and Cleopatra at Actium, Greece, in 31. Ahenobarbus died soon afterward, allegedly of remorse but possibly from a disease contracted before the battle.

Ahenobarbus, Lucius Domitius (d. 48 BC, Pharsalus, Macedonia [now Farsala, Greece]), a leader of the Optimates (conservative senatorial aristocracy) in the last years of the Roman Republic.

After the powerful generals Julius Caesar, Gnaeus Pompey, and Marcus Licinius Crassus formed an unofficial ruling triumvirate in 60 BC, Ahenobarbus repeatedly resisted their designs. As candidate for the consulate of 55, he pledged that, if elected, he would remove Caesar from the command in Gaul. The triumvirs met this threat by developing a strategy that postponed Ahenobarbus' consulate until 54. By this time he was unable to challenge their power ef-

fectively. In January 49, however, the Senate outlawed Caesar and appointed Ahenobarbus to replace him in Gaul. Caesar then crossed the Rubicon and marched on Rome, precipitating the civil war of 49–45.

Against the advice of Pompey, who had joined the senatorial camp, Ahenobarbus attempted to stop the invading army at Corfinium in central Italy. He was defeated and captured by Caesar but soon released. Immediately he raised a revolt against the Caesarians at Massilia (now Marseille) but died in battle against Caesar.

Ahenobarbus, Lucius Domitius (Roman emperor): *see* Nero.

Aḥer (Jewish heretic): *see* Elisha ben Abuyah.

Ahern, James (writer): *see* Herne, James A.

Ahhiyawā, also called **AHHIYĀ**, ancient kingdom lying to the west of the Hittite empire. The exact location of Ahhiyawā is not definitely known but may have been western Anatolia or one of the islands in the Aegean Sea. The most commonly held theory is that the people of Ahhiyawā were the Achaeans of Homer, early Mycenaean Greeks. Another theory represents them as ancestors of the Trojans. In any case, it seems quite certain that the Ahhiyawāns were a powerful seafaring people.

Much of what is known about Ahhiyawā has been derived from Hittite texts. The earliest references to the kingdom occur in documents prepared during the reign of Suppiluliumas (c. 1380–46 BC). It seems that Ahhiyawā was a large and formidable kingdom with which the Hittites had good relations. Later documents indicate that members of the Ahhiyawān royal family traveled to the Hittite capital of Hattusa to study the charioteer's art and that a statue of the god of Ahhiyawā was brought to the Hittite king Mursilis II (reigned c. 1340–1300 BC) to cure his illness. The Ahhiyawāns apparently became a threat to the Hittite empire during the reign of Tudhaliyas IV (c. 1250–20 BC). During this period a certain Atarissiyas led several attacks on Hittite vassals and cities, and some have thought this might be Atrous, the father of Agamemnon.

Ahidjo, Ahmadou (b. August 1924, Garoua, Cameroon—d. Nov. 30, 1989, Dakar, Senegal), first president of the United Republic of Cameroon, who served from 1960 to 1982. He presided over one of the few successful attempts at supraterritorial African unity: the joining of the southern half of the former British Cameroons with the larger French-speaking Cameroon.

A Muslim from the northern part of Cameroon, Ahidjo was a radio operator in the French colonial administration from 1941/42 to 1953. He was elected to the Cameroon territorial assembly in 1947 and reelected in 1952 and 1956. His early political career also included several years in France (1953–56) as the Cameroon member of the Assembly of the French Union. In the first Cameroon government (1957), he was vice premier and minister of the interior; when the first premier fell in early 1958, he formed his own party, the Cameroonian Union, and became the new premier.

Meanwhile, since 1956 the more radical, nationalist Union of the Populations of Cameroon, which advocated immediate independence from France, had taken up arms against the French administration. Ahidjo, like his predecessor, used French troops to put down the rebels, but he also offered amnesty to those who would surrender. Many refused, however, and sporadic outbreaks of violence haunted Ahidjo for years. His initial program included immediate internal autonomy,

a definite timetable for full independence, reunification with the British Cameroons, and cooperation with the French. He was able to attain independence in 1960 and the unification with the southern, British Cameroons in 1961, following a plebiscite.

In the elections held soon after independence, Ahidjo won only by a small majority but, despite continuing small-scale violence, managed to build up a stable, relatively prosperous country. After being elected five consecutive times for the presidency (in what became a one-party state), he resigned on Nov. 6, 1982, claiming that he was suffering from "exhaustion." He was replaced by a Christian southerner, Paul Biya, who proceeded to oust Ahidjo from chairmanship of the ruling party in 1983.

After 1983 Ahidjo lived in exile and in 1984 was, in absentia, condemned to death in Cameroon for complicity in a plot against Biya. He never returned to Cameroon, dividing his time between residences in Senegal and the south of France.

Ahikar, The Story of, folktale of Babylonian or Persian origin, about a wise and moral man who supposedly served as one of the chief counselors of Sennacherib, king of Assyria (704–681 BC). Like the biblical Job, Ahikar was a prototype of the just man whose righteousness was sorely tested and ultimately rewarded by God. Betrayed by his power-hungry adopted son, Ahikar was condemned to death, suffered severely, but was finally restored to his former position.

The work is classified as pseudepigraphal; *i.e.*, it is a noncanonical book that in style and content resembles authentic biblical works. A considerable number of translations (among them Syriac, Arabic, Armenian, Ethiopic, Old Turkic, Greek, and Slavonic) indicate that the story of Ahikar was immensely popular in antiquity. The writing follows the memoir style used by official state writers rather than the "wisdom" genre of literature. Nevertheless, the story of Ahikar and his proverbial wisdom influenced the development of Jewish wisdom literature early in the Hellenistic period (3rd century BC to 3rd century AD), as is shown by similar ethical doctrines in the Old Testament books of Psalms and Ecclesiastes and in the apocryphal books of Tobit and Ecclesiasticus.

ahimsa, Sanskrit **AHIMSĀ** ("noninjury"), the fundamental ethical virtue of the Jains of India, highly respected throughout the centuries by Hindus and Buddhists as well. In modern times, Mahatma Gandhi, the famous spiritual and political leader, developed his theory of passive resistance as a means of bringing about political change on the principle of ahimsa.

In Jainism, ahimsa is the standard by which all actions are judged. For a householder observing the small vows (*anuvrata*), the practice of ahimsa requires that he not kill any animal life, but for an ascetic observing the great vows (*mahāvratā*), ahimsa entails the greatest care to prevent him from knowingly or unknowingly being the cause of injury to any living substance. Living matter (*jīva*) includes not only human beings and animals but insects, plants, and atoms as well, and the same law governs the entire cosmos. The interruption of another *jīva*'s spiritual progress increases one's own karma and delays one's liberation from the cycle of rebirths. Many common Jainist practices, such as not eating or drinking after dark or the wearing of cloth mouth covers (*mukhāvastrikā*) by monks, are based on the principle of ahimsa.

Though the Hindus and Buddhists never required so strict an observance of ahimsa as the Jains, vegetarianism and tolerance toward all forms of life became widespread in India. The Buddhist emperor Aśoka in his inscriptions of the 3rd century BC stressed the sanctity of animal life. Ahimsa is one of the first disciplines learned by the student of yoga and

is required to be mastered in the preparatory stage (*yama*), the first of the eight stages that lead to perfect concentration. In the early 20th century Gandhi extended ahimsa into the political sphere as satyagraha, nonviolent resistance to a specific evil.

Ahīr, cattle-tending caste widespread in northern and central India. Considerable historical interest attaches to this caste, because its members are thought to be identical with the Abhiras of Sanskrit literature, who are mentioned repeatedly in the great epic the *Mahābhārata*. Some scholars contend that these cattlemen, scattered over southern Rājasthān and Sind (now part of Pakistan), played a role of importance in the early development of the god Krishna as the cowherd, which has continued to be a significant aspect of the Krishna legend.

Ahīram: *see* Hiram.

Ahithophel, also spelled **ACHITOPHEL**, in the Old Testament, one of King David's most trusted advisers. He took a leading part in the revolt of David's son Absalom, and Ahithophel's defection was a severe blow to David. Having consulted Ahithophel about his plans to proceed against David, Absalom then sought advice from Hushai, another of David's counselors. Hushai, who remained secretly loyal to the king, betrayed Absalom's cause by opposing Ahithophel's plan and proposing in its place a scheme of his own, which actually gave the advantage to David. This plan Absalom accepted. Ahithophel, recognizing that Hushai had outwitted him, foresaw the disastrous defeat of Absalom's forces and took his own life (II Samuel 15:31–37; 16:20–17:23).

Ahl al-Kitāb (Arabic: "People of the Book"), in Islāmic thought, those religionists such as Jews, Christians, and Zoroastrians who are possessors of divine books (*i.e.*, the Torah, the Gospel, and the Avesta), as distinguished from those whose religions are not based on divine revelations. The latter are an imprecisely identified group referred to as Sabaeans but also considered "People of the Book."

The Prophet Muḥammad gave many privileges to *Ahl al-Kitāb* that are not to be extended to heathens. *Ahl al-Kitāb* are granted freedom of worship; thus, during the early Muslim conquests, Jews and Christians were not forced to convert to Islām and had only to pay a special tax for their exemption from military service. Muslim authorities are responsible for the protection and well-being of *Ahl al-Kitāb*, for, according to a saying of the Prophet, "he who wrongs a Jew or a Christian will have myself [the Prophet] as his indicter on the day of judgment." After Muḥammad's death, his successors sent strict instructions to their generals and provincial governors not to interfere with *Ahl al-Kitāb* in their worship and to treat them with full respect.

Muslim men are permitted to marry women from *Ahl al-Kitāb* even if the latter choose to remain in their religion; Muslim women, however, are not allowed to marry Christians or Jews unless they convert to Islām.

Ahl-e Haqq (Arabic: "People of Truth," or "People of God"), a secret, syncretistic religion, derived largely from Islām, whose adherents are found in western Iran, with enclaves in Iraq. They retain the 12 imams of the Ithnā 'Ashariyah sect and such aspects of Islāmic mysticism as the communal feast. Central to their religion, however, is a belief in seven successive manifestations of God. They further believe in the transmigration of souls, asserting that every person must pass through 1,001 incarnations, in the course of which he receives the proper reward for his actions. The ultimate purification, however (becoming "luminous"), is limited to those who in the initial creation were destined to be good and were made of yellow clay; those destined to be

evil were made of black clay. On the Day of Judgment the good will enter Paradise and the wicked will be annihilated. The Ahl-e Haqq rites, all communal, include animal sacrifice.

The chief source of information about the sect is the *Firqān al-Akhbār*, written in the late 19th or early 20th century by a member.

Ahlgren, Ernst: see Benedictsson, Victoria.

Ahlin, Lars (b. April 4, 1915, Sundsvall, Swed.), influential Swedish novelist of the 1940s and 1950s.

The early novel *Täbb med Manifestet* (1943; "Täbb with the Manifesto") presents many of the central ideas of Ahlin's writings. A young proletarian finds the Communist ideology unsatisfactory and reaches a better understanding of himself and the world through a secularized Lutheran theology wherein man is perceived without preconceptions and is judged according to his deeds. Man is viewed as unfathomable but is ultimately holy and in need of divine grace. Ahlin prefers not to judge his fictional characters but rather to present them with the utmost impartiality. Similar themes are found in a number of subsequent novels, of which *Min död är min* (1945; "My Death is My Own"), *Kanelbiten* (1953; "The Cinnamon Girl"), and *Natt i marknadstältet* (1957; "Night in the Market Tent") are the best known.

Ahlin received a number of literary distinctions, among them the Prize of the Nine in 1960, the Great Novel Prize in 1962, and the Small Nobel Prize in 1966.

Aḥmad (Arabic personal name): see under Ahmed, except as below.

Aḥmad, in full AḤMAD IBN MUṢṬAFA (b. 1806, Tunis—d. 1855, Ḥalq al-Wādī, Tunisia), 10th ruler of the Ḥusaynid dynasty of Tunisia.

Succeeding his brother as the ruler of Tunis in 1837, Aḥmad began at once to modernize his armed forces: Tunisian cadets were sent to France, a military and technical academy was established, and European instructors invited to Tunis. He organized a naval force with 12 frigates purchased from France. He sent 8,000–10,000 soldiers to fight with the allies (France, England, Sardinia, and the Ottoman Empire) against the Russians in the Crimean War (1853–56).

Also active in internal reform, Aḥmad in 1841 abolished the sale of Negro slaves and in 1846 slavery altogether, and he removed many disabilities endured by the Jews. In Carthage he founded a hospital and, in 1845, Saint-Louis College, which was open to boys of all faiths and was the beginning of secular education in Tunisia. To pay for his reforms, he increased taxation, but this led to revolts in 1840, 1842, and 1843.

Prior to his rule, Tunisia was nominally a part of the empire that was ruled by Ottoman Turks. Resisting their claims of sovereignty, he sought the help of France in order to assert his independence. In 1845 he was recognized by the Ottomans as an independent sovereign. He was succeeded in 1855 by his cousin Muḥammad, who reigned until 1859.

Aḥmad, Mirza Ghulam: see Ghulam Aḥmad, Mirza.

Aḥmad al-Manṣūr, also called AL-DHAḤABI (the Golden) (b. 1549, Fès, Mor.—d. Aug. 20, 1603, Fès), sixth ruler of the Sa'di dynasty, which he raised to its zenith of power by his policy of centralization and astute diplomacy. Al-Manṣūr resisted the demands of his nominal suzerain, the Ottoman sultan, by playing off the European powers, namely, France, Portugal, Spain, and England, against one another in order to preserve Moroccan independence.

Aḥmad al-Manṣūr succeeded his brother 'Abd al-Malik in August 1578. During the early years of his rule a largely mercenary army was trained and led by Ottoman Turks. The

administrative system of the government was centralized, and important state officials were given land assignments and exempted from taxation. A survey of property was made, and land revenue was collected directly. Agriculture and the sugar industry were developed. The capital city of Marrākush was restored to its former grandeur.

Aḥmad al-Manṣūr encouraged the immigration of artisans, and his court was noted for its splendour. The cities of Gao and Timbuktu, on the Sudanese trade route, were captured in 1591, thus diverting an immense amount of gold to the central treasury, which earned him the title al-Dhahabi.

He established trade and diplomatic relations with Spain, effectively breaking the monopoly held since 1585 by the Barbary Company, which had been formed by British merchants to control foreign trade.

Aḥmad Bābā, in full ABŪ AL-'ABBĀS AḤMAD IBN AḤMAD AL-TAKRŪRĪ AL-MASSŪFĪ (b. Oct. 26, 1556, Arawān, near Timbuktu, Songhai Empire—d. April 22, 1627, Timbuktu), jurist, writer, and a cultural leader of the western Sudan.

A descendant of a line of jurists, Aḥmad Bābā was educated in Islāmic culture, including jurisprudence. When Timbuktu was conquered by the Sultan of Morocco in 1591, he was accused of refusing to recognize the Sultan's authority and of plotting a rebellion. In 1594 he was deported to the Moroccan capital of Marrākūsh. The conditions of his captivity were liberal, and he was allowed to teach and practice law. His *fatwās* (legal opinions) dating from this period are noted for their clarity of thought and clear exposition of Islāmic judicial principles. He also compiled a biographical dictionary of the famous Mālikī (one of the four schools of Islāmic law) jurists; this work is still an important source of information concerning the lives of Mālikite jurists and Moroccan religious personalities.

When the Sultan of Morocco died in 1603, Aḥmad Bābā was allowed to return to his native city. He spent the last years of his life in scholarly pursuits, which included writing a treatise on the populations of the western Sudan and a grammar of Arabic that is still used in northern Nigeria.

Aḥmad Grāñ, real name AḤMAD IBN IBRĀHĪM AL-GHĀZĪ (b. c. 1506—d. 1543), leader of a Muslim movement that all but subjugated Ethiopia. At the height of his conquest, he held more than three-quarters of the kingdom, and, according to the chronicles, the majority of men in these conquered areas had converted to Islām.

Once Aḥmad Grāñ had gained control of the Muslim Somali state of Adal (Adel), where he installed his brother as a puppet king, he determined on a *jihād* (Islāmic holy war) against Christian Ethiopia. He created an army out of the masses of heterogeneous and nomadic Somalis who had joined him, motivated by religious zeal, the prospects of wealth, and possibly by population pressure caused by Arab immigration. He also made skillful use of firearms, introduced by the Turks, and employed a small body of Turkish troops.

Although Aḥmad Grāñ defeated an Ethiopian army in Adal in 1526–27, it was not until 1531 that he felt ready for a large-scale invasion. By 1535 he had conquered the southern and central areas of the state and had even invaded the northern highlands, leaving a trail of devastation behind him. The Ethiopian king and a few followers retreated and begged for Portuguese aid. But when a small Portuguese force tried to relieve them in 1541, they were first delayed and later soundly defeated by Aḥmad Grāñ, who had meanwhile been able to obtain Turkish reinforcements. The few remaining Portuguese, however, with the new Ethiopian ruler, Galawdewos (Claudius), were

soon able to rearm themselves and rally a large number of Ethiopians. Aḥmad Grāñ, who had sent most of his Turkish troops back, was killed in the crucial battle that followed, and Galawdewos was able to regain his kingdom, though the conversion to Islām and reconversion of most of his subjects may have left a spiritual crisis less easily resolved.

Aḥmad ibn Ḥanbal (b. 780, Baghdad—d. 855, Baghdad), Muslim theologian, jurist, and martyr for his faith. He was the compiler of the Traditions of the Prophet Muḥammad (*Musnad*) and formulator of the Ḥanbalī, the most strictly traditionalist of the four orthodox Islāmic schools of law. His doctrine influenced such noted followers as the 13th–14th-century theologian Ibn Taymiyah, the Wahhābiyah, an 18th-century reform movement, and the Salafiyah, a 19th-century Egyptian movement rooted in tradition.

Life. Of pure Arab stock, Ibn Ḥanbal belonged to the tribe of Shaybān through both parents. He was still an infant when his father died at 30. When Ibn Ḥanbal was 15 he began to study the Traditions (Ḥadīth) of the Prophet Muḥammad. Seeking to learn from the great masters of his day, he travelled to the cities of Kūfah and Basra in Iraq; Mecca, Hejaz, and Medina in Arabia; and to the lands of Yemen and Syria. He made five pilgrimages to the holy city of Mecca, three times on foot. Ibn Ḥanbal led a life of asceticism and self-denial, winning many disciples. He had eight children, of whom two were well known and closely associated with his intellectual work: Ṣālih (died 880) and 'Abd Allāh (died 903).

The central fact of Ibn Ḥanbal's life is the suffering to which he was subjected during the inquisition, known as *al-miḥnah*, ordered by the caliph al-Ma'mūn. But for this great trial, and the unflinching courage he displayed in the face of his persecutors, Ibn Ḥanbal would most likely have been remembered solely for his work on the Traditions. As it is, he remains to this day, in addition to his recognized stature as an expert on Traditions, one of the most venerated fathers of Islām, a staunch upholder of Muslim orthodoxy.

The inquisition was inaugurated in 833, when the Caliph made obligatory upon all Muslims the belief that the Qur'ān was created, a doctrine of the Mu'tazilites, a rationalist Islāmic school that claimed that reason was equal to revelation as a means to religious truth. The Caliph had already made public profession of this belief in 827. Heretofore, the sacred book had been regarded as the uncreated, eternal word of God. The inquisition was conducted in Baghdad, seat of the 'Abbāsīd caliphate, as well as in the provinces. It lasted from 833 to 848, a period involving the reign of four caliphs, ending during the caliphate of al-Mutawakkil, who returned to the traditionalist view.

At the risk of his life, Ibn Ḥanbal refused to subscribe to the Mu'tazilī doctrine. He was put in chains, beaten, and imprisoned for about two years. After his release he did not resume his lectures until the inquisition was publicly proclaimed at an end. Some orthodox theologians, to survive the ordeal, had recanted, and later claimed the privilege of dissimulation, *taqīyah*, as a justification for their behaviour. This is a dispensation granted in the Qur'ān to those who wish to avail themselves of it when forced to profess a false faith, while denying it in their hearts. Other theologians, following the example of Ibn Ḥanbal, refused to repudiate their beliefs.

In 833 Ibn Ḥanbal and another theologian, Muḥammad ibn Nūḥ, who had also refused to recant, were cited to appear for trial before Caliph al-Ma'mūn, who was in Tarsus (now in modern Turkey) at the time. They were

sent off in chains from Baghdad; but shortly after beginning their journey, the Caliph died, and on their trip back to the capital, Ibn Nūḥ died.

Ibn Ḥanbal was ordered to appear before the new caliph, al-Mu'tasim. He was on trial for three days, and on the third day, after the learned men disputed with him, there followed a private conference with the Caliph who asked Ibn Ḥanbal to yield at least a little so that he might grant him his freedom. Ibn Ḥanbal made the same reply he had been making from the beginning of the inquisition; he would yield when given some ground for modifying his faith derived from the sources he regarded as authoritative, namely the Qur'an and the Traditions of Muḥammad. Losing patience, the Caliph ordered that he be taken away and flogged. Throughout the flogging the Caliph persisted in his attempts to obtain a recantation, but to no avail. Ibn Ḥanbal's unflinching spirit was beginning to have its effect upon the Caliph; but the latter's advisers warned that if he desisted from punishing him, he would be accused of having opposed the doctrine of his predecessor al-Ma'mūn, and the victory of Ibn Ḥanbal would have dire consequences on the reign of the caliphs. But the Caliph's treatment of Ibn Ḥanbal had to be suspended, nevertheless, because of the mounting anger of the populace gathering outside the palace and preparing to attack it. Ibn Ḥanbal is reported to have been beaten by 150 floggers, each in turn striking him twice and moving aside. The scars from his wounds remained with him to the end of his life.

The inquisition continued under the next caliph, al-Wāthiq, but Ibn Ḥanbal was no longer molested, in spite of attempts on the part of his opponents to persuade the Caliph to persecute him. The new caliph, like his predecessor, was most likely influenced by the threat of a popular uprising should he lay violent hands on a man popularly held to be a saint. The momentum of the inquisition carried it two years into the reign of al-Mutawakkil, who finally put an end to it in 848.

Ibn Ḥanbal earned the greatest reputation of all the persons involved in the inquisition and the everlasting gratitude of the Muslim people. He is credited with having held his ground in the face of all odds, saving Muslims from becoming unbelievers. At his funeral the procession was estimated at more than 800,000 mourners.

Achievements. The most important of Ibn Ḥanbal's works is his collection of the Traditions of the Prophet Muḥammad. This collection was heretofore believed to have been compiled by the author's son ('Abd Allāh), but there is now evidence that the work was compiled and arranged by Ibn Ḥanbal himself. These Traditions were considered by Ibn Ḥanbal as a sound basis for argument in law and religion.

Historical scholarship regarding Ibn Ḥanbal and his school has suffered from a lack of sufficient documentation, among other things. There are, therefore, some opinions regarding Ibn Ḥanbal that bear closer scrutiny in the light of new documents and recent studies. Too much stress has been laid on the influence on him of the teachings of Shāfi'i, the founder of the Shāfi'i school, whom Ibn Ḥanbal apparently met only once. He had a high respect for Shāfi'i but also for the other great jurists who belonged to other schools of law, without, for that matter, relinquishing his own independent opinions. He was against codification of the law, maintaining that canonists had to be free to derive the solutions for questions of law from scriptural sources, namely the Qur'an and the *sunnah* (the body of Islāmic custom and practice based on Muḥam-

mad's words and deeds). It was to this end that he compiled his great *Musnad*, wherein he registered all the traditions considered in his day acceptable as bases for the solution of questions, along with the Qur'an itself.

The fact that the Ḥanbali school was organized at all was due to the impact of Ibn Ḥanbal on his time. The other orthodox schools were already prospering in Baghdad when the Ḥanbali school sprang up in their midst, drawing its membership from theirs. The lateness of the hour accounts for the relatively small membership attained by the Ḥanbali school compared with the older schools. It is, however, not by the number of its members that the importance of the school and its originator should be judged but rather by their impact on the development of Islāmic religious history. In the Middle Ages the school acted as a spearhead of traditionalist orthodoxy in its struggle against rationalism. One of Ibn Ḥanbal's greatest followers, Ibn Taymiyah (1263–1328), was claimed by both the Wahhābiyah, a reform movement founded in the mid-18th century, and the modern Salafiyah movement, which arose in Egypt and advocated the continued supremacy of Islāmic law but with fresh interpretations to meet the community's changing needs. Ibn Ḥanbal himself is one of the fathers of Islām whose names have constantly been invoked against the forces of rationalism down through the ages.

Aḥmad ibn Muḥammad ibn Abū Bakr ibn Sa'īd: see Shehu Ahmadu Lobbo.

Aḥmad ibn Ṭulūn (b. September 835—d. March 884, Egypt), the founder of the Ṭulūnid dynasty in Egypt, and the first Muslim governor of Egypt to annex Syria.

As a child Aḥmad was taken into slavery and placed in the private service of the 'Abbāsīd caliph (the titular leader of the Islāmic community) at Baghdad. Later he studied theology in the city of Tarsus. He rose in the administrative structure of the 'Abbāsīd government and in 868 became a lieutenant in the service of the governor of Egypt. In Egypt he saw that the real centre of authority lay with the minister of finance, and during the next years he struggled to bring that department under his control. He was successful, and himself became vice governor. Using a rebellion in Palestine as a pretext, he purchased a large number of slaves to increase the strength of his army, which formed the basis of his personal authority. In 882, using the pretext of a holy war against the Byzantine Empire, he annexed Syria. Aḥmad never went so far as to declare formal independence from the 'Abbāsīd caliph, but the autonomy of his rule was clearly a threat to the authority of the latter, and he ceased to send any tribute to the 'Abbāsīd government. The Caliph himself was preoccupied with other problems and was unable to spare the military forces necessary to bring Aḥmad into submission.

Aḥmad ibn Ṭulūn, Mosque of, huge and majestic red brick building complex built in 876 by the Turkish governor of Egypt and Syria. It was built on the site of present-day Cairo and includes a mosque surrounded by three outer *ziyadahs*, or courtyards. Much of

the decoration and design recalls the 'Abbāsīd architecture of Iraq. The crenellated outside walls have merlons that are shaped and perforated in a decorative pattern. The courtyards are lined with arcades of broad arches and heavy pillars. In the mosque and the courtyard the arches are decorated with elaborate designs in carved stucco. The roofed oratory of the mosque is divided by pillars into five long aisles or naves originally ornamented with panels of carved wood.

The building was restored several times, notably between 1296 and 1299, when the wall facing Mecca and the minaret—which has three floors, each in a different shape (square, spiral, and octagonal)—were rebuilt. It was used as a belt factory in the 18th century and was divided into shops in 1814. Classed as a historic monument in 1890, the mosque has since been completely restored.

Ahmad Khan, Sir Sayyid, Sayyid also spelled SYAD, or SYED, Ahmad also spelled AHMED (b. Oct. 17, 1817, Delhi—d. March 27, 1898, Aligarh, India), Muslim educator, jurist, and author, founder of the Anglo-Mohammedan Oriental College at Aligarh, Uttar Pradesh, India, and the principal motivating force behind the revival of Indian Islām in the late 19th century. His works, in Urdu, include *Essays on the Life of Mohammed* (1870) and commentaries on the Bible and on the Qur'an. In 1888 he was made a Knight Commander of the Star of India.

Sayyid's family, though progressive, was highly regarded by the dying Mughal dynasty. His father, who received an allowance from the Mughal administration, became something of a religious recluse; his maternal grandfather had twice served as prime minister of the Mughal emperor of his time and had also held positions of trust under the East India Company. Sayyid's brother established one of the first printing presses at Delhi and started one of the earliest newspapers in Urdu, the principal language of the Muslims of northern India.

The death of Sayyid's father left the family in financial difficulties, and after a limited education Sayyid had to work for his livelihood. Starting as a clerk with the East India Company in 1838, he qualified three years later as a subjudge and served in the judicial department at various places.

Sayyid Ahmad had a versatile personality, and his position in the judicial department left him time to be active in many fields. His career as an author (in Urdu) started at the age of 23 with religious tracts. In 1847 he brought out a noteworthy book, *Āthār aṣṣanādīd* ("Monuments of the Great"), on the antiquities of Delhi. Even more important was his pamphlet, "The Causes of the Indian Revolt." During the Indian Mutiny of 1857 he had taken the side of the British, but in this booklet he ably and fearlessly laid bare the weaknesses and errors of the British administration that had led to dissatisfaction and a countrywide explosion. Widely read by British officials, it had considerable influence on British policy.

His interest in religion was also active and lifelong. He began a sympathetic interpretation of the Bible, wrote *Essays on the Life of Mohammed* (translated into English by his son), and found time to write several volumes of a modernist commentary on the Qur'an. In these works he sought to harmonize the Islāmic faith with the scientific and politically progressive ideas of his time.

The supreme interest of Sayyid's life was, however, education—in its widest sense. He began by establishing schools, at Muradabad (1858) and Ghāzīpur (1863). A more ambitious undertaking was the foundation of the Scientific Society, which published translations of many educational texts and issued a bilingual journal—in Urdu and English.

These institutions were for the use of all citizens and were jointly operated by the Hindus and the Muslims. In the late 1860s there occurred developments that were to alter the course of his activities. In 1867 he was transferred to Benares, a city on the Ganges with great religious significance for the Hindus. At about the same time a movement started at Benares to replace Urdu, the language cultivated by the Muslims, with Hindi. This movement and the attempts to substitute Hindi for Urdu in the publications of the Scientific Society convinced Sayyid that the paths of the Hindus and the Muslims must diverge. Thus, when during a visit to England (1869–70) he prepared plans for a great educational institution, they were for "a Muslim Cambridge." On his return he set up a committee for the purpose and also started an influential journal, *Tahdhīb al-Akhilāq* ("Social Reform"), for the "uplift and reform of the Muslim." A Muslim school was established at Aligarh in May 1875, and, after his retirement in 1876, Sayyid devoted himself to enlarging it into a college. In January 1877 the foundation stone of the college was laid by the Viceroy. In spite of conservative opposition to Sayyid's projects, the college made rapid progress. In 1886 Sayyid organized the All-India Muhammadan Educational Conference, which met annually at different places to promote education and to provide the Muslims with a common platform. Until the founding of the Muslim League in 1906, it was the principal national centre of Indian Islām.

Sayyid advised the Muslims against joining active politics and to concentrate instead on education. Later, when some Muslims joined the Indian National Congress, he came out strongly against that organization and its objectives, which included the establishment of parliamentary democracy in India. He argued that, in a country where communal divisions were all-important and education and political organization were confined to a few classes, parliamentary democracy would work only inequitably. Muslims, generally, followed his advice and abstained from politics until several years later when they had established their own political organization. (S.M.I./Ed.)

Baljon, *The Reforms and Religious Ideas of Sir Sayyid Ahmad Khan* (1949); and Hadi Hussain, *Syed Ahmed Khan: Pioneer of Muslim Resurgence* (1970).

Ahmad Mūsā (fl. 14th century, Tabrīz, Azerbaijan), painter active at the court of the Il Khans at Tabrīz. He is said to have learned painting from his father and to have "drawn the veil from the face of painting and invented the art of the Persian miniature." He was active under Abū Sa'īd (ruled 1316–35), the last of the Mongol sultans in fact as well as name. He illustrated a *Kalīla wa Dimna* (book of animal fables) and a book of the Mi'rāj (the miraculous journey of Muḥammad), which are probably now preserved in part in the "Conqueror's Albums" of the imperial Ottoman library at the Topkapı Palace at Istanbul. Ahmad Mūsā's most famous pupil was Shams ad-Dīn, who painted at the court of the Jalāyir sultans of Baghdad in the latter part of the 14th century.

Ahmad Shāh, in full AḤMAD SHĀH BAHĀDUR MUJĀHID-UD-DĪN ABŪ NAṢR (b. Dec. 24, 1725, Delhi—d. Jan. 1, 1775, Delhi), ineffectual Mughal emperor of India from 1748 to 1754, who has been characterized as a "good-natured imbecile," without personality, training, or qualities of leadership. He was entirely dominated by others, including the queen mother, Udham Bai, and the eunuch superintendent of the harem, the emperor's vicar Javid Khān. Twice during his reign, the

Afghan Aḥmad Shāh Durrānī plundered the northwest Punjab area, extorting money and land from him. At a demonstration by the Marāthās in Sikandarābād, he fled, abandoning the women of his family to captivity.

In 1750 Aḥmad Shāh's *wazīr* ("vizier"), Šafdar Jang, who had been defeated by Afghans of the Doab, joined the Marāthās of southwest India in attempting to gain the spoils of Aḥmad Shāh's empire. Aḥmad Shāh was blinded and deposed by the Marāthās and their allies in 1754, after which he lived in confinement until his death.

Ahmad Shāh Durrānī (b. 1722?, Multān, Punjab—d. Oct. 16–23?, 1772, Toba Ma'rūf, Afg.), founder of the state of Afghanistan and ruler of an empire that extended from the Amu Darya to the Indian Ocean and from Khorāsān into Kashmir, the Punjab, and Sind. Head of the central government, with full control of all departments of state in domestic and foreign affairs, both civil and military, the shāh was assisted by a prime minister and a council of nine life-term advisers that he selected from the chiefs of the leading Afghan tribes.

A member of the noble Sadōzai clan and the second son of Moḥammad Zamān Khān, a hereditary chief of the Abdālī tribe of Afghans, Aḥmad rose to command an Abdālī cavalry group under Nāder Shāh of Persia, and, on Nāder Shāh's assassination, the Afghan chiefs elected Aḥmad as shāh. He was crowned in 1747 near Qandahār, where coins were struck in his name and where he set up his capital. Embarking on the conquest of regions held by ineffectual rulers, he invaded India nine times between 1747 and 1769, supposedly with no intention of founding an empire there. After an unopposed march to Delhi in 1757, he plundered that city, Āgra, Mathura, and Vr̥ndāvana.

Before an outbreak of cholera among his troops forced his return to Afghanistan, Aḥmad married Hazrat Baygam, daughter of the Indian Mughal emperor Muḥammad Shāh. His son Tīmūr remained behind as viceroy of the Punjab and married the daughter of India's puppet emperor 'Ālamgīr II. Tīmūr was driven out in 1758 by a force of Sikhs, Mughals, and Marāthās, but in 1759–61 Aḥmad Shāh swept the Marāthās from the Punjab and destroyed their large army at Pānīpat, north of Delhi. In the 1760s he attempted four times to crush the Sikhs, but his empire was restive with serious revolts nearer home, and he lost control of the Punjab to them. He is buried in a mausoleum in Aḥmad Shāhī, the new capital he built.

Ahmad Sirhindī, SHAYKH, byname MUJADDID-Ī ALFĪ-Ī THĀNĪ (Urdu: "Renewer of the Second Millennium") (b. 1563, Sirhind, India—d. 1624), Indian Muslim theologian and educator, who in Islāmīc mysticism played a prominent role in reemphasizing Qur'ānic orthodoxy and tempering Hindu pantheistic influences.

The son of a shaykh, he studied at Siyalkot and later mixed in the society of Mughal government ministers in Āgra. Returning to his home in Sirhind, he was initiated (1008) in the Šūfī order Naqshbandīyah, led by Khwāja Bākī, a celebrated saint of Delhi, and soon was writing and lecturing against Shī'ite doctrines. The imperial court, then of Shī'ite persuasion, summoned him to Āgra and, for a time, imprisoned him. Later, though, the court reconciled to his ideas, a blend of mysticism and Muslim orthodoxy; and his ideas spread widely through southern and central Asia and even to Turkey.

Though he wrote many tracts, he is remembered chiefly for the letters (*Makūbāt*) that he wrote to disciples and other persons outlining his thoughts on many areas of mysticism and orthodoxy and reasserting what he deemed the clear distinctions between God, man, and the world.

Ahmadābād, also spelled AHMEDABAD, city, administrative headquarters of Ahmadābād district, Gujarāt state, west central India, on the Sābarmati River, north of Bombay (Mumbai). The city was founded in AD 1411 by the

The Jaina temple of Hāthīsingh in Ahmadābād, Gujarāt, India

Candida

Muslim ruler of Gujarāt, Sultan Aḥmad Shāh, next to the older Hindu town of Asāwal. Ahmadābād grew larger and wealthier for a century, but dynastic decay and anarchy brought decline, and the city was captured in 1572 by the Mughal emperor Akbar. Renewed eminence under the Mughals ceased with the death of Aurangzeb in 1707. Further decline was arrested by the British annexation of Gujarāt in 1818. The city's first cotton mills were opened in 1859–61, and it has become the sixth most populous city and largest inland industrial centre in India. Ahmadābād became the temporary capital of Gujarāt state in 1960; the state administration was moved in 1970 to Gāndhīnagar. In 2001 the city was rocked by a massive earthquake that killed thousands.

In the city Hindu, Muslim, and Jaina architectures met, and its ancient architectural remains contrast sharply with modern mills and factories. An attractive feature of the city is Lake Kankaria, offering promenades, boating, a hill garden, and a museum designed by the architect Le Corbusier. Ahmadābād is the home of Gujarāt University (1949) and of the Lalbhai Dalpatbhai Institute for Indological Research. The suburb of Sābarmati became well known as the seat of Mohandas K. Gandhi's ashram, or religious retreat.

About half of the city's population depend upon the cotton industry, with various other light manufactures. Roads lead to Bombay and central India, the Kāthiāwār Peninsula, and the Rājasthān border. It is a major junction on the Western Railway, with lines running to Bombay, Delhi, and the Kāthiāwār Peninsula.

Ahmadābād district stretches across the neck of the Kāthiāwār Peninsula. The northeast is dotted with low hills that gradually give way southwestward to a great plain, the only fertile area in the district. The chief crops are cotton, millet, wheat, and pulses. Parts of the district are wooded. The main rivers are the Sābarmati and its tributaries, which flow southward into the Gulf of Cambay. Area (district) 3,362 square miles (8,707 square km). Pop. (2001 prelim.) city, 3,515,361; metropolitan area, 4,442,651; district, 5,808,378.

Ahmadī, al-, town and *muhāfazah* (governorate) in southern Kuwait. The oasis town, capital of the *muhāfazah*, was built after 1946 with the development of the oil field in which it is located. Al-Ahmadī is the headquarters

of the Kuwait Oil Company. Pipelines link it with Minā' (port) al-Aḥmadi, on the Persian Gulf to the east, where a refinery and tanker terminals are located. Al-Aḥmadi *muhāfazah* is 1,984 sq mi (5,138 sq km) in area. Pop. (1995 prelim.) town, 21,504; *muhāfazah*, 263,806.

Aḥmadiyah, a modern Islāmic sect and the generic name for various Šūfi (Muslim mystic) orders. The sect was founded in Qādiān, the Punjab, India, in 1889 by Mirza Ghulam Aḥmad (c. 1839–1908), who claimed to be the *mahdi* (a figure expected by some Muslims at the end of the world), the Christian Messiah, an incarnation of the Hindu god Krishna, and a reappearance (*burūz*) of Muḥammad. The sect's doctrine, in some aspects, is unorthodox: for example, it is believed that Jesus feigned death and resurrection but in actuality escaped to India, where he died at the age of 120; also, *jihād* ("holy war") is reinterpreted as a battle against unbelievers to be waged by peaceful methods rather than by violent military means.

On the death of the founder, Mawlawi Nur-ad-Din was elected by the community as *khalīfah* ("successor"). In 1914, when he died, the Aḥmadiyah split, the original, Qadiani, group recognizing Ghulam Aḥmad as prophet (*nabī*) and his son Hadrat Mirza Bashir-ad-Din Mahmud Aḥmad (b. 1889) as the second caliph, the new Lahore society accepting Ghulam Aḥmad only as a reformer (*mujaddid*).

The Qadianis, residing chiefly in Pakistan (though there are communities in India and West Africa and to some extent in Great Britain, Europe, and the United States), are a highly organized community with a considerable financial base. They are zealous missionaries, preaching Aḥmadi beliefs as the one true Islām, with Muḥammad and Mirza Ghulam Aḥmad as prophets. In 1947, with the establishment of Pakistan, they officially relocated from Qādiān to Rabwah, Pakistan.

The Lahore group are also proselytizers, though more concerned in gaining converts to Islām than to their particular sect. Led from its inception to his death in 1951 by Mawlana Muhammad Ali, the sect has been active in English- and Urdu-language publishing and in liberalizing Islām.

Aḥmadiyah also designates several Šūfi orders, the most important of which is that of Egypt named after Ahmad al-Badawī, one of the greatest saints of Islām (d. 1276). Al-Badawī achieved great fame for his knowledge of Islāmic sciences, but he eventually abandoned speculative theology and devoted himself to contemplation in seclusion. Soon he became known as a miracle-working saint and had thousands of followers. He arrived in Ṭanṭā (south of Cairo, Egypt) in 1236. His followers were also called *Suṭūḥiyah* from *aṣḥāb as-saḥ* (the people of the roof); according to one anecdote, when al-Badawī arrived at Ṭanṭā, he climbed upon the roof of a private house and stood motionless looking into the sun until his eyes became red and sore. This action was then imitated by some of his followers.

After al-Badawī's death, the Aḥmadiyah was headed by 'Abd al-'Al, a close disciple who kept the order under strict rule until his death in 1332. 'Abd al-'Al inherited the order's symbols: a red cowl, a veil, and a red banner that belonged to al-Badawī. Before his death, 'Abd al-'Al ordered a chapel built on al-Badawī's tomb, which was later replaced by a large mosque.

The Aḥmadiyah order, which is representative of the lower type of dervishes, faced great opposition from Muslim legalists, who, in general, opposed all Šūfism, and from political figures who felt threatened by the tremendous influence the order had on the masses. Under the Mamlūk dynasty, however, the head of

the Aḥmadiyah at times enjoyed considerable privileges and was treated as a dignitary. During the Ottoman rule the Aḥmadiyah suffered from official neglect because of the powerful rivalry from Turkish orders, but this did not lessen in any way the deep veneration for al-Badawī among the Egyptians. The Aḥmadiyah is one of the most popular orders in Egypt, and the three yearly festivals in honour of al-Badawī are major celebrations. Numerous minor orders are considered branches of the Aḥmadiyah and are spread all over the Islāmic world. Among these are the Shinnāwiyah, the Kannāsiyah, the Bayyūmiyah, the Sallāmiyah, the Halabiyah, and the Bundāriyah.

Ahmadnagar, also spelled AHMEDNAGAR, town, administrative headquarters of Ahmadnagar district, Mahārāshtra state, western India, on the Sina River. Known as Bhinar in early Yādava times, it was conquered by Malik Aḥmad Niẓām Shāh, founder of the Ahmadnagar dynasty, in 1490. It was later taken by the Mughals, Marāṭhās, and British. Chief among its historical sites are Aḥmad Niẓām Shāh's fort, in which Jawaharlal Nehru was imprisoned in the 1940s, and the Mughal palace and gardens. Connected by road and rail to Bombay, Pune (Poona), and Sholāpur, the town is a commercial centre whose major industries are cotton and leather processing. It has three colleges affiliated with the University of Poona.

Ahmadnagar district occupies 6,577 sq mi (17,035 sq km) in the upper Godāvari River Basin. The river forms the district boundary in the north, and several of its tributaries, including the Mula, traverse the northern parts of the district. The Sina and Bhīma rivers flow southeastward to meet the Krishna River in Karnāṭaka state. All these rivers originate in the forested Sahyādri Hills of the Western Ghāts, which form the western boundary.

Agriculture is the mainstay of the district. Rainfall is extremely unreliable, however, and food scarcity is a perennial concern. Millet, wheat, and cotton are the district's chief dry crops, and sugarcane ranks as the most important irrigated crop. Industries include sugar processing and cotton ginning and pressing. The district is known for its Ayurvedic (traditional Indian) herbal medicines. Important tourist sites include the Bhandardara Dam and the religious centre at Shirdi. Pop. (1991) town, 181,339; metropolitan area, 222,088; district, 3,373,000.

Ahmadu Hammadi Babu: see Shehu Ahmadu Lobbo.

Ahmadu Seku (d. 1898, Sokoto, Northern Nigeria), second and last ruler of the Tukolor empire in West Africa, celebrated for his resistance to the French occupation.

Succeeding his father, al-Ḥājj 'Umar, in 1864, Ahmadu ruled over a great empire centred on the ancient Bambara kingdom of Segu, in present Mali. By the Treaty of Nango (1881) he granted France most-favoured-nation status. After the advance of the French to Kita and Bamako, he abandoned Segu as his capital and accepted a French protectorate (Treaty of Gouri, May 12, 1887). But Col. Louis Archinard took the offensive against him in 1888 and by 1891 had seized most of his strongholds.

Aḥmad 'Urābī Pasha al-Miṣri: see 'Urābī Pasha.

Aḥmar, al-Baḥr al- (Asia): see Red Sea.

Ahmed (Arabic personal name): see under Ahmad, except as below.

Ahmed, also spelled ACHMED, or ACHMET, name of Ottoman sultans grouped below chronologically and indicated by the symbol •.

• **Ahmed I** (b. April 18, 1590, Manisa, Ottoman Empire—d. Nov. 22, 1617), Ottoman

sultan from 1603 to 1617, whose authority was weakened by wars, rebellions, and misrule. The rebellions he was able to suppress; he executed some of the viziers and exiled many palace dignitaries for bribery and intrigue; and he introduced a new regulation for the improvement of land administration. The peace of Zsitvatorök (1606) that he signed with Austria was a blow to Ottoman prestige, and he was compelled to extend commercial privileges to France, Venice, and the Netherlands within his domains.

Ahmed I, being entertained by midgets in mock combat, miniature, early 17th century; in the Topkapı Saray Museum, Istanbul

By courtesy of the Topkapı Saray Museum, Istanbul

Ahmed was pious and made many donations, especially to the holy places of Mecca and Medina. He built the great Blue Mosque near the Church of Hagia Sophia. Of his seven sons, Osman II, Murad IV, and Ibrahim I eventually succeeded to the throne.

• **Ahmed II** (b. Aug. 1, 1642—d. Feb. 6, 1695, Edirne, Ottoman Empire), Ottoman sultan (1691–95) whose reign was marked by the continuing war with the Holy League (Austria–Poland–Venice).

Soon after his accession to the throne, Ahmed's forces were defeated by the Austrians at Slankamen, Hung. The able grand vizier (chief minister) Fazıl Mustafa Köprülü died in the battle, and the Ottomans suffered substantial territorial losses in Hungary. In 1692 the Venetians attacked Crete and in 1694 captured Chios. In addition, Ahmed faced unrest in his Arab provinces of Syria, Hejaz, and Iraq. To find land for the nomadic Turkmen tribes, Ahmed encouraged tribal settlement in Anatolia and Syria and put an end to certain abuses in the Ottoman land administration system. Generally, however, Ahmed, who had been imprisoned in the palace before his accession, was unable to show any independence and remained under the influence of his courtiers.

• **Ahmed III** (b. 1673—d. 1736), sultan of the Ottoman Empire from 1703 to 1730. With Charles XII of Sweden, a refugee at his court, he was forced into war with Russia (1711–13) and came nearer than any other Turkish sovereign to breaking that power. Encircled near the Pruth (1711), the Russians had to agree to restore Azov, to destroy the Azovian forts, and to abstain from interference in Polish or Cossack affairs. In 1715 Ahmed directed the capture of the Morea (Peloponnesus) from the Venetians, but when Austria intervened, the Turks suffered reverses, losing Belgrade in 1717. Under the peace of Passarowitz (1718), which Ahmed made, Turkey retained its conquests from the Venetians but ceded Hungary and part of Serbia.

Deposed during the uprising led by Patrona Halil in 1730, Ahmed died in captivity in 1736. His reign is sometimes known as the Tulip

Ahmed III, attended by a son, portrait miniature by Levni, early 18th century; in the Topkapı Saray Museum, Istanbul

Time because of the popularity of that flower in Constantinople in the early 18th century.

Ahmed, Fakhruddin Ali (b. May 13, 1905, Delhi—d. Feb. 11, 1977, New Delhi), statesman who was president of India from 1974 to 1977.

The son of an army doctor from Assam, Ahmed was educated in India and studied history at the University of Cambridge, graduating in 1927. After returning to India, he was elected to the Assam legislature (1935). As Assam's minister of finance and revenue in 1938, he was responsible for some radical taxation measures. On the outbreak of World War II in 1939, the Congress Party had a confrontation with British power, and Ahmed was jailed for a year. Soon after release he was again imprisoned for another three and a half years, being released in April 1945.

In 1946 he was appointed advocate general of Assam and held the post for six years. After a term in the national Parliament, he returned to Assam politics until Prime Minister Indira Gandhi included him in her first Cabinet in January 1966. He held a variety of portfolios—irrigation and power, education, industrial development, and agriculture. Ahmed became India's fifth president in 1974. He was a soft-spoken man of quiet humour.

Ahmed Cevdet Paşa: see Cevdet Paşa, Ahmed.

Ahmed Haşim (b. 1884, Baghdad—d. June 4, 1933, Istanbul), writer, one of the most outstanding representatives of the Symbolist movement in Turkish literature.

Born into a prominent family, Haşim developed his knowledge of French literature and his fondness for poetry at Galatasaray Lycée in Constantinople (now Istanbul). After briefly studying law, he worked for the government tobacco offices. Later he served as an official government translator. After military service in World War I, he worked for the Ottoman Public Debt Administration and then held various teaching positions. In 1924 and 1928 he made trips to Paris during which he met leading French literary figures.

Haşim's early poetry was written in classical Ottoman style, but, after his study of the poetry of Charles Baudelaire and the Symbolist poetry of Arthur Rimbaud, Stéphane Mallarmé, and others, his poetic style changed. In 1909 he joined the *Fecr-i âti* ("Dawn of the Future") literary circle but gradually drew apart from this group and developed his own style. Haşim, following the French masters, strove to develop the Turkish Symbolist movement. In a 1924 article on Turkish lit-

erature for the French publication *Mercur de France*, he stated that poetry is the intermediary language between simple speech and music. His poetry at times seems intentionally obscure; nevertheless, he creates images and moods of great beauty and sensitivity. Among his most famous poetry collections are *Göl saatleri* (1921; "The Hours of the Lake") and *Göl kuşları* ("The Birds of the Lake").

Ahmed Vefik Paşa (b. July 6, 1823, Constantinople [now Istanbul]—d. April 2, 1891, Constantinople), Ottoman statesman and scholar who presided over the first Ottoman Parliament (1877) and who is known for his contributions to Turkish studies.

Born into a family of diplomats, Ahmed Vefik was appointed (1849) imperial commissioner in the Danubian principalities and later ambassador to Persia and to France. He presided over the first Turkish Parliament (1877) and was twice appointed grand vizier (chief minister) for brief periods in 1878 and 1882. In 1879 he became the *vali* (governor) of Bursa, where he sponsored important reforms in sanitation, education, and agriculture and established the first Ottoman theatre.

Ahmed Vefik spent his leisure translating Molière's plays and compiling Turkish dictionaries and historical and geographical manuals. He edited the first *Salnâme* ("Year Book") of the Ottoman Empire (1847), and in 1876 he published *Lehçe-i Osmani* ("Language of the Ottomans"), a concise dictionary that emphasized pure Turkish and formed a basis for the works of other Turkish scholars.

After December 1882 he was confined, on Sultan Abdülhamid II's order, to his house at Rumeli Hisar on the Bosphorus. His library was sold for the payment of his debts.

Ahmed Yesevi, also spelled AHMAD YASAWĪ, Yesevi also spelled YASAVĪ (b. second half of the 11th century, Sayrām [now in Kazakhstan]—d. 1166, Yasī, Turkistan [now Turkmenistan]), poet and Şūfī (Muslim mystic), an early Turkish mystic leader who exerted a powerful influence on the development of mystical orders throughout the Turkish-speaking world.

Very little is known about his life, but legends indicate that his father died when the boy was young and his family moved to Yasī, where he began his mystical teaching, hence his name. He is said to have gone to Bukhara to study with the great Şūfī leader Yūsuf Hamadhānī and other famous mystics. Finally he returned to Yasī. The extant work attributed to the poet is the *Divan-i hikmet* ("Book of Wisdom"), containing poems on mystical themes. Scholars believe that the work is probably not his. It is felt, however, that the poems in the *Divan* are similar in style and sentiment to what he wrote. The importance of Yesevi cannot be overestimated. Legends about his life were spread throughout the Turkish Islāmic world, and he developed a tremendous following. The conqueror Timur erected a magnificent mausoleum over his grave in 1397/98, to which pilgrims came, revering Yesevi as a saint.

Ahmed Yesevi wrote poetry for the people, and his mystical order was a popular brotherhood. Not only Islāmic but also ancient Turco-Mongol practices and customs were preserved in their ritual. His disciples formed many affiliated mystical associations that spread throughout the Turkish world. His poetry influenced Turkish literature a great deal, paving the way for the development of mystical folk literature.

Ahmedabad (India): see Ahmadābād.

Ahmedi, Taceddin, in full TACEDDIN (TAJ AD-DĪN) İBRAHİM İBN HIZR AHMEDI (b. 1334?, Anatolia—d. 1413, Amasya, Ottoman Empire), one of the greatest poets of 14th-century Anatolia.

As a young man, Ahmedi studied with the

famous scholar Akmal ad-Din (al-Babarti) in Cairo. He then went to Kütahya, in Anatolia, and wrote for the ruler Amīr Süleyman (1367–86). Later he went to the court of the Ottoman sultan Bayezid I (1389–1403), and, at the Battle of Ankara, in which the Ottomans suffered a drastic defeat, Ahmedi apparently met the victor, the world conqueror Timur and wrote a *qasida* (ode) for him.

At the death of Sultan Bayezid, Ahmedi joined the monarch's son Süleyman Çelebi in the city of Edirne and presented him with panegyrics and one of his best-known works, the *İskendername* ("The Book of Alexander"), a work that he had dedicated originally to Amīr Süleyman of the house of Germiyan in Kütahya but that he revised and added to for many years. Modeled after the work of the great Persian poet Neẓāmī (d. 1209), Ahmedi's *İskendername* is a poem of some 8,000 rhymed couplets (*mašnāvī*), in which he uses the legend of Alexander as a framework for discourses on theology, philosophy, and history. The last part is regarded as an important early source for Ottoman history because the poet apparently based it on a very early chronicle that is no longer extant.

At the death of his patron, Süleyman Çelebi, in 1411, Ahmedi then wrote panegyrics for the new Ottoman sultan, Mehmet Çelebi I (d. 1421), until his own death in 1413.

In addition to the *İskendername*, Ahmedi wrote a *divan*, or collection of poems; many *mašnāvī*; a poem, *Cemşid u Hürşid*; and a didactic work, *Tervih al-Ervah* ("The Comfort of the Spirit").

Ahmednagar (India): see Ahmadnagar.

Ahmet Paşa Bursali (b. Edirne?, Ottoman Empire—d. 1496/97, Bursa), one of the most important figures in 15th-century Turkish literature.

Born into a prominent family, Ahmet Paşa received a classical Islāmic education and was appointed as a teacher in the madrasah (religious college) in the city of Bursa. In 1451 he became judge of the city of Edirne. With the accession of Sultan Mehmet II (1451–81), he became *qāḍī 'asker* ("military judge") and tutor to the sultan and took part in the conquest of Constantinople in 1453. After falling out of favour with the sultan, he spent many years in virtual exile in Bursa and then as governor of a number of Ottoman cities. With the accession of Sultan Bayezid II (1481–1512), however, he continued his career in government service until his death in 1496/97.

Principally a panegyrist, Ahmet Paşa wrote mainly *qasida* (odes) and *ghazels* (lyrics) and is considered the first master of classical poetry in Ottoman literature. The melodious poems in his *divan*, or collection of poems, had a strong influence on later Ottoman classical poets, securing for him an important place in Turkish literary history.

Ahmose, also spelled AHMOSIS, Greek AMA-SIS, name of Egyptian kings grouped below chronologically and indicated by the symbol ●.

● **Ahmose I** (reigned c. 1539–14 BC), founder of the 18th dynasty, who completed his brother's expulsion of the Hyksos (Asiatic rulers of Egypt), invaded Palestine, and re-exerted Egypt's hegemony over Nubia, to the south.

Resuming the war of liberation against the Hyksos early in his reign, Ahmose crushed the foreigners' allies in Middle Egypt and, advancing down the Nile River, captured Memphis, the traditional capital of Egypt, near modern Luxor, he undertook a waterborne operation against Avaris, the Hyksos capital, in the eastern delta, followed by a land siege. When a rebellion flared in Upper Egypt, he hastened

upriver to quell the rising, while the queen mother Ahhotep helped to contain it. Having put down the rising, he captured Avaris and then pursued the enemy to Sharuhén, a Hyksos stronghold in Palestine, which was reduced after a three-year siege.

Before advancing into Palestine, Ahmose, in three campaigns, advanced into Nubia, whose ruler had been an ally of the Hyksos. The rich gold mines of the south provided another incentive for Ahmose's expansion into Nubia.

After his borders were secure, Ahmose established an administration loyal to him in Egypt and granted lands to distinguished veterans of his campaigns and to members of the royal family. He reactivated the copper mines at Sinai and resumed trade with the cities of the Syrian coast, as attested by inscriptions recording the use of cedar found in Syria and by the rich jewelry from his reign. He restored neglected temples, erected chapels for his family, and planned more ambitious works, but he died soon afterward, leaving a prosperous and reunited Egypt.

• **Ahmose II**, also called **AMASIS** (fl. 6th century BC), king of the 26th dynasty (reigned 570–526 BC), a general who seized the throne during a revolt against King Apries. The account of the 5th-century-BC Greek historian Herodotus reveals Ahmose as a shrewd and opportunistic ruler, who, while promoting Greek trade with Egypt, strictly regulated it.

In 570, after Apries' unsuccessful campaign against Cyrene, in modern Libya, the Egyptian troops mutinied, and when Ahmose was sent to pacify them the mutineers proclaimed him king. In the ensuing civil war the Egyptians under his command defeated an invasion by Apries, who was supported by the Babylonian king Nebuchadrezzar II. Ahmose killed Apries in battle but later gave him a royal burial.

Ahmose then turned to diplomacy, securing an alliance with Cyrene by marrying a woman of that country and also seeking alliances in Greece. Herodotus tells of his friendship with Polycrates, tyrant of Samos, and also mentions his donation toward rebuilding the temple at Delphi. Nonetheless, to regulate Greek influence in Egypt he confined merchants to the city of Naukratis in the Nile River delta, southwest of his own capital. His reign was a time of great prosperity in Egypt.

Perhaps employing the fleet of his friend Polycrates, Ahmose reputedly subdued Cyprus, exacting tribute from it. Herodotus states that Ahmose allied himself with Croesus when the Lydian king was seeking assistance against Persia. Yet Persian power grew rapidly, and Ahmose died only about six months before King Cambyses' invasion of Egypt.

Aho, Juhani, pseudonym of JOHANNES BROFELDT (b. Sept. 11, 1861, Lapinlahti, Finland, Russian Empire—d. Aug. 8, 1921, Helsinki, Finland), novelist and short-story writer who began as a realist but toward the end of his life made large concessions to Romanticism.

A country clergyman's son, Aho studied at Helsinki University, worked as a journalist, and was an active member of the liberal group Nuori Suomi ("Young Finland").

Aho's early realistic stories and novels humorously describe life in the Finnish backwoods he knew so well. His novel *Rautatie* (1884; "The Railway"), the story of an elderly couple's first railway trip, is a Finnish classic. Influenced by contemporary Norwegian and French writers—Henrik Ibsen, Bjørnstjerne Martinius Bjørnson, Guy de Maupassant, and particularly Alphonse Daudet—he described the life of the educated classes in *Papin tytär* (1885; "The Parson's Daughter") and *Papin rouva* (1893; "The Parson's Wife").

In the 1890s Aho was drawn toward romantic nationalism: the long novel *Panu* (1897)

dealt with the struggle between paganism and Christianity in 17th-century Finland, and *Ke-vät ja takatalvi* (1906; "Spring and the Untimely Return of Winter"), with the national awakening of the 19th century. His soundest romantic work, *Juha* (1911), is the story of the unhappy marriage of a cripple in the Karelian forests. Aho's short stories, *Lastuja*, 8 series (1891–1921; "Chips"), have been most enduring; they are concerned with peasant life, fishing, and the wildlife of the lakelands. In these, as in his reminiscences of childhood, *Muistatko—?* (1920; "Do You Remember?"), Aho displays a quiet lyricism.

aholehole, any of several species of fishes constituting the family Kuhlidae (order Perciformes). Various members of the genus *Kuhlia* inhabit marine or fresh waters in the Indo-Pacific region, whereas representatives of the other two genera are restricted to freshwater or brackish habitats of Australia. Superficially the aholeholes resemble the freshwater sunfishes (family Centrarchidae) and are presumably closely related. The Hawaiian aholehole (*Kuhlia sandvicensis*) is restricted to coastal waters throughout the Hawaiian Islands. Its maximum length is about 30 cm (12 inches). Some species in the family reach lengths of 45 cm (18 inches).

Ahom, tribe that ruled much of Assam from the 13th century until the establishment of British rule in 1838. Their power in Assam reached its peak during the reign of King Rudra Singh (1696–1714). They originated in the Chinese province of Yunnan and began migrating into Indochina and northern Myanmar (Burma) in the first centuries AD. Their original language is now extinct, and they speak Assamese.

Ahram, Al- (Egyptian: "The Pyramids"), daily newspaper published in Cairo, long regarded as Egypt's most authoritative and influential newspaper.

It was founded in 1875 by two Lebanese-Christian brothers, Salim and Bishara Takla. As a daily from 1881, the paper became famous for its independence and objectivity, despite British censorship and control, and for its coverage of international news and nonpolitical news about Egypt and Egyptians. Its influence waned, however, after censorship tightened as Egyptian independence neared.

In the late 1950s *Al-Ahram* came under the influence of the Egyptian government, and President Gamal Abdel Nasser made his friend Muhammad Hassanin Haikil its editor. In 1960 Nasser nationalized the press, and *Al-Ahram* became the de facto voice of the government. Haikil's influence on the paper was profound. He was an eloquent editorialist and a solid journalist, and he built the paper's prestige, its journalistic excellence, and its makeup and technical operation to new levels. The paper had become the dominant daily in the Arab world. Haikil was removed as editor in 1974 when he lost the confidence of President Anwar el-Sādāt, but the qualities he had built into *Al-Ahram* have remained.

Ahrāmāt al-Jizah (ancient Egyptian pyramid field): see Giza, Pyramids of.

Ahriman, Avestan ANGRA MAINYU ("Destructive Spirit"), the evil spirit in the dualistic doctrine of Zoroastrianism. His essential nature is expressed in his principal epithet—Druj, "the Lie." The Lie expresses itself as greed, wrath, and envy. To aid him in attacking the light, the good creation of Ahura Mazda, the Wise Lord, Ahriman created a horde of demons embodying envy and similar qualities. Despite the chaos and suffering effected in the world by his onslaught, believers expect Ahriman to be defeated in the end of time by Ahura Mazda. Confined to their own realm, his demons will devour each other, and his own existence will be quenched.

The modern Zoroastrians of India, the Parsis, tend to diminish the importance of Ahriman by explaining him away as an allegory of man's evil tendencies, thus restoring omnipotence to Ahura Mazda.

AHS: see African horse sickness.

Aḥsāʾ, Al- (Saudi Arabia): see Hasa, Al-

Aḥsāʾī, al-, also called SHAYKH AḤMAD, in full SHAYKH AḤMAD IBN ZAYN AD-DĪN IBN IBRĀHĪM AL-AḤSĀʾĪ (b. 1753, Al-Hasa, Arabia [now in Saudi Arabia]—d. 1826, near Medina), founder of the heterodox Shīʿite Muslim Shaykhi sect of Iran.

After spending his early years studying the Islāmic religion and traveling widely in Persia and the Middle East, al-Aḥsāʾī in 1808 settled in Yazd, Persia, where he taught religion. His interpretation of the Shīʿite faith (one of the two major branches of Islām) soon attracted many followers but aroused controversy among the orthodox religious leaders of the day. A central idea of Shīʿite Islām is that the greater imam, the leader of Islām, is descended from the male offspring of ʿAlī (the Prophet Muḥammad's son-in-law) and Fāṭimah (the Prophet's daughter) and is divinely appointed and divinely inspired. After 874 the spiritual functions of the imam were performed by *wakīls*, or agents, who were in contact with the mahdi, the last imam and a messianic deliverer. But following the death of ʿAlī ibn Muḥammad as-Sāmarrī in 940, this direct contact between the community and the mahdi ceased. The Shīʿites believed that some day prior to the apocalyptic end of the world, the mahdi would establish a reign of justice.

Al-Aḥsāʾī taught that at all times there must be direct human contact between the mahdi and the community and probably believed himself to be the medium of that contact. The doctrine brought him into conflict with the orthodox Shīʿite theologians of Basra, Baghdad, and Mosul, who regarded themselves as the spiritual caretakers of the community during the mahdi's absence. Al-Aḥsāʾī's final breach with the established and orthodox Shīʿite theologians occurred in 1824, when he was formally denounced as an infidel. Following his excommunication, the Shaykh left the area and died during a pilgrimage to Mecca. He was succeeded as the leader of the Shaykhi sect by Sayyid Kāzīm Rashtī (d. 1843).

Ahuachapán, city, western El Salvador, on the small Molino River (with a hydroelectric station) at the foot of La Lagunita Volcano. Originally called Güeciapam by the Indians, it was renamed Agüecha before becoming the town (1823) and the city (1862) of Ahuachapán. A manufacturing and distributing centre (the most important product being coffee), it is also noted for its mineral baths, drawn from thermal springs, notably below the nearby Malacatiupán Falls. A geothermal power plant, using heat from the springs, began operation in 1975. Pop. (1985 est.) city, 20,376; mun., 78,918.

Ahuizotl (d. 1503), eighth king of the Aztecs, under whose reign (1486–1503) the Aztec empire reached its greatest extent.

The aggressive Ahuizotl succeeded his brother, Tizoc, to the throne. He proved a merciless warrior, conquering tribes as far south as present-day Guatemala and in territory along the Gulf of Mexico, using such tactics as forced marches, ambushes, and surprise attacks. His men feared and respected him, and their king, after conquering a foreign city, chose to camp with his men rather than stay in a captured palace. Conquest brought enormous wealth to the Aztec empire as tribute poured in from all the vassal states. The capital of Tenochtitlán grew to such an extent that Ahuizotl had another aqueduct built. He built the great temple of Malinalco as well.

The king imposed tight bureaucratic control over the empire.

Ahuitzotl is known primarily for having occasioned the greatest orgy of sacrificial blood-letting in Aztec history. In 1487 he decided to dedicate his new temple at Tenochtitlán. The ceremonies, lasting four days, consisted of prisoners of war forming four lines, each one extending over three miles. As the captives were marched up to the altar, priests and Aztec nobles, including Ahuitzotl, had the honour of cutting open their chests and tearing out their hearts. Between 20,000 and 80,000 prisoners were killed this way, while guests from the conquered provinces were asked to watch. Ahuitzotl was later killed when he hit his head on a stone lintel trying to escape the great flood that devastated Tenochtitlán in 1503.

Ahura Mazdā (Avestan: "Wise Lord"), also spelled ORMIZD, or ORMAZD, supreme god in ancient Iranian religion, especially in the religious system of the Iranian prophet Zoroaster (7th century–6th century BC). Ahura Mazdā

Ahura Mazdā, symbol from a doorway of the main hall of the Council Hall, Persepolis, Persia

By courtesy of the Oriental Institute, the University of Chicago

was worshiped by the Persian king Darius I (reigned 522 BC–486 BC) and his successors as the greatest of all gods and protector of the just king.

According to Zoroaster, Ahura Mazdā created the universe and the cosmic order. He created the twin spirits Spenta Mainyu and Angra Mainyu (Ahriman)—the former beneficent, choosing truth, light, and life, the latter destructive, choosing deceit, darkness, and death. The struggle of the spirits against each other makes up the history of the world.

In Zoroastrianism as reflected in the Avesta, Ahura Mazdā is identified with the beneficent spirit and directly opposed to the destructive one. He is all-wise, bounteous, undeceiving, and the creator of everything good. The beneficent and evil spirits are conceived as mutually limiting, coeternal beings, the one above and the other beneath, with the world in between as their battleground. In late sources (3rd century AD onward), Zurvān ("Time") is made the father of the twins Ormazd and Ahriman (Angra Mainyu) who, in orthodox Mazdaism, reign alternately over the world until Ormazd's ultimate victory.

Something of this conception is reflected in Manichaeism, in which God is sometimes called Zurvān, while Ormazd is his first emanation, Primal Man, who is vanquished by the destructive spirit of darkness but rescued by God's second emanation, the Living Spirit.

Ahvāz, Arabic AHWĀZ, town, southwestern Iran. Ahvāz is situated on both banks of the Kārūn River where it crosses a low range of sandstone hills. The town has been identified with Achaemenid Tareiana, a river crossing on the royal road connecting Susa, Persepolis, and Pasargadae. Ardāshīr I, the Sāsānian king (224–241) who rebuilt the town, named it Hormuzd Ardāshīr. He dammed the river, providing irrigation water, and the town prospered. When the Muslim Arabs conquered it in the 7th century, they renamed it Sūq al-Ahwāz ("Market of the Hūzī"). Ahwāz is the

plural of Hūzī, or Khūzī, a local warlike tribe that gave its name to the historical region of Khūzestān. Arab historians of the 12th century described Ahwāz as the centre of a large sugarcane and rice-growing area irrigated by a system of great canals from a dam constructed across the river on solid rock. Ahvāz had begun to decline in the 19th century when the dam collapsed and nearly destroyed the town, but the discovery of oil in Khūzestān in the 20th century brought new prosperity to Ahvāz.

Because of its location near the border with Iraq, Ahvāz was heavily bombed during the Iran-Iraq War (1980–90). Nonetheless a steel complex west of the town began operating in 1989. Ahvāz is a junction of two branches of the Trans-Iranian Railway. It is also connected with Abādān, Khorramshahr, Shūshtar, Dezful, and the oil fields by road and with Tehrān by air. Shahid Chamran University (1955; formerly Jundi Shapūr University) is located there. Pop. (1996) 804,980.

Ahvenanmaa (Finland): see Åland Islands.

ahwāl (Islām): see hāl.

Ai, ancient Canaanite town destroyed by the Israelites under their leader Joshua (Joshua 7–8). Biblical references agree in locating Ai (Hebrew: *ha-Ay*, "The Ruin") just east of Bethel (modern Baytīn in the West Bank). This would make it identical with the large early Bronze Age site now called At-Tall. Excavations there in 1933–35 by a French expedition uncovered a large temple and other remains of the 3rd millennium BC. That occupation ended about 2500 BC, and there was no later reoccupation except briefly in the 12th–11th century BC. The biblical events, however, are usually assigned to a period between about 1400 to 1200 BC. A widely accepted explanation is that early Israelite tradition identified the Canaanite town that was buried under the Israelite Bethel with the imposing ruins of the still earlier At-Tall, only 1.5 miles (2.4 km) to the east.

Ai Qing, Wade-Giles romanization AI CH'ING, pseudonym of JIANG HAIQING, or CHIANG HAI-CH'ENG (b. March 27, 1910, Chin-hua, Chekiang province, China—d. May 5, 1996, Beijing), Chinese poet whose free verse was influential in the development of *xinshi* ("new poetry").

The son of a well-to-do landowner, Ai Qing was encouraged to learn Western languages. He studied painting in Paris from 1928 to 1932, and he developed an appreciation for Western literature. Imprisoned for his radical political activities, he began to write poetry under his pen name. His first collection of verse, *Dayanhe* (1936), reflects his concern for the common people of China; the title poem recalls the foster nurse (called Dayanhe in the poem) who reared him. He went to Yen-an in 1941 and eventually accepted the literary teachings of the Chinese Communist Party leader Mao Zedong. Ai Qing published a number of additional volumes in the 1940s, such as *Kuangye* (1940; "Wildness"), *Xiang taiyang* (1940; "Toward the Sun"), and *Beifang* (1942; "North"). An advocate of free expression and the role of the writer as social critic, Ai Qing used simple language and a free style in creating his socially oriented poems.

After 1949 Ai Qing served on various cultural committees, but in 1957 he was officially censured as a rightist for criticizing the communist regime. He remained silent for 21 years and was interned in labour camps in Heilungkiang and Sinkiang. He began writing again in 1978, publishing books such as *Guilai de ge* (1980; "Song of Returning"). *Selected Poems of Ai Qing* was published in 1982 and *Ai Qing quanji* ("The Complete Works of Ai Qing") in 1991.

Aichbühl, site of a Middle Neolithic settlement (end of the 3rd millennium BC) on the

shores of Lake Feder (Federsee) in southeastern Baden-Württemberg *Land* (state), southwestern Germany. Foundations of 25 rectangular buildings arranged in an irregular row along the shoreline were uncovered in the peat wetland by R. Schmidt in 1930. Approximately 20 of the buildings were two-room houses averaging 16.5 by 26.0 feet (5 by 8 m) in size, with walls built of split wooden posts arranged vertically. A central building, likely used for communal purposes, was approximately 66 by 66 feet (20 by 20 m); the remaining buildings were classified as storage houses. The economy was based primarily on hunting, with some farming and livestock breeding. Aichbühl's ceramics were unpainted and round-bottomed, but, unlike most other Neolithic pottery of the region, they were decorated with incised patterns.

Aichi, ken (prefecture), central Honshu, Japan, on the Pacific coast. More than half of its area lies within the Nōbi Plain and two smaller plains to the east. The northwestern border with Gifu prefecture is formed by the Kiso River, sometimes known as the Nihon (Japan) Rhine. The irregular coast is marked by the peninsulas of Chita (west) and Atsumi (east), which enclose Mikawa Bay and lie within Mikawa Bay Quasi-National Park.

During the Tokugawa (Edo) era (1603–1867) the area that is now Aichi prefecture was Japan's centre for cotton cultivation and manufacture. Its capital, Nagoya, and surrounding industrial suburbs now constitute the Chūkyō

Pleasure boats on the Kiso River, Aichi ken, Japan
Etsunon Arakawa—Onon Press

Industrial Zone, Japan's second-ranking industrial concentration after Keihin (Tokyo-Yokohama Region). Textiles, steel, ceramics, automobiles, machinery, plywood, chemicals, cloisonné, and processed foods are produced. Toyohashi is a major cotton and silk textile centre, and Seto is noted for its china. There are well-developed road and rail services; main port facilities are in Nagoya. Area 1,991 square miles (5,156 square km). Pop. (2004 est.) 7,205,625.

Aichinger, Gregor (b. 1564, Regensburg, Bishopric of Ratisbon [now in Germany]—d. Jan. 21, 1628, Augsburg), German composer of religious music during the stylistic transition from the late Renaissance to early Baroque.

Aichinger took holy orders and became organist to the family of Jakob Fugger at Augsburg from 1584. He visited Italy in 1584–87 and again in 1598–1600. His music is chiefly choral and ecclesiastical, set to Latin texts. It shows a conservative taste influenced by the Venetian school of composers, especially Giovanni Gabrieli, with whom he studied. His motets were well known and frequently appeared in contemporary collections. His *Cantiones Ecclesiasticae* (1607) was one of the

earliest German examples of the use of basso continuo.

Aidan, SAINT (b. Ireland—d. Aug. 31, 651, Bamburgh, Northumberland, Eng.; feast day August 31), apostle of Northumbria, monastic founder, and first bishop of Lindisfarne, or Holy Island, off the coast of Northumberland. Aidan was a monk on the island of Iona when King Oswald of Northumbria requested that he be made bishop of the newly converted Northumbrians. Consecrated in 635, Aidan settled on Lindisfarne, where he established his church, monastery, and see near the royal stronghold of Bamburgh. From Lindisfarne, Aidan evangelized northern England.

AIDS, abbreviation of **ACQUIRED IMMUNODEFICIENCY SYNDROME**, transmissible disease of the immune system caused by the human immunodeficiency virus (HIV). HIV slowly attacks and destroys the immune system, the body's defense against infection, leaving an individual vulnerable to a variety of other infections and certain malignancies that eventually cause death. AIDS is the final stage of HIV infection, during which time fatal infections and cancers frequently arise.

The emergence of AIDS. AIDS was first reported in 1981 by investigators in New York and California. Initially most cases of AIDS in the United States were diagnosed in homosexual men, who contracted the virus primarily through sexual contact, and in intravenous drug users, who became infected mainly by sharing contaminated hypodermic needles. In 1983 French and American researchers isolated the causative agent, HIV, and by 1985 tests to detect the virus had been developed.

HIV/AIDS spread to epidemic proportions in the 1980s, particularly in Africa, where the disease may have originated. Spread was likely facilitated by several factors, including increasing urbanization and long-distance travel in Africa, international travel, changing sexual mores, and intravenous drug use. According to the United Nations' 2004 report on AIDS, some 38 million people were living with HIV, approximately 5 million people become infected annually, and about 3 million people die each year from AIDS.

People living in sub-Saharan Africa accounted for some 70 percent of all infections, and in some countries of the region the prevalence of HIV infection of inhabitants exceeded 10 percent of the population. Rates of infection were lower in other parts of the world, but the epidemic spread rapidly in eastern Europe, India, South and Southeast Asia, Latin America, and the Caribbean. Rates of infection were also on the rise in the United States and western Europe. In the United States nearly one million people were living with HIV. In Asia the sharpest increases in HIV infections were found in China, Indonesia, and Vietnam. Access to retroviral treatment for AIDS remains limited around the world, and the World Health Organization estimates that 9 out of 10 people needing treatment will not receive it.

Transmission. HIV is transmitted by the direct transfer of bodily fluids, such as blood and blood products, semen and other genital secretions, or breast milk, from an infected person to an uninfected person. The primary means of transmission is heterosexual intercourse with an infected individual; the virus can enter the body through the lining of the vagina, penis, rectum, or mouth. HIV frequently is spread among intravenous drug users who share needles or syringes. Prior to the development of screening procedures and techniques that destroy HIV in blood products, transmission also occurred through contaminated blood products; many people with hemophilia contracted HIV in this way. Today the risk of contracting HIV from a

blood transfusion is extremely small. In rare cases transmission to health care workers may occur by an accidental stick with a needle used to obtain blood from an infected person. The virus also can be transmitted across the placenta or through the breast milk from mother to infant; administration of antiretroviral medications to both the mother and infant around the time of birth reduces the chance that the child will be infected. HIV is not spread by coughing, sneezing, or casual contact (e.g., shaking hands). HIV is fragile and cannot survive long outside of the body; direct transfer of bodily fluids is required for transmission. Other sexually transmitted diseases, such as syphilis, genital herpes, gonorrhea, and chlamydia, increase the risk of contracting HIV, probably through the genital lesions that they cause.

AIDS is a zoonosis, an infection that is shared by humans and lower vertebrate animals. A virus that is genetically similar to HIV has been found in chimpanzees in western equatorial Africa. This virus, known as simian immunodeficiency virus (SIV), does not readily cause disease in chimpanzees. The practice of hunting and butchering chimpanzees for meat may have allowed transmission of the virus to humans, probably in the first half of the 20th century. A different form of SIV that infects African green monkeys may have given rise to the virus called HIV-2. HIV-2 can cause AIDS, but it does so more slowly than HIV-1. Worldwide, the most common human immunodeficiency virus is HIV-1. HIV-2 is found mostly in western Africa.

The main cellular target of HIV is a special class of white blood cells critical to the immune system known as helper T lymphocytes, or helper T cells. Helper T cells are also called CD4+ T cells because they have on their surfaces a protein called CD4. Helper T cells play a central role in normal immune responses by producing factors that activate virtually all the other immune system cells. These include B lymphocytes, which produce antibodies needed to fight infection; cytotoxic T lymphocytes, which kill cells infected with a virus; and macrophages and other effector cells, which attack invading pathogens. AIDS results from the loss of most of the helper T cells.

HIV is a retrovirus, one of a unique family of viruses that consist of genetic material in the form of RNA (instead of DNA) surrounded by a lipoprotein envelope. HIV cannot replicate on its own and instead relies on the mechanisms of the host cell to produce new viral particles. HIV infects helper T cells by means of a protein embedded in its envelope called gp120. The gp120 protein binds to a molecule called CD4 on the surface of the helper T cell, an event that initiates a complex set of reactions that allow the HIV genetic information into the cell. Once the virus has infected a T cell, HIV copies its RNA into a double-stranded DNA copy by means of the viral enzyme reverse transcriptase. Because reverse transcriptase lacks the "proofreading" function that most DNA synthesizing enzymes have, many mutations arise as the virus replicates, allowing the virus to escape from antiviral immune responses and antiretroviral drugs.

Next, the viral genome is integrated into the host cell DNA. These genes are transcribed into viral RNA molecules, some of which are incorporated into new virus particles, while others are used as messenger RNA for the production of new viral proteins. Viral proteins assemble at the plasma membrane together with the genomic viral RNA to form a virus particle that buds from the surface of the infected cell, taking with it some of the host cell membrane that serves as the viral envelope. Most infected cells die in about one day. The number of helper T cells that are lost through direct infection exceeds the number of new cells produced by the immune system, eventually resulting in a decline in the number of

helper T cells. A measurement of the number of helper T cells (CD4+ cells) in the blood, called the CD4 count, provides a good indication of the status of the immune system.

Course of infection. The course of HIV infection involves three stages: primary HIV infection, the asymptomatic phase, and AIDS. During the first stage the transmitted HIV replicates rapidly, and some persons may experience an acute flu-like illness that usually persists for one to two weeks. During this time a variety of symptoms may occur, such as fever, enlarged lymph nodes, sore throat, muscle and joint pain, rash, and malaise. Standard HIV tests are initially negative because HIV antibodies generally do not reach detectable levels in the blood until a few weeks after the onset of the acute illness. As the immune response to the virus develops, the level of HIV in the blood decreases.

The second phase of HIV infection, the asymptomatic period, lasts an average of 10 years. During this period the virus continues to replicate, and there is a slow decrease in the CD4 count (the number of helper T cells). When the CD4 count falls to about 200 cells per microliter of blood (in an uninfected adult it is typically about 1,000 cells per microliter), patients begin to experience opportunistic infections—i.e., infections that arise only in individuals with a defective immune system. This is AIDS, the final stage of HIV infection. The most common infections are *Pneumocystis carinii* pneumonia, tuberculosis, *Mycobacterium avium* infection, herpes simplex infection, bacterial pneumonia, toxoplasmosis, and cytomegalovirus infection. Patients can also develop dementia and certain cancers, including Kaposi sarcoma and lymphomas. Death ultimately results from the relentless attack of pathogens or from the body's inability to fight off malignancies.

A small proportion of individuals infected with HIV has survived longer than 10 years without developing AIDS. It may be that such individuals mount a more vigorous immune response to the virus or that they are infected with a weakened strain of the virus.

Diagnosis, treatment, and prevention. Tests for the disease check for antibodies to HIV, which appear from four weeks to six months after exposure. The most common test for HIV is the enzyme-linked immunosorbent assay (ELISA). If the result is positive, the test is repeated on the same blood sample. Another positive result is confirmed using a more specific test such as the Western blot. A problem with ELISA is that it produces false positive results in people who have been exposed to parasitic diseases such as malaria; this is particularly troublesome in Africa, where both AIDS and malaria are rampant. Polymerase chain reaction (PCR) tests, which screen for viral RNA and therefore allow detection of the virus after very recent exposure, and Single Use Diagnostic Screening (SUDS) are other options. Because these tests are very expensive, they are often out of reach for the majority of the population at risk for the disease.

There is no cure or effective vaccine for HIV infection. Efforts at prevention have focused primarily on changes in sexual behaviour such as the practice of abstinence and the use of condoms. Attempts to reduce intravenous drug use and to discourage the sharing of needles have also led to a reduction in infection rates in some areas. HIV infection is treated with three classes of antiretroviral medications. Protease inhibitors, which inhibit the action of an HIV enzyme called protease, include ritonavir, saquinavir, indinavir, amprenavir, nelfinavir, and lopinavir. Nucleoside reverse transcriptase (RT) inhibitors (e.g., abacavir [ABC], zidovudine [AZT], zalcitabine [ddC], didanosine [ddI], stavudine [d4T], and lamivudine [3TC]) and non-nucleoside RT inhibitors (e.g., efavirenz, delavirdine, and nevirapine) both inhibit the action of reverse

transcriptase. Each drug has unique side effects, and, in addition, treatment with combinations of these drugs leads to additional side effects including a fat-redistribution condition called lipodystrophy.

Because HIV rapidly becomes resistant to any single antiretroviral drug, combination treatment is necessary for effective suppression of the virus. Highly active antiretroviral therapy (HAART), a combination of three or more RT and protease inhibitors, has resulted in a marked drop in the mortality rate from HIV infection in the United States and other industrialized states since its introduction in 1996. Because of its high cost, HAART is generally not available in regions of the world hit hardest by the AIDS epidemic. Although HAART does not appear to eradicate HIV, it largely halts viral replication, thereby allowing the immune system to reconstitute itself. Levels of free virus in the blood become undetectable; however, the virus is still present in reservoirs, the best-known of which is a latent reservoir in a subset of helper T cells called resting memory T cells. The virus can persist in a latent state in these cells, which have a long life span due to their role in allowing the immune system to respond readily to previously encountered infections. These latently infected cells represent a major barrier to curing the infection. Patients successfully treated with HAART no longer suffer from the AIDS-associated conditions mentioned above, although severe side effects may accompany the treatment. Patients must continue to take all the drugs without missing doses in the prescribed combination or risk developing a drug-resistant virus; viral replication resumes if HAART is discontinued. (R.F.S.)

Social, legal, and cultural aspects. As with any epidemic for which there is no cure, tragedy shadows the disease's advance. From wreaking havoc on certain populations (such as the gay community in San Francisco in the 1980s) to infecting more than one-third of adults in sub-Saharan African countries such as Botswana at the turn of the 21st century, AIDS has had a devastating social impact. Its collateral cultural effect has been no less far-reaching, sparking new research in medicine and complex legal debates, as well as intense competition among scientists, pharmaceutical companies, and research institutions.

In order to raise public awareness, advocates promote the wearing of a loop of red ribbon to indicate their concern. Activist groups lobby governments for funding for education, research, and treatment. Support groups provide a wide range of services including medical, nursing, and hospice care, housing, psychological counseling, meals, and legal services. Those who have died of AIDS have been memorialized in the more than 44,000 panels of the AIDS Memorial Quilt, which has been displayed worldwide both to raise funds and to emphasize the human dimension of the tragedy. The United Nations designated December 1st as World AIDS Day.

Regarding access to the latest medical treatments for AIDS, the determining factors tend often to be geographic and economic. Simply put, developing nations often lack the means and funding to support the advanced treatments available in industrialized countries. On the other hand, in many developed countries specialized health care has caused the disease to be perceived as treatable or even manageable. This perception has fostered a lax attitude toward HIV prevention (such as safe sex practices or sterile needle distribution programs), which in turn has led to new increases in HIV infection rates.

Because of the magnitude of the disease in Africa, and in sub-Saharan Africa in particular, the governments of this region have tried to fight the disease in a variety of ways. Some countries have made arrangements with multinational pharmaceutical companies to make

HIV drugs available in Africa at lower costs. Other countries, such as South Africa, have begun manufacturing these drugs themselves instead of importing them. Plants indigenous to Africa are also being scrutinized for their usefulness in developing HIV treatments.

In the absence of financial resources to pay for new drug therapies, many African countries have found education to be the best defense against the disease. In Uganda, for example, songs about the disease, nationally distributed posters, and public awareness campaigns starting as early as kindergarten have all helped to stem the spread of AIDS. Prostitutes in Senegal are licensed and regularly tested for HIV, and the clergy, including Islamic religious leaders, work to inform the public about the disease. Other parts of Africa, however, have seen little progress. For example, the practice of sexually violating very young girls has developed among some HIV-positive African men because of the misguided belief that such acts will somehow cure them of the disease. In the opinion of many, only better education can battle the damaging stereotypes, misinformation, and disturbing practices associated with AIDS.

Laws concerning HIV and AIDS typically fall into four broad categories: mandatory reporting, mandatory testing, laws against transmission, and immigration. The mandatory reporting of newly discovered HIV infections is meant to encourage early treatment. Many countries, including Canada, Switzerland, Denmark, and Germany, have enacted mandatory screening laws for HIV. Some countries, such as Estonia, require mandatory testing of prison populations (in response to explosive rates of infection among the incarcerated). Most of the United States requires some form of testing for convicted sex offenders. Other legal and international issues concern the criminalization of knowing or unknowing transmission (more prevalent in the United States and Canada) and the rights of HIV-positive individuals to immigrate to or even enter foreign countries.

In the United States some communities have fought the opening of AIDS clinics or the right of HIV-positive children to attend public schools. Several countries—notably Thailand, India, and Brazil—have challenged international drug patent laws, arguing that the societal need for up-to-date treatments supersedes the rights of pharmaceutical companies. At the start of the 21st century many Western countries were also battling the reluctance of some governments to direct public awareness campaigns at high-risk groups such as homosexuals, prostitutes, and drug users out of fear of appearing to condone their lifestyles.

For the world of art and popular culture, HIV/AIDS has been double-edged. On the one hand, AIDS removed from the artistic heritage many talented photographers, singers, actors, dancers, and writers in the world. On the other hand, as with the tragedy of war and even the horror of the Holocaust, AIDS has spurred moving works of art as well as inspiring stories of perseverance. From Paul Monette's *Love Alone*, to John Corigliano's *Symphony No. 1*, to the courage with which American tennis star Arthur Ashe publicly lived his final days after acquiring AIDS from a blood transfusion—these, as much as the staggering rates of infection, constitute the legacy of AIDS. (K.D.)

Aiken, city, seat of Aiken county, western South Carolina, U.S. Aiken lies 16 miles (26 km) northeast of Augusta, Ga. It was chartered in 1835 and named for the railroad entrepreneur William Aiken. Aiken was originally a health resort. During the American Civil War, the Confederate forces of General Joe Wheeler defeated General Hugh J. Kilpatrick's Federal troops in the town's main street. By the early 20th century Aiken was

a winter colony for the wealthy, noted for equestrian sports, especially polo. It experienced a boom after 1950 with the building of the Savannah River Atomic Plant in an area now called the Savannah River Site, 12 miles (19 km) south. The city became a focus of regional industrialization. A branch campus of the University of South Carolina was established there in 1961. Also situated in the city is Aiken Technical College (1972). Hope-land Gardens, on a former estate, includes the Thoroughbred Hall of Fame. Pop. (2000) 25,337.

Aiken, Conrad, in full CONRAD POTTER AIKEN (b. Aug. 5, 1889, Savannah, Ga., U.S.—d. Aug. 17, 1973, Savannah), American writer and critic whose works, influenced by early psychoanalytic theory, are concerned largely with the human need for self-awareness. He himself faced considerable trauma in his childhood when he found the bodies of his parents after his father had killed his mother and committed suicide. He later wrote of this in his autobiography, *Ushant* (1952).

Educated at Harvard University, where he was a friend and contemporary of T.S. Eliot (whose poetry was to influence his own), Aiken divided his life almost equally between England and the United States until 1947, when he settled in Massachusetts. He played a significant role in introducing the work of American poets to the British public.

After three early collections of verse, he wrote five "symphonies" between 1915 and 1920 in an effort to create poetry that would resemble music in its ability to express several levels of meaning simultaneously. Then came a period of narrative poems, several volumes of lyrics and meditations, and, after World War II, a return to musical form but with richer philosophical and psychological overtones. The best of his poetry is contained in *Collected Poems* (1953), including a long sequence "Preludes to Definition," which some critics consider his masterwork, and the often anthologized "Morning Song of Senlin."

Most of his fiction was written in the 1920s and '30s. His short stories—notably "Strange Moonlight" from *Bring! Bring!* (1925) and "Silent Snow, Secret Snow" and "Mr. Arcularis" from *Among the Lost People* (1934)—were generally more successful than his novels.

The Short Stories of Conrad Aiken (1950) was followed by *A Reviewer's ABC: Collected Criticism from 1916 to the Present* (1958) and *The Collected Novels* (1964).

aikido (Japanese: "way of spiritual harmony"), self-defense system that resembles the fighting methods jujitsu and judo in its use

An aikidoist executing a throw
Ken Brown

of twisting and throwing techniques and in its aim of turning an attacker's strength and momentum against himself. Pressure on vital nerve centres is also used. Aikido was developed to subdue, rather than maim or kill as in jujitsu and karate, but many of its movements can nevertheless be deadly. Aikido especially emphasizes the importance of achieving complete mental calm and control of one's own body to master an opponent's attack. As in other Oriental martial arts, the development of courtesy and respect is an integral part of aikido training.

The basic skills of aikido probably originated in Japan in about the 14th century. In the early 20th century they were systematized in their modern form through the work of the Japanese martial-arts expert Ueshiba Morihei. There are no offensive moves in aikido. As taught by Ueshiba, it was so purely defensive an art that no direct contest between practitioners was possible. Later a student of Ueshiba, Tomiki Kenji, developed a competition style (known as Tomiki aikido) that incorporates aikido techniques. A competitor attempts to score points by swiftly touching an opponent with a rubber or wooden knife, and the other tries to avoid and disarm the attacker. The two alternate in wielding the knife. *See also* martial art.

aileron, movable part of an airplane wing that is controlled by the pilot and permits him to roll the aircraft around its longitudinal axis. Ailerons are thus used primarily to bank the aircraft for turning. Ailerons have taken different forms through the years but are usually part of the wing's trailing edge, near the tip. Their efficiency in lateral control made obsolete the Wright brothers' system of wing warping.

Ailey, Alvin, Jr. (b. Jan. 5, 1931, Rogers, Texas, U.S.—d. Dec. 1, 1989, New York, N.Y.), American dancer, choreographer, and director of the Alvin Ailey American Dance Theater.

Having moved with his family to Los Angeles in 1942, Ailey became involved with the Lester Horton Dance Theater there in 1949. Following Horton's death in 1953, Ailey was director of the company until it disbanded in 1954. He moved to New York City that year. There he performed in various stage productions and studied acting with Stella Adler and dance with Martha Graham, Hanya Holm, Charles Weidman, and others.

In 1958 Ailey formed his own dance company. The Alvin Ailey American Dance Theater, composed primarily of blacks, toured extensively both in the United States and abroad. In addition to works by Ailey, the

company performed the works of several pioneer choreographers of modern dance, including Horton, Pearl Primus, and Katherine Dunham. The company's signature piece is *Revelations* (1960), a powerful, early work by Ailey that is set to American Negro spirituals.

Ailey subsequently continued to choreograph works for his own and other modern-dance companies. The Alvin Ailey American Dance Theater, through its highly successful tours on every continent, made him the best-known American choreographer abroad from the 1960s through the '80s.

Ailly, Pierre d' (b. 1350, Compiègne, Fr.—d. Aug. 9, 1420, Avignon), French theologian, cardinal, and advocate of church reform whose chief aim was to heal the Great Schism of the Western church (1378–1417). He advocated the doctrine of conciliarism—the subordination of the pope to a general council—and in 1381 he suggested convoking such a council in an effort to end the schism.

D'Ailly studied at the College of Navarre of the University of Paris, where he became a doctor of theology (1380). He became master of the college in 1384 and later was made chancellor of the university and the king's confessor and almoner (1389). He displeased the university, however, by supporting the antipope Benedict XIII, who appointed him bishop of Le Puy (1395) and then bishop of Cambrai (1397). He gradually broke with Benedict, who, with the Roman pope Boniface IX, refused to abdicate to heal the schism. D'Ailly then returned to his earlier conciliar doctrine, which steadily became more extreme.

D'Ailly played a prominent part in the Council of Pisa (1409), which declared Benedict and the new Roman pope Gregory XII deposed and elected a third, the conciliar pope Alexander V, who was succeeded the following year by John XXIII. John made d'Ailly a cardinal (1411), bishop of Orange, and his legate to Germany (1413). The schism nevertheless persisted, there being now three popes instead of two, and d'Ailly favoured calling a new general council, which was convened at Constance (1414–18). He was influential in the decisions of the Constance council, which called for the abdication of John XXIII, condemned the Hussites (heretical followers of the Bohemian Reformer Jan Hus), supported conciliarism, and accepted a compromise on the roles of the council and the cardinals in order to elect a new pope, Martin V (November 1417). The possibility that d'Ailly might be elected pope was ruled out by a hostile coalition of Italians, Germans, and English. He subsequently retired to Avignon, where he was legate for Martin.

D'Ailly was the author of several influential works. Although many of his views on the constitution of the church were later rejected as heretical, particularly inasmuch as they were echoed by Protestant Reformers, they were adopted in his time as the only apparent way of ending the Great Schism. D'Ailly was interested in science, and he advocated calendar reforms that were later effected by Pope Gregory XIII. D'Ailly's treatise *Image of the World*, which supported the idea that the East Indies could be reached by sailing west, was studied and annotated by Christopher Columbus before he made his epochal voyages.

Aimoin (b. 960—d. 1010), French Benedictine monk whose history of the Franks was highly esteemed in the European Middle Ages.

After his arrival at the Abbey of Fleury-sur-Loire (between 979 and 985), Aimoin

wrote about St. Benedict, completing the second and third books of the *Miracula Sancti Benedicti* in 1005 (the first book had been the work of an earlier writer). During this time he also wrote the biography of the abbot Abbon (d. 1004), who suggested that Aimoin compose a history of the Franks. His *Historia Francorum*, or *Libri IV de gestis Francorum*, was compiled from texts from the Merovingian period that were rewritten by Aimoin in better Latin. Later, 12th-century historians expanded and refined his history of the Franks. His biographies of Abbon and St. Benedict were historically more valuable. Aimoin's description of Abbon's two trips to Rome, made because of political disagreements between the French king and the church, is one of the many important historical events of the 10th century recounted in his histories.

Aimorés Mountains, Portuguese **SERRA DOS AIMORÉS**, mountainous region divided between the states of Minas Gerais and Espírito Santo, eastern Brazil, occupying an area of about 3,900 square miles (10,100 square km). The mountains form a crystalline-hill upland with an average elevation of 3,000 feet (900 m). They are covered with semideciduous forest and are crossed by the São Mateus River and several smaller streams. The Doce River closely follows the mountainous region's southwestern border. Mantena (Gabriel Emílio) is the principal town in the area.

Ain, département, Rhône-Alpes région, eastern France. It lies in the angle between the Rhône River (to the south) and the Saône River (to the west) and borders Switzerland to the east. Covering 2,225 square miles (5,762 square km), the *département* is bisected by the Ain River, which flows south to the Rhône and separates the fertile Bresse and swampy Dombes lowlands in the west from the Jura scarps to the east. The latter are covered with pasture and timber. Bresse is a region of diversified farming and swine and poultry raising; horses and geese are bred in the pool-studded Dombes. The rest of Ain is concerned primarily with stock raising, cheesemaking, forest activities, and small manufacturing (notably textiles and plastics). Bourg is the capital and largest town in the *département*. Hydropower is supplied by the Ain and Rhône rivers. Other industries include diamond cutting, plastics, and precision machinery. There is a thriving tourist industry for winter sports and angling, and some of the gorges and ridges in the *département* are quite striking. Ain's four *arrondissements* take their names from Bourg, Belley (a bishopric), Nantua, and Gex. Pop. (1988 est.) 460,100.

Ain, al- (United Arab Emirates): *see* 'Ayn, al-.

Ain Beïda, formerly **DAOUD**, town, northeastern Algeria. It is situated on a plateau at the eastern edge of the Sétif plains. The plateau, once occupied by a large lake, now has several shallow depressions containing saline lakes. Sheltered on the east by wooded hills, Ain Beïda is in a grain-producing area irrigated by wells and springs.

Evidence of Roman settlement can be noted in the remains of lead and copper mines in the neighbouring hills and in the inscriptions that are on display in the Public Garden. Ain Beïda was founded as a French military post (two forts, 1848 and 1850) to control the powerful, Arabized Harakta Berbers. It is a road and rail junction as well as a trading centre for agriculture produce. There are saltworks at the Garaet et-Tarf Depression, 11 miles (18 km) southwest, and phosphate deposits are located nearby. Pop. (1987) mun., 61,997.

Ain Jalut, Battle of (1260): *see* 'Ayn Jālūt, Battle of.

Ain River, river, eastern France, flowing 124 miles (200 km) southward from the Jura

Ailey, 1960

Plateau through Jura and Ain départements. The river emerges from its gorge near Pont-d'Ain, having powered several hydroelectric stations (the largest of which is the Barrage de Vouglans). The Ain then crosses the Dombes lowlands and joins the Rhône River.

Ain Sefra, town, western Algeria. It is situated in the Saharan Atlas, 28 miles (45 km) east of the Moroccan border. The town lies in a broad valley between Mount Aissa and Mount Mekter, on either side of the usually dry Wadi Ain Sefra.

Ain Sefra was founded in 1881 as a French garrison town. The former European quarter in the town, rebuilt after a disastrous flood in 1904, is clustered around the railway station on the north bank of the wadi. The oldest part of the town, with its traditional walled gardens, lies to the southwest. Ain Sefra's market deals in sheep, wool, skins, and salt brought there by nomadic Berbers. Pop. (1987) 23,799.

Ain Temouchent, town, northwestern Algeria, on the right bank of the Wadi Sennène. The town is bounded on the south by the Wadi Temouchent, with the Tessala Mountains in the background. Built on the site of the ruined Roman Albula and the later Arab settlement of Ksar ibn Senar, the town was founded in 1851 with the arrival of Spanish immigrants. It lies in a narrow valley and is surrounded by vineyards and orchards planted in fertile basaltic soils. Pop. (1998) 54,832.

Ainsworth, William Harrison (b. Feb. 4, 1805, Manchester, Lancashire, Eng.—d. Jan. 3, 1882, Reigate, Surrey), English author of popular historical romances.

Ainsworth initially studied law but left it for literature. His first success came with the novel *Rookwood* (1834), featuring the highwayman Dick Turpin as its main character. This book was followed by many other historical novels, 39 in all, including *The Tower of London* (1840), *Old St. Paul's, a Tale of the Plague and the Fire of London* (1841), and *Windsor Castle: An Historical Romance* (1843).

William Harrison Ainsworth, detail of a portrait by Daniel Maclise, about 1834; in the National Portrait Gallery, London

By courtesy of the National Portrait Gallery, London

Ainsworth became editor of *Bentley's Miscellany* in 1839, and he owned that periodical from 1854 to 1868. He was also editor at various times of *The New Monthly Magazine* and his own *Ainsworth's Magazine*. His novels made him a wealthy man, but his ventures as an editor and publisher were generally unsuccessful. His novels excel in accurately and vividly conveying the pageantry and bustle of history, but they lack coherence of plot and subtlety of characterization.

Ainu, indigenous people of Hokkaido, Sakhalin, and the Kuril Islands who are differentiated physically and culturally from their Asian neighbours. Their origins are obscure. One claim that they were descended from European peoples has since been disproved, and many contemporary Ainu claim some connection to the prehistoric Jōmon culture (*q.v.*).

Ainu couple in ceremonial dress, Hokkaido Island, Japan

By courtesy of the Consulate General of Japan, New York City

The Ainu language, an isolate, is reported to have had as many as 19 dialects. At the turn of the 21st century, it was virtually extinct, being supplanted by the Japanese language.

The Ainu formerly lived on all four major Japanese islands but were pushed northward over the centuries by the Japanese. Inter-marriage with and cultural assimilation by the Japanese have made the traditional Ainu virtually extinct. Of the approximately 24,000 persons on Hokkaido who are still considered Ainu, hardly any are purebloods and very few maintain the language and religion. Most of them now resemble the Japanese in physique.

The traditional Ainu were round-eyed, short-statured, and brunette and had abundant body and facial hair. The men wore heavy beards, and the women had moustachelike tattooing around the mouth. They dressed in bark cloth or skin drapes, often decorated with geometric designs. They were hunters, fishermen, and trappers until the Japanese moved into Hokkaido and attempted to settle them in agriculture. Many of them now work in the construction industry or as day labourers.

The traditional religion of the Ainu centred on local forces of nature, which were thought to have souls or spirits. The most important ritual in the Ainu religion involved the sacrifice of a bear.

air, mixture of gases comprising the Earth's atmosphere. The mixture contains a group of gases of nearly constant concentrations and a group with concentrations that are variable in both space and time. The atmospheric gases of steady concentration (and their proportions in percentage by volume) are as follows:

nitrogen (N ₂)	78.084
oxygen (O ₂)	20.946
argon (Ar)	0.934
neon (Ne)	0.0018
helium (He)	0.000524
methane (CH ₄)	0.0002
krypton (Kr)	0.000114
hydrogen (H ₂)	0.00005
nitrous oxide (N ₂ O)	0.00005
xenon (Xe)	0.0000087

The uniformity of composition is maintained by mixing associated with atmospheric motions; but, above a height of about 90 km (55 miles), diffusional processes become more important than mixing, and the lighter gases (hydrogen and helium, in particular) are more abundant above that level.

Of the gases present in variable concentra-

tions, water vapour, ozone, carbon dioxide, sulfur dioxide, and nitrogen dioxide are of principal importance. The typical concentration ranges of these gases (in percentage by volume) are as follows:

water vapour (H ₂ O)	0 to 7
carbon dioxide (CO ₂)	0.01 to 0.1 (average about 0.032)
ozone (O ₃)	0 to 0.01
sulfur dioxide (SO ₂)	0 to 0.0001
nitrogen dioxide (NO ₂)	0 to 0.000002

Although present in relatively small amounts, these variable constituents may be very important for maintaining life on Earth's surface. Water vapour is the source for all forms of precipitation and is an important absorber and emitter of infrared radiation. Carbon dioxide, besides being involved in the process of photosynthesis, is also an important absorber and emitter of infrared radiation. Ozone, which is present mainly in the atmospheric region 10 to 50 km (6 to 30 miles) above the Earth's surface, is an effective absorber of ultraviolet radiation from the Sun and effectively shields the Earth from all radiation of wavelengths less than 3,000 angstroms.

air (music): *see* ayre.

air bladder (fish): *see* swim bladder.

air brake, either of two kinds of braking systems. The first, used by railroad trains, trucks, and buses, operates by a piston driven by compressed air from reservoirs connected to brake cylinders. When air pressure in the brake pipe is reduced, air is automatically admitted into the brake cylinder. The first practical air brake for railroads was invented by George Westinghouse (*q.v.*) in the 1860s.

The term is also used to refer to the braking system used by aircraft and race cars. This brake consists of a flap or surface that can be mechanically projected into the airstream to increase the resistance of the vehicle to air and lower its speed.

Air Canada, airline established by act of the Canadian Parliament in the Trans-Canada Air Lines Act of April 10, 1937. Known for almost 28 years as Trans-Canada Air Lines, it assumed its current name on Jan. 1, 1965. Air Canada's headquarters are in Montreal.

Initially flying a scheduled route between Vancouver, B.C., and Seattle, Wash., the airline so expanded its services through its own routes and through connectors that by the early 21st century it was reaching more than 90 communities throughout Canada and the United States, as well as points in Bermuda, the Caribbean, the United Kingdom, and continental Europe, Asia, Australia, and South America. In 1966 it became the first North American airline to serve Moscow.

As a crown corporation the company enjoyed a monopoly on Canadian domestic air transport from 1937 to 1959; in the 1960s and '70s, however, restrictions were gradually lifted, and other Canadian carriers began to compete for both domestic and international routes. To further deregulate, to acquire capital for upgrading its fleet, and to better operate in a competitive market, the company was partially privatized in 1988 by the sale of 45 percent of its shares to its employees and the general public; it was fully privatized the following year. In 2000 Air Canada became one of the world's largest commercial airlines after acquiring Canadian Airlines International, the second largest carrier in Canada.

air-conditioning, the control of temperature, humidity, purity, and motion of air in an enclosed space, independent of outside conditions.

An early method of cooling air as practiced

in India was to hang wet grass mats over windows where they cooled incoming air by evaporation. Modern air-conditioning had its beginnings in the 19th-century textile industry, in which atomized sprays of water were used for simultaneous humidification and cooling.

In the early 20th century, Willis Carrier of Buffalo, N.Y., U.S., devised the "dew point control," an air-conditioning unit based on the principle that cooled air reaches saturation and loses moisture through condensation. Carrier also devised a system (first installed in 1922 at Graumann's Metropolitan Theater in Los Angeles) wherein conditioned air was fed from the ceiling and exhausted at floor level. The first fully air-conditioned office building, the Milam Building in San Antonio, Texas, U.S., was constructed in the late 1920s. The development of highly-efficient refrigerant gases of low toxicity known as Freons (carbon compounds containing fluorine and chlorine or bromine) in the early 1930s was an important step. By the middle of that decade American railways had installed small air-conditioning units on their trains, and by 1950 compact units had become practical for use in single rooms. Since the late 1950s air conditioning has become more common in developed regions outside the United States.

In a simple air conditioner, the refrigerant, in a volatile liquid form, is passed through a set of evaporator coils across which air inside the room is passed. The refrigerant evaporates and, in the process, absorbs the heat contained in the air. When the cooled air reaches its saturation point, its moisture content condenses on fins placed over the coils. The water runs down the fins and drains. The cooled and dehumidified air is returned into the room by means of a blower.

In the meantime the vaporized refrigerant passes into a compressor where it is pressurized and forced through condenser coils, which are in contact with outside air. Under these conditions the refrigerant condenses back into a liquid form and gives off the heat it absorbed inside. This heated air is expelled to the outside, and the liquid recirculates to the evaporator coils to continue the cooling process. In some units the two sets of coils can reverse functions so that in winter, the inside coils condense the refrigerant and heat rather than cool the room. Such a unit is known as a heat pump.

Alternate systems of cooling include the use of chilled water. Water may be cooled by refrigerant at a central location and run through coils at other places. In some large factories a version of the earlier air-washer systems is still used to avoid the massive amount of coils needed otherwise. Water may be sprayed over glass fibres and air blown through it. Dehumidification is achieved in some systems by passing the air through silica gel which absorbs the moisture, and in others, liquid absorbents cause dehydration.

The design of air-conditioning systems takes many circumstances into consideration. A self-contained unit, described above, serves a space directly. More complex systems, as in tall buildings, use ducts to deliver cooled air. In the induction system, air is cooled once at a central plant and then conveyed to individual units, where water is used to adjust the air temperature according to such variables as sunlight exposure and shade. In the dual-duct system, warm air and cool air travel through separate ducts and are mixed to reach a desired temperature. A simpler way to control temperature is to regulate the amount of cold air supplied, cutting it off once a desired temperature is reached.

Distribution of air is a concern because direct exposure to the cool air may cause discomfort. In some cases, cooled air needs to be

slightly reheated before it is blown back into a room. One popular method of distribution is the ceiling diffuser, from which air is blown out along the ceiling level and allowed to settle down. The linear diffuser brings air through a plenum box or duct with a rectangular opening; louvers divert the down-flowing air. Other units are circular, and their fins radiate the air. Some ceilings are perforated to allow passage of cool air, and other ceilings are simply cooled so that basic ventilation can circulate the cool air.

air-cushion machine, also called **GROUND-EFFECT MACHINE**, or **HOVERCRAFT**, vehicle that operates on land or water with its weight supported by air pressure created between the craft and the ground surface. There are two classes of air-cushion machines: those that generate their own pressure differential irrespective of forward speed, called aerostatic craft (sometimes denoted by the acronym ACV, for air-cushion vehicle), and those that require forward speed before the pressure differential can be achieved, called aerodynamic ground-effect machines (GEMs).

A brief treatment of air-cushion machines follows. For full treatment, see *MACROPAEDIA: Transportation*.

Sir John Thornycroft of Great Britain was perhaps the first to conceive of an air-cushion vehicle. In the 1870s he theorized that if a ship had a plenum chamber (essentially an empty box, open at the bottom) for a hull and if that plenum chamber were pumped full of air, the ship would rise out of the water and move faster, since there would be reduced drag. He built models to test his idea and in 1877 took out a patent. Thornycroft discovered a problem with his concept, however, that for several decades hindered the development of a successful craft: how to keep the air cushion from escaping from under the craft.

It is generally agreed that in the 1950s Christopher Cockerell, also of Great Britain, was the first to devise a method of containing the air cushion. Instead of having a plenum chamber for a hull, Cockerell designed a craft with a slot running around the entire circumference of its bottom from which air could be jetted. The peripheral jets used to pump the air were angled inward slightly, so that the jetted air would mass under the craft and lift it. It was theorized that the force of these jets would create a curtain of air that would keep the air cushion from escaping. In 1959 the world's first practical air-cushion vehicle, the SR.N1, was launched. This first model was able to carry only three passengers at relatively slow speeds and only over calm water or even ground. It differed from Cockerell's original plans in one major respect: it was found that the force of the peripheral jets was not enough to contain the air-cushion, and so a rubberized "skirt" was suspended around the craft's perimeter. The special advantage of the skirt was that it helped to maintain the air cushion over uneven ground or in choppy water.

The skirt is one of the five main components of an air-cushion vehicle, the other four being the hull, engine, lift system, and propulsion system. In construction of the hull, aluminum skin is welded onto frames, also made of aluminum. The hull supports the gas turbine engine, which usually powers both the lift and propulsion systems. Proportionately far more of the engine's power is used to lift the vehicle than to propel it. For lift, high-speed centrifugal fans are used to drive the air through the jets under the craft. A modified aircraft propeller is used for propulsion. Situated at the rear of the craft, the propeller is often mounted on a pylon that can swivel to give the pilot greater control in maneuvering. Further directional control is provided by rudderlike fins at the rear of the craft. Control of these vehicles is difficult because of the air cushion.

The skirt has gone through a great number of

developments since the SR.N1 was launched. Originally the skirt hung like a curtain around the edge of the craft and was made of rubberized material that quickly wore out from friction with the surface (water or land) during high-speed travel. Skirts are now made of highly durable nylon and plastic, and instead of having the appearance of a curtain, the skirts, known as bag skirts, resemble a thick tube around the craft's edge. Air is jetted from holes along the inside of the inflated bag skirt under the craft to form the air cushion. Bag skirts also provide a means of support for the vehicle when it is at rest. Attached to the bottom edge of the bag skirt is a secondary skirt made of fingerlike segments that protect the bag skirt from friction damage.

In the early 1960s it was thought that air-cushion machines would ply the world's oceans at high speeds, or open up the Earth's desert and arctic areas. As the problems of skirt design and engine maintenance (gas turbines are easily clogged and fouled by saltwater spray) arose, the early optimism faded. Although research and development of various craft were being conducted in several nations in the late 20th century, especially for military applications, Great Britain was the only nation in which there was large-scale production. The British built successively larger and faster vehicles and pioneered their commercial use as ferries across the English Channel. The Hovercrafts in use over that route travel at speeds of approximately 60 knots (about 70 miles per hour) and can carry some 420 passengers and 60 vehicles.

air de cour (French: "court air"), genre of French solo or part-song predominant from the late 16th century through the 17th century. It originated in arrangements, for voice and lute, of popular chansons (secular part-songs) written in a light chordal style. Such arrangements were originally known as *vau-* (or *voix-*) *de-villes* ("town voice"), the name *air de cour* becoming common after its use in 1571 in a collection by Adrian Le Roy and Robert Ballard. Other notable early collections were published by Pierre Attaignant and Pierre Phalèse; Antoine Boesset, Jean de Cambefort, and Michel Lambert were among the composers included.

Early collections drew heavily on chanson arrangements, but new pieces were also composed explicitly as accompanied solo song. Typically, the *air de cour* was a strophic song (the same music for all stanzas) written for one or two voices and lute or harpsichord or for four or five unaccompanied voices. There were two repeated sections, and often a refrain; singers often embellished the melody on the repetitions. The texts were usually love poems in stylized language, sometimes in *vers mesuré* (quantitative verse written in imitation of the poetry of classical antiquity), but they also included drinking songs, religious feasts, and other subject matter. *Musique mesurée*, a short-lived musical style that reflected the metre of *vers mesuré* in the duration of the musical notes, left its mark on the *air de cour* in a tendency to use irregular rhythmic patterns. See also *ayre*.

air embolism, also called **GAS EMBOLISM**, blockage of an artery or vein by an air bubble. Air can be introduced into the blood vessels during surgery or traumatic accidents. One type of traumatic embolization occurs when lung tissue is ruptured; bubbles of air pass from the alveoli (air sacs) of the lungs into nearby capillaries and veins. The air bubbles are then carried into the heart, where, if trapped, they can cause myocardial infarction, the destruction of tissue in the heart muscle; usually, however, the air rises to the brain. The consequent blockage of vessels carrying blood to the brain starves this tissue of its vital blood supply. Nervous tissue becomes irreversibly damaged after about five minutes

of oxygen and nutritional starvation; convulsions, unconsciousness, respiratory difficulties, and death may ensue.

Air embolism is one of the most common hazards of underwater diving while breathing compressed air. *See also* mediastinal emphysema; decompression sickness.

air force, that military organization of a nation which is primarily responsible for the conduct of air warfare. The air force has the missions of gaining control of the air, supporting surface forces (as by bombing and strafing), and accomplishing strategic-bombing objectives. The basic weapon systems of air forces are such military airplanes as fighters, bombers, fighter-bombers, attack aircraft, reconnaissance craft, and training craft. Since the mid-20th century, the air forces of some of the world's major powers have also operated those nations' contingents of land-based intercontinental ballistic missiles, as well as of nuclear-armed long-range bombers. The army and naval branches of a nation's armed forces may also operate aircraft, but the air force usually remains the prime instrument of a nation's air power. The organization, command structure, and personnel grades within air forces vary from country to country.

Air forces and air warfare are treated in a number of articles in the *MACROPAEDIA*. For treatment of the history, types, and technological development of military aircraft, *see* War, Technology of; Transportation. For treatment of tactical and strategic considerations in aerial warfare, *see* War, Theory and Conduct of.

Air France, in full *COMPAGNIE NATIONALE AIR FRANCE*, French international airline originally formed in 1933 and today serving all parts of the globe. With British Airways, it was the first to fly the supersonic Concorde. Headquarters are in Paris.

In May 1933, four airlines—*Société Centrale pour l'Exploitation de Lignes Aériennes* (founded 1919), *Compagnie Internationale de Navigation* (1920), *Air Union* (1923), and *Air Orient* (1929)—merged and negotiated with the French government to form a national system. A few months later with the support of the government, the combine merged with another line, *Compagnie Générale Aérienne* (founded 1919), to form Air France, which in the years before World War II developed one of the most extensive networks in Europe. Nearly devastated by the war, the company resumed Paris-London service on Oct. 11, 1945. The following year, it reorganized, and in 1948 a new *Compagnie Nationale Air France* was incorporated by act of Parliament, with 70 percent of the new company owned by the French government.

The first Air France transatlantic flight, from Paris to New York City, was inaugurated on June 25, 1946. Routes expanded in the coming decades so that by the early 21st century the airline was serving more than 200 cities in more than 80 countries. In 1976 it inaugurated Concorde flights, initially from Paris to Rio de Janeiro; in 1982 that route and others had to be cut owing to their unprofitability, leaving the Paris-New York flight as its sole route. Further financial losses, however, led Air France to cease its Concorde operations in 2003.

In 1999 public ownership in Air France increased, and a privatization program was launched in 2002. In 2004 Air France acquired the Dutch airline KLM to create Air France-KLM, the largest airline in Europe.

air gun, weapon based on the principle of the primitive blowgun that shoots bullets, pellets, or darts by expansion of compressed air.

Most modern air guns are inexpensive BB guns (named for the size of the shot fired). The best of these develop about half the muzzle velocity of light firearms, are accurate enough for marksmanship training at ranges up to 100

feet (30 m), and can kill small game. Darts with tranquilizing drugs may be fired to immobilize animals for handling or capture. An air-gun projectile seldom carries beyond 300 feet (92 m).

Early weapons had a reservoir of compressed air that, when suddenly released by a trigger, projected a single bullet or charge of shot with limited range and accuracy. During the 16th century a spring was substituted for the reservoir. When the trigger released the spring, the latter actuated a piston that compressed air which in turn drove the missile through the bore or barrel of the gun. This is the principle used in most air "rifles," and it can also be used in air pistols.

Later weapons were constructed on the older principle of a reservoir, but these use cylinders of compressed gas, usually carbon dioxide. A single cylinder will give a number of shots before replacement is necessary; gas guns are comparable in power and accuracy to air guns.

Air-India Limited, airline founded in 1932 (as Tata Airlines) and now an international airline owned by the Indian government and serving southern and east Asia, the Middle East, Europe, Africa, and the United States. Headquarters are in Bombay.

The first scheduled service was inaugurated in 1932 by J.R.D. Tata, flying mail and passengers between Karachi, Ahmadabad, Bombay, Bellary, and Madras. By 1939 routes had been extended to Trivandrum, Delhi, Colombo, Lahore, and intermediate points. After World War II, in 1946, Tata Airlines was converted into a public company and renamed Air-India Limited. Two years later, to inaugurate international services between Bombay and Cairo, Geneva, and London, Air-India International Limited was formed.

In 1953 India nationalized all Indian airlines, creating two corporations—one for domestic service, called Indian Airlines Corporation (merging Air-India Limited with six lesser lines), and one for international service, Air-India International Corporation. The latter's name was abbreviated to Air-India in 1962. In the following decades, international routes were greatly extended. In 1994 the airline again took the name Air-India Limited.

air law, law governing the use of airspace and occurrences therein. Airspace is understood as the area stretching from the ground to outer space. Although radio waves, projectiles, and other objects may traverse the airspace, the term air law generally refers only to laws regulating civil aviation and governing airplanes, dirigibles, balloons, and other such craft.

A brief treatment of air law follows. For full treatment, *see* *MACROPAEDIA*: Transportation Law.

A fundamental principle of international law is that of national sovereignty over airspace, a principle recognized by the Convention Relating to the Regulation of Aerial Navigation (Paris, 1919). That convention was superseded by the Convention of International Civil Aviation (Chicago, 1944), which also recognized that "every state has complete and exclusive sovereignty over the airspace above its territory." The Chicago convention also stated that persons in an aircraft above a state are subject to the laws of that state. The aircraft must also obey the local rules of air and air-traffic control, including regulations pertaining to entry, clearance, immigration, passports, customs, health, and documents relating to the aircraft, crew, passengers, and cargo. Every state is entitled, by the rules of the Chicago convention, to regulate the transit and traffic of foreign aircraft in its airspace.

Laws pertaining to airports are also considered a part of air law. In most countries airports are nationally licensed, and unlicensed places can be used for the landing and taking off of aircraft only under restrictive conditions, if at all. In the United States the Civil Aeronautics

board (CAB; 1938–84) was charged with the power to make safety regulations, grant licenses, and establish other rules of flight; deregulation of the industry in 1978–79 curtailed the activities of the board, and in 1985 its remaining functions were assumed by other agencies. Parties to the Chicago convention must make airports open to aircraft of other parties on the same basis as they do to their own aircraft.

Laws pertaining to airports also stipulate the mutual responsibilities of nearby landowners and airport operators. Courts have prohibited the establishment of airports where a strong showing of injury to neighbours has been made. The owner of a property adjacent to an airport may be prohibited from building structures that are hazardous to air navigation.

Aircraft themselves are subject to the regulations of air law. Aircraft have to be registered in a country, and the Chicago convention stipulated that an aircraft engaged in international navigation is required to have a certificate of airworthiness issued by the state in which it is registered; the convention also requires that certificates of competency and licenses be issued to pilots and other members of the operating crew.

Air law is also concerned with criminal jurisdiction in airspace. Formerly, when an aircraft flew in the airspace of a foreign nation, the law of that nation was applicable. Since that time, however, the criminal law of the state of registry has often been applied in order to avoid determining in which nation's airspace the criminal act was committed. Air law also provides a means to define piracy or acts of violence by the crew, as well as hijacking, known legally as unlawful seizure. It also defines the responsibility of states toward hijacked planes in their territory.

The chief standing organization regulating air law is the International Civil Aviation Organization, affiliated with the United Nations and headquartered in Montreal.

air lock, device that permits passage between regions of differing air pressures, most often used for passage between atmospheric pressure and chambers in which the air is compressed, such as pneumatic caissons and underwater tunnels. The air lock also has been used as a design feature of space vehicles; on March 18, 1965, the Soviet cosmonaut Aleksey Leonov passed through an air lock to become the first man to walk in space.

Sir Thomas Cochrane patented an air lock in 1830 for use in harbour works; its application to bridge foundations was pioneered by Isambard Kingdom Brunel, James Eads, and others; James Henry Greathead used it in tunneling in the 19th century.

A typical modern air lock consists of a cylinder of steel plate with airtight doors located at both ends, one opening from the outside

Air locks for Boston Harbor Tunnel

By courtesy of Robert S. Mayo, C.E. Mayo Tunnel & Mine Equipment, Inc., Lancaster, Pa.

into the lock, the other from the lock into the compressed-air chamber, together with valves to admit or to exhaust compressed air. One of the doors must always be closed; before the other is opened, the pressure within the air lock must be equalized with that on the opposite side.

Two types of air locks are in general use: the horizontal, for tunnels, in which the doors are hinged on vertical axes; and the vertical, for caissons, in which the door arrangement must make provision for the cable that hoists material from the working chamber to the surface.

air mass, in meteorology, large body of air having nearly uniform conditions of temperature and humidity at any given level of altitude. Such a mass has distinct boundaries and may extend hundreds or thousands of kilometres horizontally and sometimes as high as the top of the troposphere (about 10–13 km [6–8 miles] above the Earth's surface). An air mass forms whenever the atmosphere remains in contact with a large, relatively uniform land or sea surface for a time sufficiently long to acquire the temperature and moisture properties of that surface. The Earth's major air masses all originate in polar or subtropical latitudes. The middle latitudes constitute essentially a zone of modification, interaction, and mixing of the polar and tropical air masses.

Air masses are commonly classified according to four basic source regions. These are Polar (cold and dry), Arctic (cool and moist), Equatorial (hot and dry), and Tropical (warm and moist), in international terminology; they are respectively called continental Polar, maritime Polar, continental Tropical, and maritime Tropical in the United States.

Continental Polar (cP) air usually forms in winter over extensive land areas such as central Asia, northern Canada, and the Antarctic continent. It is likely to be stable and is characteristically free of condensation forms. When heated or moistened from the ground with strong turbulence, this type of air mass develops limited convective stratocumulus cloud forms with scattered light rain or snow showers. In summer strong continental heating rapidly modifies the coolness and dryness of the cP air mass as it moves to lower latitudes. Daytime generation of cumulus clouds is the rule, but the upper-level stability of the air mass is usually such as to prevent rain showers.

Maritime Polar (mP) air masses develop over the polar areas of both the Northern and the Southern hemispheres. They generally contain considerably more moisture than the cP air masses. As they move inland in middle and high latitudes, heavy precipitation may occur when the air is forced to ascend mountain slopes or is caught up in cyclonic activity (*see* cyclone).

The continental Tropical (cT) air mass originates in arid or desert regions in the middle or lower latitudes, principally during the summer season. It is strongly heated in general, but its moisture content is so low that the intense dry convection normally fails to reach the condensation level. Of all the air masses, the cT is the most arid, and it sustains the belt of subtropical deserts worldwide.

The maritime Tropical (mT) is the most important moisture-bearing and rain-producing air mass throughout the year. In winter it moves poleward and is cooled by the ground surface. Consequently, it is characterized by fog or low stratus or stratocumulus clouds, with drizzle and poor visibility. A steep lapse rate aloft in regions of cyclonic activity ensures the occurrence of heavy frontal and convective rains. In summer the characteristics of the mT air mass over the oceans and in zones of cyclonic activity are basically the

same as in winter. Over warm continental areas, however, the air mass is strongly heated so that, instead of fog and low stratus clouds, widely scattered and locally heavy afternoon thunderstorms occur.

Air massif, French *MASSIF DE L'AIR*, group of granitic mountains rising sharply from the Sahara in central Niger. Several of these mountains approach and exceed 6,000 feet (1,800 m), the highest being Mount Gréboun (6,378 feet [1,944 m]). The mountains are dissected by deep valleys, called *koris*, in which some vegetation permits the pasturage of livestock, owned mainly by Tuaregs. Hot springs are found in the mountains, as are ancient rock carvings. Uranium and other minerals are mined.

air pocket, downdraft encountered by an aircraft in flight. *See* updraft and downdraft.

air racing, sport of racing airplanes either over a predetermined course or cross-country up to transcontinental limits. Air racing dates back to 1909, when the first international meet was held at Reims, Fr. Such meets played a large part in the development of airplane design.

Air racing, very popular during the 1920s and '30s, was largely subsidized by airplane manufacturers interested in demonstrating their wares. Speed and long-distance records were continually being set, and famous trophy races included the Schneider (France), the King's Cup (England), and the Pulitzer, Thompson, and Bendix trophies in the United States. Of these races, only the last two survived after World War II. After World War II, largely because of increased costs, the advent of jets, and the preemption of the best planes by the military, air racing declined in popularity. Formula One racing—in imitation of automobile racing as supervised by the Fédération de l'Automobile—in which specific wingspan, undercarriage, airframe weight, stock engine, and brake specifications are predetermined for each class of airplane, with a particular race-course assigned for each class, originated in the United States in 1969 and has to a large extent superseded other forms of air racing.

air sac, any of the air-filled extensions of the breathing apparatus of many animals. Air sacs are found as tiny sacs off the larger breathing tubes (tracheae) of insects, as extensions of the lungs in birds, and as end organs in the lungs of certain other vertebrates. They serve to increase respiratory efficiency by providing a large surface area for gas exchange. *See also* pulmonary alveolus.

air-sea interface, boundary between the atmosphere and the ocean waters. The interface is one of the most physically and chemically active of the Earth's environments. Its neighbourhood supports most marine life.

The atmosphere gains much of its heat at the interface in tropical latitudes by back radiation from the heated ocean. In turn, the atmosphere heats the ocean surface in higher latitudes. Atmospheric motion at the interface generates waves and currents. The atmosphere acquires most of its moisture and additional energy in the form of latent heat from the evaporation of water at the interface. Enormous quantities of oxygen and carbon dioxide are exchanged between the atmosphere and the ocean at the interface; this exchange aids and benefits from marine life processes.

The impact of climate at the interface controls the salinities and temperatures of surface ocean waters. The density of seawater is determined by these parameters and, in turn, controls to which depths in the ocean the water masses flow. Photosynthesis, the fundamental basis for oceanic life, takes place just below the interface, where the necessary ingredients of solar energy, carbon dioxide, and nutrient seawater salts are all available.

air space, also spelled *AIRSPACE*, in international law, the space above a particular national territory, treated as belonging to the government controlling the territory. It does not include outer space, which, under the Outer Space Treaty of 1967, is declared to be free and not subject to national appropriation. The treaty, however, did not define the altitude at which outer space begins and air space ends.

air spring, load-carrying component of an air suspension system used on machines, automobiles, and buses. A system used on buses consists of an air compressor, an air-supply tank, leveling valves, check valves, bellows, and connecting piping. Basically, an air-spring bellows is a column of air confined within a rubber and fabric container that looks like an automobile tire or two or three tires stacked on top of one another. The check valves admit additional air to the bellows from the air-supply tank to maintain vehicle height when the load is increased, and the leveling valves vent excess air from the bellows when the vehicle rises because of unloading. The vehicle thus remains at a fixed height regardless of load. Although an air spring is flexible under normal loads, it becomes progressively stiffer when compressed under an increased load. Air suspension was introduced on some luxury cars in the late 1950s, but it was dropped after several model years. Recently, new leveling systems have been developed for passenger cars, including air-adjustable rear shock absorbers; some air-spring systems operate without an air compressor.

air-traffic control, the supervision of the movements of all aircraft, both in the air and on the ground, in the vicinity of an airport. *See* traffic control.

Consult the INDEX first

air warfare, also called *AERIAL WARFARE*, military operations conducted by airplanes, helicopters, or other manned craft that are propelled aloft. Air warfare may be conducted against other aircraft, against targets on the ground, and against targets on the water or beneath it. Air warfare is almost entirely a creation of the 20th century, in which it has become a primary branch of military operations.

The dawn of military aviation occurred at the end of the 18th century, when hot-air balloons were first developed. Balloons were subsequently used as airborne platforms to provide observation of enemy-troop movements in several 19th-century wars. In the early 20th century two lines of development bore fruit, owing to technological improvements of lighter-than-air craft (such as airships) and the invention of the internal-combustion engine. The German soldier Ferdinand von Zeppelin first flew one of his rigid airships in 1900, and the Wright brothers in the United States made the first successful powered flight of a heavier-than-air craft in 1903. Military interest in aviation was stimulated by these endeavours, and thereafter developments were fairly rapid. By World War I, flying units existed in the British, French, German, Russian, and Italian armed forces.

The aircraft used in World War I were mostly biplanes, *i.e.*, craft having two sets of wing surfaces, usually mounted one above the other. These planes were constructed of wooden frames and had fabric skins. Initially aircraft were used only for reconnaissance duties, but the military soon began equipping planes with machine guns so that they could shoot down enemy aircraft and thus gain control of the air. The resulting "dogfights" between opposing fighter planes marked the start of aerial combat. Zeppelin airships were used on medium-distance raids to bomb cities, and the Allies

built airplanes large and powerful enough to drop significant loads of bombs on railways and airfields. By the war's end, air warfare had become a useful but not an essential form of military operations.

The two most important types of military aircraft had emerged in World War I. Fighter airplanes' primary mission was to secure the control of important airspaces by attacking and destroying all types of enemy aircraft that may be operating in those airspaces. Fighters had to be fast, powerful, and highly maneuverable planes equipped with specialized weapons for downing enemy aircraft. Bomber planes' mission was to destroy ground targets by dropping bombs on them. These generally larger, heavier, slower planes needed protection by fighters against enemy-fighter attack.

The period between the world wars was marked by important technological advances in military aircraft. Highly maneuverable but slow biplanes were replaced in the 1930s by much faster monoplanes, and the durable all-metal fuselage (which needed no internal bracing) replaced the flimsy wooden frames and cloth skins of previous aircraft. Streamlining and new high-performance engines gave military aircraft greater speeds, and the mounting of machine guns or small-diameter cannon in the wings (rather than behind the propeller) became a standard practice. Bombers were equipped with bombsights and bomb racks and bays and could thus carry greater loads of bombs and drop them more accurately. A new type of naval vessel, the aircraft carrier, was developed to serve as a floating platform from which aircraft could operate at sea.

The air warfare in World War II was on a greater scale than any seen before or since that conflict. Control of the air was an integral part of the Germans' blitzkrieg tactics, in which fighters and bombers softened up the enemy's forward defensive positions and disrupted his lines of communication and supply in the rear. The first major battle fought exclusively in the air, the Battle of Britain (1940), ended in victory for the British when their fighter forces were able to retain control of England's airspace in the face of concentrated German bomber and fighter raids. Another milestone was the Battle of Midway (1942), the first naval battle fought between aircraft carriers, and the first in which the combat consisted exclusively of bombing raids carried out over distances of several hundred miles. A third milestone was the Allies' strategic air offensive against the German homeland in 1943-45, in which massive air fleets attacked Germany's cities, infrastructure, and industrial capacity. Strategic bombing took on a new significance with the dropping of American atomic bombs on the Japanese cities of Hiroshima and Nagasaki in 1945, thus ending World War II.

In 1944 the development of the world's first jet aircraft foreshadowed the most important postwar developments in military aircraft. Jet-powered aircraft could fly much faster than even the fastest propeller-driven planes, and by the early 1960s the major air forces of the world had totally converted to jet aircraft. Long-range jet bombers were developed that could deliver nuclear bombs over intercontinental distances. The fastest fighter aircraft could fly at two or even three times the speed of sound and carried guided missiles and cruise missiles in addition to machine guns and automatic cannon. Sophisticated radar and other electronics systems enabled pilots to detect and hit their targets amid the quicker tempo of jet-powered aerial combat.

Jet aircraft were extensively employed in a continuing series of limited wars, including the Korean War (1950-53), the Vietnam War (1954-75), the Arab-Israeli wars of 1967 and 1973, and the Soviet intervention in Afghanistan (1979-89). In the meantime, new types of aircraft were developed or adapted for military use. Helicopters were discovered to be ex-

remely useful for the speedy evacuation of wounded from a battle zone. Highly maneuverable helicopter gunships were developed to strafe infantry or other ground targets at close quarters. Vertical (VTOL) or short (STOL) take-off-and-landing aircraft have takeoff capabilities that are similar to those of helicopters but perform as ordinary jet aircraft after having gained altitude. *See also* attack aircraft; bomber; fighter aircraft.

Airborne Warning and Control System (military technology): *see* AWACS.

Airbus Industrie, European aircraft-making consortium formed in 1970 to fill a market niche for short- to medium-range, high-capacity jetliners and to compete with long-established American manufacturers. It is the world's second largest maker of commercial aircraft (after Boeing). Headquarters are near Toulouse, Fr.

Airbus was created as a *Groupement d'Intérêt Economique* (GIE; "Grouping of Mutual Economic Interest"), a unique form of partnership instituted in French law in 1967. In 2001 the GIE was replaced by a single private enterprise. Full members include the German-French-Spanish-owned European Aeronautic Defence and Space Company (EADS), with an 80-percent interest, and Britain's BAE Systems, with 20 percent. Belgium's Belairbus and Italy's Alenia are risk-sharing associate members in selected programs.

Airbus's major partners have a dual role as shareholders and industrial participants, and they perform much of the aircraft subassembly in their own factories. A fleet of special Airbus aircraft (Super Transporter Beluga, based on the A300-600 passenger aircraft) is used to airlift the subassemblies to one of two final assembly lines in France and Germany. The Airbus A300/A310 and A330/A340 aircraft families and the A320 aircraft are completed at a complex near Toulouse, while the A318, A319, and A321 aircraft are assembled in Hamburg, Germany.

Airbus Industrie management company originally was set up with funding shared equally between France's *Aérospatiale* and Germany's *Deutsche Airbus* (a joint venture of *Messerschmitt-Bölkow-Blohm* and *VFW-Fokker*). Spain's *Construcciones Aeronáuticas S.A.* (CASA) joined in 1971 with a 4.2-percent share, and British Aerospace (later BAE Systems) entered with a 20-percent share in 1979. By the end of the 20th century, owing to a series of mergers and consolidations among European firms, EADS had emerged owning 80 percent of the consortium.

Airbus's first product, the short- to medium-range A300, entered service in 1974. It was the first wide-body jetliner equipped with only two engines for more economical operation. The A320 (entered service 1988) incorporated numerous technical innovations, notably fly-by-wire (electric rather than mechanically linked), computer-based flight controls. The four-engine A340 (1993) and smaller, twin-engine A330 (1994) were long-range airliners. In 2000 Airbus launched development of the A380, intended to be the world's largest airliner with a typical seating of 555 passengers.

aircraft carrier, naval vessel from which airplanes may take off and on which they may land. As early as November 1910, an American civilian pilot, Eugene Ely, flew a plane off a specially built platform on the deck of the U.S. cruiser *Birmingham* at Hampton Roads, Va. On Jan. 18, 1911, in San Francisco Bay, Ely landed on a platform on the quarterdeck of the battleship *Pennsylvania*, using wires attached to sandbags on the platform as arresting gear; he then took off from the same ship.

The British navy also experimented with the carrier; during World War I it developed the first true carrier with an unobstructed flight deck, the *HMS Argus*, built on a converted

merchant-ship hull. The war ended before the *Argus* could be put into action, but the U.S. and Japanese navies quickly followed the British example. The first U.S. carrier, a converted collier renamed the *USS Langley*, joined the fleet in March 1922. A Japanese carrier, the *Hosyo*, which entered service in December 1922, was the first carrier designed as such from the keel up.

Aircraft carrier *USS John F. Kennedy*

By courtesy of the U.S. Navy

Fundamentally, the carrier is an airfield at sea with special features necessitated by limitations in size and the medium in which it operates. To aid short takeoffs and landings, airspeeds over the deck are increased by turning the ship into the wind. Catapults flush with the flight deck assist in launching aircraft; for landing, aircraft are fitted with retractable hooks that engage transverse wires on the deck, braking them to a quick stop. The control centres of a carrier are situated in the superstructure (the "island"), at one side of the flight deck. Aircraft landings are guided by radio and radar and by visual signals from the deck.

Carriers were first used in combat during the early stages of World War II. The Japanese attack on Pearl Harbor by carrier-based planes on Dec. 7, 1941, dramatically demonstrated the potential of the aircraft carrier, which thereafter was the dominant combat vessel of the war. The carrier played leading roles in the sea battles of the Pacific theatre, such as Midway Island, Coral Sea, and Leyte Gulf.

Carriers built after the war were larger and had armoured flight decks. Jet aircraft posed serious problems because of their greater weight, slower acceleration, higher landing speeds, and greater fuel consumption. Three British innovations contributed toward solution of these problems: a steam-powered catapult, an angled, or canted, flight deck, and a mirror landing-signal system.

On Sept. 24, 1960, the first nuclear-powered carrier, the *Enterprise*, was launched by the United States. It had no need for the fuel bunkers, smokestacks, and ducts for the elimination of exhaust gases that had occupied space in previous carriers.

Subsequent design modifications produced such variations as the light carrier, equipped with electronic gear for the detection of submarines, and the helicopter carrier, intended for conducting amphibious assault. Another development was the substitution of missile armament for much of the former anti-aircraft firepower. Carriers with combined capabilities are classified as multipurpose carriers.

Airedale terrier, the largest of the terriers, probably descended from the otterhound and an extinct broken-haired dog, the black-and-tan Old English terrier. The Airedale stands about 23 inches (58 cm) and usually weighs from 40 to 50 pounds (18 to 23 kg). It has a boxy appearance, with a long, squared muzzle; in profile, the line of the forehead extends straight to the nose. Its coat is dense and wiry, with a black saddle and with tan legs, muzzle, and underparts. Intelligent and

Airedale terrier
Walter Chandoha

courageous, powerful and affectionate, though reserved with strangers, it has been used as a wartime dispatch carrier, police dog, guard, and big-game hunter. It is nicknamed "king of the terriers."

airfield: *see* airport.

airfoil, also spelled **AEROFOIL**, shaped surface, such as an airplane wing, tail, or propeller blade, that produces lift and drag when moved through the air. An airfoil produces a lifting force that acts at right angles to the airstream and a dragging force that acts in the same direction as the airstream.

High-speed aircraft usually employ low-drag, low-lift airfoils that are thin and streamlined. Slow aircraft that carry heavy loads use thicker airfoils with high drag and high lift.

airframe, basic structure of an airplane or spacecraft excluding its power plant and instrumentation; its principal components thus include the wings, fuselage, tail assembly, and landing gear. The airframe is designed to withstand all aerodynamic forces as well as the stresses imposed by the weight of the fuel, crew, and payload.

Most airframes of early airplanes consisted of a fuselage of truss design constructed of narrow hardwood boards or steel tubing and braced with wires. This basic framework supported the wing structure, which was composed of spars with ribbing. Both the fuselage and wings were covered by a skin of cotton fabric. Airframe construction was radically improved during the 1930s. The aerodynamically contoured fuselage shell characteristic of all modern aircraft was introduced at this time, and high-strength, lightweight metals (chiefly aluminum alloys, magnesium, and some stainless steel and titanium) replaced wood and fabric throughout the airframe.

airglow, faint luminescence of the Earth's upper atmosphere that is caused by air molecules' and atoms' selective absorption of solar ultraviolet and X-radiation. Most of the airglow emanates from the region about 70 to 300 km (42 to 180 miles) above the surface of the Earth. Unlike the aurora, airglow does not exhibit structures such as arcs and is emitted from the entire sky at all latitudes at all times. The nocturnal phenomena is called nightglow. Dayglow and twilight glow are analogous terms.

Nightglow is very feeble in the visible region of the spectrum; the illumination it gives to a horizontal surface at the ground is only about the same as that from a candle at a height of 91 m (300 feet). It is possibly about 1,000 times stronger in the infrared region.

Observations from the Earth's surface and data from rockets and satellites indicate that much of the energy emitted during nightglow comes from recombination processes. In one such process, radiant energy is released when oxygen atoms recombine to form molecular

oxygen, O₂, which had originally become dissociated upon absorbing sunlight. In another process, free electrons and ions (notably ionized atomic oxygen) recombine and emit light.

In the daytime and during twilight, the process of resonance scattering of sunlight by sodium, atomic oxygen, nitrogen, and nitric oxide seems to contribute to airglow. Moreover, interactions between cosmic rays from deep space and neutral atoms and molecules of the upper atmosphere may play a role in both the nocturnal and daytime phenomena in the high latitudes.

Airlangga (Indonesian ruler): *see* Erlangga.

airmail, letters and parcels transported by airplanes. Airmail service was initiated in 1911 in England between Hendon (northwest of London) and Windsor, to celebrate the coronation of George V. Service was irregular, however, and only 21 trips were made. Continuous regular air transport of letters between London and Paris was established in 1919, and a similar service for parcels in 1921. Other European air links soon followed. Regular airmail service in the United States was begun in 1918 between Washington, D.C., and New York City, using War Department planes and pilots. The first transcontinental airmail service was established in 1920, between San Francisco and New York City.

The superiority of air transport for long-distance continental and intercontinental mail routes soon became apparent. Airmail service was extended to Egypt, Karachi, Singapore, and other parts of the British Empire in the 1920s and '30s. Regular transpacific airmail service, from San Francisco to the Philippines (with several stops in between), began in 1935, and regular airmail service across the North Atlantic began in 1939. Since 1946 airmail services have developed rapidly to provide a network connecting Europe and North America with all parts of the world. There are still areas, however, such as in Africa, in which airmail services are relatively poor or incomplete. Air transport of first-class mail without a surcharge has become common within Europe and the United States. Intercontinental air transport of mail is still usually accompanied by a surcharge.

airplane, also called **AEROPLANE**, or **PLANE**, any of a class of fixed-wing aircraft that is heavier than air, propelled by a screw propeller or a high-velocity jet, and supported by the dynamic reaction of the air against its wings.

A brief treatment of airplanes follows. Articles providing fuller treatment appear in the **MACROPAEDIA**. The history of aviation and the technical aspects of aircraft and their operation are treated in **Transportation**. For manufacturing technology, *see* **Industries, Manufacturing**. For military aircraft, *see* **War, The Technology of**.

The essential components of an airplane are a wing system to sustain it in flight, tail surfaces to stabilize the wing, movable surfaces (ailerons, elevators, and rudders) to control the attitude of the machine in flight, and a power plant to provide the thrust to push the craft through the air. An enclosed body (fuselage) houses the crew, passengers, and cargo, as well as the controls and instruments used by the navigator. An airplane also requires a support system (such as wheels or pontoons) when it is at rest on a surface and during takeoff and landing.

Most airplanes in use today are monoplanes (*i.e.*, aircraft with a single pair of wings). They are termed high-wing when the wing is attached at the top of the fuselage, midwing when it extends from or near the centre of the fuselage section, and low-wing when the wing structure fastens to the fuselage structure at the bottom. The biplane with two or more horizontal wing systems, one above the other,

connected by a series of struts and wires, has virtually disappeared. The few biplanes still in service are used mainly for sport flying or for agricultural crop dusting.

Monoplanes may be characterized by the planform (top view) of their wings, which may be rectangular, tapered, swept-back, or delta. A so-called variable-geometry concept incorporating adjustable sweepback is a compromise to obtain good high- and low-speed characteristics from the same wing. For takeoff and landing, hinged wing panels are extended at right angles to the fuselage in order to utilize the advantages of long-span and high-aspect ratio. For high speed and maneuvering in flight, the panels are swung rearward to make (with the tail surfaces) a delta configuration.

The normal location for stabilizers, fins, rudders, and elevators is well behind the wing, mounted on the tapered tail section of the fuselage. The standard arrangement (until the advent of jet engines) was a cruciform assembly, with vertical fins and rudders and horizontal stabilizer and elevators forming a cross, the axis of which was approximately coincident with the fuselage axis. In some large, high-wing airplanes with relatively short, large-diameter fuselages, airflow over the horizontal tail surfaces was disturbed to the extent that control effectiveness under some flight conditions was compromised. Also, in designs in which jet pods were to be mounted at the after end of the fuselage, it was necessary to relocate the horizontal surfaces to keep them clear of the jet blasts. The solution was the so-called T-tail configuration, in which the horizontal surfaces were mounted at the top of the vertical fin structure.

Where three jet engines are used, the fin structure may incorporate the air intake for the centre engine or the entire engine pod. The consequent increase in weight of the tail structure has changed the appearance of many airplanes. To maintain a viable relationship between centre of lift of the wings and the airplane's centre of gravity, the wings were moved aft and the nose section of the fuselage was extended far forward for proper balance.

For two- or four-engined planes (either piston engine or turbine-propeller combinations or turbojets), the power plants are normally distributed outboard along the wings, either in nacelles projecting from wing and edges or in suspended pods. Jet pods are also attached to the rear of the fuselage, as mentioned earlier. A combination of both systems (wing pods and tail pod) may be employed.

Landing-gear configuration depends on whether the aircraft is designed to operate from land airports or from water surfaces or from both. Pneumatic-tired, wheeled landing gear has been used in most airplanes since the earliest days. Spring-loaded, hydraulically damped shock absorbers take up landing impact loads. Wheel brakes are generally hydraulically operated. Until the late 1930s the common arrangement called for a pair of wheels well forward of the airplane centre of gravity with a skid, or tail wheel, aft. The airplane rested on the ground in a distinctly nose-up attitude, only becoming parallel to the ground during takeoff and landing. In the late 1930s the undercarriage plan was reversed. For all large aircraft and most small ones, the main wheels were moved aft to a position well behind the aircraft's centre of gravity and a nose wheel (steerable) installed well forward. The fuselage remains parallel with the ground at rest, during takeoff run, and on landing.

Airplanes that are designed to operate from water are called either float seaplanes or flying boats, depending on their landing apparatus. In float seaplanes the wheeled landing gear is replaced by two buoyant floats, or pontoons. In flying boats the lower part of the fuselage is designed as a boatlike float, and smaller floats are attached to the wings.

For carrier-based planes, landing-gear con-

figurations are similar to those for land-based planes but must be strengthened to take the extra loads imposed by acceleration (from zero to flying speed in some 60 m [200 feet]) by catapult. Also, fuselages must be modified and reinforced to permit installation of a tail hook to engage arresting gear cables strung crosswise on the deck in the landing area. Another necessary modification for carrier-based airplanes is the folding wing, which makes it possible to accommodate a greater number of machines in limited hangar-deck space and to permit handling on the elevators connecting flight deck and hangar deck.

airport, also called AIR TERMINAL, AERODROME, or AIRFIELD, site and installation for the takeoff and landing of aircraft. An airport usually has paved runways and maintenance facilities and serves as a terminal for passengers and cargo.

A brief treatment of airports follows. For full treatment, see MACROPAEDIA: Public Works.

An airplane requires forward speed through the air in order to sustain flight. Attainment of the required speed is accomplished by means of a runway on which the aircraft is accelerated forward from a standing position to the takeoff speed. The runway is used in the opposite manner for a landing; the plane is brought down to the runway at a speed which will just barely sustain flight, and after it is on the ground it is brought to a stop.

The runways are strips of the overall airport area designated for the landing and takeoff of aircraft. In the early days of aviation, large, open, grass-covered fields were used as airports. Known as landing fields, these airports allowed a pilot to head directly into the wind to aid takeoff and landing operations. (Heading into the wind increases a plane's lift on takeoff and slows a plane down during landing.) In the 1930s aircraft became heavy enough that hard runway surfaces (such as concrete or asphalt) were required to keep them from sinking into the turf or mud. These aircraft were still sensitive to crosswinds, however, so most airports were provided with four or five runways aligned in different directions so that pilots could choose one having a minimum amount of crosswind at the time of takeoff or landing. As aircraft continued to increase in weight and speed during the 1930s and '40s, they became less sensitive to crosswinds, and the number of runways was generally reduced to two. Parallel runways are now common; they can handle more traffic and separate takeoff and landing operations. The length of runways has steadily increased; runways of 4,570 m (15,000 feet) have been built to accommodate four-engined jet aircraft capable of carrying 250 or more passengers.

Air-traffic controllers, aided by radar and other electronic navigation devices, direct incoming and outgoing aircraft from airport control towers and control centres located some distance from the airfield. The controllers also direct all aircraft movements on the ground, guiding pilots as they taxi their planes between the loading apron and runway.

Passenger and cargo terminals have grown steadily larger and more complex with the increase in airport size. In some airports special ground transit systems (e.g., monorail or moving sidewalks) have been installed between parking areas and terminals. Passenger boarding is conducted according to either the so-called trickle system, in which boarding procedures are stretched out over a period of time, or the group system, in which all processing is first carried out, and the passengers board in a group. Cargo terminals, where airfreight is loaded, unloaded, and sorted, employ forklift trucks, cargo-cart trains, belt conveyers, and other techniques and machinery.

Lighting is of major importance in an airport, despite the development of instrumented landing systems. A revolving green and white

beacon has long been the visible mark of an airport. High-intensity white or amber approach lights, often running in a straight line beyond the limits of the airport, guide pilots to runways. White runway lights are turned on and off as needed by the control tower or by automatic systems. Green threshold lights indicate the ends of the runways, while blue lights mark the taxiways used by aircraft to enter and exit from runways. Red lights are used to mark obstructions, and red flashing lights are used to warn of high obstructions.

Virtually all governments prescribe standards for construction and operation of airports. The International Civil Aviation Organization issues a set of internationally accepted standards covering number, length, and orientation of runways, visual ground aids, and other details.

airship, also called DIRIGIBLE, or DIRIGIBLE BALLOON (from French *diriger*, "to steer"), a self-propelled, lighter-than-air craft.

Three main types of airships have been built: nonrigids (blimps), semirigids, and rigids. All three types have four principal parts: a cigar-shaped bag, or balloon, that is filled with a lighter-than-air gas; a car or gondola that is slung beneath the balloon and holds the crew and passengers; engines that drive propellers; and horizontal and vertical rudders to steer the craft. Nonrigids are simply balloons with cars attached by cables; if the gas escapes, the balloon collapses. Semirigids likewise depend on the internal gas to maintain the balloon's shape, but they also have a structural metal keel that extends longitudinally along the balloon's base and supports the car. Rigids consist of a light framework of aluminum-alloy girders that is covered with fabric but is not airtight. Inside this framework are a number of gas-filled balloons, each of which can be filled or emptied separately; rigids keep their shape whether they are filled with gas or not.

The usual gases used for lifting airships are hydrogen and helium. Hydrogen is the lightest known gas and thus has great lifting capacity, but it is also highly flammable and has caused many fatal airship disasters. Helium is not as buoyant but is far safer than hydrogen because it does not burn. The gas-containing envelopes of early airships used cotton fabric impregnated with rubber, a combination that was eventually superseded by synthetic fabrics such as neoprene and Dacron.

The first successful airship was constructed by Henri Giffard of France in 1852. Giffard built a 160-kilogram (350-pound) steam engine capable of developing 3 horsepower, sufficient to turn a large propeller at 110 revolutions per minute. To carry the engine weight he filled a bag 44 m (144 feet) long with hydrogen and, ascending from the Paris Hippodrome, flew at a speed of 10 km (6 miles) per hour to cover a distance of about 30 km (20 miles).

In 1872 a German engineer, Paul Haenlein, first used an internal-combustion engine for flight in an airship that used lifting gas from the bag as fuel. In 1883 Albert and Gaston Tissandier of France became the first to successfully power an airship using an electric motor. The first rigid airship, with a hull of aluminum sheeting, was built in Germany in 1897. Alberto Santos-Dumont, a Brazilian living in Paris, set a number of records in a series

of 14 nonrigid, gasoline-powered airships that he built from 1898 to 1905.

The most successful operator of rigid airships was Ferdinand, Count von Zeppelin, of Germany, who completed his first airship, the LZ-1, in 1900. This technically sophisticated craft, 128 m (420 feet) long and 11.6 m (38 feet) in diameter, had an aluminum frame of 24 longitudinal girders set within 16 transverse rings and was powered by two 16-horsepower engines; it attained speeds approaching 32 km (20 miles) per hour. Zeppelin continued improving his designs through World War I, when many of his airships (called zeppelins) were used to bomb Paris and London. Airships were also used by the Allies during the war, chiefly for antisubmarine patrol.

In the 1920s and '30s airship construction continued in Europe and the United States. A British dirigible, the R-34, made a round-trip transatlantic crossing in July 1919. In 1926 an Italian semirigid airship was successfully used by Roald Amundsen, Lincoln Ellsworth, and General Umberto Nobile to explore the North Pole. In 1928 the *Graf Zeppelin* was completed by Zeppelin's successor, Hugo Eckener, in Germany. Before it was decommissioned nine years later it had made 590 flights, including 144 ocean crossings. In 1936 Germany inaugurated a regular transatlantic passenger service with the dirigible *Hindenburg*.

Despite these achievements, airships were virtually abandoned in the late 1930s because of their cost, their slow speed, and their intrinsic vulnerability to stormy weather. In addition, a succession of disasters—the best known probably being the explosion of the hydrogen-filled *Hindenburg* in 1937—coupled with advances in heavier-than-air craft in the 1930s and '40s made dirigibles commercially obsolete for most applications.

airspeed indicator, instrument that measures the speed of an aircraft relative to the surrounding air, using the differential between the pressure of still air (static pressure) and that of moving air compressed by the craft's forward motion (ram pressure); as speed increases, the difference between these pressures increases as well.

Pressures are measured by a Pitot tube, a U-shaped apparatus with two openings, one perpendicular to the flow of air past the aircraft and one facing directly into the flow. Mercury or a similar liquid fills the bend in the tube, forming parallel columns balanced by the air pressure on each side. When static and ram pressure are equal, the columns have the same height. As the ram pressure increases, mercury on that side of the tube is pushed back and the columns become imbalanced. The difference between the two columns can be calibrated to indicate the speed; this value, called the indicated airspeed, may be given in knots, miles per hour, or other units.

Since the airspeed indicator is calibrated at standard temperature and pressure, its readings are inaccurate at different temperatures and altitudes. An (uncorrected) indicated airspeed is still used to estimate an aircraft's tendency to stall. Instruments that electronically correct for altitudinal differences and temperature give the true air-

Graf Zeppelin in flight
The Bettmann Archive

speed, which is used to calculate the aircraft's position. In faster aircraft, indicators that measure airspeed relative to the speed of sound, called Machmeters, are used.

Airy, Sir George Biddell (b. July 27, 1801, Alnwick, Northumberland, Eng.—d. Jan. 2, 1892, Greenwich, London), English scientist who was astronomer royal from 1835 to 1881.

Airy graduated from Trinity College, Cambridge, in 1823. He became Lucasian professor of mathematics at Cambridge in 1826 and Plumian professor of astronomy and director of the Cambridge observatory in 1828. In 1835 he was appointed the seventh astronomer royal—i.e., director of the Royal Greenwich Observatory, a post he would hold for more than 45 years.

Airy, c. 1877

Ann Ronan Picture Library/Image Select International

Airy completely reorganized the Greenwich observatory, installing new apparatus and rescuing thousands of lunar observations from oblivion. Most importantly, he modernized the observatory's system for making extremely precise observations of stellar positions. He wielded great power within the British scientific community, and he opposed government support of pure science, arguing that original research was best left to private individuals and institutions. Modern scholars absolve him of the charge that his hesitation to publicize the calculations of John C. Adams in 1845 somewhat delayed the discovery of Neptune.

Airy in 1827 made the first successful attempt to correct astigmatism in the human eye (his own) by use of a cylindrical eyeglass lens. He also contributed to the study of interference fringes, and the Airy disk, the central spot of light in the diffraction pattern of a point light source, is named for him. Airy was also the first to propose (c. 1855) the theory that mountain ranges must have root structures of lower density, proportional to their height, in order to maintain isostatic equilibrium. He was knighted in 1872.

Aisén, also spelled AYSÉN, in full AISÉN DEL GENERAL CARLOS IBÁÑEZ DEL CAMPO, *región*, southern Chile, bounded on the east by Argentina and on the west by the Pacific Ocean. Aisén includes the Chonos Archipelago, the Taitao Peninsula, and the mainland between the Palena River in the north and O'Higgins Lake in the south. It is divided into the provinces of Aisén, General Carrera, Coihaique, and Capitán Pratt. In the south and east the Andes Mountains rise from 3,000 to 13,000 feet (1,000 to 4,000 m), appearing as rugged blocks separated by glaciated valleys and fjords. Perennial snowfields cap most elevations above 3,000 feet; glaciers extend into the valleys and, in some cases, to the sea. The rough land at lower elevations is forested, chiefly with broad-leaved evergreens. Heavy, all-year rains and uniformly cool temperatures

prevail. The rivers of Aisén are among the most turbulent in Chile.

The region's inhabitants grow potatoes and wheat and raise sheep and cattle. Lumber, lead, and zinc are also produced in the region. Coihaique is the largest town and regional capital. Area 42,095 square miles (109,025 square km). Pop. (1994 est.) 86,814.

'Ā'ishah, in full 'Ā'ISHAH BINT ABI BAKR (b. 614, Mecca, Arabia [now in Saudi Arabia]—d. July 678, Medina), the third and most favoured wife of the Prophet Muḥammad (the founder of Islām), who played a role of some political importance after the Prophet's death.

All Muḥammad's marriages had political motivations, and in this case the intention seems to have been to cement ties with 'Ā'ishah's father, Abū Bakr, who was one of Muḥammad's most important supporters. 'Ā'ishah's physical charms, together with the genuine warmth of their relationship, secured her a place in his affections that was not lessened by his subsequent marriages. It is said that in 627 she accompanied the Prophet on an expedition but became separated from the group. When she was later escorted back to Medina by a man who had found her in the desert, Muḥammad's enemies claimed that she had been unfaithful. Muḥammad, who trusted her, had a revelation asserting her innocence and publicly humiliated her accusers. She had no important influence on his political or religious policies while he lived.

When Muḥammad died in 632, 'Ā'ishah was left a childless widow of 18. She remained politically inactive until the time of 'Uthmān (644–656; the third caliph, or leader of the Islāmic community), during whose reign she played an important role in fomenting opposition that led to his murder in 656. She led an army against his successor, 'Alī, but was defeated in the Battle of the Camel. The engagement derived its name from the fierce fighting that centred around the camel upon which 'Ā'ishah was mounted. Captured, she was allowed to live quietly in Medina.

aisle, portion of a church or basilica that parallels or encircles the major sections of the structure, such as the nave, choir, or apse (aisles around the apse are usually called ambulatories). The aisle is often set off by columns or by an arcade.

The name derives from the French for "wing," because in Romanesque architecture the aisles flanked only the nave and were often covered by roofs of lower height, thus forming wings. Although the aisle area may be used for seating, especially in more recent times, it was originally intended as a path to seats or to the front of the church. Today, the word also refers to any passageway that gives access to seating in a church, theatre, or other public structure.

Aisne, département, Picardie *région*, northern France. Aisne was created from parts of the old provinces of the Île de France, Picardy, and Champagne. It touches the Ardennes Forest and the Belgian frontier on the northeast. The Aisne River enters the *département* from the east and flows west to join the Oise River. Outlying masses of rock, often with steep flanks, occur in much of the region and form important sites such as that of Laon, the capital, and the Chemin des Dames ridge.

Aisne receives 20 to 30 inches (500 to 750 mm) of precipitation annually and contains rich grainlands in the south and west, with dairying in the hilly Thiérache country (northeast). Beet sugar is an important industrial crop. Saint-Quentin and other towns weave silk, cotton, and wool, and Saint-Gobain has made mirrors since the 17th century. The agricultural and industrial centre of northern Aisne is Guise.

Laon, Soissons, Saint-Quentin, Château-Thierry, and Vervins head *arrondissements*

and are the chief towns. The *département* is in the educational division of Douai.

Several of Aisne's architectural monuments were destroyed in World War I. The medieval churches of Laon, Braine, and Urcel survive, however, and the basilica of Saint-Quentin was restored. The ruined castle of La Ferté-Milon also escaped war damage. The German offensive in 1918 against the Chemin des Dames is sometimes called the Battle of the Aisne. The battlefield around the town of Château-Thierry lies nearby, to the south. Area 2,845 square miles (7,369 square km). Pop. (1993 est.) 540,500.

Aistis, Jonas, also called JONAS KOSSU-ALEKSANDRAVIČIUS, or JONAS KUOSA-ALEKSANDRIŠKIS, pseudonym of JONAS ALEKSANDRAVIČIUS (b. July 7, 1904, Kampiškės, near Kaunas, Lithuania, Russian Empire—d. June 13, 1973, Washington, D.C., U.S.), poet whose lyrics are considered among the best in Lithuanian literature and who was the first modern Lithuanian poet to turn to personal expression.

Aistis studied literature at the University of Kaunas and in 1936 went to France to study French literature at the University of Grenoble, receiving his doctorate in 1944. Because of the Soviet occupation, he did not return to Lithuania but went in 1946 to the United States, where, in 1958, he joined the staff of the Library of Congress, Washington, D.C.

Aistis' early collections of verse, written while he was still in Lithuania, contain his finest work; especially noteworthy is his fourth collection, *Užgesę chimeros akys* (1937; "The Dead Eyes of the Chimera"). His patriotic verse, written in exile, was not as successful as his earlier work. Three collections of his essays were also published, and he edited several collections of poetry, among them *Lietuvių poezijos antologija* (1950; "Anthology of Lithuanian Poetry"). *Poezija* (1961; "Poetry") contains his collected poems to that time.

Aitken, John (b. Sept. 18, 1839, Falkirk, Stirlingshire, Scot.—d. Nov. 14, 1919, Falkirk), Scottish physicist and meteorologist who, through a series of experiments and observations in which he used apparatus of his own design, elucidated the crucial role that microscopic particles, now called Aitken nuclei, play in the condensation of atmospheric water vapour in clouds and fogs. Ill health prevented Aitken from holding any official position; he worked instead in the laboratory in his home in Falkirk. Much of his work was published in the journals of the Royal Society of Edinburgh, of which he was a member.

Aitken, Robert Grant (b. Dec. 31, 1864, Jackson, Calif., U.S.—d. Oct. 29, 1951, Berkeley, Calif.), American astronomer who specialized in the study of double stars, of which he discovered more than 3,000.

From 1891 to 1895 Aitken was professor of mathematics and astronomy at the University of the Pacific, Stockton, Calif. In 1895 he joined the staff of Lick Observatory, Mt. Hamilton, Calif., as assistant astronomer, be-

Aitken

coming associate director in 1923 and director in 1930; he retired in 1935. He published *The Binary Stars* (1918) and *New General Catalogue of Double Stars Within 120° of the North Pole* (1932).

Aix-en-Provence, city, Bouches-du-Rhône *département*, Provence-Alpes-Côte-d'Azur *région*, southern France, north of Marseille. Lying on the plain 1 mile (1.6 km) from the right bank of the Arc River, it is on the crossroads of main routes to Italy and the Alps. The conquering Roman proconsul Sextius Calvinus built a huge entrenched camp called *Aquae Sextiae* in the valley about 123 BC. In 102 BC, Marius routed the Teutons at the Battle of Aix. The Visigoths, Franks, Lombards, and finally Muslim invaders from Spain successively plundered the town. As the medieval capital of Provence, governed by the counts and dukes of Anjou, Aix flowered as a centre

The Fontaine de la Rotonde in the Place de la Liberation off Cours Mirabeau, Aix-en-Provence
Carol Gachet

of learning and the arts. Its university, now the Universities of Aix-Marseille, was founded in 1409 and recognized by papal bull in 1413. In 1486 Provence passed to the French crown, and Aix became the seat of a *parlement*.

North of the tree-lined Cours Mirabeau lies the old town, with Roman ruins and structures of the Middle Ages around the 11th–13th-century archdiocesan Saint-Sauveur Cathedral; southward is the “new” town, rich in fine 17th- and 18th-century houses, surrounded on all sides by recent urban growth. The hot mineral springs—the most noted is the Thermes Sextius—are still used for rheumatic and vascular diseases. Serene, sun-dappled, and fountain-splashed, Aix is an agricultural centre, especially noted for Provençal olives and almonds from the countryside painted by Paul Cézanne, whose atelier is preserved as one of several city museums. Since the city functions principally as a residential suburb of Marseille, industrial development is light but includes food processing and electrical machinery. Pop. (1990) 126,854.

Aix-la-Chapelle (Germany): see Aachen.

Aix-la-Chapelle, Congress of (Oct. 1–Nov. 15, 1818). the first of the four congresses held by Great Britain, Austria, Prussia, Russia, and France to discuss and take common action on European problems following the Napoleonic Wars (1800–15). This congress (held at Aix-la-Chapelle—now Aachen, Ger.) was attended

by Alexander I of Russia, Francis I of Austria, Frederick William III of Prussia, and their representatives. Great Britain was represented by Viscount Castlereagh and by the Duke of Wellington. Armand-Emmanuel, Duke de Richelieu, represented France.

At the first session Richelieu offered to pay most of the war indemnity owed by France to the allies in return for the withdrawal of their armies of occupation by November 30. This offer was accepted. On October 9 a treaty was signed settling the claims against France as a result of the wars. France was admitted to the new Quintuple Alliance as an equal. Although the old Quadruple Alliance of Great Britain, Austria, Prussia, and Russia was secretly renewed in a protocol signed on November 15, this renewal was largely a formality.

The congress also discussed suppression of the slave trade and of the Barbary pirates, but no decision was reached. The status of Jews and many other questions were considered.

Aix-la-Chapelle, Treaty of (Oct. 18, 1748). treaty negotiated largely by Britain and France, with the other powers following their lead, ending the War of the Austrian Succession (1740–48). The treaty was marked by the mutual restitution of conquests, including the fortress of Louisbourg on Cape Breton Island, Nova Scotia, to France; Madras in India, to England; and the barrier towns to the Dutch. The right of the Habsburg heiress Maria Theresa to the Austrian lands was guaranteed, but the Habsburgs were seriously weakened by the guarantee to Prussia, not a party to the treaty, of its conquest of Silesia. Both Britain and France were trying to win the friendship of Prussia, now clearly a significant power, for the next war. Maria Theresa gave up to Spain the duchies of Parma, Piacenza, and Guastalla in Italy. The treaty confirmed the right of succession of the house of Hanover both in Great Britain and in Hanover. In the commercial struggle between England and France in the West Indies, Africa, and India, nothing was settled; the treaty was thus no basis for a lasting peace.

Aix-Marseille I, II, and III, Universities of, French UNIVERSITÉS D'AIX-MARSEILLE I, II, ET III, coeducational, state-financed, autonomous institutions of higher learning at Aix-en-Provence and Marseille, founded under France's 1968 Orientation Act, reforming higher education. The institutions developed out of the original University of Provence, founded in 1409 as a *studium generale* by Louis II of Provence and recognized by papal bull in 1413. From the 15th to the 18th century it developed as an institution of classical learning, liberal arts, theology, law, and medicine. It was suppressed during the French Revolution, reestablished in Aix and Marseille, and came to be known as Aix-Marseille.

In 1896 Aix-Marseille became one of 17 self-governing regional universities financed by the state. Under the Orientation Act of 1968, Aix-Marseille was divided into three institutions, each with independent units of teaching and research. The University of Provence (Aix-Marseille I) is primarily a school of languages and letters. It has an observatory and a centre for tele-education. The University of Aix-Marseille (Aix-Marseille II) is primarily a school of medicine and sciences. The University of Law, Economics and Science (Aix-Marseille III) was added in 1973 in restructuring of Aix-Marseille I and II.

Aizawa Yasushi, also called AIZAWA SEISHISAI (b. July 5, 1782, Mito, Hitachi Province, Japan—d. Aug. 27, 1863, Mito). Japanese nationalist thinker whose writings helped provoke the movement that in 1868 overthrew the Tokugawa shogunate and restored power to the emperor.

Aizawa's fief of Mito, one of the branches of the great Tokugawa family, was a centre

of Confucian learning and loyalty. Thus, the threat to these traditional beliefs posed by growing contact with the West was keenly felt in Mito. Writing in the early 19th century, when Western ships were first beginning to be seen off the Japanese coast, Aizawa argued that the new “barbarians” had to be dealt with decisively, but that in order to do so Japan had to adopt certain Western military techniques and develop her armaments and defenses. Even so, contact with foreigners should be limited, according to Aizawa, for to encourage trade would undermine the Japanese nation. He realized that the real threat to the country was a weak, apathetic citizenry; strength could be ensured only through promotion of nationalistic sentiment, including loyalty to the emperor as the real sovereign.

According to Aizawa, Japan's natural supremacy and its unique position at the centre of the world resulted from the fact that the Japanese ruling line was directly descended from Amaterasu (the sun goddess), and the basis of morality, which had become confused by the introduction of the false doctrines of Buddhism, was loyalty to the emperor; emperor worship thus provided the basis of later Japanese ultranationalism. Aizawa's book *Shinron* (“New Proposals”), stressing the supremacy of the Japanese nation, remained influential well into the 20th century.

Aizawl, town and capital of Mizoram state, northeastern India. It is situated on a ridge at an elevation of about 2,950 feet (900 m) and is the most populous town in the state. In the 1970s Aizawl was the scene of an armed attack on the government treasury and other offices by members of the Mizo National Front. Aluminum utensils, handloomed textiles, and furniture are manufactured in the town. Electricity is generated by a diesel-power station, and there is an airport nearby.

The surrounding region is a part of the Assam-Myanmar (Burma) geologic province, with north-south-aligned, steeply inclined hill ranges. The rapid Dhaleswari (Tiwang), Tui-vawl, and Sonai (Tuirail) rivers and their tributaries crisscross the region. Timber and bamboo are collected from the dense hillside forests. The soil cover is generally thin except in the river valleys, where rice, corn (maize), beans, tobacco, cotton, pumpkins, oilseeds, and peanuts (groundnuts) are grown. Poultry raising, hunting, fishing, and animal husbandry supplement agriculture. Handweaving, blacksmithing, carpentry, basketmaking, and hat making are the main cottage industries. The Mizo Hills tribes of the region are mostly emigrants from Myanmar, and most have become Christians. The Border Roads Organization has built many paved roads in the area. Pop. (1991 prelim.) 154,343.

Aizu-wakamatsu, city, Fukushima *ken* (prefecture), Honshu, Japan, in the centre of the Aizu basin, surrounded by volcanic mountains. A castle was built on the site in 1384. Much of the present city dates from 1590, when the castle was rebuilt and named Tsugata Castle. During the Tokugawa period (1603–1867), Aizu-wakamatsu was an important commercial and manufacturing centre, famous for its lacquer ware. It was held as a fief by a member of the Tokugawa family and was the scene of the last resistance to the Meiji Restoration (1868). During the final battle, the city was razed and the castle destroyed.

In the late 19th century Aizu-wakamatsu became an administrative centre, and its commercial importance was strengthened with the arrival of a railway. Most of its industry continues to be traditional, with small-scale establishments producing lacquer ware, ceramic ware, sake (rice wine), decorative candles, and characteristic little paper oxen (*akabeko*).

Larger plants for the production of lacquer ware have been built. Tourists are attracted by the city and the castle (rebuilt in 1965). On Mount Imori, outside the city, is the cemetery for the samurai of the White Tiger Corps, who withstood the Meiji forces. Natu-

Tsuruga Castle (14th century, rebuilt in 1965) in Aizu-wakamatsu, Japan

ral tourist attractions include the hot springs and maple groves at Mount Higashi, to the southeast. Pop. (1991 est.) 119,289.

Ajaccio, town, capital of Corse-du-Sud *département*, Corse *région*, France, and Mediterranean port, on the west coast of the island of Corsica. Napoleon's birthplace, Maison Bonaparte, is now a museum, as is part of the city hall. The original settlement of Ajax was founded by the Romans 2 miles (3 km) north of the present site, to which the town was removed by the Genoese in 1492. Save for the period 1553–59, the city did not become French until 1768. From 1793 to 1811, Ajaccio was the capital of Liamone *département*, and in 1976 it was made capital of Corse-du-Sud *département*, one of the two into which the island was divided. Its economy rests largely on tourism, but there is some light in-

Ajaccio, on the Mediterranean coast of western Corsica

Ajanta Caves, Buddhist rock-cut cave temples and monasteries, near Ajanta village,

Ajanta Caves in north-central Mahārāshtra, India
Art Resource

north-central Mahārāshtra state, western India, celebrated for their wall paintings. The temples are hollowed out of granite cliffs on the inner side of a 70-foot (20-metre) ravine in the Wagurna River valley, 65 miles (105 km) northeast of Aurangābād, at a site of great scenic beauty.

The group of some 30 caves was excavated between the 1st century BC and the 7th century AD and consists of two types, *caityas* ("sanctuaries") and *vihāras* ("monasteries"). Although the sculpture, particularly the rich ornamentation of the *caitya* pillars, is noteworthy, it is the fresco-type paintings that are the chief interest of Ajanta. These paintings depict colourful Buddhist legends and divinities with an exuberance and vitality that is unsurpassed in Indian art.

Ajaria, also spelled ADZHARIYA, or ADŽARIJA, republic in Georgia, in the southwestern corner of that country adjacent to the Black Sea and the Turkish frontier. It is largely mountainous with the exception of a narrow coastal strip. Batumi (*q.v.*) is the capital and largest city. Ajaria was under Turkish rule from the 17th century until 1878, when it was annexed by Russia and attached to Georgia. From 1922 to 1991 it was an autonomous republic of the U.S.S.R.

Two east-west ranges, the Ajar-Imeretinsky in the north and the Shavshetsky in the south, rise from the Black Sea coastal lowlands to

41° to 46° F (5° to 8° C) and average August temperatures ranging from 70° to 73° F (21° to 23° C). The climate becomes more severe in the foothills and mountains as elevation increases; above 6,000 feet (1,800 m) it is cold, and snow lies on the summits for six months. The highest rainfall in Georgia occurs at Batumi, where an average 62 inches (1,600 mm) are recorded annually. Subtropical vegetation prevails in the lowland areas, and coniferous forests, scrub, and alpine meadows predominate on the mountain slopes.

The population includes Georgians, Russians, Armenians, and the Ajars themselves, a Georgian population Islamicized under Turkish rule. Although the Ajars are not a nationality distinct from other Georgians, they do represent a distinctive cultural segment of the Georgian homeland. Of the total population, less than one-half is urban and two-thirds live in the coastal lowlands and foothills.

Subtropical crops, which form the basis of the republic's economy, include tea, citrus fruits, and avocados, tung trees (for oil), eucalyptus trees (camphor oil), and bamboo. Tobacco is grown in the higher areas, in which livestock raising is also important. Industrial development is concentrated around Batumi, the terminus of a pipeline from Baku on the Caspian Sea. Industrial activity includes oil refining, shipping and shipbuilding, food processing, light manufacturing, and the production of wine, plywood, furniture, and chemical pharmaceuticals. The republic is linked with the rest of Georgia by a road over the Goderdzi Pass in the Arsiyan Mountains and by the Transcaucasian Railway, which runs north along the coast from Batumi, then eastward. Ajaria has air services from Batumi to Tbilisi, Georgia; Moscow; and other cities. Area 1,200 square miles (3,000 square km). Pop. (1991 est.) 381,500.

Ajax (Latin), Greek ΑΙΑΣ, byname AJAX THE GREATER, in Greek legend, son of Telamon, king of Salamis, described in the *Iliad* as being of great stature and colossal frame, second only to the Greek hero Achilles in strength and bravery. He engaged Hector (the chief Trojan warrior) in single combat and, with the aid of the goddess Athena, rescued the body of Achilles from the hands of the Trojans. He competed with the Greek hero Odysseus for the armour of Achilles but lost, which so enraged him that it caused his death. According to a later story Ajax' disappointment drove him mad. On coming to his senses he slew himself with the sword that he had received as a present from Hector. The legend has it that from his blood sprang a red flower that bore on its leaves the initial letters of his name, AI, letters that are also expressive of lament. Ajax was the tutelary hero of the island of Salamis, where he had a temple and an image and where a festival called Aianteia was celebrated in his honour.

Ajax (Latin), Greek ΑΙΑΣ, byname AJAX THE LESSER, in Greek legend, son of Oileus, king of Locris. In spite of his small stature, he held his own among the other heroes before Troy; but he was also boastful, arrogant, and quarrelsome. For his crime of dragging King Priam's daughter Cassandra from the statue of the goddess Athena and violating her, he barely escaped being stoned to death by his Greek allies. Voyaging homeward, his ship was wrecked, but Ajax was saved. Then, boasting of his escape, he was cast by Poseidon into the sea and drowned.

Ajax was worshiped as a national hero by the Opuntian Locrians (who lived on the Malian Gulf in central Greece and on whose coins he appeared), who always left a vacant place for him in their battle line.

Ajdukiewicz, Kazimierz (b. Dec. 12, 1890, Tarnopol, Pol., Austro-Hungarian Empire [now Ternopol, Ukraine]—d. April 12,

1963, Warsaw, Pol.), Polish logician and semanticist who was the chief contributor to the Warsaw school of philosophy and logic, which analyzed the relationship of language and knowledge. He is credited with developing in 1920 the first deductive theory for the study of logic based on syntax.

Obtaining a doctorate from the University of Lvov, where he studied philosophy, physics, and mathematics, Ajdukiewicz lectured in philosophy at the universities of Lvov, Poznań, and Warsaw (1921–61). His principal works include *Z metodologii nauk dedukcyjnych* (1921; "On the Methodology of the Deductive Sciences"), articles in the periodical *Studia Logica*, and a collection of his articles from 1920 to 1939 and 1946 to 1964 entitled *Język i poznanie*, 2 vol. (1960–65; "Language and Knowledge").

ajiva, Sanskrit *AJĪVA*, in the Jainist philosophy of India, "nonliving substance," as opposed to *jiva*, "soul" or "living matter." *Ajiva* is divided into: (1) *ākāśa*, "space," (2) *dharmā*, "that which makes motion possible," (3) *adharma*, "that which makes rest possible," and (4) *pudgala*, "matter." *Pudgala* consists of atoms; is eternal yet subject to change and development; is both gross (that which it is possible to see) and subtle (that which cannot be perceived by the senses). The invisible karma (causative) matter that adheres to and weighs down the soul is an example of subtle *pudgala*. The first three types of *ajiva* are necessary conditions for the subsistence of both souls and matter.

Some of the above terms are also used in Buddhist philosophy, but with meanings that are quite different.

To make the best use of the Britannica, consult the INDEX first

Ājivika, an ascetic sect that emerged in India about the same time as Buddhism and Jainism. It was founded by Gośāla Maskariputra (also called Gosālo Makkhaliputto), a contemporary and early friend of Mahāvīra, the founder of Jainism. His doctrines and those of his followers are known only from Buddhist and Jainist sources, which record that he was lowborn and that he died shortly before the Buddha after a quarrel with Mahāvīra.

The sect professed a total determinism in the transmigration of souls, or series of rebirths. Whereas other groups allowed that man himself can better his lot in the course of his transmigration, the Ājivikas held that the affairs of the entire universe were ordered by a cosmic force called *niyati* (Sanskrit: "rule," or "destiny"), which determined all events and thus man's fate to the last detail and which barred personal efforts to change or accelerate improvement. "Just as a ball of string will, when thrown, unwind to its full length, so fool and wise alike will take their course." Despite this melancholy view of man's condition, the Ājivikas practiced austerities not for any purposeful goal but because their *niyati* had determined them to do so.

After a period of acceptance during the reign of the Maurya dynasty (3rd century BC), the sect apparently dwindled, although followers lived on until the 14th century in the region that became the modern state of Mysore. In latter-day developments of the sect, the founder Gośāla came to be worshiped as a divinity, and the tenet of *niyati* developed into the doctrine that all change was illusory and that everything was eternally immobile, the last consequence of a consistent determinism.

'Ajjul, Tall al-, ancient site in southern Palestine, located at the mouth of the Ghazzah Wadi just south of the town of Gaza (modern Ghazzah). The site, often called "ancient Gaza," was excavated between 1930 and 1934 by British archaeologists under the direction

of Sir Flinders Petrie. Although the earliest remains on the site date back perhaps as far as 2100 BC, the town seems to have reached its zenith during the Middle Bronze Age (c. 2300–c. 1550 BC), especially during the 17th and 16th centuries, when it was probably controlled by the Hyksos (15th Dynasty) rulers of Egypt. Included in the remains of that period were a great Hyksos-style fosse (defense ditch), portions of several private dwellings, and a large building covering an area of about a half an acre. If, as seems probable, the building is to be identified as a palace, it is the largest palace of that period yet discovered in Palestine. The palace was succeeded by four other large buildings, the last of which probably dated from about 1200 BC.

Ajka, post-1945 industrial town, Veszprém megye (county), west-central Hungary, 15 miles (24 km) west of Veszprém in the Csinger valley in the Bakony Mountains. Ajka developed as a small coal-mining village in the late 19th century, but major growth occurred in the mid-20th century. In 1942 the German occupation forces began bauxite exploitation of a deposit considered to be Europe's largest. Ajka now has an aluminum furnace, an alumina works, a glassworks, food-processing facilities, and a telecommunications parts factory. Major brown-coal-mining centres in the vicinity are Halimba, Szóc, and Nyirád. Manganese is mined at Urkút. Pop. (1989 est.) 34,000.

'Ajmān, also spelled 'UJMĀN, constituent emirate of the United Arab Emirates (formerly Trucial States, or Trucial Oman); the smallest state of the country. It is composed of three sections; the principal portion, on the Persian Gulf coast, is completely surrounded by the emirate of ash-Shāriqah. This section is the site of 'Ajmān town, the capital and only urban settlement. 'Ajmān also includes two interior exclaves (noncontiguous sections) on the Oman promontory, the horn of the Arabian Peninsula. They are tiny al-Manāmah, 37 miles (60 km) east-southeast of 'Ajmān town, and Maşfūt, 56 miles (90 km) southeast of 'Ajmān town, in the Ḥattā Wadi, at the promontory's base. Estimated total area is 100 square miles (250 square km).

The sheikh of 'Ajmān signed the British-sponsored General Treaty of Peace, abjuring piracy, in 1820; this was 'Ajmān's first recognition as an autonomous state. It also subscribed to the maritime truce of 1835 and to the Perpetual Maritime Truce in 1853. To forestall Turkish and French expansion along the Trucial Coast, the sheikhs, including 'Ajmān's ruler, signed an Exclusive Agreement (1892), placing their foreign relations in the hands of the British government. In 1968, Britain announced its forthcoming withdrawal from the Persian Gulf area. Negotiations were begun to create a nine-member federation (including 'Ajmān, the six other Trucial States, Bahrain, and Qatar). The latter two states abandoned the proposed federation and became separately independent (August and September 1971). The British left the area in December 1971, and the United Arab Emirates was formed, of which 'Ajmān was an original constituent.

Economically, 'Ajmān is the poorest member of the United Arab Emirates. Shortly after 1900, when the sheikh's influence extended only a few miles from 'Ajmān town, about 40 pearling boats and a date-palm plantation there were the sole economic activities. From 1961 to the early 1970s, one of 'Ajmān's main sources of revenue was from the sale of many varieties of postage stamps, designed to be of interest to Western collectors. These stamps were never shipped to 'Ajmān and served no legitimate postal purpose; most were not recognized by reliable philatelic organizations and catalogs. Some commemorative coins were also issued. In 1972, the United Arab

Emirates announced the establishment of a post office department, to take over philatelic emissions from member emirates.

Much of the emirate's revenue is provided by grants from the oil-rich member emirate of Abu Dhabi; 'Ajmān town now boasts a modern ruler's palace and includes other up-to-date structures. The deepening of the creek at 'Ajmān town in order to provide deep-water port facilities was undertaken during the 1970s, and a prefabricated-housing factory was built. There is also a ship repair yard. 'Ajmān's interior exclaves have some agriculture; al-Manāmah has a camp of the national defense forces, and Maşfūt has deposits of high-quality marble. The state has little commerce and industry. Foreign aid from Kuwait has helped in the establishment of a few schools. Petroleum concessions have been granted to Western companies, but no oil has been found. 'Ajmān town is connected by paved road with Dubayy town and Ra's al-Khaymah town. Pop. (1985 prelim.) 64,318.

Ajmer, also spelled AJMERE, or AJMIR, city, central Rājasthān state, northwestern India. The city is on the lower slopes of Tārāgarh Hill, on the summit of which stands a fortress. It was probably founded about 1100 and was the capital of the former state. Architectural monuments include an ancient Jaina temple (converted c. 1200 into a mosque); the

The Shrine of Khwājah Ṣaḥīb at Ajmer, Rājasthān, India

Baldev—Shostal Assoc./EB Inc

white marble tomb complex of the Muslim saint Mu'ih-ud-Din Chishtī (d. 1236); and the palace of Akbar (Mughal emperor who reigned from 1556 to 1605), now a museum. The city was a Muslim military base used in operations against the Rājputs (the warrior people who ruled the historic region of Rājputāna). To the north lies Anā Śāgar, a lake created in the 11th century, on the shores of which stand marble pavilions built by Shāh Jahān (Mughal emperor of India from 1628 to 1658). Situated on major road and rail routes, Ajmer is a trade centre for salt, mica, cloth fabrics, and agricultural products. Industries include railway workshops and oilseed mills; cotton and

woolen fabrics as well as hosiery, soap, shoes, saddlery, and pharmaceuticals are produced there. Ajmer is known for its handicrafts and cloth weaving and dyeing.

Ajmer lies in a hilly region that forms part of the Arāvalli Range and its outliers and is drained by headstreams of the Lūni River flowing southwestward and by tributaries of the Banās River flowing eastward. Agriculture is the principal occupation; and corn (maize), wheat, millet, gram (chick-pea), barley, cotton, oilseeds, chilies, and onions are the chief crops. The region also has cotton, textile, and hosiery mills and cotton-ginning and pressing factories. Mica, feldspar, and building-stone deposits are worked.

Ajmer was founded by Ajayadeva, an 11th-century Rājput ruler; it was annexed to the Delhi Slave dynasty in 1193. Upon payment of tribute it was returned to its Rājput rulers, but it was taken by Akbar I in 1556. In 1770 it was annexed by the Marāṭhās, after which the area was a continual Rājput-Marāṭhā battleground until it was ceded to the British in 1818. In 1878 the region of Ajmer was constituted as a chief commissioner's province known as Ajmer-Merwara and was divided into two separate tracts. The larger of these comprised Ajmer and Merwara subdivisions; the smaller, to the southeast, comprised Kekri subdivision. It became a part of the state of Rājasthān in 1956. Pop. (1991 prelim.) 401,930.

Ajo, town, Pima county, southwestern Arizona, U.S. Spaniards mined in the area in the 1750s, and the Ajo Copper Company (1854) was the first incorporated mining concern in the Arizona Territory. The mines remained dormant from about 1860 until the 1900s when a townsite was laid out and a railroad built to Gila Bend, 40 miles (64 km) north. The town's economy virtually depends on the Phelps Dodge Corporation, which operates the New Cornelia Open Pit Mine (390 acres [158 hectares]) and a smelter plant. The community, originally named *Muy Vavi* (Papago: "Warm Water"), was renamed Ajo (Spanish: "Garlic"), for the wild garlic found in the surrounding hills. Nearby are the Papago Indian Reservation (east), the Cabeza Prieta National Wildlife Refuge (west), and the Organ Pipe Cactus National Monument (south). Pop. (1990) 2,919.

AK-47, also called **KALASHNIKOV MODEL 1947**, Soviet assault rifle, one of the most widely used shoulder weapons in the world. The initials AK represent *Avtomat Kalashnikov*, Russian for "automatic Kalashnikov," for its designer, Mikhail Timofeyevich Kalashnikov (b. 1919). It has both semiautomatic and automatic capabilities and fires intermediate-power 7.62-millimetre ammunition.

The AK-47 is a short and well-designed gun. It has a separate gas return tube above the barrel, a long box magazine that holds 30 rounds, and a cyclic firing rate of 600 rounds per minute. It is manufactured in several countries in two basic designs. One has a wooden stock, the other a folding metal stock. In the 1980s the AK-47 was replaced by the AKM, a modernized version with better sights but the same basic operation. The AK-47 and its AKM version, however, remained the basic shoulder weapons for virtually all communist armies, as well as for many guerrilla and nationalist movements throughout the world. It was produced in the Soviet Union, Bulgaria, China, East Germany, Hungary, North Korea, Poland, Romania, and Yugoslavia.

Ak Koyunlu, also spelled **AQ QOYUNLU** (Turkish: "White Sheep"), Turkmen tribal federation that ruled northern Iraq, Azerbaijan, and eastern Anatolia from AD 1378 to 1508.

The Ak Koyunlu were present in eastern Anatolia at least from 1340, according to Byzantine chronicles, and most Ak Koyunlu leaders, including the founder of the dynasty, Kara Osman (reigned 1378–1435), married Byzantine princesses.

In 1402 Kara Osman was granted all of Diyār Bakr in northern Iraq by the Turkic ruler Timur. The strong presence of the Kara Koyunlu (*q.v.*: "Black Sheep"), a rival Turkmen federation, in western Iran and Azerbaijan temporarily checked any expansion, but the rule of Uzun Ḥasan (1452–78) brought the Ak Koyunlu to fresh prominence. With the defeat of Jihān Shāh, the Kara Koyunlu leader, in 1467 and the defeat of Abū Sa'īd, the Timurid, in 1468, Uzun Ḥasan was able to take Baghdad, the Persian Gulf, and Iran as far east as Khorāsān. The Ottoman Turks were simultaneously (1466–68) moving eastward in Anatolia, threatening Ak Koyunlu domains and forcing Uzun Ḥasan into an alliance with the Qaramānids of central Anatolia. In 1464 the Ak Koyunlu had already turned to the Venetians, enemies of the Ottomans, in an attempt to stave off the inevitable Ottoman attack. Despite promises of military aid, the Venetian arms never were provided, and Uzun Ḥasan was defeated by the Ottomans in Tercan (modern Mamahatun) in 1473.

Ya'qūb (reigned 1478–90) sustained the dynasty a while longer, but after his death the Ak Koyunlu were torn apart by internal strife and ceased to be a threat to their more powerful neighbours. The Ṣafavids of Iran, members of the Shī'ite sect of Islām, were already undermining the allegiance of some of the Ak Koyunlu, predominantly of the Sunnite sect. The two powers met in battle near Nakhichevan in 1501–02, and the Ak Koyunlu Alwand was defeated by Esmā'il I. In his retreat from the Ṣafavid armies, Alwand in his turn destroyed an autonomous Ak Koyunlu state in Mardin, Diyār Bakr (1503). The last Ak Koyunlu ruler, Murād, who had been contending for power with his brothers Alwand and Muḥammad since 1497, was also defeated by Esmā'il (1503). Murād established himself briefly in Baghdad (until 1508); but, with his retreat to Diyār Bakr, the dynasty ended.

Akaba (Jordan): *see* 'Aqabah, al-.

Akademgorodok (Russian: "Academic Town"), scientific research centre located on the northeast corner of the Novosibirsk Reservoir, near the city of Novosibirsk, south-central Russia. Akademgorodok is the headquarters of the Siberian branch of the Academy of Sciences.

Akademgorodok was founded in 1957 by the academicians Mikhail Lavrentyev, Sergey Sobolev, Andrey Trofimuk, and Sergey Khristianovich. Akademgorodok was designed to organize and carry out theoretical and experimental research in the natural and economic sciences and technology, with an eye toward marshaling the productive resources of Siberia and the Soviet (Russian) Far East. By the late 20th century, Akademgorodok housed more than 20 separate research institutes as well as a university and residential facilities.

Akademiya Nauk Range, also spelled **AKADEMIYA NAUK**, Russian **KHREBET AKADEMIYA NAUK** ("Academy of Sciences Range"), mountain range, western Pamirs, central Tajikistan. The mountains, extending north-south, are approximately 68 miles (110 km) in length and are composed mostly of sedimentary and metamorphic rocks, together with some granite. Glaciation from permanent snowcaps extends over an area of 580 square miles (1,500 square km). The highest peak in Tajikistan, Communism Peak (24,590 feet [7,495 m]), is

located in the range; there are 24 peaks above 19,700 feet (6,000 m). The mountains were named in 1927 in honour of the Academy of Sciences.

Akagera River (Burundi): *see* Kagera River.

Akaka Falls, waterfall, Hawaii county, northeastern Hawaii Island, Hawaii, U.S., a central feature of Akaka Falls State Park (65 acres [26 hectares]). Easily reached by foot trail, the falls are located 12 miles (19 km) northwest

Akaka Falls, Hawaii Island

of Hilo in a canyon 4 miles (6.5 km) inland from the village of Honomu on the Hamakua Coast. The falls plunge 420 feet (128 m) through dense tropical overgrowth into a pool of Kolekole Stream.

Akāl Takht (Punjabi: "Throne of the Timeless One"), the chief centre of religious authority for the Sikh community of India. The Akāl Takht is located at the city of Amritsar (Punjab state), opposite the Harimandir, or Golden Temple, the principal Sikh house of worship; it is also the headquarters of the Shiromanī Akālī Dal ("Leading Akālī Party"), predominant among the Sikhs. Similar seats of authority are located at Anandpur and Patiala (Punjab), Patna (Bihār), and Nānded (Mahārāshtra). The Akāl Takht was badly damaged during the assault on the Golden Temple by the Indian army in June 1984.

When in 1708 Gurū Gobind Singh declared that the line of personal Gurūs (religious guides) had come to an end, the authority of the office of Gurū was considered to be embodied in the holy scriptures, the *Adi Granth*. Disputes in interpretation had to be settled by the entire Sikh community. Decisions were made at annual or semiannual meetings in Amritsar, when groups would assemble behind their elected leaders in the open area in front of the Akāl Takht. Resolutions had to be carried unanimously; they then became *gurmata*s (decisions of the Gurū) and were binding on all Sikhs. Both political and religious decisions were taken at Akāl Takht meetings up until 1809, when Maharaja Ranjit Singh, the leader of the newly unified Sikh state, abolished political *gurmata*s and began to seek counsel from both Sikhs and non-Sikhs. In the 20th century, resolutions of local congregations on nonpolitical matters relating to the interpretation of Sikh doctrine or rules of conduct can be appealed to the Akāl Takht; decisions taken there are conveyed in the form of *hukamnāmā*s (orders). A *hukamnāmā* issued from the Akāl Takht is considered mandatory for all Sikhs.

Akālī (Punjabi: "Timeless One," or "Eternal One"), a movement in Sikhism; also any member of suicide squads in the armies of the Sikhs, a religious group of India. The Akālī suicide squads first appeared about 1690

when the execution of two predecessors and continuing persecution by the Mughals forced the 10th Gurū Gobind Singh to take up arms. The Akālīs were also known as *nihangs* (Persian: "crocodiles"; a name first used by the Mughals for their suicide squads) and wore a distinctive blue uniform. Some present-day Akālīs continue to wear a blue tunic and a conical blue turban and to carry a sword.

The Akālī name was revived in the 1920s during the gurdwara reform movement as a semimilitary corps of volunteers raised to oppose the British government. After the Sikhs regained control of their gurdwaras, or shrines, the Akālīs continued to represent the Sikh community in the Punjab and took the lead in the agitation for a Punjabi-speaking, Sikh-majority state. This goal was achieved in 1966 with the establishment of the Indian state of Punjab. A major political party of Punjab state is the Shiromani Akālī Dal (SAD; "Leading Akālī Party"). Although it competes in national elections, it is mainly concerned with the status of the Sikhs in Punjab state.

Akan, ethnolinguistic grouping of peoples of the Guinea Coast who speak Akan languages (of the Kwa branch of the Niger-Congo family). They include the speakers of the Akyem, Anyi, Ashanti, Attie, Baule, Brong, Fanti, and Guang languages; some scholars also consider

Akan tribal chief
Jacques Jangoux

Two distinct Akan languages. Most Akan peoples live in Ghana, where they settled in successive waves of migration between the 11th and 18th centuries; others inhabit the eastern part of Côte d'Ivoire and parts of Togo.

Yams are the staple food crop in the Akan economy, but plantains and taro are also important; cocoa and palm oil are major commercial resources.

Every traditional Akan tribe is grouped into exogamous matrilineal clans, the members of which trace their descent from a common ancestress; these clans are hierarchically organized and are subdivided into localized matrilineages, which form the basic social and political units of Akan society. Most Akan live in compact villages that are divided into wards occupied by the matrilineages and subdivided into compounds of extended multigeneration families. The village is a political unit under a headman, elected from one of the lineages, and a council of elders, each of whom is the elected head of a constituent lineage. The lineage head is the custodian of the lineage's stools, the symbols of unity between the spirits of the ancestors and the living members

of the lineage; every lineage also has its own god or gods. There is a strong feeling of corporate responsibility among lineage members. Matrilineal descent also governs inheritance, succession, and land tenure. Paternal descent is also recognized and determines membership in the *ntoro*, a group sharing certain taboos, surnames, forms of etiquette, and ritual purification ceremonies.

The most prominent aspect of Akan religion is an ancestor cult the rites of which serve to enforce tribal unity and morality. Other religious practices are based on belief in a supreme deity who created the universe and in lesser deities and spirits.

Akan states, historic complex of gold-producing forest states in western Africa lying between the Komoé and Volta rivers (in an area roughly corresponding to the coastal lands of the modern republics of Togo, Ghana, and, in part, Côte d'Ivoire). Their economic, political, and social systems were transformed from the 16th to the 18th century by their trade with Europeans on the coast. Of the northern Akan or Bron states the earliest (established c. AD 1450) was Bono; of the southern the most important were Denkyera, Akwamu, Fanti, and Ashanti.

Akansa (people): see Quapaw.

Akarai Mountains (South America): see Acaraí Mountains.

Akaroa, community, Canterbury local government region, eastern South Island, New Zealand. It is situated on the shore of French Bay, inside Akaroa Harbour, which is a rocky inlet on the Banks Peninsula formed when the sea breached the erosion-enlarged crater of an ancient volcano.

In 1838 a French whaler, Captain Jean Langlois, agreed with the local Maori chiefs to buy 30,000 acres (12,000 hectares) of the peninsula. He returned to France to organize the Nanto-Bordelaise Company (1839), which, backed by a warship, dispatched a settlement force. Arriving in 1840, the settlers found that the British had in the interim declared sovereignty over South Island. An agreement reached between the French and the British allowed the company to establish its settlement, which was sold to the New Zealand government in 1849. The settlement serves a fruit- and dairy-farming area. A summer resort and fishing port, Akaroa lies 52 miles (84 km) by road southeast of Christchurch. The town's name derives from the Maori for "long harbour." Pop. (1986) 722.

Akashi, city, Hyōgo ken (prefecture), Honshu, Japan. The city is adjacent to Kōbe on the Akashi Strait of the Inland Sea. It developed as a castle town, and many relics of the Jōmon and Yayoi periods remain on the nearby hills.

Municipal Astronomical Science Museum and planetarium at Akashi, Japan
World Photo—Shostal Assoc

Artifacts of the Jōmon period (4500–250 BC; a hunting and gathering society) include pottery with distinctive cord impressions. During the Yayoi period (250 BC–AD 250) immigrants from Korea introduced irrigation techniques and bronze and iron implements.

Before World War II Akashi was a thriving city, its economy based on the aircraft industry. During the war, half of the population was lost to air raids in the old part of the city. The heavy steel industry, developed during the Korean War, revived Akashi as an industrial and residential district. The city was formerly a fishing centre, but the yield of marine products has decreased because of overfishing and marine pollution. The Japanese standard-time meridian, 135° E, passes through the city. Pop. (1992 est.) 278,458.

Akashic record, in occultism, a compendium of pictorial records, or "memories," of all events, actions, thoughts, and feelings that have occurred since the beginning of time. They are said to be imprinted on Akasha, the astral light, which is described by spiritualists as a fluid ether existing beyond the range of human senses. The Akashic records are reputedly accessible to certain select individuals—e.g., a spiritualist medium who conducts a séance. Akasha allegedly transmits the waves of human willpower, thought, feeling, and imagination and is a reservoir of occult power, an ocean of unconsciousness to which all are linked, making prophecy and clairvoyance possible.

Akbar, in full ABŪ-UL-FATĤ JALĀL-UD-DĪN MUĤAMMAD AKBAR (b. Oct. 15, 1542, Umarkot, Sind, India—d. 1605, Āgra), greatest of the Mughal emperors of India (reigning 1556–1605), who extended Mughal power over most of the Indian subcontinent. In order to preserve the unity of his empire, Akbar adopted programs that won the loyalty of the non-Muslim populations of his realm. He reformed and strengthened his central administration and also centralized his financial system and reorganized tax collection processes. Although he never renounced Islām, he took an active interest in other religions, persuading Hindus, Parsis, and Christians, as well as Muslims, to engage in religious discussion before him. Illiterate himself, he encouraged scholars, poets, painters, and musicians, making his court a centre of culture.

Early life. Abū-ul-Fatĥ Jalāl-ud-Dīn Muḥammad Akbar was descended from Turks, Mongols, and Iranians—the three peoples who predominated in the political elites of northern India in medieval times. Among his ancestors were Timur (Tamerlane) and Genghis Khan. His father, Humāyūn, driven from his capital of Delhi by the Afghan usurper Shēr Shāh Sūr, was vainly trying to establish his authority in Sind. Soon Humāyūn had to leave India for Afghanistan and Iran, where the shāh lent him some troops. Humāyūn regained his throne in 1555, 10 years after Shēr Shāh Sūr's death. Akbar, at the age of 13, was made governor of the Punjab.

Humāyūn had barely established his authority when he died, in 1556. Within a few months his governors lost several important places, including Delhi itself, to Hemū, a Hindu minister who claimed the throne for himself. But a Mughal force defeated Hemū on the historical battlefield of Pānipat, which commanded the route to Delhi, thus ensuring Akbar's succession.

At Akbar's accession his rule extended over little more than the Punjab and the area around Delhi, but under the guidance of his chief minister, Bayram Khān, his authority was gradually consolidated and extended. The process continued after Akbar forced Bayram Khān to retire in 1560 and began to govern

on his own—at first still under household influences but soon as an absolute monarch.

Imperial expansion. Akbar first attacked Mālwa, a state of strategic and economic importance commanding the route through the Vindhya hills to the Deccan and containing rich agricultural land; it fell to him in 1561.

Akbar, miniature portrait from the *Akbar-nāmah* by Abū-ul-Fazl, c. 1600; in the India Office Library, London

By courtesy of the India Office Library, London

Toward the zealously independent Hindu Rājputs, a military race inhabiting rugged, hilly Rājasthān, Akbar adopted a policy of conciliation and conquest. Successive Muslim rulers had found the Rājputs dangerous, however weakened by disunity. But in 1562, when Raja Bihārī Mal of Amber (Jaipur), threatened by a succession dispute, offered Akbar his daughter in marriage, Akbar accepted the offer. The Raja acknowledged Akbar's suzerainty, and his sons prospered in Akbar's service. Akbar followed the same feudal policy toward the other Rājput chiefs. They were allowed to hold their ancestral territories, provided that they acknowledged Akbar as emperor, paid tribute, supplied troops when required, and concluded a marriage alliance with him. The emperor's service was also opened to them and their sons, offering rewards both in honour and in money.

Akbar, however, showed no mercy to those who refused to acknowledge his supremacy. When, after protracted fighting in Mewār, Akbar captured the historic fortress of Chitor in 1568, he massacred its inhabitants. Even though Mewār did not submit, the fall of Chitor prompted other Rājput *rajās* to accept Akbar as emperor in 1570 and to conclude marriage alliances with him, although the state of Mārwar held out until 1583.

One of the notable features of Akbar's government was the extent of Hindu, and particularly Rājput, participation. Rājput princes attained the highest ranks, as generals and as provincial governors, in the Mughal service. Discrimination against non-Muslims was reduced by abolishing the taxation of pilgrims and the tax payable by non-Muslims in lieu of military service. Rājput princes had ruled unhampered in previous centuries, and some Rājputs and many other Hindus had cooperated with previous Muslim governments. Yet Akbar was far more successful than any previous Muslim ruler in winning the cooperation

of Hindus at all levels in his administration. The further expansion of his territories gave them fresh opportunities.

In 1573 Akbar conquered Gujarāt, an area with many ports that dominated India's trade with western Asia, and then turned east toward Bengal. A rich country with a distinctive culture, Bengal was difficult to rule from Delhi because of its network of rivers, always apt to flood during the monsoon. Its Afghan ruler, declining to follow his father's example and acknowledge Mughal suzerainty, was forced to submit in 1575. When he rebelled and was defeated and killed in 1576, Akbar annexed Bengal.

Toward the end of his reign, Akbar embarked on a fresh round of conquests. Kashmir was subjugated in 1586, Sind in 1591, and Qandahār in 1595. Mughal troops now moved south of the Vindhya Mountains into the Deccan in peninsular India. By 1601 Khāndesh, Berār, and part of Ahmadnagar were added to Akbar's empire. His last years were troubled by the rebellious behaviour of his son, Prince Salīm, who was eager for power.

Administrative reform. Previous Indian governments had been weakened by the disintegrating tendencies characteristic of pre-modern states—the tendency of armies to split up into the private forces of individual commanders and the tendency of provincial governors to become hereditary local rulers. Akbar combatted this trend by instituting comprehensive reforms that involved two fundamental changes. First, every officer was, at least in principle, appointed and promoted by the emperor, instead of his immediate superior. Second, the traditional distinction between the nobility of the sword and that of the pen was abolished: civil administrators were assigned military ranks, thus becoming as dependent on the emperor as army officers.

These ranks were systematically graded from commanders of 10 to commanders of 5,000, higher ranks being allotted to Mughal princes. Officers were paid either in cash from the emperor's treasury or, more frequently, by the assignment of lands from which they had to collect the revenue, retaining the amount of their salary and remitting the balance to the treasury. Such lands seem to have been transferred frequently from one officer to another: this increased the officers' dependence on the emperor, but it may also have encouraged them to squeeze as much as they could from the peasants with whom their connection might be transitory. Politically, the greatest merit of the system was that it enabled the emperor to offer attractive careers to the able, ambitious, and influential. In this way, Akbar was able to enlist the loyal services of many Rājput princes.

Akbar's reforms required a centralized financial system, and thus by the side of each provincial governor (*sūbadār*, later called *nawab*) was placed a civil administrator (*dīwān*) who supervised revenue collection, prepared accounts, and reported directly to the emperor. As a further safeguard against abuses, Akbar reorganized the existing network of newswriters, whose duty was to send regular reports of important events to the emperor. Akbar also seems to have instituted more efficient revenue assessment and collection in an effort to safeguard the peasants from excessive demands and the state from loss of money. But such efficiency could only have been enforced in the areas directly administered by the central government. This excluded the lands under tributary rulers such as the Rājputs and also the lands assigned for the maintenance of Mughal officers.

Yet, notwithstanding Akbar's reforms, travellers' accounts indicate that the Indian peasants remained impoverished. The official elite, on the other hand, enjoyed great wealth; liberal patronage was given to painters, poets, musicians, and scholars, and luxury industries

flourished. Akbar also supported state workshops for the production of high-quality textiles and ornaments.

Personality and assessment. Akbar maintained a luxurious and brilliant court, at which elaborate ceremonial emphasized his distance from other men, though he was careful to cultivate public opinion outside court circles. Every morning at dawn he stood at an open window to be seen and revered by the people. Foreign observers commented on the graceful manner in which he accepted little gifts from the people and showed himself ready to hear the complaint of any man who dared to approach him.

Physically, he was strong and could withstand hardship on campaigns. Although he seems to have been no more than five feet seven inches tall, he impressed observers as a dominating personality. Clearly, although he was illiterate, he had a powerful and original mind. His unprejudiced inquiries into Christian doctrines misled the Jesuit missionaries he invited to his court into thinking that he was on the point of conversion. He persuaded the Muslim theologians at his court to accept him as arbiter on points of Islāmic law in dispute among them. Although this seems to have been little more than an expression of his systematic approach to problems, the orthodox were offended. He gave further offense by the religious discussions he encouraged between Muslims, Hindus, Parsis, and Christians. These discussions were continued by a small group of courtiers who shared with Akbar a taste for mysticism. Although their doctrines and ceremonies, known as the Divine Faith (*Dīn-e Ilāhī*), assigned a central place to Akbar himself, it would be an oversimplification to ascribe political motives to these developments.

Begun in 1570 and abandoned in 1586, Akbar's capital of Fatehpur Sikri, near Delhi, was evidence of the resources he could command. Its combination of Hindu and Muslim architectural styles symbolized the contact of cultures that he encouraged. Similarly, he commissioned the translation of Sanskrit classics into Persian, giving illustrated copies to his courtiers. He also received with enthusiasm the European pictures brought by the Jesuits, and his painters incorporated European techniques of realism and perspective in the distinctive Mughal style (characterized by a vivid treatment of the physical world) that began to develop during his reign. Akbar's reign was an example of the stimulating effects of cultural encounter. It has also often been portrayed as a model for future governments—strong, benevolent, tolerant, and enlightened. Effective government in a country geographically as vast and socially as complex as India demands a wide measure of social support: Akbar understood this need and satisfied it.

(K.A.B.)

BIBLIOGRAPHY. Vincent A. Smith, *Akbar the Great Mogul, 1542–1605*, 2nd ed. (1919), is still the standard biography. Ashirbadi Lal Srivastava, *Akbar the Great*, vol. 1, *Political History, 1542–1605*, vol. 2, *Evolution of Administration, 1556–1605* (1962–67), is a reliable account.

Akbar period architecture, building style that developed in India under the patronage of the Mughal emperor Akbar (reigned 1556–1605). The style is best exemplified by the fort at Āgra (built 1565–74) and the magnificent city of Fatehpur Sikri (1569–74), but fine examples are also found in the gateway to the 'Arab Sarā'i, Delhi (c. 1560), the Ajmer fort (1564–73), the Lahore fort with its outstanding decoration (1586–1618), and the Allahābād fort (1583–84), now largely dismantled.

The architecture of the Akbar period is characterized by a strength made elegant and graceful by the rich decorative work. Many elements from the Hindu tradition were absorbed in the decorative work.

The fortress-palace of Āgra is impressive for the massive enclosure wall, its entire length of 1½ miles (2½ kilometres) faced with dressed stone. The main entranceway, which is known as the Delhi gate, is decorated with white marble inlay against the warm red sandstone.

Gateway to the 'Arab Sarāī, Delhi, c. AD 1560
P. Chandra

The capital city of Fatehpur Sikri is one of the most notable achievements of Islāmic architecture in India. The city, which was deserted only a few years after it was built, is a great complex of palaces and lesser residences and religious and official buildings, all erected on top of a rocky ridge 26 miles (42 kilometres) west of Āgra. The so-called Divān-e Khāṣṣ (Hall of Private Audience) is arresting in its interior arrangement, which has a single massive column encircled by brackets supporting a stone throne platform, from which radiate four railed balconies. The Jodhā Bāi palace and the residence of the emperor's friend, Bīrbal, again show—in their niches and brackets—features adopted from the religious and secular architecture of the Hindus.

The most imposing of the buildings at Fatehpur Sikri is the great mosque, the Jāmi' Masjid, which served as a model for later congregational mosques built by the Mughals. The massive gateway, the Buland Darwāzah (Victory Gate), gives a feeling of immense strength and height, an impression emphasized by the steepness of the flight of steps by which it is approached.

Akebia, genus of woody vines comprising two species native to Asia but introduced elsewhere for their ornamental foliage and fast growth. The genus belongs to the family Lardizabalaceae.

Five-leaf akebia, or chocolate vine (*A. quinata*), has five leaflets to each leaf arranged like the fingers on a hand; inconspicuous purplish flowers in small clusters; and oblong purple berries. Three-leaf akebia (*A. trifoliata*) has three leaflets to a leaf. Both species are rampant twining vines often used for shading and screening on arbors and fences and for ground covering on embankments.

akee, also spelled ACKEE (*Blighia sapida*), tree of the soapberry family native to West Africa, widely cultivated throughout tropical and subtropical regions for its edible fruit. The tree grows about 9 metres (30 feet) tall and bears pinnate leaves and fragrant white flowers. Brought to the Caribbean area with slaves from Africa, the akee tree was introduced to science by William Bligh, famous as captain

of the ill-fated "Bounty," hence its botanical name.

At maturity, the reddish, woody shell of the fist-sized fruits splits open to reveal three segments of white flesh, each with large shiny black seeds. The soft, bland flesh is eaten as a vegetable. Akee and salt fish is a popular dish in the Caribbean.

Akeley, Carl (Ethan) (b. May 19, 1864, Clarendon, N.Y., U.S.—d. Nov. 17, 1926, Albert National Park, Belgian Congo), U.S. naturalist and explorer who developed the taxidermic method for mounting museum displays to show animals in their natural surroundings. His method of applying skin on a finely molded replica of an animal gave results of unprecedented realism and elevated taxidermy from a craft to an art. His modelling led to sculpture, and he executed notable pieces showing elephants, lions, and lion spears. Akeley's goal was to create a panorama of Africa and its big game in U.S. museums.

At 19 he became an apprentice at Ward's Natural Science Establishment in Rochester, N.Y., and during his associations with the Field Museum of Natural History in Chicago (1895–1909) and the American Museum of Natural History in New York City (1909–26) he made five trips to Africa to study, hunt, and collect big game. In 1923 his book *In Brightest Africa* appeared. He died during his last expedition and was buried on Mt. Mikenon in Albert National Park (now Virunga National Park), in Zaire, the first wildlife sanctuary in central Africa, which he had helped establish. His inventions include the Akeley cement gun, used in mounting animals, and the Akeley camera, a motion-picture camera adapted for use by naturalists, with which Akeley made the first motion pictures of gorillas in their natural habitat.

Museum display of elephants mounted by Carl Akeley in Stanley Field Hall, the Field Museum of Natural History, Chicago

By courtesy of the Field Museum of Natural History, Chicago

Akeley's second wife, Mary Lee Jobe Akeley (1886–1966), was well known as an explorer and naturalist before her marriage (1924). Upon her husband's death she remained in Africa in charge of the expedition. She was named his successor as adviser to the American Museum of Natural History, at which the Akeley African Hall was named in their honour.

Aken (Germany): see Aachen.

Aken, Jerome van: see Bosch, Hiëronymus.

Akenside, Mark (b. Nov. 9, 1721, Newcastle upon Tyne, Northumberland, Eng.—d. June 23, 1770, London), poet and physician, best known for his poem *The Pleasures of Imagination*, an eclectic philosophical essay that takes as its starting point papers on the same subject written by Joseph Addison for *The Spectator*. Written in blank verse derived from Milton's, it was modelled (as its pref-

ace states) on the Roman poets Virgil (the *Georgics*) and Horace (the *Epistles*). A debt to Virgil is certainly apparent in the way in which Akenside invests an essentially unpo-

Akenside, engraving by E. Fisher, 1772, after a painting by A. Pond, 1754

etic subject—the abstractions of philosophic thought—with poetic form, through studied elevation of language and with considerable grace. The influence of Horace is clear in the skillfully handled transitions from one theme to another and the tact with which the entire subject is treated.

Later adopting the ode as his favourite poetic form, Akenside was more than willing to consider himself the English Pindar, one of several aspects of his character that was satirized in Tobias Smollett's novel *The Adventures of Peregrine Pickle*, in which Akenside appears as the physician in scenes set on the European continent.

Akenside attended the University of Edinburgh, intending to become a minister but instead studying medicine. His first poem, "The Virtuoso," in imitation of the Elizabethan poet Edmund Spenser, appeared in 1737. *The Pleasures of Imagination* first appeared in three books in 1744. A fourth book was added later, and the whole poem was extensively revised, finally appearing posthumously in *The Poems of Mark Akenside, M.D.* (1772). Also in 1744 Akenside turned to satire in *An Epistle to Curio*, occasioned by the political reversal executed by William Pulteney, who, though opposing the Whig prime minister Sir Robert Walpole, professed Whig sympathies for years but then accepted the earldom of Bath in the Tory ministry that succeeded Walpole's. The following year Akenside published *Odes on Several Subjects*. He had, meanwhile, been unsuccessful in attempts to establish a medical practice either at Northampton or at Hampstead. In 1747, however, a friend established him in practice in a house in Bloomsbury Square, London. His reputation increased, and he was eventually made physician to the queen. Later works include "Hymn to the Naiads" and "To the Evening Star" (both 1746).

Akerlof, George A. (b. June 17, 1940, New Haven, Conn.), U.S. economist and winner of the Nobel Prize in economic science in 2001.

Akerlof did his undergraduate work at Yale (1962) and received his Ph.D. from the Massachusetts Institute of Technology (MIT) in 1966. For most of his career he taught at the University of California, Berkeley, where his work in economics tended to include concerns that were usually exclusive to disciplines such as psychology, sociology, and anthropology.

Along with A. Michael Spence and Joseph Stiglitz, Akerlof won the Nobel Prize for his study on markets with asymmetric information (*i.e.*, markets in which actors on one side of a

market are more knowledgeable than those on the other side). Akerlof's study concentrated on those markets in which sellers of a product have more information than buyers about the product's quality. Using the example of a secondhand-car market, he demonstrated that this could lead to "adverse selection" of poor quality products, such as a defective car known as a "lemon." In his 1970 seminal work "The Market for Lemons: Quality Uncertainty and the Market Mechanism," Akerlof explained how asymmetric information prevents markets from functioning efficiently and examined the consequences. He suggested that many economic institutions had emerged in the market in order to protect themselves from the consequences of adverse selection, including secondhand-car dealers who offered guarantees to increase consumer confidence.

åkermanite, mineral composed of dicalcium magnesium disilicate, $\text{Ca}_2\text{MgSi}_2\text{O}_7$, one end-member of the melilite mineral series (see melilite).

Akershus, *fylke* (county), southeastern Norway. Covering 1,898 square miles (4,917 square km), it extends north from Oslo Fjord to the southern end of Lake Mjøsa and east to the Swedish frontier. The Vorma River flows through Akershus from Mjøsa into the Glåma River and on to Lake Øyeren. The national capital, Oslo, is the county seat, though it is a separate *fylke* and *bykommune* (urban commune) and thus lies outside the boundaries of Akershus. Embracing numerous suburbs of Oslo, Akershus is one of the most densely populated areas of Norway. It contains the historic village of Eidsvoll, 30 miles (48 km) north of Oslo, in which the National Assembly voted Norway's constitution in 1814. Between Eidsvoll and Oslo is Gardermoen international airport. Shipping, manufacturing, and tourism are the economic mainstays of the county. Pop. (2000 est.) 467,052.

akh, in Egyptian religion, the spirit of a deceased person and, with the *ka* and *ba* (*qq.v.*), a principal aspect of the soul. By enabling the soul to assume temporarily any form it desired, for the purpose of revisiting the earth or for its own enjoyment, the *akh* characterized the soul of a deceased person as an effective entity in the next world. The *akh*-soul was generally represented as a bird and could appear to the living as a ghost.

Akhaia (Greece): see Achaea.

Akhḍar Mountains, Arabic AL-JABAL AL-AKHḌAR, also spelled GEBEL EL-ACHDAR, mountain range of northeastern Libya that extends along the Mediterranean coast for about 100 miles (160 km) in an east-northeasterly direction between the towns of al-Marj and Darnah. Rising sharply in two steps, the first reaching 985 feet (300 m) and the second about 1,800 feet (550 m), the limestone range (about 20 miles [32 km] wide) then blends into a plateau crowned by hills attaining elevations of nearly 3,000 feet (900 m). It descends eastward to the barren, stony terrain of al-Buḥān and southward to the Libyan Sahara. Dissected by river valleys, the mountain chain is covered with sparse low bush, remnants of scrub forest, and scattered cultivation. It has a comparatively high rainfall (15–20 inches [375–500 mm] annually) and high humidity, but periodic drought does occur.

The Akhḍar (Arabic: "Green") presented the most promising area of Cyrenaica and was colonized by the Italians in the 1930s. The settlements, interrupted during World War II and later deserted, have now been recolonized by Libyans. Livestock herding (camels, goats, and sheep) among the mountains involves a degree of nomadism, and there is limited

agriculture, notably in the al-Marj plain and around Darnah, producing grain, olives, grapes, and almonds. A large agricultural project in the area has improved reclamation and irrigation. The mountain chain was a major battleground during World War II.

Akhenaton, also spelled AKHNATON, or IKHNATON, also called AMENHOTEP IV, or NEFERKHEPERURE AMENHOTEP, Greek AMENOPHIS (fl. 14th century BC, Egypt), king of Egypt (1353–36 BC) of the 18th dynasty, who established a new monotheistic cult of Aton (hence his assumed name, Akhenaton, meaning "One Useful to Aton").

Egyptian religion and culture before Akhenaton's reign. The religion of ancient Egypt was static and traditional, urging that the gods had given a good order and that it was necessary for man to hold firmly to the order. When changes did occur, religion tried to incorporate them into the system as though they

Akhenaton, detail of the sandstone pillar statue from the Aton temple at Karnak, c. 1370 BC; in the Egyptian Museum, Cairo

Hirner Fotoarchiv, München

came from the creation. By the time Akhenaton took the throne as the fourth pharaoh named Amenhotep, the 18th dynasty (1539–1292 BC) had run for nearly 200 years, and there had been a century of imperial conquest and control of foreign lands. Egypt dominated Palestine, Phoenicia, and Nubia. The nation was powerful, rich, and courted by lesser princes. To maintain these gains, a military and political group controlled the culture. Since the Egyptian state had always been theocratic, ruled by a god or gods, according to traditional beliefs, this group interlocked with the priesthood. The richest and most powerful of the gods, such as Amon of Thebes or Re of Heliopolis, it was held, dictated the purpose of the state. The king had to apply to the gods for oracles directing his major activities. In return for wealth, elegance, and the role of the leading actor in a drama of imperial success, the pharaoh had relinquished his religious (and military) authority to others.

A century before Akhenaton, the energetic pharaoh Thutmose III had conquered the neighbouring parts of Asia and Africa. His successors continued his vigorous method of life, but, when the conquered territories were firmly held, that vigour turned from warfare to sports. Akhenaton's father, Amenhotep III, was a mighty hunter in his youth, but the son was weak physically and could not follow the pattern of outdoor feats. His activities were intellectual.

The sudden spread of empire had excited the Egyptian culture. Architecture became less firmly planted and soared upward in assertiveness. In the visual arts, the predominant heavy, angular style of rendering became softer and rounder. Egyptian soldiers and officials lived in foreign countries, and foreigners lived in Egypt. The sharp differences between the people of the Nile valley and the people abroad were blurred. Egyptian gods had temples in other countries, and foreign gods were introduced into Egypt. Gods and goddesses were concerned about Asia and Africa, as well as Egypt. Hymns before Akhenaton's reign show that the spread of empire meant the spread of religion. Gods became universal. Egypt had already combined gods, with Amon and Re (the sun-god) becoming Amon-Re or even Amon-Re-Harakhte. This permitted the Egyptians to think of the gods as unified forces, which was a prelude to monotheism.

There were other breaks in tradition. The royal line, wherever possible, had been kept pure by marriages of the heirs with princesses of the king's own family. Amenhotep III defied this custom by marrying a commoner named Tiy. She apparently enjoyed unusual power in the palace without abandoning her loyalty to her husband. Akhenaton was a child of this marriage.

Empire was held firmly by garrisons abroad, which assured the favourable flow of trade to Egypt. Near the Nile valley there were rich gold mines, so that the country could dominate both trade and politics. Messengers traveled between Egyptian and foreign cities carrying letters written in Babylonian cuneiform, the international language of the day, on clay tablets. This correspondence shows the imperial power and elegance of Egypt, which seemed to be assured of its unending dominance over all the nearby countries.

Akhenaton's early reign. Scholars disagree whether Amenhotep III associated his son Amenhotep IV on the throne for several years of coregency or whether the younger king succeeded to rule after the death of his father. It is here assumed that the older king died before the younger pharaoh gained power. The latter still used the family name Amenhotep, and on his ascension he still worshiped the old gods, especially Amon of Thebes and a sun-god, Re-Harakhte. His first buildings near Thebes were started in the older, massive architecture, using huge stone blocks and showing the worship of Re-Harakhte. The art was traditional, even though the figures of men and gods were carved in a softer outline than they had been a century earlier.

Within his first few years as pharaoh there were changes. He abandoned the temple to Re-Harakhte and began to build a place to worship a new form of sun-god—the disk of the sun, called the Aton. It had been a little-known deity for two generations before him. The Aton was never shown in human or animal form, except insofar as the extended rays of the sun disk might end in hands to confer blessings upon men. This was the life-giving and life-sustaining power of the sun. He had no image in the hidden sanctuary of a temple but was to be worshipped out in sun-warmed openness. The buildings for the Aton were of a new kind. The massive solidity of the older temples was given up, and walls were run up of much smaller stones and were jammed with excited little scenes in a feverish new art. When artistic inventiveness was encouraged, forms were exaggerated to the point of caricature. Since the young king had a drooping jaw, a scrawny neck, sloping shoulders, a pot belly, and thick thighs, these features were carved in a grotesque way. The shape of the king became the flattering pattern for his followers, so that they also were shown with thin necks and round bellies. The king's wife, Nefertiti, may be beautiful in some of the sculptures made of her, but the new art often

showed her as though she were a misshapen hag. Egyptian art changed from a static statement of eternity into a liveliness that is both fascinating and repelling. It came down from eternity to the here and now, with pictures of the king presiding over a specific ceremony, kissing his wife, or gnawing on a bone at the dining table. As long as art had shown the indefinite future, it had had no exact time or place; under the new pharaoh it told stories about what happened to the royal family and their followers.

Life and rule at Akhetaton (Amarna). The new temples were built at Karnak, near Thebes, a region dominated by the god Amon and by the families that had run the state for several generations. The new king had to break away sharply from this traditional setting. In the fifth year of his reign he changed his name from Amenhotep ("Amon Is Satisfied") to Akhenaton ("One Useful to Aton"), thus formally declaring his new religion; and he moved his capital from Thebes more than 200 miles (300 km) north to a desert bay on the east side of the Nile River, a place now called Tell el-Amarna or Amarna. Here he began to build a new city, which he called Akhetaton ("Place of the Aton's Effective Power"). He took an oath that he would never go beyond the bounds of this place, which seems to mean not that he would never leave it but that he would not push the city limits beyond designated boundary stones. He was now free from the hostile forces at Thebes.

In their new home, Akhenaton, Nefertiti, and their six daughters gave themselves over to the new "truth." Their family life was open to the public. They worshiped the Aton in a temple open to the sunlight. The newly made nobles and officials gave their devotion to Akhenaton and Nefertiti.

Although the Egyptian texts always asserted that the king was a god and therefore the source of every benefit for the land, the complexities of a large empire, the activities of the bureaucrats, and the enticements of royal privilege had made Akhenaton's predecessors captives of the state. His political reforms were hence reactionary, inasmuch as he tried to recapture the old authority of the king. If the focus is only on the spectacular new elements that he introduced, the fact that his domination of rule was a restoration of a very old "truth" may be obscured.

The new city at Amarna must have had charm. Officials lived in spacious villas with trees, pools, and gardens. Indoors the walls were painted in the free flowing new art, with marsh scenes near the floor and floral bouquets near the ceiling. Amarna art ranged from the very gracious, such as the famous bust of Nefertiti, to the grotesque. Everything was lively. Probably the elegant fragility of the portrait of Nefertiti displeased the traditionalists. Instead of presenting a solidity that might last forever, it gave a delicate and fleeting impression. The new "truth" came down to earth. The prime minister was shown running in front of the king's chariot, an exertion that would have been unthinkable in the staid old times. Scenes of the busy market and the soldiers' guardroom, with lively comments of the people, are depicted. Present-day viewers of this ancient art feel as though they were there.

The new religion. The religion of the Aton is not completely understood. Akhenaton and Nefertiti worshipped only this sun-god. For them he was "the sole god." Akhenaton had dropped his older name Amenhotep, and the name "Amon" was also hacked out of the inscriptions throughout Egypt. Here and there the names of other gods and goddesses were removed, and in some texts the words "all gods" were eliminated. The funerary religion dropped Osiris, and Akhenaton became the source of blessings for the people after death. The figure of Nefertiti replaced the figures of

protecting goddesses at the corners of a stone sarcophagus. Yet Akhenaton and Nefertiti directed their worship only to the Aton. It was the closest approach to monotheism that the world had ever seen.

The king addressed a beautiful hymn to his god, expressing gratitude for the benefits of life. The Aton, says the hymn, gave these blessings not only to the Egyptians but also to "Syria and Nubia" and to "all distant foreign countries," to "all men, cattle, and wild beasts," to the lion coming from his den, the fish in the river, and the chick within the egg. Men live when the sun has risen, but at night the dark land is as if dead. It has often been pointed out that this hymn has a remarkable similarity to Psalm 104 in the Bible. Both the hymn and the psalm reflect a common family of ideas, according to which God or the god is praised for his bounties.

The Aton religion was a happy nature worship, without an ethical code. Men were asked only to be grateful to the sun for life and warmth. It was unlike the awful austerity of the great gods of former Egypt, who might punish man for disobedience. It was quite unlike the heavy demands that the Hebrew god would lay upon his people. In the Aton religion there was no "Thou shalt . . ." and no "Thou shalt not. . . ."

An aesthetic and intellectual religion, it probably had no deep roots. There is no evidence that the people worshiped the Aton happily; in their tombs they prayed to the Aton but also to Akhenaton and Nefertiti. The people wanted to see a definite force. Akhenaton was the same god-king who had always ruled Egypt, and Nefertiti could substitute for all the former mother goddesses. The king and queen seem to have accepted this worship as their just due.

The decline and end of Akhenaton's reform movement. The politics of the time must have been troubled. Although the ruling classes had been shorn of their powers, there was still an army. It may have been restless, because the documents show that Akhenaton paid little attention to it. Without a strong army and navy, foreign trade began to fall off, and internal taxes began to disappear into the pockets of local officials, finally causing the discontented priesthood and civil officials to combine with the army to discredit the new movement. Akhenaton was able to withstand these forces, but his weaker successors could not.

The Amarna Letters, discovered in the ruins of Tell el-Amarna from an archive of international correspondence directed by Asian princes to the courts of Amenhotep III and Akhenaton, reflect the new situation. The army commanders and high commissioners in Palestine and Syria were neglected. The local princes, who had seen their advantage in trading with Egypt, became despondent when Egypt did not answer their appeals for support. Hostile forces arose, ambitious princes in Palestine and Syria, invaders from the eastern desert, and the venturesome Hittites to the north. The Amarna Letters, as well as the archives found at the Hittite capital, show the disintegration of the Egyptian empire in Asia. Loyal princes were forced to flee their cities. Aggressors, aided by the Hittites, captured territory from the Egyptian army. It may be that Egypt lost all of its holdings except the southwest corner of Palestine. Akhenaton's preoccupation with ideas and ideals cost Egypt its proud empire.

Akhenaton may have given in a little in the face of these disasters. In the 12th year of his reign the queen mother, Tiy, a practical woman, made a visit to Amarna. There is some evidence that he modified his extremism after that. The matter is confused, involving Akhenaton's estrangement from Nefertiti and the promotion of his young son-in-law Smenkhkare as a favourite. Since Smenkhkare

apparently returned to Thebes, compromise seems to have been in the air.

When Akhenaton died, he was succeeded briefly by Smenkhkare and then by a second son-in-law, Tutankhaton. The latter was forced to change his name to Tutankhamen, dropping the Aton and embracing Amon, to abandon Amarna and move back to Thebes, and to pay penance by giving the old gods new riches and privileges. When the tomb of Tutankhamen was discovered in western Thebes in 1922, it gave a final illustration of the sumptuous glories of Amarna art. A few years after the death of this young king, the army took over the throne in the person of General Horemheb. He instituted counterreforms in order to restore the old system fully.

Assessment. Akhenaton was a strange figure, spiritually and physically. Representations of his peculiar, unmanly body have been studied by pathologists with no unanimous conclusions. Some modern scholars have also questioned his ability to father children, but the presence of six daughters would certainly indicate that he was potent. Despite conflicting statements in the literature, it now seems certain that his mummy has never been found. Anciently and modernly he has been a controversial person, but the very fury of the controversy shows that he was a major figure of ancient history. The strong and changing forces of his day shaped his determined nature, and yet he stood estranged from his day in the strength of his ideas and ideals.

(Jo.A.W.)

BIBLIOGRAPHY. The classic statement about Akhenaton is given by James Henry Breasted, *A History of Egypt from the Earliest Times to the Persian Conquest* (1905, reissued 1964). See also Cyril Aldred, *Akhenaten, King of Egypt* (1988). Early excavations at Tell el-Amarna are treated in T.E. Peet et al., *The City of Akhenaten*, 3 vol. in 4 (1923-51, reissued 1972); and J.D.S. Pendlebury, *Tell el-Amarna* (1935), a summary up to that date. The first phase of an ongoing, massive archaeological investigation of the period is treated in *The Akhenaten Temple Project*, vol. 1, *Initial Discoveries*, by Ray Winfield Smith and Donald B. Redford (1976). New information from this project is utilized in Donald B. Redford, *Akhenaten: The Heretic King* (1984).

Akhisar, historically THYATIRA, town, western Turkey, in a fertile plain on the Great Zab River (the ancient Lycus). The ancient town, originally called Pelopia, was probably founded by the Lydians. It was made a Macedonian colony about 290 bc and renamed Thyatira. It became part of the kingdom of Pergamum in 190 bc and was an important station on the ancient Roman road from Pergamum (Bergama) to Laodicea (near Denizli). Its early Christian church appears as one of the seven churches in the Revelation to John. Akhisar was incorporated into the Ottoman Empire in the 15th century. The modern town is connected by railway and road to Izmir and Manisa and exports cotton, tobacco, graphite, opium, wool, raisins, and dyes. Pop. (1990 prelim.) 74,002.

Akhlame, also spelled AKHLAMŪ, ancient Semitic nomads of northern Syria and Mesopotamia and traditional enemies of the Assyrians. They are first mentioned about 1375 bc in an Egyptian source (one of the Tell el-Amarna letters), in which they are said to have advanced as far as the Euphrates River; about the same time there was also evidence of them in Assyria, at Nippur, and around the Persian Gulf. During the next century, they interrupted travel between Babylon and Hattusa (Boğazköy), and Tukulti-Ninurta I (1244-08 bc) of Assyria recorded that he conquered "the mountains of the Akhlamū." An inscription of the Assyrian king Tiglath-pileser I (1115-

1077), however, refers for the first time to the "Akhlamû-Aramaecans," and soon thereafter the Akhlame disappear from Assyrian annals and are replaced by the Aramaecans. The relationship between the Akhlame and the Aramaecans is still a matter of conjecture.

Akhmadulina, Bella, in full IZABELLA AKHATOVNA AKHMADULINA (b. April 10, 1937, Moscow), Russian-language poet of Tatar and Italian descent, a distinctive voice in post-Stalinist Soviet literature.

Bella Akhmadulina, 1965

Novosti from Sovfoto

Akhmadulina completed her education at the Gorky Literary Institute in 1960, after which she traveled in Central Asia. She was eventually admitted to the Soviet Writers' Union, although her uncompromisingly individualistic work elicited official criticism and met with some difficulty in publication. Like her fellow poet Yevgeny Yevtushenko, to whom she was married during the 1950s, she drew audiences of thousands at readings of her work.

Her first collection, *Struna* ("The Harp String"), appeared in 1962. The long poem "Moya rodoslovnaya" (1964; "My Family Tree"), the title of which alludes to a poem by Aleksandr Pushkin from 1830, is marked by ambitious but assured experimentation in both theme and technique. The creative act was a recurring theme in her work. Subsequent volumes include *Uroki muzyki* (1969; "Music Lessons"), *Stikhi* (1975; "Poems"), and *Taina* (1983; "Secret"). Akhmadulina also published translations of poetry from Georgian and other languages.

Akhmatova, Anna, pseudonym of ANNA ANDREYEVNA GORENKO (b. June 11 [June 23, New Style], 1889, Bolshoy Fontan, near Odessa, Ukraine, Russian Empire—d. March 5, 1966, Domodedovo, near Moscow), Russian poet recognized at her death as the greatest woman poet in Russian literature.

Akhmatova began writing verse at the age of 11 and at 21 became a member of the Acmeist group of poets, whose leader, Nikolay Gumilyov, she married in 1910 but divorced in 1918. The Acmeists, through their periodical

Anna Akhmatova

Novosti Press Agency

Apollon ("Apollo"; 1909–17), rejected the esoteric vagueness and affectations of Symbolism and sought to replace them with "beautiful clarity," compactness, simplicity, and perfection of form—all qualities in which Akhmatova excelled from the outset. Her first collections, *Vecher* (1912; "Evening") and *Chyotki* (1914; "Rosary"), especially the latter, brought her fame. While exemplifying the best kind of personal or even confessional poetry, they achieve a universal appeal deriving from their artistic and emotional integrity. Akhmatova's principal motif is love, mainly frustrated and tragic love, expressed with an intensely feminine accent and inflection entirely her own.

Later in her life she added to her main theme some civic, patriotic, and religious motifs but without sacrifice of personal intensity or artistic conscience. Her artistry and increasing control of her medium were particularly prominent in her next collections: *Belaya staya* (1917; "The White Flock"), *Podorozhnik* (1921; "Plantain"), and *Anno Domini MCMXXI* (1922). This amplification of her range, however, did not prevent official Soviet critics from proclaiming her "bourgeois and aristocratic," condemning her poetry for its narrow preoccupation with love and God, and characterizing her as half nun and half harlot. The execution in 1921 of her former husband, Gumilyov, on charges of participation in an anti-Soviet conspiracy (the Tagantsev affair) further complicated her position. In 1923 she entered a period of almost complete poetic silence and literary ostracism, and no volume of her poetry was published in the Soviet Union until 1940. In that year several of her poems were published in the literary monthly *Zvezda* ("The Star"), and a volume of selections from her earlier work appeared under the title *Iz shesti knig* ("From Six Books"). A few months later, however, it was abruptly withdrawn from sale and libraries. Nevertheless, in September 1941, following the German invasion, Akhmatova was permitted to deliver an inspiring radio address to the women of Leningrad [St. Petersburg]. Evacuated to Tashkent soon thereafter, she read her poems to hospitalized soldiers and published a number of war-inspired lyrics; a small volume of selected lyrics appeared in Tashkent in 1943. At the end of the war she returned to Leningrad, where her poems began to appear in local magazines and newspapers. She gave poetic readings, and plans were made for publication of a large edition of her works.

In August 1946, however, she was harshly denounced by the Central Committee of the Communist Party for her "eroticism, mysticism, and political indifference." Her poetry was castigated as "alien to the Soviet people," and she was again described as a "harlot-nun," this time by none other than Andrey Zhdanov, Politburo member and the director of Stalin's program of cultural restriction. She was expelled from the Union of Soviet Writers; an unreleased book of her poems, already in print, was destroyed; and none of her work appeared in print for three years.

Then, in 1950, a number of her poems eulogizing Stalin and Soviet communism were printed in several issues of the illustrated weekly magazine *Ogonyok* ("The Little Light") under the title *Iz tsikla "Slava miru"* ("From the Cycle 'Glory to Peace'"). This uncharacteristic capitulation to the Soviet dictator—in one of the poems Akhmatova declares: "Where Stalin is, there is Freedom, Peace, and the grandeur of the earth"—was motivated by Akhmatova's desire to propitiate Stalin and win the freedom of her son, Lev Gumilyov, who had been arrested in 1949 and exiled to Siberia. The tone of these poems (those glorifying Stalin were omitted from Soviet editions of Akhmatova's works published after his death) is far different from the moving and universalized lyrical cycle, *Rekviem* ("Requiem"), composed between 1935 and 1940

and occasioned by Akhmatova's grief over an earlier arrest and imprisonment of her son in 1937. This masterpiece—a poetic monument to the sufferings of the Soviet peoples during Stalin's terror—was never published in the Soviet Union.

In the cultural "thaw" following Stalin's death, Akhmatova was slowly and ambivalently rehabilitated, and a slim volume of her lyrics, including some of her translations, was published in 1958. After 1958 a number of editions of her works, including some of her brilliant essays on Pushkin, were published in the Soviet Union (1961, 1965, two in 1976, 1977); none of these, however, contains the complete corpus of her literary productivity. Akhmatova's longest work, *Poema bez geroya* ("Poem Without a Hero"), on which she worked from 1940 to 1962, was not published in the Soviet Union until 1976. This difficult and complex work is a powerful lyric summation of Akhmatova's philosophy and her own definitive statement on the meaning of her life and poetic achievement.

Akhmatova executed a number of superb translations of the works of other poets, including Victor Hugo, Rabindranath Tagore, Giacomo Leopardi, and various Armenian and Korean poets. She also wrote sensitive personal memoirs on Symbolist writer Aleksandr Blok, the artist Amedeo Modigliani, and fellow Acmeist Osip Mandelstam.

In 1964 she was awarded the Etna-Taormina prize, an international poetry prize awarded in Italy, and in 1965 she received an honorary doctoral degree from Oxford University. Her journeys to Sicily and England to receive these honours were her first travel outside her homeland since 1912. Akhmatova's works were widely translated, and her international stature continued to grow after her death.

BIBLIOGRAPHY. Sam N. Driver, *Anna Akhmatova* (1972), combines a brief biography with a concise survey of the poetry. Amanda Haight, *Anna Akhmatova: A Poetic Pilgrimage* (1976), is a critical biography analyzing the relation of the poet's life to her poetry. Ronald Hingley, *Nightingale Fever: Russian Poets in Revolution* (1981), defines the historical and social background of the four poetical titans of 20th-century Russia. Anatoly Nayman, *Remembering Anna Akhmatova* (1991; originally published in Russian, 1989), is a work of the poet's literary secretary who witnessed her last years.

Akhmīm, also spelled ΕΚΗΜΙΝ, town, Sawhāj muhāfaẓah (governorate), Upper Egypt, on the east bank of the Nile, above Sawhāj on the west bank. Extensive necropolises dating from the 6th dynasty (c. 2345–c. 2181 BC) until the late Coptic period reveal the site's antiquity. In 1981 remains of a temple (Roman period) with Ramesside statues were excavated in the city. The name apparently derives from the pharaonic Khent-min and Coptic Khmin. Its deity was Min, in Hellenistic times identified with Pan, whence the name Panopolis, meaning "city of Pan." Also referred to as Chemmis or Khemmis, it was the capital of the 9th, or Chemmite, nome (department) of Ptolemaic Upper Egypt. Linen weaving is cited as an ancient industry there by the Greek geographer Strabo (born c. 63 BC). The 18th-dynasty pharaoh Ay (reigned c. 1323–19 BC) and the 5th-century AD Greek poet Nonnus were born at Akhmīm. The Coptic dialect once spoken in the area had an important literature.

In the Islāmic period it became a provincial capital under Faṭimid caliph al-Mustanshir (11th century AD); in the 18th century it was incorporated into the former province of Jirjā (Girga), and the town was sacked during the Mamlūk civil wars.

The modern town is a market and processing centre for cereals, sugarcane, dates, and cotton. Manufactures include textiles, clothing, pottery, and bricks; the ancient weaving tradition has been revived as well. An electrical transformer station started operation in 1980.

Akhnaton (Egyptian king): see Akhenaton.

Akhṭal, al-, in full GHIYĀTH IBN GHAWTH IBN AṢ-ṢALT AL-AKHṬAL (b. c. 640, al-Hirah, Mesopotamia, or the Syrian Desert—d. 710), poet of the Umayyad period (661–750), esteemed for his perfection of Arabic poetic form in the old Bedouin tradition.

Al-Akhṭal (“The Loquacious”) was a Christian but did not take the duties of his religion seriously, being addicted to drink and women. He was a favourite panegyrist and friend of the Umayyad caliph Yazīd I and his generals Ziyād ibn Abihī and al-Ḥajjāj. He continued as court poet to the caliph ‘Abd al-Malik but fell in disfavour under Walīd I.

Together with the poets Jarir and al-Farazdaq, al-Akhṭal forms a famous trio in early Arabic literary history. Because they closely resembled one another in style and vocabulary, their relative superiority was disputed. The philologist Abū ‘Ubaydah, however, placed al-Akhṭal highest of the three because among his poems there were 10 qasidas (formal odes) regarded as flawless and 10 others as nearly flawless, and this could not be said of the other poets.

Akiba ben Joseph (b. c. AD 40—d. c. 135, Caesarea, Palestine [now in Israel]), Jewish sage, a principal founder of rabbinic Judaism. He introduced a new method of interpreting Jewish oral law (Halakha), thereby laying the foundation of what was to become the Mishna, the first postbiblical written code of Jewish law.

The subject of numerous popular legends, Akiba is said to have been an illiterate shepherd who began to study after the age of 40. His devoted wife, Rachel, supported him both morally and materially during this arduous period of late learning (12 years, according to one account). His principal teachers were the great masters of the Law, Eliezer ben Hyrcanus and Joshua ben Hananiah. Akiba established his academy in Bene Beraq (near present-day Tel Aviv-Yafo), and the leading sages of the following generation, especially Meir and Simeon ben Yoḥai, were his disciples.

Akiba perfected the method of biblical interpretation called “Midrash,” whereby legal, sacral, and ethical tenets that had been sanctioned by Jewish oral tradition were viewed as being implied in Scripture. Thus, Scripture, in addition to its overt meaning, is understood as replete with implied teaching; it is, in fact, all-encompassing. The “Written Law” of Scripture and the “Oral Law” of tradition are ultimately one. Many midrashic works of the 2nd century originated in Akiba’s school. In addition, he collected the oral traditions that regulated the conduct of Jewish personal, social, and religious life and arranged them systematically. (Akiba has been called “the father of the Mishna.”) His apprehension of Scripture was opposed by the contemporary exegete Rabbi Ishmael ben Elisha, who taught that “the Torah speaks in the language of men” and should not be forced to yield special meanings but instead should be interpreted exclusively by means of set, logical rules of interpretation.

Akiba’s importance lies both in his achievements as a rabbinic scholar and in the impact of his personality on his time. He was strict in matters of law (“No pity in judgment!”—i.e., compassion is irrelevant in establishing what the law is or means), but he opposed the death penalty. He respected the role of the woman in life and attributed the redemption of the Israelites from Egyptian bondage to the meritoriousness of women of that generation. He was modest in his personal life, and he was known for his concern for the poor.

As judge he addressed litigating parties:

“Know before whom you are standing. You are standing before him whose word created the world, not before Akiba ben Joseph.”

His lectures were on legal subjects, scriptural exegesis, and religious thought. For him the central teaching of Judaism resided in the commandment “love your neighbour as yourself.” God’s love for man is expressed in that he created man in his image. Man has freedom of will (“Everything is foreseen, yet freedom of choice is given”); his deeds determine his fate, yet his true reward will be granted only in the world to come. In the present life there is much suffering, but “suffering is precious” and man should praise God for it. The people of Israel, who in a special sense are “God’s children,” have the task to “proclaim the glory of God to all the nations of the world.” Akiba interpreted the Song of Solomon as a dialogue of love between Israel and God. For the sake of this love Israel withdraws from the affairs of the world. In these teachings—partly in answer to early Christian tenets—Akiba laid the basis for an ideology of Israel in dispersion among the nations of the world.

About the year 95, Akiba and other sages journeyed to Rome. Arriving at the seaport Puteoli they beheld the power and grandeur of the empire. While his companions wept, remembering the victory of Rome over Judaea some two decades ago, Akiba remained calm. If God is so kind to the wicked Romans, he explained, he will, in the end, be even kinder to Israel. He was equally calm when he visited the ruins of the Jerusalem Temple, destroyed by the Romans in the year 70. The prophecies of doom have come true, he commented; now we may anticipate the fulfillment of the prophecies of reconstruction.

Scholarly opinion is divided on the extent of Akiba’s participation in an ill-fated rebellion against Rome (132–135) led by Bar Kokhba (originally Simeon ben Koziba). Some consider Akiba to have been the spiritual force behind the uprising. Others take note of the Talmudic report that Akiba considered Bar Kokhba to be the promised messianic king but see no evidence of further action on his part. Akiba was, it is true, apprehended by the Romans, imprisoned in Caesarea, and finally martyred (c. 135), but his offense is recorded as having been his continued public teaching rather than revolutionary activity. He accepted the agony of martyrdom serenely (he was flayed alive, according to tradition), grateful for the opportunity to fulfill the commandment to “love God . . . with all your life,” which he always interpreted to mean “even when he takes your life.” His last words were, “the Lord is one,” the final words of the Jewish confession of faith (“Hear, O Israel! The Lord is our God, the Lord is one”).

(N.N.G.)

BIBLIOGRAPHY. Louis Finkelstein, *Akiba: Scholar, Saint and Martyr* (1936, reissued 1990), is an extensive biographical narrative, with emphasis on Akiba’s intellectual development.

Akihito, original name TSUGU AKIHITO, era name HEISEI (b. Dec. 23, 1933, Tokyo, Japan), emperor of Japan from 1989. As scion of the oldest imperial family in the world, he was, according to tradition, the 125th direct descendant of Jimmu, Japan’s legendary first emperor.

Akihito was the fifth child and eldest son of Emperor Hirohito and Empress Nagako. During his early years he was reared in the traditional imperial manner, beginning his education at the Peers’ School in 1940. He lived outside of Tokyo during the last years of World War II but returned to the Peers’ School (from 1949 Gakushūin) after the war. Because of the changes the war had brought to Japanese society, not the least of which was the removal of the emperor’s power to rule in any way other than ceremonially, Akihito’s education was broadened to include training in the En-

glish language and in Western culture. His tutor was Elizabeth Gray Vining, an American Quaker. Like his father, he eventually took up marine biology as a field of endeavour. In 1952 Akihito came of age and was invested as heir to the Japanese throne. Seven years later, breaking a 1,500-year-old tradition, he married a commoner, Shōda Michiko, who was the daughter of a wealthy businessman. Michiko was a graduate of a Roman Catholic university for women in Tokyo. Their first child, Crown Prince Naruhito, was born on Feb. 23, 1960; he was followed by Prince Aki-shino (b. Nov. 30, 1965) and Princess Nori (b. April 18, 1969).

Akihito became emperor on Jan. 7, 1989, after the death of his father. He was formally enthroned on Nov. 12, 1990. His reign was designated Heisei, or “Achieving Peace.”

Akimov, Nikolay Pavlovich (b. April 16 [April 3, Old Style], 1901, Kharkov, Ukraine, Russian Empire—d. Sept. 6, 1968, Moscow), scenic designer and producer, known for the diversity of his bold experiments in stage design and dramatic interpretation—most especially for his cynical reinterpretation of *Hamlet* (1932), in which the king’s ghost was

Akimov, self-portrait
Sovfoto

represented as a fiction cunningly devised by Hamlet, Ophelia was portrayed as intoxicated rather than mad, and her drowning was depicted as the result of a drunken orgy.

Akimov’s design career began in 1922. He worked chiefly with Russian dramas, in which he combined cinematic with theatrical methods. His notorious version of *Hamlet*, his first venture as a producer, caused vehement reaction and was eventually withdrawn from distribution. From 1935 to 1949 and after 1955, Akimov was chief producer of the Leningrad Comedy Theatre. He also became professor and head of the faculty for design and production at the Leningrad Theatrical Institute from 1960.

Akindynos, Gregorios (b. c. 1300, Bulgaria—d. c. 1349), Byzantine monk and theologian who was the principal opponent of Hesychasm, a Greek monastic movement of contemplative prayer. He was eventually condemned for heresy.

A student of the monk-theologian Gregory Palamas, Akindynos absorbed from him the Hesychast theory of ascetical contemplation, a method of Eastern mysticism that used repetitive formulas and mental concentration through specific bodily postures to achieve inner peace and divine union through a vision of God. The theologically conservative Akindynos at first sided with Palamas but later attempted to convince him of certain errors in the Hesychast theory.

Abetted by the accession of Emperor John V Palaeologus in 1341 and encouraged by the patriarch of Constantinople, John XII Calecas, Akindynos recorded in 1343 the history of the

Hesychast dispute and by 1344 had composed seven treatises against Palamas' doctrine. Aspiring to be bishop of Thessalonica, Akindynos propagated anti-Palamite views there. In 1347, however, he was condemned by a synod after the pro-Palamas emperor John VI Cantacuzenus came to power and in 1351 was posthumously anathematized (solemnly cursed or banned) by being placed on the official list of heretics.

Akindynos' anti-Palamite letters are contained in *Patrologia Graeca*, edited by J.-P. Migne (1857–66).

akiriyāvāda (Buddhist philosophy): see akiriyāvāda.

Akita, *ken* (prefecture), northwestern Honshu, Japan, on the Sea of Japan coast. Its area is 4,483 square miles (11,612 square km) and is divided between lowlands (west) and a plateau region (east). The Hachiman Plateau is dotted with volcanoes such as Mount Komaga (5,371 feet [1,637 m]), near the eastern border with Iwate prefecture. The plateau is covered with white fir trees and alpine plants that grow amid fissures yielding steam, smoke, and boiling mud. In the extreme northeast, on the border with Aomori prefecture, is Towada Lake, which is the central feature of Towada-Hachimantai National Park.

Akita Plain, west of the Ōu and Dewa mountain ranges, is crossed by rivers flowing into the Sea of Japan. Chief among them are the Yoneshiro River (north), the Omono River (central), and the Ishizawa River (south). Hachirō Lagoon, on the Oga Peninsula, was once the second largest body of water in Japan after Lake Biwa and was about 50 miles (80 km) in circumference, but it was almost totally reclaimed for rice cultivation during the 10-year period after 1958.

Lumbering is also important in the prefecture. Mineral wealth includes deposits of copper, sulfur, lead, and manganese. Before and immediately after World War II, oil refiner-

Young men balancing the *kantō*, bamboo frames hung with paper lanterns, during the Tanabata Festival (August 5–7) in Akita, Japan

J. Schmidlin—Bavaria Verlag

ies were operated in Akita, along the Sea of Japan, but as crude-oil imports rose sharply, the oil refineries moved to the Pacific coast for convenience of importing. Akita city, the prefecture capital and major city, still produces some petroleum products and chemicals; it is served by the outport of Tsuchizakiminato. Akita University, founded in 1949, is located there. Noshiro is known for its wood products. Other important towns are Honjō, Oga, Yokote, and Ōdate. Pop. (1990) city, 302,359; prefecture, 1,227,491.

akita, breed of working dog that originated in the mountains of northern Japan. In 1931

the Japanese government designated the breed as a national treasure. The Akita is a powerful, muscular dog with a broad head, erect, pointed ears (small in relation to head size), and a large curved tail carried over the back or curled against the flank. Akitas are bred in a variety of colours and markings, including all-white, brindle, and pinto. Except for the white, all akitas bear a distinct mask (dark area around the muzzle). Akitas were admitted into the show classifications of the American Kennel Club (AKC) in 1973. According to AKC standards, males must be 26 to 28 inches (66 to 71 cm) high at the withers, females 24 to 26 inches (60 to 66 cm).

'**Akkā** (Israel): see 'Akko.

Akkad, ancient region in what is now central Iraq. Akkad was the northern (or northwestern) division of ancient Babylonian civilization. The region was located roughly in the area where the Tigris and Euphrates rivers are closest to each other, and its northern limit extended beyond the line of the modern cities of al-Fallūjah and Baghdad. The early inhabitants of this region were predominantly

Akkad and Sumer in the 2nd millennium BC

From G. Roux, *Ancient Iraq*

Semitic, and their speech is called Akkadian. To the south of the region of Akkad lay Sumer, the southern (or southeastern) division of ancient Babylonia, which was inhabited by a non-Semitic people known as Sumerians.

The name of Akkad was taken from the city of Agade, which was founded by the Semitic conqueror Sargon in about 2300 BC. Sargon united the various city-states in the region and extended his rule to encompass much of Mesopotamia, in the process creating the first empire in history. After the fall of Sargon's dynasty in about 2150 BC, the central Iraq region was ruled by a state jointly composed of Sumerians and Akkadians.

Under the kings of Akkad, their Semitic language, known as Akkadian, became a literary language that was written with the cuneiform system of writing. Akkadian is the oldest Semitic dialect still preserved.

Akkadian language, also spelled ACCADIAN, also called ASSYRO-BABYLONIAN, extinct Semitic language of the Northern Peripheral group, spoken in Mesopotamia from the 3rd to the 1st millennium BC.

Akkadian spread across an area extending from the Mediterranean Sea to the Persian Gulf during the time of Sargon (Akkadian Sharrum-kin) of the Akkad dynasty, who reigned from about 2334 to about 2279 BC. By about 2000 Akkadian had supplanted Sumerian as the spoken language of southern Mesopotamia, although Sumerian remained in use as the written language of sacred literature. At about the same time, the Akka-

dian language divided into the Assyrian dialect, spoken in northern Mesopotamia, and the Babylonian dialect, spoken in southern Mesopotamia. At first the Assyrian dialect was used more extensively, but Babylonian largely supplanted it and became the lingua franca of the Middle East by the 9th century BC. During the 7th and 6th centuries BC, Aramaic gradually began to replace Babylonian as the spoken and written language; after that, Babylonian was still used for writings on mathematics, astronomy, and other learned subjects, but by the 1st century AD it had completely died out. Scholars deciphered the Akkadian language in the 19th century.

Akkadian, written in a cuneiform script developed from that of the Sumerians, contained about 600 word and syllable signs. The sound system of the language had 20 consonants and 8 vowels (both long and short *a*, *i*, *e*, and *u*). Nouns occurred in three cases (nominative, genitive, and accusative), three numbers (singular, dual, and plural), and two genders (masculine and feminine); the feminine was distinguished from the masculine by the addition of the suffix *-i* or *-at* to the stem. The verb had two tenses (past and present-future).

In 1921 scholars at the Oriental Institute of the University of Chicago began to compile a standard dictionary of the Akkadian language. By the 1990s most of the 22 planned volumes of this dictionary had been published.

Akkadian writing: see cuneiform writing.

Akkerman (Ukraine): see Belgorod-Dnestrovsky.

'**Akko**, also spelled ACRE, or 'AKKĀ, city, northwest Israel. It lies along the Mediterranean Sea, at the north end of the Bay of Haifa (formerly Bay of Acre). Its natural harbour was a frequent target for Palestine's many invaders over the centuries. The earliest mention of 'Akko is in an Egyptian text dating from the 19th century BC. The Bible (Judges 1) states that the city did not fall to the Jews under Joshua and his successors; the Canaanites and Phoenicians, Semitic peoples of Palestine and the Levant coast, long held the site. Later it was conquered by Alexander the Great (336 BC) and by the Egyptian king Ptolemy II Philadelphus (reigned 285–246 BC), who renamed the city Ptolemais.

'Akko was a principal base of the Romans when they suppressed the Jewish revolt of AD 66–70. Later conquerors include the Persians (614), the Arabs (638), and the crusaders (1104), who named the city St. Jean d'Acre and made it their last capital. Its capture in 1291 by the Mamlūk sultan al-Ashraf Khalil (reigned 1290–93) marked the end of crusader rule in the Holy Land. From 1516 to 1918 'Akko was, except for brief intervals, under the rule of the Ottoman Turks. In 1918 it

Great Mosque of al-Jazzār, built in 1781, 'Akko, Israel

Keystone

was taken by British forces and subsequently became a part of Palestine under British mandate (1922).

The city's old fortifications and citadel were strengthened by Ahmad Pasha al-Jazzār (Arabic: "The Butcher"), the Turkish governor (1775–1804), and withstood Napoleon's siege (1799). Though the city had surrendered to the Egyptian viceroy Ibrahim Pasha in 1832, the citadel itself had never been successfully forced until May 3, 1948, when, as a British prison, it was taken by the Irgun Zvai Leumi, a Jewish guerrilla group. 'Akko was occupied by regular Israeli troops on May 17, 1948. Though most of the city's Arab inhabitants fled during the Israeli takeover, about 3,000 remained; the city's population in the late 20th century was about three-fourths Jewish.

'Akko's ancient port has silted up in modern times and has become secondary to Haifa's across the bay. It is used only by small fishing boats. Industries in modern 'Akko include a steel-rolling mill and match, tile, and plastic plants. Prominent structures, aside from the citadel, include the Great Mosque, built by Al-Jazzār and named for him; the Municipal Museum, housed in the Pasha's bathhouse; the Crypt of St. John, actually a crusader refectory; and several churches built on crusader foundations. Just north of the city is the tomb of Bahā' Ullāh, Iranian founder of the Bahā'ī faith. To the south is a large industrial zone; paint factories are found in the east. The city remains the major trade centre for Arab settlements in western Galilee and is becoming popular with tourists. 'Akko is the site of the Nautical College of the Israeli navy. Pop. (1993 est.) 44,200.

Aklavik, hamlet, Inuvik region, northwestern Northwest Territories, Canada. It is situated in the Mackenzie River delta near the Yukon border. Its Eskimo name can be translated "where there are bears." Established as a Hudson's Bay Company trading post on the south bank of the Mackenzie River's West Channel in 1912, Aklavik was moved to the north bank in 1920. It is the site of a radio and meteorological station. Fur trapping and the manufacture of fur garments and Eskimo handicrafts are the main sources of income. In 1955 the administrative staff (for what was then called the Western Arctic region) and some of the population moved to Inuvik town, 33 miles (53 km) east, because shifting permafrost-silt soil hampered building and road and sewer construction in Aklavik. Pop. (1991) 801.

Aklya Kona (Inca religion): *see* Chosen Women.

Akmeist (Russian poet): *see* Acmeist.

Akmolinsk (city, Kazakhstan): *see* Aqmola.

Akō, city, Hyōgo *ken* (prefecture), western Honshu, Japan. During the Heian period (794–1185), it was a seaside resort for courtesans from Kyōto. It became a castle town in the 17th century, when the powerful Ikeda clan took up residence. Since the beginning of the 20th century, the establishment of chemical factories and steel mills has transformed Akō into one of Japan's most polluted industrial cities. The city's traditional cotton-weaving and salt-making industries no longer have much significance. Akō is well known in Japan for its Kabuki theatre productions featuring swordplay and samurai, and the city attracts tourists to its annual Akō samurai festival in December. Inc. city, 1951. Pop. (1990) 51,131.

Akola, city, north-central Mahārāshtra state, western India, on the Mūrna River. An important road and rail junction in the Tāpti River valley, it is a commercial centre trading chiefly in cotton. There are also textile and vegetable-oil industries. In the past it was incorporated in turn into several local Muslim kingdoms. Akola is an important educational

centre with several colleges affiliated with the University of Nāgpur.

The chief crops grown in the surrounding area are rice, cotton, wheat, millet, and peanuts (groundnuts). The region's industries are agriculturally based; cotton ginning, oil processing, and cigarette manufacture are important. Pop. (1991 prelim.) city, 327,946.

Akosombo Dam, rock-fill dam on the Volta River, near Akosombo, Ghana, completed in 1965 as part of the Volta River project. Its construction was jointly financed by the government of Ghana, the World Bank, the United States, and the United Kingdom. The dam rises 440 feet (134 m) above ground level and has a crest 2,200 feet (670 m) wide and a volume of 10,451,000 cubic yards (7,991,000 cubic m). The dam impounds Lake Volta; this huge reservoir has a capacity of 120,000,000 acre-feet (148,000,000,000 cubic m) and

Akosombo Dam on the Volta River in southeastern Ghana

Jacques Jangoux

is used for commercial fishing and navigation. The large electric-power-generating capacity (882 megawatts) of the Akosombo Dam meets Ghana's needs and provides a surplus for sale to neighbouring countries. The dam supplies electricity to a large, economically important aluminum smelter in the coastal town of Tema.

Akow (Taiwan): *see* P'ing-tung.

Akranes, town, western Iceland. It is situated along Faxa Bay, at the tip of a peninsula between Borgar and Hval fjords. A fishing port and local market centre, it is connected by road to Reykjavik, 20 miles (32 km) southeast. Akranes is the site of one of Iceland's largest cement plants. Pop. (1992 est.) 5,272.

akriyāvāda (Sanskrit: "doctrine denying the effect of deeds"), Pāli AKIRIYĀVĀDA, set of beliefs held by heretic teachers in India who were contemporaries of the Buddha. The doctrine was a kind of antinomianism that, by denying the orthodox karmic theory of the efficacy of former deeds on a person's present and future condition, also denied the possibility of a person's influencing his own destiny through preferring righteous to bad conduct. The doctrine's teachers were therefore severely criticized for immorality by their religious opponents, including Buddhists. Their views are known only through uncomplimentary references in Buddhist and Jaina literature. Among the heretic teachers whose names are known are Pūraṇa Kāśyapa, a radical antinomian; Gośāla Maskariputra, a fatalist; Ajita Keśakambalin, the earliest-known materialist in India; and Pakudha Kātyāyana, an atomist. Gośāla's followers formed the Ājivika sect, which enjoyed some acceptance during the Maurya period (3rd century BC) and then dwindled.

Akron, city, seat (1842) of Summit county, northeastern Ohio, U.S. It lies along the Cuyahoga River, 41 miles (66 km) south-southeast of Cleveland. Akron is the centre of a metropolitan area that includes the cities of Cuyahoga Falls, Tallmadge, and Stow and several villages. At 1,200 feet (370 m) above

sea level, it was named for its "high place" (Greek: *akros*) on the watershed between the Mississippi River and the Great Lakes. Laid out in 1825 by General Simon Perkins, commissioner of the Ohio Canal Fund, the town was assured substantial growth by the completion of the Ohio and Erie Canal in 1827 and of the Pennsylvania and Ohio Canal in 1840, linking it with Pittsburgh. Water power and transportation supplied by these canals led to Akron's early development as an industrial centre. The abundant water supply and the arrival of the railroads prompted Benjamin F. Goodrich to move a small rubber factory to the site in 1871. This industry rapidly expanded with the advent of the automobile and the demand for rubber tires. Between 1910 and 1920 the city's population tripled to more than 200,000, and Akron became known as the "rubber capital of the world" and the international or American headquarters of the far-flung giants of the rubber industry—Firestone, General Tire, Goodrich, and Goodyear. The city's manufactures are now well diversified and, apart from a wide variety of rubber and plastic products, include farm machinery, aluminum siding, house fittings, electrical and transportation equipment, fishing tackles, children's books and toys, and chemicals. In the late 20th century, however, some manufacturing plants and downtown stores were closed.

The hangar at the city's airport is the site of the Goodyear Aerospace Corporation Air Dock (for airships [blimps]). This hangar is one of the world's largest buildings without interior supports. Akron is an important truck terminal and distribution point between the eastern seaboard and the Midwest.

More than 4,300 acres (1,700 hectares) in the city are occupied by parks, and surrounding lakes and reservoirs and several golf courses afford recreation facilities. The World Series of Golf is an annual professional tournament. Nearby Derby Downs is the site of the annual All-American Soap Box Derby for homemade gravity-powered cars. The city's cultural centres include the Akron Art Museum, American Indian Art Hall of Fame, and the Stan Hywet Hall (with antiques dating from the 16th century). The University of Akron was founded in 1870 as Buchtel College, Inc. village, 1836; city, 1865. Pop. (1992 est.) city, 226,490; Akron PMSA, 662,347.

Akrotiri, British military enclave in south-central Cyprus that was retained as a "sovereign base area" by the United Kingdom under the London Agreement of 1959 granting the independence of Cyprus. Located southwest of Limassol, the enclave comprises Akrotiri Peninsula, the southernmost part of the island, and a small coastal area north of Episkopi Bay. The enclave has a hospital, a weather station, and an airfield. Akrotiri and Dhekēlia sovereign base to the northeast (together totaling 99 square miles [256 square km]) are used as British training facilities and staging areas between Britain and southern Asia and the Far East. They are also support areas for United Nations forces on Cyprus. In the late 1970s, controversy arose in Cyprus over the reported use of Akrotiri by the United States as a station for monitoring Soviet activities.

aksak (Turkish: "limping"), also called BULGARIAN RHYTHM, variety of musical metre

characterized by combinations of unequal units of beats, such as 2 plus 3 or 3 plus 2 and their extensions. Thus 3 + 3 + 2, or 2 + 3 + 3, produces $\frac{1}{2}$ units quite unlike the $\frac{1}{4}$ common to Western music. As non-Western music, as well as eastern European folk music, began to exert influence in the West, *aksak* rhythms found their way into the works of a number of 20th-century composers of Western art music, Bela Bartók and Igor Stravinsky foremost among them.

The word *aksak* was borrowed from Turkish musical theory to replace the phrase "Bulgarian rhythms" that had been applied earlier to such rhythms by Bartók and by the Romanian ethnomusicologist Constantin Brailoiu.

Aksakov, Konstantin Sergeyeovich (b. March 29 [April 10, New Style], 1817, Novo-Aksakovo, Russia—d. Dec. 7 [Dec. 19], 1860, Zacynthus, Greece), Russian writer and one of the founders and principal theorists of the Slavophile movement.

The son of the novelist Sergey Timofeyevich Aksakov, he entered Moscow University, where he was influenced by the work of the German philosopher G.W. Hegel. From the mid-1830s Aksakov focused, along with Yury F. Samarin and Aleksey S. Khomyakov, on the development of early Slavophile ideas. Aksakov praised the traditional spirituality of Russia, believing that the conventional wisdom and Christian virtues of the peasants should serve as a guide to Russia's privileged classes. He decried the European values that had been imposed by Peter the Great. Aksakov was a frequent contributor of essays and literary criticism to periodicals such as *Molva*.

His brother Ivan Sergeyeovich Aksakov (1823–86), who also was an early Slavophile, became a controversial journalist, newspaper publisher, and proponent of Pan-Slavism in the later 19th century.

Aksakov, Sergey Timofeyevich (b. Sept. 20 [Oct. 1, New Style], 1791, Ufa, Russia—d. April 30 [May 12], 1859, Moscow), novelist noted for his realistic and comic narratives and for his introduction of a new genre, a cross between memoir and novel, into Russian literature.

Brought up in a strongly patriarchal family, Aksakov was educated in the pseudoclassical tradition at home, at school, and at the newly

Sergey Timofeyevich Aksakov, detail of an oil painting by Ivan Nikolayevich Kramskoy, 1878; in the State Tretyakov Gallery, Moscow

founded university in Kazan. He became a translator in the legislative commission of the civil service, served in the militia in the struggle against Napoleon in 1812, married in 1815, and in 1816 retired to the family estate. After a decade as a sporting country squire, he returned to the civil service in Moscow and became literary censor, inspector, and, later, director of the college of land surveying. Inheriting money, he retired in 1839 and lived in

and near Moscow, entertaining his friends—mainly writers and Slavophiles.

Before 1834, when his successful *Buran* ("Blizzard") was published, Aksakov's writings reflected outmoded literary tastes: translations of Nicolas Boileau and Molière, undistinguished verse, and articles on the theatre. But then he was inspired—by his love of rural Russia in the days of serfdom, by his Slavophile sons Ivan and Konstantin, and by his admiration of the novelist Nikolay Gogol—to set down the story of his grandfather, his parents, and his own childhood, transposed into realistic fiction. This effort resulted in three books that have become classics: *Semyeynaya khronika* (1856; *The Family Chronicle*), *Vospominaniya* (1856; "Reminiscences"; Eng. trans. *A Russian Schoolboy*), and *Detskie gody Bagrova-vnuka* (1858; *Childhood Years of Grandson Bagrov*). Aksakov unfolds his chronicles objectively in an unaffected style with simple language. Their interest lies in the illusion of reality and intimacy created by his vivid remembrance of his own and his forebears' past. These works, blending personal reminiscence with the techniques of the novelist, brought Aksakov fame. The finest book of the trilogy, *The Family Chronicle*, also shows a remarkable understanding of family psychology.

Also of interest are Aksakov's books on shooting, fishing, and butterfly collecting and his recollections of Gogol, which are firsthand material on his friend's complex personality.

Akselrod, Pavel Borisovich, also called PAUL AXELROD (b. Aug. 25, 1850?, Chernigov?, Ukraine, Russian Empire [now Chernihiv, Ukraine]—d. 1928, Berlin, Ger.), Marxist theorist, a prominent member of the first Russian Social Democratic Party, and subsequently a Menshevik leader.

Akselrod participated in the Narodnik (populist) movement during the 1870s and with Georgi Plekhanov formed the revolutionary

Akselrod
ITAR—TASS/Sovfoto

splinter group Black Repartition in 1879. He went to western Europe, became a Marxist, and was a founder of the Liberation of Labour (1883), the first organization committed to spreading Marxism in Russia. He also became a member of the editorial board of the Marxist newspaper *Iskra* ("The Spark"; 1900). He adopted Menshevism at the Second Congress of Russian Social Democrats (1903) and for the next 15 years was the leading ideologist of the Mensheviks. Akselrod called for Russian Marxists to abandon violent revolutionary activities and instead concentrate their efforts on labour organizing and parliamentary work, as in the Social Democratic tradition of western Europe. Akselrod opposed the Bolshevik leader Vladimir Lenin's emphasis on a highly centralized Marxist political party led by professional revolutionaries, and he predicted that if such a party were to gain power in Russia, it would simply replace the despotism of the

tsarist autocracy with its own form of despotism.

During World War I Akselrod favoured the defense of Russia, and he opposed the Bolshevik Revolution in October 1917. In the ensuing years he was one of the leading Marxist critics of Leninist rule. He lived in western Europe from 1917 on. His memoirs *Perezhitoye i Peredumanoye* ("Experiences and Reflections") were published in 1923.

Akshak, ancient city of Mesopotamia on the northern boundary of Akkad, identified by some authorities with the Babylonian city of Upi (Opis). About 2500 BC Akshak was conquered by Eannatum, king of Lagash. About a century later Akshak temporarily established its hegemony over Sumer and Akkad. The location of Akshak is uncertain, although the Mari letters (from the royal archives at Mari on the Euphrates River; c. 1770 BC) indicate that it lay near Eshnunna in the Diyālā River valley.

Akṣobhya, in Mahāyāna and Vajrayāna (Tantric) Buddhism, one of the five "self-born" Buddhas. See Dhyāni-Buddha.

Aksum, also spelled AXUM, a powerful kingdom in northern Ethiopia during the early Christian era.

Despite common belief to the contrary, Aksum did not originate from one of the Semitic Sabaean kingdoms of southern Arabia but instead developed as a local power. At its apogee (3rd–6th century AD), Aksum became the greatest market of northeastern Africa; its merchants traded as far as Alexandria and beyond the Nile River. Aksum continued to dominate the Red Sea coast until the end of the 9th century, exercising its influence from the shores of the Gulf of Aden to Zeila on the northern coast of Somaliland (modern Somalia and Djibouti).

During the 2nd and 3rd centuries AD, its growth as a trading empire increasingly impinged on the power of the kingdom of Meroe, the fall of which was brought about in the 4th century by an Aksumite invasion.

During the 4th century, the kings of Aksum were Christianized—thus becoming both politically and religiously linked to Byzantine Egypt. At the same time, they extended their authority into southern Arabia. In the 6th century, an Aksumite king reduced the Yemen to a state of vassalage. In the latter part of the 6th century, however, the Persians invaded South Arabia and brought Aksumite influence there to a close. Later, the Mediterranean trade of Aksum was ended by the encroachment of the Arabs in the 7th and 8th centuries.

Gradually, Aksumite power shifted internally to the Agew people, whose princes shaped a new Christian line in the Zagwe dynasty (q.v.) of the 12th–13th century.

Aksum, also spelled AXUM, ancient town in northern Ethiopia. It lies at an elevation of about 7,000 feet (2,100 m), just west of Adwa.

Once the seat of the kingdom of Aksum, it is now a tourist town and religious centre best known for its antiquities. Tall granite obelisks, 126 in all, stand (or lie broken) in the central square. One measuring 110 feet (34 m), now fallen, is said to be the tallest obelisk ever erected. The obelisks range from nearly plain slabs to intricately inscribed pillars. The most recent of the obelisks announces the adoption of Christianity by a 4th-century king. At least 27 carved stone thrones have been unearthed in the overgrown ruins of the ancient palace.

Aksum has long been regarded a holy city for the Ethiopian Orthodox church. According to tradition, the Church of St. Mary of Zion contains the Ark of the Covenant. Over the centuries, however, the church has been destroyed and rebuilt several times; the present structure dates from the 17th century. Emperor Haile Selassie I built the new Church of St. Mary of Zion near the old one in 1965.

An airport, a hospital, a health centre, and a community centre serve the town. Pop. (1989 est.) 21,857.

Aksyonov, Vasily Pavlovich, Aksyonov also spelled AKSENOV (b. Aug. 20, 1932, Kazan, Russia, U.S.S.R.), Russian novelist and short-story writer, one of the leading literary spokesmen for the generation of Soviets who reached maturity after World War II.

The son of parents who spent many years in Soviet prisons, Aksyonov was raised in a state home and graduated from medical school in 1956. After working a few years as a doctor, he turned to writing, and in the cultural thaw of the late 1950s and early '60s he published a number of short stories and novels. His novels *Kollegi* (1960; *Colleagues*), *Zvezdnyi bilet* (1961; *A Ticket to the Stars*), and *Apel'siny iz Morokko* (1963; "Oranges From Morocco") are fast-moving narratives dealing with youthful rebels and misfits in Soviet society. In these books Aksyonov excels in reproducing the racy slang and jargon of characters who are attracted to Western culture even though they share the collectivist ideals of the previous generation.

Aksyonov began incorporating stronger elements of fantasy, satire, and parody in such later novels as *Zatovarennaia bochkotara* (1968; *Surplussed Barrelware*) and *Ostrov Krym* (1981; *The Island of Crimea*). His independent spirit had incurred the disfavour

Aksyonov, 1989
ITAR—TASS/Sovfoto

of the Soviet authorities beginning in the late 1960s. Because of his reputation and his involvement in the attempted publication of *Metropol*, an uncensored literary journal, in 1980 he was forced into exile in the West. His citizenship was restored by decree in 1990.

One of his most important later novels was *Ozhog* (1980; *The Burn*), an anarchic blend of memory, fantasy, and realistic narrative in which the author tries to sum up Russian intellectuals' spiritual responses to their homeland. Another, *Skazhi izyum* (1985; *Say Cheese!*), is an irreverent portrait of Moscow's intellectual community during the last years of Leonid Brezhnev's leadership. *Pokolenie zimy* (*Generations of Winter*, 1994) chronicles the fate of a family of intellectuals at the hands of the Soviet regime during the period of Stalin's rule.

Aktyubinsk (Kazakstan): see Aqtöbe.

akund floss, also called CALOTROPIS FLOSS, downy seed fibre obtained from *Calotropis procera* and *C. gigantea*, plants of the Asclepiadaceae family. The plants are native to southern Asia and Africa and were introduced to South America and the islands of the Caribbean. The yellowish material is made up of thin fibres 2 to 3 cm (0.75 to 1.12 inches) long and 12 to 42 microns (a micron is about 0.00004 inch) in diameter and is harvested by hand. Akund floss is used primarily as upholstery stuffing, sometimes mixed with the seed

fibre kapok. In certain areas it is variously known as ak, mader, or mudar.

Akure, town, capital of Ondo state, southwestern Nigeria. It lies in the southern part of the forested Yoruba Hills and at the intersection of roads from Ondo, Ilesha, Ado-Ekiti, and Owo. Akure is an agricultural trade centre for the yams, cassava, corn (maize), bananas, rice, palm oil and kernels, okra, and pumpkins grown by the Ondo branch of the Yoruba people. Although cocoa is by far the most important local commercial crop, cotton, teak, and palm produce are also cultivated for export. The town's industries include electronics manufacturing, soft drink bottling, weaving, and pottery making. Akure is the site of a federal university of technology (founded in 1981). Pop. (1993 est.) 150,500.

Akureyri, town, northern Iceland. It lies at the southern end of Eyja Fjord. Akureyri is the chief centre of the north and is one of the island's most populous urban centres outside the Reykjavík metropolitan area. While primarily a commercial and distributing centre, Akureyri is also a fishing port, agricultural market, and manufacturing centre for woolen goods, fish oil, shoes, and fish and dairy products. Ironworking, woodworking, and shipbuilding are all significant industries.

Akureyri, Iceland, near the southern end of Eyja Fjord
J. Allan Cash

The town has a technical college, an agricultural experimental station, an airport, botanical gardens, and several museums. Inc. 1876. Pop. (1993 est.) 14,799.

Akutagawa Prize, Japanese AKUTAGAWA RYŪOSUKE SHŌ, Japanese literary prize awarded semiannually for the best serious work of fiction by a promising new Japanese writer. The prize is generally considered, along with the Naoki Prize, Japan's most prestigious and sought-after literary award. Short stories or novellas win the prize more frequently than do full-length novels.

The Akutagawa Prize was created in 1935 by the writer Kikuchi Kan to honour the memory of his friend and colleague, Akutagawa Ryūnosuke, an esteemed writer who had committed suicide in 1927. The prize was awarded from 1935 to 1944 and again from 1949.

Akutagawa Ryūnosuke, pseudonym CHŌKŌDŌ SHUJIN, or GAKI (b. March 1, 1892, Tokyo, Japan—d. July 24, 1927, Tokyo), prolific Japanese writer of stories, plays, and poetry, noted for his stylistic virtuosity.

As a boy Akutagawa was sickly and hypersensitive, but he excelled at school and was a voracious reader. He began his literary career while attending Tokyo Imperial University (now the University of Tokyo), where he studied English literature from 1913 to 1916.

The publication in 1915 of his short story "Rashōmon" led to his introduction to Natsume Sōseki, the outstanding Japanese novelist of the day. With Sōseki's encouragement he began to write a series of stories derived largely from 12th- and 13th-century collections of Japanese tales but retold in the light of modern psychology and in a highly individual style. He ranged wide in his choice of material, drawing inspiration from such disparate sources as China, Japan's 16th-century

Akutagawa Ryūnosuke

By courtesy of the International Society for Educational Information, Tokyo

Christian community in Nagasaki, and European contacts with 19th-century Japan. Many of his stories have a feverish, unhealthy intensity that is well-suited to their often macabre themes.

In 1922 he turned toward autobiographical fiction, but Akutagawa's stories of modern life lack the exotic and sometimes lurid glow of the older tales, perhaps accounting for their comparative unpopularity. His last important work, "Kappa" (1927), although a satiric fable about elflike creatures (*kappa*), is written in the mirthless vein of his last period and reflects his depressed state at the time. His suicide came as a shock to the literary world. Akutagawa is one of the most widely translated of all Japanese writers, and a number of his stories have been made into films. The film classic *Rashomon* (1951), directed by Kurosawa Akira, is based on a combination of Akutagawa's story by that title and another story of his, "Yabu no naka" (1921; "In a Grove").

akvavit (distilled liquor): see aquavit.

Akwa Ibom, state, southeastern Nigeria. Its area formed part of Cross River state until 1987, when Akwa Ibom state was created. Akwa Ibom is bounded by the Cross River on the east and by the Bight of Biafra of the Atlantic Ocean on the south. There are extensive saltwater mangrove swamps along the coast and tropical rain forests and oil palms farther inland.

The state's population consists mainly of Ibibio peoples who raise yams, rice, cowpeas, corn (maize), and cassava for subsistence and oil palms and cocoa as cash crops. Poultry, pigs, sheep, goats, and rabbits are raised. Shrimping along the coast and deep-sea fishing are also economically important. The state's mineral resources include lignite deposits and offshore oil fields. The inland city of Uyo is the state capital and is the site of a university (founded 1983). Other major communities include Opobo and Oron near the coast and Ikot-Ekpene inland. Oron is the site of a museum of ethnography, founded in 1959. The Oron-

Ikot-Ekpen highway and the Cross River are major arteries of transportation. Area 2,734 square miles (7,081 square km). Pop. (1995 est.) 2,638,413.

Akwamu, Akan state (c. 1600–1730) of the Gold and Slave coasts of western Africa. At its apogee in the early 18th century, it stretched more than 250 miles (400 km) along the coast from Whydah (now Ouidah, Benin) in the east to beyond Winneba (now in Ghana) in the west.

Its founders, an Akan people who are traditionally said to have come from Twifu Heman, northwest of Cape Coast, moved during the late 16th or early 17th century to the region of modern Akim Abuakwa, where they founded the state of Akwamu. As the state grew rich on the sale of gold from the Birim River district, its inhabitants sought to extend their authority. Because they were hemmed in on the north and northwest by the state of Akim and other states in loose alliance with or subject to the powerful Denkyera, they expanded south and southeast toward the Ga and Fanti towns of the coast. These they subdued between 1677 and 1681 under their king (*akwamuhene*), Ansa Sasraku. They also extended their influence over the state of Ladoku in the east (1679) and, under Ansa's successor, over the Fanti state of Agona in the west (1689). In 1702 they crossed the Volta River to occupy Whydah, a coastal state of Dahomey (now in southern Benin), and in 1710 subdued the Ewe people of the Ho region. By this time, however, their former satellite, Ashanti, had grown rich and powerful and was becoming increasingly hostile to Akim. Pressured by the Ashanti, the Akim peoples retreated upon Akwamu's borders and, after a long war, succeeded in infiltrating them. The *akwamuhene* was forced to flee, and by 1731 the state had ceased to exist.

Akwapim-Togo Ranges, narrow belt of ridges and hills in Ghana, western Africa. They extend in a southwest-northeast line for about 200 miles (320 km) from the Densu River mouth (near Acera) on the Atlantic coast to the boundary with Togo. Averaging 1,500 feet (460 m) in height, the hills continue eastward to the Niger River as the Togo Mountains in Togo and as the Atakora Mountains in Benin, and they contain isolated peaks near the Togo border. The Volta River cuts through their complex of closely packed folds at Ajena (Volta) Gorge and is harnessed by the great dam at Akosombo 1 mile (1.6 km) downstream.

Although the area is fertile and supports semideciduous forest, the ranges' descent to the surrounding plains is frequently steep and marked by abrupt cliffs. The central highlands, once important for palm oil and cocoa, have suffered greatly from erosion. The section within the Volta River region is important for cash crops of cacao and coffee. Plantains, cassava, and corn (maize) also are grown. Because of an equable climate, the ranges contain hill resorts such as Aburi, located some 20 miles (32 km) north of Acera, and Amedzofe. Roads are sparse and are mainly limited to the south.

Akyab (Myanmar [Burma]): see Sittwe.

Akzo Nobel NV, diversified Dutch manufacturer of paints, coatings, and chemicals. The company was formed from the merger of Akzo NV and the Swedish firm Nobel Industries AB in 1994. Its headquarters are in Arnhem, Neth.

Akzo NV had its origins in the German chemical manufacturer Vereinigte Glanzstoff-Fabriken, which was formed in 1899 and made rayon and paints. Vereinigte merged with a Dutch rayon manufacturer, Nederland-

sehe Kunstzijdefabriek, in 1929, and the new company assumed the name AKU. This firm merged with the major Dutch chemical company Koninklijke Zout-Organon NV (KZO) in 1969 to form Akzo NV, a major Dutch manufacturer of synthetic fibres, industrial chemicals, plastics, paint, adhesives, and pharmaceuticals. Akzo NV ran into financial difficulties in the 1970s owing to competition from East Asian fibre makers and rapidly rising prices for the petroleum-based feedstocks used to make chemicals and fibres. In response, Akzo deemphasized its fibre business and diversified further into paints and specialty chemicals.

Nobel Industries AB was created in 1984 by the merger of the Swedish chemical firm KemaNobel with the Swedish weapons maker Bofors. This merger reunited the two largest companies that had once been owned by Alfred Nobel, the 19th-century inventor of dynamite and founder of the Nobel Prizes. At the time of its merger with Akzo in 1994, Nobel Industries was a manufacturer of paints, adhesives, and specialty chemicals. The merger created one of Europe's largest chemical and paint manufacturers.

al-, Arabic definite article, meaning "the." It often prefixes Arabic proper nouns, especially place-names; an example is Al-Jazīrah (Arabic: "The Island"), the name of an interfluvial region in The Sudan. The article is often used in lowercase form, hence al-Jazīrah. Reference works, including *Encyclopædia Britannica*, often alphabetize names beginning with *al-* under the main part of the name (thus, in the example, "Jazīrah, al-"). Thirteen Arabic letters—the so-called sun letters, *t, th, d, dh, r, z, s, sh, ṣ, ḍ, ṭ, ḏ, and n*—assimilate the *l* of *al-* in pronunciation; thus, Ash-Shām (the colloquial Arabic name of Damascus), not Al-Shām.

Care must be taken to avoid confusing the definite article *al-* meaning "the" with the form "Āl," a different Arabic construction that is used to designate a family or tribal name. "Āl" is invariable and does not elide; thus, Āl Sa'ūd, not Ās-Sa'ūd. The form "Āl" is always romanized with a capital letter, irrespective of its position in an English sentence.

Al-'Arab, Shaṭṭ (Iraq): see 'Arab, Shaṭṭ Al-

Al-'Arabah, Wadi (Palestine): see 'Arabah, Wadi Al-

Āl Bū Sa'īd DYNASTY, Muslim dynasty of Oman, in southeastern Arabia (c. 1749 to the present), and of Zanzibar, in East Africa (c. 1749–1964).

Aḥmad ibn Sa'īd, who had been governor of Ṣuḥār, Oman, in the 1740s under the Persian Ya'rūbids, managed to displace the Ya'rūbids by about 1749 and become imam of Oman and of Zanzibar, Pemba, and Kilwa, in East Africa. His successors—known as *sayyids* or, later, as sultans—expanded their possessions in the late 18th century to include Bahrain in the Persian Gulf and Bandar-e 'Abbās, Hormuz, and Qeshm (all in Iran). In 1798 the threat of the militant Wahhābīs (a puritanical Sunnite sect that had arisen in Najd) caused Sulṭān ibn Aḥmad (reigned 1792–1804) to conclude a treaty with the East India Company that would assure a British presence in Muscat (Masqaṭ), the Āl Bū Sa'īdī capital, which was an important port on the trade route to India.

Under Sa'īd ibn Sulṭān (reigned 1806/07–56), the Bū Sa'īdī family reached the peak of its influence. Sa'īd established treaties with the United States (1833) and France (1844), strengthened his ties with Great Britain, and placed the East African Arab and Swahili colonies from Mogadisho (Muqdisho) to Cape Delgado under his suzerainty. The equilibrium of the sultanate was still threatened by Wahhābī attacks and tribal unrest in the mountains, but, with British aid, Sa'īd kept them in check. In 1854, out of gratitude for

such support, the sayyid gave Great Britain the Khuriya Muriya Islands.

On Sa'īd's death in 1856, the Āl Bū Sa'īdī dominions were divided by the British between Sa'īd's two sons: Oman came under Thuwaynī's rule (1856–66), while Zanzibar went to Mājid (reigned 1856–70).

In Zanzibar, the Bū Sa'īdīs remained in power even under the British protectorate (1890–1963) but were overthrown in 1964 when Zanzibar was incorporated into the United Republic of Tanzania.

In Oman, an opposition movement that was organized in the mountains in 1901 by 'Isā ibn Ṣāliḥ threatened the Bū Sa'īdīs until a treaty, known as the Treaty of As-Sib (Sept. 25, 1920), was signed between Imam 'Isā ibn Ṣāliḥ and Sultan Taymūr ibn Fayṣal (reigned 1913–32), by virtue of which Sultan Taymūr ruled over the coastal provinces and Imam 'Isā over the interior. Opposition broke out again in 1954 when the tribes appealed to Saudi Arabia for aid in establishing an independent principality, but Sultan Sa'īd ibn Taymūr (reigned 1932–70) was able to put down the rebellion with British aid.

In the mid-1960s a Marxist-led rebellion broke out in the southern Dhofar region; this and other concerns eventually prompted the ouster of Sultan Sa'īd by his son, Qābūs ibn Sa'īd (reigned 1970–). Qābūs began the first programs to modernize Oman's infrastructure, social programs, and government bureaucracy. In the late 20th century the sultanate encouraged foreign investment, maintained ties with British and American interests, and aligned itself with the moderate Arab powers.

Āl Wahībah Dunes, Arabic RAMLAT ĀL WAHĪBAH, sandy desert, east-central Oman. It fronts the Arabian Sea on the southeast and stretches along the coast for more than 100 miles (160 km). The desert consists of honey-coloured dunes that are dark red at their base and rise to heights of 230 feet (70 m). The sands are crisscrossed with tracks and routes for vehicles. There is very little surface water, but underground water traditionally is tapped by tunneling into the earth at a shallow angle until the water table is reached. The region is solely inhabited by Yal Wahībah nomads.

'Alā' od-Dīn 'Aṭā Malek Joveynī (Persian historian): see Joveynī, 'Aṭā Malek.

Ala Shan Desert, southernmost portion of the Gobi (desert), occupying some 400,000 square miles (1,000,000 square km) in north-central China. Covering portions of the western Inner Mongolia Autonomous Region and northern Kansu *sheng* (province), it is bounded by the Huang Ho (Yellow River) and Holan Mountains on the east and southeast; by the Ch'i-lien Mountains on the south and southwest; by the northern reaches of the Hei River (the Jo River) on the west; and by a tectonic depression and the China-Mongolia border on the north. It extends about 350 miles (550 km) northwest-southeast and has a maximum width of about 170 miles (270 km) in the northwest, narrowing in the southeast. Physiographically, the desert is largely a plain, ranging in elevation from 2,690 feet (820 m) in the northwest to 5,450 feet (1,666 m) in the southeast.

Chinese geographers divide the region into three smaller deserts, the T'eng-ko-li (Tengri) Desert in the south, the Pa-tan-ehi-lin (Baden Dzareng, or Batan Tsalang) in the west, and the Wu-lan-pu-ho (Ulan Buh) in the northeast.

Alabama, constituent state of the United States of America lying in the eastern south-central region of the country.

A brief treatment of Alabama follows. For full treatment, see **MACROPAEDIA: United States of America: Alabama**.

Facing the Gulf of Mexico at Mobile Bay in the south, Alabama is also bounded by the states of Florida on the south, Georgia on the east, Tennessee on the north, and Mississippi on the west. The capital is Montgomery. Roughly rectangular in shape, the state extends about 335 miles (540 km) from north to south and 210 miles (340 km) from east to west.

The earliest inhabitants were Indians, whose occupancy has probably spanned 10,000 years. Visible evidence of their activity are settlement sites, ceremonial centres, and great burial mounds around Moundville, near Tuscaloosa. At the time of initial European exploration in the 16th century, the main resident Indian groups were the Creeks, Cherokees, Choctaws, and Chickasaws.

Several Spanish treasure seekers, especially Hernando de Soto, made the initial European contact, while the French founded the first permanent settlement at Fort Louis in 1702. The first blacks arrived in 1719 when a slave ship unloaded its cargo at Dauphin Island. The 17th and 18th centuries were marked by struggles between French, British, and Spanish authorities for control of the region. Although control over most of the territory passed from Britain to the United States in 1783, the Spanish maintained a foothold at Mobile Bay until 1813. The Alabama Territory was created in 1817 and was granted statehood in 1819. Alabama seceded from the Union during the American Civil War (1861), joining the Confederate States of America, which had its first capital at Montgomery. Readmission to the Union occurred in 1868. Efforts during Reconstruction to include the black population in the mainstream of government, education, and the economy failed, and by the mid-1870s a rigid policy of racial segregation had developed that rendered blacks virtually powerless until the mid-1960s.

Physiographically Alabama can be divided into two main regions of approximately equal area: the southern extremities of the Appalachian Highlands in the north, and the coastal plain of the Gulf of Mexico in the south. The Cumberland Plateau of the far north drains to the northwest through the Tennessee River, while the rest of the state is drained southward through broad, fertile valleys.

The Alabama climate is temperate, with an average annual temperature of some 60° F (16° C) in the north and 67° F (19° C) in the south. Rainfall is fairly evenly distributed throughout the year, with a yearly average of 52 inches (1,320 mm) at Birmingham and 62 inches (1,570 mm) at Mobile. Under these favourable conditions the growing season ranges from 200 days in the north to 300 days in the south. Soil conditions throughout the state are also well suited for agriculture.

Early rural settlement patterns reflected that fact, and until the 1960s more than one-half of the population was still rural, decreasing only to 40 percent by 1980. Only two cities, Birmingham and Mobile, have populations exceeding 200,000. Almost three-quarters of the population is white and one-quarter black, both groups being characterized by deep genealogical roots in the state. Religious affiliations are primarily Protestant, the vast majority of churches remaining without integrated congregations.

Cotton dominated the economy of Alabama until the boll weevil blight of 1915 forced diversification of crops. Cotton is still a major crop, but Alabama also produces soybeans, corn (maize), peanuts (groundnuts), forest products, poultry, cattle, and hogs. Industrial development centred on the iron and steel industry of Birmingham with its nearby resources of iron ore, coal, and limestone.

Hydroelectric plants constructed by the Tennessee Valley Authority in the 1930s provided abundant low-cost electricity for the development of such industries as aluminum, textiles, paper, chemicals, fabricated metals, and rubber and plastics. The Browns Ferry, Farley, and Bellefonte nuclear-reactor complexes provide additional electric power.

River-barge traffic on the navigable Tennessee River and the Black Warrior-Tombigbee-Mobile river systems is heavy. New construction at the Alabama State Docks has turned Mobile into a major ocean terminal. Mobile Bay is connected to the Intracoastal Waterway. Highways, airways, and railroads crisscross the state.

Alabamans, often referring to their state as the "Heart of Dixie," have maintained the cultural traditions of the antebellum South, as evidenced by the many fine plantation museums and by a rich vein of rural tradition and folklore. Universities include the University of Alabama, Auburn University, and Tuskegee University. Important scientific and technological research is conducted at the Alabama Space and Rocket Center at Huntsville. Area 51,705 square miles (133,915 square km). Pop. (2000) 4,447,100.

Alabama claims, maritime grievances of the United States against Great Britain, accumulated during and after the American Civil War (1861–65). The claims are significant in international law for furthering the use of arbitration to settle disputes peacefully and for delineating certain responsibilities of neutrals toward belligerents. The dispute centred on the Confederate cruiser *Alabama*, built in England and used against the Union as a commerce destroyer, which captured, sank, or burned 68 ships in 22 months before being sunk by the USS *Kearsarge* off Cherbourg, Fr. (June 1864).

At the outset of the war, a Federal blockade of Southern ports and coasts automatically extended belligerent status to the Confederacy. To protect its own interests, Britain took the lead among European countries in proclaiming its neutrality (May 14, 1861). The Confederacy immediately set about building a navy to engage the Union's naval power and to destroy its merchant marine. Along with several other ships, the *Alabama* was built or fitted out privately on British territory and put to sea despite the belated intervention of the British government.

Battle between the Confederate blockade runner *Alabama* and the Union's *Kearsarge* in the harbour of Cherbourg, Fr.; detail from a painting by Édouard Manet (1832–83)

By courtesy of the John G. Johnson Collection, Philadelphia

As early as October 1863, the U.S. minister to Great Britain, Charles Francis Adams, protested that the British must take responsibility for the damages caused by British-built Confederate raiders, but he conceded that his government would be willing to submit the matter to arbitration. Amid bombastic U.S. threats of annexing Canada, Anglo-American

misunderstanding was exacerbated after the end of the Civil War by unsettled disputes over Canadian fisheries and the northwestern boundary. A proposed settlement in the Johnson-Clarendon Convention was angrily rejected by the United States. To avoid further deterioration of Anglo-American relations, a joint high commission was set up, and on May 8, 1871, the parties signed the Treaty of Washington, which, by establishing four separate arbitrations, afforded the most ambitious arbitral undertaking the world had experienced up to that time. In addition, Great Britain expressed official regret over the matter.

Certain wartime maritime obligations of neutrals, already agreed to in article 6 of the treaty, were outlined in the principal arbitration of the *Alabama* claims, meeting at Geneva, as follows: that a neutral government must use "due diligence" to prevent the fitting out, arming, or equipping, within its jurisdiction, of any vessel believed to be intended to carry a war against a power with which it was at peace and to prevent the departure of such a vessel (the substance of this clause was included in article 8 of the 1907 Hague Convention) and that a neutral must not permit its ports or waters to be used as a base of naval operations for similar purposes. In addition, on Sept. 14, 1872, the tribunal voted unanimously that Britain was legally liable for direct losses caused by the *Alabama* and other ships and awarded the United States damages of \$15,500,000 in gold.

This settlement gave new impetus to the process of arbitration, which had been latent for many years.

Alabama Platform, in U.S. history, Southern political leader William L. Yancey's response (1848) to the antislavery Wilmot Proviso (*q.v.*). The Alabama platform insisted that the U.S. government protect slavery in territories ceded to the United States by Mexico and that no territorial legislature be allowed to prohibit slavery. The Democratic Party declined to adopt Yancey's platform at the national conventions of 1848 and 1860. After the 1860 convention nominated Stephen A. Douglas for the presidency, Southern party members broke away to nominate John C. Breckinridge to run on the Alabama Platform.

Alabama River, river in southern Alabama, U.S. It is formed by the Coosa and Tallapoosa rivers, 7 miles (11 km) northeast of Montgomery, winds westward to Selma, and then flows southward. Its length is 318 miles (512 km). The river drains 22,600 square miles (58,500 square km) and is navigable most of the year. It receives its chief tributary, the Cahaba, 17 miles (27 km) below Selma. The Alabama is joined 44 miles (71 km) above Mobile by the Tombigbee to form the Mobile and Tensaw rivers, which flow into the Gulf of Mexico. Mobile and Montgomery became major cities largely because they were on this important traffic artery. The Coosa-Alabama river system, with various locks and dams, exerts a dominant influence on economic developments in the state.

alabaster, fine-grained, massive gypsum (*q.v.*) that has been used for centuries for statuary, carvings, and other ornaments. It normally is snow-white and translucent but can be artificially dyed; it may be made opaque and similar in appearance to marble by heat treatment. Florence, Livorno, and Milan, in Italy, and Berlin are important centres of the alabaster trade. The alabaster of the ancients was a brown or yellow onyx marble.

alabastron, elongated, narrow-necked flask, used as a perfume or unguent container. The Greek alabastron has no handles but often lugs (ear-shaped projections), sometimes

pierced with string holes. There are three types of classical alabastron: a basic Corinthian bulbous shape about 3 to 4 inches (8 to 10 cm)

Corinthian terra-cotta alabastron, 625–600 bc; in the Metropolitan Museum of Art, New York City

By courtesy of the Metropolitan Museum of Art, New York City, bequest of George D. Pratt, 1935

high that appeared from the mid-7th century bc and was common in Greece; a long, pointed version found in eastern Greek, Etruscan, and Italo-Corinthian pottery; and an Attic type, from 4 to 8 inches (10 to 20 cm) high, with a rounded base and occasionally two small lugs, common from the late 6th to the early 4th century bc. All three types are found in pottery form. The last two types are justifiably named alabastron, as they were made of alabaster.

Examples of alabastrons in opaque glass exist from 1000 bc in Egypt, 600 bc in Assyria, and the 2nd century bc in Syria and Palestine. The earliest Egyptian alabastron is columnar, with a palm capital and a small plinth as a stand, and is circled with wavy bands of glass thread. Later examples, in dark-blue glass or milk glass, have a funnel-shaped opening or a broad disk-lipped neck; decoration consists of scallops, festoons, or, more commonly, ringed patterns, among which combed zigzags are especially effective.

Alaca Hüyük, ancient Anatolian site northeast of the old Hittite capital of Hattusa at Boğazköy, north-central Turkey. Its excavation was begun by Makridi Bey in 1907 and resumed in 1935 by the Turkish Historical Society. Inside a sphinx gate, traces of a large Hittite building were discovered. Below the

Copper finial showing a stag and two steers, from Alaca Hüyük, c. 2400–2200 bc; in the Archaeological Museum, Ankara

By courtesy of the Archaeological Museum, Ankara, photograph, Josephine Powell, Rome

Hittite remains was a royal necropolis of 13 tombs dating from about 2500 bc. Although material from the same period at Alişar Hüyük (qv) seemed to indicate a relatively primitive community of farmers and traders, the tombs of Alaca Hüyük provide evidence of considerable cultural accomplishment and refinement. While the tomb pottery is comparatively primitive in style, there is ample evidence of the advanced accomplishments of Copper Age metallurgy. Filigree ornaments, jewelry, bowls, jugs, and chalices of gold were found, and sheet gold or gold wire was freely used in ornamentation. Vessels and bands of silver, and bowls and statuettes of copper or bronze are also represented. Included in the tomb finds were female “idols”; these were probably early cult images of the typical Anatolian mother goddess.

Although the ethnic identity of Alaca’s pre-literate inhabitants is uncertain, it is most plausible to assign them to the non-Indo-European population that preceded the arrival of the people now known as Hittites; archaeological parallels are available among Heinrich Schliemann’s Trojan treasures from Troy (level II) and from the Early Bronze Age at Cyprus.

Aladdin, Arabic ‘ALĀ’ AD-DIN, hero of one of the best known stories in *The Thousand and One Nights*. The son of a deceased Chinese tailor and his poor widow, Aladdin is a lazy, careless boy who meets an African magician claiming to be his uncle. The magician brings Aladdin to the mouth of a cave and bids him enter and bring out a wonderful lamp that is inside, giving him a magic ring for his safety in the meantime. Aladdin goes in and returns with the lamp but refuses to hand it over to the magician until he is safely out of the cave. The magician thereupon shuts him inside the cave with the lamp and departs. Wringing his hands in dismay in the dark, Aladdin finds that he can summon up powerful jinn, or genies, by rubbing the ring. He returns home and soon finds that rubbing the lamp also produces genies. These supernatural spirits grant him his every wish, and Aladdin eventually becomes immensely wealthy, builds a wonderful jeweled palace, and marries the beautiful daughter of the sultan. After defeating the attempts of the frustrated African magician and his even more wicked younger brother to recover the lamp, Aladdin lives in longtime marital happiness, succeeds the sultan, and reigns for many years, “leaving behind him a long line of kings.”

Aladura (Yoruba: “Owners of Prayer”), religious movement among the Yoruba peoples of western Nigeria, embracing some of the independent prophet-healing churches of West Africa. The movement, which in the early 1970s had several hundred thousand adherents, began about 1918 among the younger elite in the well-established Christian community. They were dissatisfied with Western religious forms and lack of spiritual power and were influenced by literature from the small U.S. divine-healing Faith Tabernacle Church of Philadelphia. The 1918 world influenza epidemic precipitated the formation of a prayer group of Anglican laymen at Ijebu-Ode, Nigeria; the group emphasized divine healing, prayer protection, and a puritanical moral code. By 1922 divergences from Anglican practice forced the separation of a group that became known as the Faith Tabernacle, with several small congregations.

The main expansion occurred when a prophet-healer, Joseph Babalola (1906–59), became the centre of a mass divine-healing movement in 1930. Yoruba religion was rejected, and pentecostal features that had been suppressed under U.S. influence were restored. Opposition from traditional rulers, government, and mission churches led the movement to request help from the pentecostal Apos-

toloc Church in Britain. Missionaries arrived in 1932, and the Aladura movement spread and consolidated as the Apostolic Church. Problems arose over the missionaries’ use of Western medicines—clearly contrary to doctrines of divine healing—their exclusion of polygamists, and their assertion of full control over the movement. In 1938–41 the ablest leaders, including Babalola and Isaac B. Akinyele (later Sir), formed their own Christ Apostolic Church, which by the 1960s had 100,000 members and its own schools and had spread to Ghana. The Apostolic Church continued its connection with its British counterpart; other secessions produced further “apostolic” churches.

The Cherubim and Seraphim society is a distinct section of the Aladura founded by Moses Orimolade Tunolase, a Yoruba prophet, and Christiana Abiodun Akinsowon, an Anglican who had experienced visions and trances. In 1925–26 they formed the society, with doctrines of revelation and divine healing replacing traditional charms and medicine. They separated from the Anglican and other churches in 1928. In the same year the founders parted, and further divisions produced more than 10 major and many minor sections, which spread widely in Nigeria and to Benin (formerly Dahomey), Togo, and Ghana.

The Church of the Lord (Aladura) was started by Josiah Olunowo Oshitelu, an Anglican catechist and schoolteacher, whose unusual visions, fastings, and devotions led to his dismissal in 1926. By 1929 he was preaching judgment on idolatry and native charms and medicines, uttering prophecies, and healing through prayer, fasting, and holy water. The Church of the Lord (Aladura), which he founded at Ogere in 1930, spread to north and east Nigeria, Ghana, Liberia, Sierra Leone, and beyond Africa—New York City and London—where several other Aladura congregations also meet. The Aladura movement continues to grow and includes many small secessions, ephemeral groups, prophets with one or two congregations, and healing practitioners.

Alâeddin Ali Aşık Paşa: see *Aşık Paşa*.

Alagoas, *estado* (state) of northeastern Brazil. It is the second smallest of Brazil’s 23 states and is an agricultural region in the early stages of industrialization. Situated on the northern bank of the São Francisco River, it is bounded on the north and west by the state of Pernambuco, on the east by the Atlantic Ocean, on the south by Sergipe, and on the west by Bahia. It has an area of 10,707 square miles (27,731 square km). Its coastline is about 138 miles (220 km) long. The name of the state derives from its large number of lakes (*lagôas*). The capital is Maceió.

Pôrto Calvo in the north and Penedo, located on the northern bank of the São Francisco River, were founded during the early years of the Portuguese occupation of Brazil, in the 16th century. In the early part of the 17th century the Dutch obtained a foothold but were soon expelled. At about the same time, *quilombos*—fortified settlements of fugitive slaves, with a distinct culture that had many African characteristics—were established in the forests. Alagoas was a district of Pernambuco until 1817, when it became a captaincy (fief). Following the proclamation of Brazilian independence in 1822, it became a province of the empire, and in 1889 it became a state of the republic.

The climate of Alagoas is hot and humid along the coast and hot and dry in the interior. The terrain slopes downward from a semi-barren plateau to a narrow coastal plain. The principal rivers of the state are the São Francisco and the Mundaú, Paraíba, and Coruripe. Lagoa Mundaú, or Lagoa do Norte (Lake of the North), and Lagoa Manguaba, or Lagoa do Sul (Lake of the South), are the largest of

the state's many lakes. Geologically, Alagoas consists mostly of the southern part of the Serra da Borborema (Borborema Mountain Range). The Serra Lisa (Lisa Mountain) is the state's highest point. There are four zones of vegetation: the coastal plain; the Mata, or tropical rain forest; the Agreste, a shrubby savanna parkland; and the Caatinga, an arid region covered with underbrush and cacti. The animal life of the state is rich and varied.

The Alagoans are a mixture of peoples of European, African, and Indian origin. White and black-skinned peoples predominate in the coastal region of Alagoas, *caboclos*—copper-skinned people of mixed European and Indian descent—in the interior. The language of the state is Portuguese. Roman Catholicism is the principal religion.

In addition to the University of Alagoas there is a state school of medical sciences and a private school of social service. Many institutions provide technical instruction.

Abundant electric power is available from the Paulo Afonso hydroelectric project on the São Francisco River; the towns are supplied with electricity. The water supply, however, remains inadequate. The São Francisco River is being canalized, both for navigation and to supply the hinterland with water for domestic use. Sanitary conditions are poor. Although there are hospitals and other medical establishments in the state, all suffer from shortages of staff and funds.

While Alagoas is still primarily an agricultural state, industrialization is making progress. The main agricultural products are sugarcane, beans, palm, coconuts, cassava (manioc), rice, corn (maize), cotton, and tobacco. Cattle raising is increasing in the Bacia Leitera, a dairying region in the west central part of the state. Sugar refining is the state's most important industry; other industries include textile manufacturing, dairy processing, iron smelting, and the processing of corn, rice, fertilizers, and hides.

Deposits of amianthus, a fine, silky asbestos, are mined. There are a number of oil wells in production, and further drilling and prospecting has taken place. Oil production and exploration are centred on Arapiraca, Maceió, Marechal Deodoro, São Miguel, Coqueiro Sêco, and Piaçabuçu.

The capital, Maceió, is the chief commercial city, has an industrial district, and a modest foreign and coastwise trade is carried on through its port, Jaraguá. Inland water transport is available on the São Francisco River and on several lakes. Flights from Palmares Airport link Maceió to other Brazilian state capitals.

Among the state's cultural institutions are the Historical and Geographic Institute, the Academy of Letters, and a medical society. Pop. (2000 prelim.) 2,817,903.

Alagoinhas, city, northeastern Bahia state, northeastern Brazil, lying 35 mi (56 km) inland from the Atlantic coast at 607 ft (185 m) above sea level. It was elevated to city rank in 1880, and its municipality is the largest orange-producing region in the state. Bananas, lemons, and cassava (manioc) are also cultivated, and dairying is widespread. Tanning, coal mining, and lumbering are also important. Products are exported by rail and road to Salvador, the state capital, 70 mi south, and to neighbouring communities. Pop. (2000 prelim.) 112,339.

Alain, pseudonym of ÉMILE-AUGUSTE CHARTIER (b. March 3, 1868, Mortagne, Fr.—d. June 2, 1951, Le Vésinet, near Paris), French philosopher whose work profoundly influenced several generations of readers.

Graduating in philosophy, he taught at *lycées* in a number of towns, including Rouen, where he became involved in politics and began contributing a daily short article of 600 words to a Radical newspaper. The high liter-

ary quality of these articles soon attracted attention and they were collected and published (1908) in a book that came to be regarded as a classic. Appointed to teach philosophy at the Lycée Henri Quatre, in Paris, Alain became the mentor of most of the teachers of philosophy of the next generation in France. In defiance of public opinion he foretold and denounced World War I; on its outbreak, however, he enlisted in the artillery. Refusing promotion, he spent the whole war in the ranks; and it was in the front line or in battery telephonists' dugouts that he wrote *Mars, ou la guerre jugée* (1921; *Mars; or, The Truth About War*, 1930), *Quatre-vingt-un Chapitres sur l'esprit et les passions* (1917), and *Système des beaux-arts* (1920). Later he resumed his post at the Lycée Henri Quatre. His most important publications over the ensuing years were *Les Idées et les âges* (1927), *Entretiens au bord de la mer* (1931), *Idées* (1932), *Les Dieux* (1934), *Histoire de mes pensées* (1936), and *Les Aventures de coeur* (1945). When age and painful disease made it impossible for him to teach any longer, he retired to a little house in the neighbourhood of Paris, where his disciples could visit him. In 1951 he was awarded the Grand Prix National de Littérature, of which he was the first recipient; this was the only honour that he accepted.

Alain DE LILLE, Latin ALANUS DE INSULIS (b. c. 1128, probably Lille, Flanders—d. 1202, Cîteaux, Fr.), theologian and poet so celebrated for his varied learning that he was known as "the universal doctor." He studied and taught at Paris, lived for some time at Montpellier, and later joined the Cistercians in Cîteaux.

As a theologian, Alain shared in the mystic reaction of the second half of the 12th century against the Scholastic philosophy, adopting an eclectic Scholasticism composed of rationalism and mysticism. In his main theological treatise, *The Art of the Catholic Faith*, he utilized a mathematical demonstration to try to prove the truth of the dogmas defined in the creed. His *Treatise Against Heretics* attempted to refute heterodoxy on rational grounds; and his *Maxims of Theology* assumed that the principles of the faith are self-evident propositions.

Alain is noted in the history of medieval Latin literature for two poems: *Plaint of Nature*, a clever satire on human vices, and *Anticlaudianus*, a lengthy allegory concerning the creation and perfection of the human soul by God and nature, theology and philosophy, the virtues and the arts. M. Baumgartner's *Die Philosophie des Alanus de Insulis* was published in 1896.

Alain-Fournier, pseudonym of HENRI-ALBAN FOURNIER (b. Oct. 3, 1886, La Chapelle-d'Angillon, Cher, Fr.—d. Sept. 22, 1914, in the first Battle of the Marne), French writer whose only completed novel, *Le Grand Meaulnes* (1913; *The Lost Domain*, 1959), is a modern classic. Based on his happy childhood in a remote village in central France, it reflects his longing for a lost world of delight. The hero,

Alain-Fournier, drawing by André Lhote
J.E. Bulloz

an idealistic but forceful schoolboy, runs away and at a children's party in a decrepit country house meets a beautiful girl—whose prototype Alain-Fournier had met in 1905. The rest of the novel describes his search for her and for the house and the mood of wonderment he knew there. Its outstanding quality is evocation of an atmosphere of other-worldly nostalgia, against a realistically observed rural background. Other works, mainly published posthumously, include a correspondence (2 vol., 1948) with the critic Jacques Rivière, his brother-in-law. A biography by R. Gibson, *The Quest of Alain-Fournier*, appeared in 1953.

Alajuela, province, northwestern Costa Rica, bounded on the north by Nicaragua. The province, 3,700 sq mi (9,500 sq km) in area, descends northward from the Cordillera Central in the south and the Cordillera Guanacaste in the west to the San Juan River, which drains Lake Nicaragua to the Caribbean Sea and is part of the international boundary. After San José, Alajuela is the leading province in livestock and the second in industrial and commercial activity. It grows about half the nation's sugarcane and is a significant producer of coffee and fruits. The southern part of the province is traversed by the Pan-American Highway and by the Costa Rica Railway, which pass through Alajuela, the provincial capital. Pop. (2000 est.) 650,310.

Alajuela, capital, Alajuela province, northwestern Costa Rica, on the central plateau at an altitude of 3,141 ft (957 m). Known in colonial days as La Lajuela and Villahermosa, the town was active in support of independence from Spain in 1821; five years later it suffered from a plot to restore Spanish control over Costa Rica. For a brief period in the 1830s Alajuela served as the nation's capital. It was the home of Juan Santamaría, a Costa Rican soldier and hero of the defense against the invasion by the U.S. filibuster (military adventurer) William Walker in 1856. Alajuela was the starting point and centre of much of the construction activity of Costa Rica's coast-to-coast railroad begun in the 1870s. It is now a summer resort, famous for its flowers and markets. The city is on the Pan-American Highway, just northwest of San José, the national capital. Pop. (2000 est.) 53,430.

Alakol Lake, Russian OZERO ALAKOL, also called OZERO ALA-KUL, salt lake in Kazakhstan, 110 miles (180 km) east of Lake Balkhash, near the border with Sinkiang Uighur Autonomous Region, China. Lake Alakol has a drainage basin of about 26,500 square miles (68,700 square km), an area of 1,025 square miles, reaches a depth of about 148 feet (45 m), and receives the Urdzhar River (north).

Alalakh, modern TELL AÇANA, also called 'ATSHANAH, ancient Syrian city in the Orontes (Asi) valley, southern Turkey. Excavations (1936–49) by Sir Leonard Woolley uncovered numerous impressive buildings, including a massive structure known as the palace of Yarim-Lim, dating from c. 1780 BC, when Alalakh was the chief city of the district of Mukish and was incorporated within the kingdom of Yamkhad.

Excavations also revealed a towered palace, occupied by several successive rulers, one of whom, Idrimi, ruled for 30 years and probably died about 1450 BC. The town was raided frequently because of its border location, but it was always rebuilt and remained a rich centre until its final destruction by the Sea Peoples shortly after 1200 BC.

Alamán, Lucas (b. October 1792, Guanaajuato, Mex.—d. June 2, 1853, Mexico City),

politician and historian, the leader of Mexican conservatives for nearly 30 years and the spokesman for a strong, centralized government that would support industrialization, educational expansion, and agricultural modernization. Living during a corrupt and brutal period of Mexican politics, he stood out as an honest and honourable political figure.

Born in an area of extensive gold and silver mining, Alamán was trained as a mining engineer. He served in 1819 as the Mexican deputy in the Cortes (Spanish Parliament) and sought money and technical assistance for the Mexican mining industry. In Europe he developed a lifelong admiration for the stability of British political institutions.

Returning to an independent Mexico in 1822, Alamán served first as foreign minister under Guadalupe Victoria (1824–29), then as the powerful and influential chief minister of Anastasio Bustamante (1829–32). Alamán's career was marked by his frequent controversies with the United States and his ambitious, but unfulfilled, economic and political plans. He slowed down migration from the United States into Texas (at that time part of Mexico) and interfered with the signing of a trade treaty. His economic schemes, which attempted to force Mexico into rapid industrialization, were perhaps utopian for the primitive Mexican economy and remained only as plans on paper.

Alamán, as a historian, was the founder of the National Museum and the General Archive in Mexico City and is remembered for his historical works *Disertaciones sobre la historia de la república mejicana*, 3 vol. (1844–49: "Dissertations on the History of the Mexican Republic"), and *Historia de México*, 5 vol. (1848–52).

Alamanni (Germanic people): *see* Alemanni.

Alameda, city, Alameda county, California, U.S. It lies on an island (6.5 miles [11 km] long by 1 mile [1.6 km] wide) in San Francisco Bay, across the Oakland Harbor Channel from Oakland, with which it is connected by bridges and underground tunnels. The site was originally a peninsula that was part of Rancho San Antonio and was also the site of Indian shell mounds. The locality was settled in the 1850s. Its growth was stimulated by a ferry service to San Francisco and the building of railroad bridges and terminals. The Tidal Canal (1902) changed Alameda to an island with an industrialized waterfront dominated by shipbuilding, steel fabrication, and lumber milling. Port facilities attracted fishing and cargo vessels, and in 1940 it became the site of a large naval air station. The College of Alameda opened in 1966. Inc. 1854. Pop. (1990) 76,459.

Alamein, battles of el- (June–July 1942; Oct. 23–Nov. 6, 1942), two engagements between British and Axis forces in Egypt during World War II.

After the British had inflicted severe defeats on the Italian forces in North Africa, the German general Erwin Rommel was chosen commander of Axis forces in Libya (February 1941) and in January 1942 started a new drive eastward along the North African coast to seize the Suez Canal. After losing *Banghāzī* in January, the British held the Germans in check until May. Then the German and Italian forces were able to destroy most of the British tank force, take Tobruk, and move eastward into Egypt, reaching el-Alamein (al-'Alamayn) on June 30, 1942. By mid-July Rommel was still there, blocked, and had even been thrown on the defensive, thus ending the first engagement.

General Harold Alexander took command of the British troops in this theatre in August, and

General Bernard L. Montgomery was named his field commander. On Oct. 23, 1942, the British 8th Army started a devastating attack from el-Alamein. Rommel's forces—vastly outnumbered, with fewer than 80,000 against the 230,000 British—were routed. By November 6 the British had wound up the second battle and driven the Germans westward from Egypt back into Libya.

alamiqui (mammal): *see* solenodon.

Alamo (Spanish: "Cottonwood"), 18th-century Franciscan mission in San Antonio, Texas, U.S., the site of a historic resistance effort by a small group of determined fighters for Texan independence (1836) from Mexico.

The building was originally the chapel of the Mission San Antonio de Valero, which had been founded between 1716 and 1718 by Franciscans. Before the end of the century the mission was abandoned and the buildings had fallen into partial ruin. After 1801 the chapel was occupied sporadically by Spanish troops. Apparently it was during this period that the old chapel became popularly known as "the Alamo" from the grove of cottonwood in which it stood.

In December 1835, at the opening of the Texas war for independence, a detachment of Texas volunteers drove a Mexican force from San Antonio and occupied the Alamo. Some Texan leaders, including Sam Houston, counseled the abandonment of San Antonio as impossible to defend with the small body of troops available, but the volunteers at the Alamo refused to retire from their exposed

The Alamo, San Antonio

By courtesy of the Greater San Antonio Chamber of Commerce

position. On Feb. 23, 1836, a Mexican army, commanded by General Antonio López de Santa Anna, arrived from south of the Rio Grande and immediately began a siege of the Alamo. The small defending force was supplemented by some later arrivals and amounted to about 184 men. This force was commanded by Colonel James Bowie and Colonel William B. Travis and included the renowned Davy Crockett. For 13 days the Alamo's defenders held out, but on the morning of March 6 the Mexicans (variously estimated at 1,800 to more than 6,000) stormed through a breach in the outer wall of the courtyard and overwhelmed the Texans. Santa Anna had ordered that no prisoners be taken, and 183 of the defenders were slain (only about 15 persons, mostly women and children, were spared). The Mexicans suffered heavy casualties, with the number killed reliably estimated at from 1,000 to 1,600. These casualties and the time lost in reducing the Alamo dislocated Santa Anna's campaign long enough to permit Houston to perfect plans for the defense of Texas. The Alamo became for Texans a symbol of heroic resistance.

For many years after 1845 the Alamo was used by the U.S. Army for the quartering of troops and the storage of supplies. In 1883 the state of Texas purchased the Alamo and in 1903 acquired title to the remainder of the old mission grounds. The Alamo and adjacent buildings have been restored and are maintained as a historic site.

Alamogordo, city, seat (1899) of Otero county, southern New Mexico, U.S. It lies at the west base of the Sacramento Mountains and east of the Tularosa Basin. Founded by John A. and Charles B. Eddy in 1898, it became a division point on the Southern Pacific Railroad and developed as a lumber town and agricultural-market centre. The Holloman Air Force Base was constructed there during World War II, and the first atomic bomb was exploded at the "Trinity Site" (60 miles [97 km] northwest) on July 16, 1945. The base later tested guided missiles, and it now houses aerospace research facilities. Scarcity of water has impeded postwar development, but water is supplied from many wells and the 85-mile (137-kilometre) Bonito pipeline system. White Sands National Monument, the International Space Hall of Fame (honouring space pioneers), and the Mescalero (Apache) Reservation are nearby. The city is headquarters for Lincoln National Forest. It is the site of the New Mexico School for the Blind (1903) and of a branch of New Mexico State University. Inc. 1912. Pop. (1990) 27,596.

Alamosa, city, seat of Alamosa county, southern Colorado, U.S. It lies along the Rio Grande in the San Luis Valley. It was founded and incorporated in 1878 when Garland City, a former terminus of the Denver and Rio Grande Western Railroad, was moved to the site. It developed as a rail and highway centre from which vegetables, including the famous Red McClure potatoes, are shipped. It is the seat of Adams State College (1921) and is the gateway to the Great Sand Dunes National Monument. Part of Rio Grande National Forest is nearby. Pop. (1990) 7,579.

Alanbrooke (of Brookeborough), Alan Francis Brooke, 1st Viscount, BARON ALANBROOKE OF BROOKEBOROUGH (b. July 23, 1883, Bagnères-de-Bigorre, Fr.—d. June 17, 1963, Hartley Wintney, Hampshire, Eng.), British field marshal and chief of the Imperial General Staff during World War II.

Educated in France and at the Royal Military Academy (Woolwich), he served in World War I. Between the world wars he distinguished himself in staff duties and was in charge of military training (1936–37). Brooke began service in World War II as commander of a corps in France; after the retreat to Dunkirk, he was responsible for covering the evacuation (May 26–June 4, 1940). In July he took command of the home forces until promoted to chief of staff in December 1941. He established good relations with the U.S.

forces and exercised a strong influence on Allied strategy. Alanbrooke's diaries formed the basis for Sir Arthur Bryant's *Turn of the Tide* (1957) and *Triumph in the West* (1959), which provoked controversy because of their criticism of General Dwight D. Eisenhower's ability as a military commander and of U.S. strategy in general. For his military services Alanbrooke was created a baron in 1945 and viscount in 1946.

Åland Islands, Swedish ÅLAND SKÄRGÅRD, Finnish AHVENANMAA, archipelago comprising Ahvenanmaan autonomous *kunta* (commune), southwestern Finland. The islands lie at the entrance to the Gulf of Bothnia, 25 miles (40 km) off the Swedish coast, at the eastern edge of the Åland Sea. The archipelago has a land area of 590 square miles (1,527 square km) and consists of about 35 inhabited islands, 6,500 other, uninhabited islands, and many rocky reefs. The bedrock is primarily granite and covered with a soil that, though mainly clay, is rich in limited areas.

Åland, the largest island in the group, is known locally as "the mainland"; it consists of rugged granite to the north and rich agricultural soil to the southeast. Mariehamn, the administrative capital and chief seaport, is located on Åland, as is Orrdals Hill, the highest point of the archipelago, rising to a height of 423 feet (129 m). From the 1800s until World War II, Mariehamn served as the centre of a sailing fleet engaged in grain trade with Australia. Few of these ships still operate, though the colourful history of the fleet is reflected in an excellent maritime museum. Fishing, which originally brought settlement to coastal areas unsuited to agriculture, is a declining source of income.

The archipelago has the highest crop yields in Finland per unit area because of the mild climate and fertile soil. Small, highly mechanized farms produce spring and autumn wheat, oats, barley, rye, cucumbers, and onions. Potatoes are the almost exclusive crop of Kökar Island. The climate also favours apple, plum, and pear orchards. Ayrshire cattle dominate the dairy farms, and sheep are also raised. Transportation, tourism, and civil service account for much of the nonagricultural employment. The islands are linked to Sweden and the Finnish mainland by ferry and steamship services and by air service from Mariehamn airport. Swedish is the sole official language and is the language of instruction in schools.

The archipelago shows evidence of Bronze and Iron Age settlement as well as distinctive Viking graveyards and numerous medieval granite churches. The islands were Christianized during the 12th century by Swedish missionaries. In 1714 they were seized by the Russian tsar Peter I the Great after his naval victory over Sweden. When the grand duchy of Finland was ceded to Russia in 1809, the islands were included with the provision that they would not be fortified. Russia began fortification in the 1830s, however, with the building of the Bomarsund garrison. The fortress was destroyed in 1854 during the Crimean War by Anglo-French troops. The Åland Convention between Britain, France, and Russia (1856) stipulated that the islands would never be fortified again. Because of their long history of economic and cultural association with Sweden, the Ålanders claimed the right of self-determination and sought to become part of Sweden when Finland declared its independence in 1917. Finland granted the islands autonomy in 1920 but refused to acknowledge their secession. The League of Nations became mediator of the Åland question, granting the islands a unique autonomy while directing that they remain part of Finland.

Ahvenanmaan autonomous *kunta* has a single-chamber parliament. Most administrative powers are vested in an Executive Council with ministers appointed by the provincial parliament. The people elect one representative to the Finnish parliament. There is a board that exercises certain administrative powers retained by the national government and that is headed by a governor appointed by the Finnish president upon agreement with the speaker of the Ahvenanmaan provincial parliament. Pop. (1991 est.) 24,515.

Alang language: see Halång language.

Alani, also called ALANS, an ancient nomadic pastoral people that occupied the steppe region northeast of the Black Sea. The Alani were first mentioned in Roman literature in the 1st century AD and were described later as a warlike people that specialized in horse breeding. They frequently raided the Parthian empire and the Caucasian provinces of the Roman Empire. About AD 370, however, they were overwhelmed by the Huns, and many fled westward, crossing into Gaul with the Vandals and Suebi (406). Although some of the Alani settled near Orléans and Valence, most went to North Africa with the Vandals, causing the official title of the Vandal kings in Africa to be "kings of the Vandals and the Alani." The Alani who remained under the rule of the Huns are said to be ancestors of the modern Ossetes of the Caucasus.

alanine, either of two amino acids, one of which (α -alanine) is a constituent of proteins. An especially rich source of α -alanine is silk fibroin, from which the amino acid was first isolated in 1879. Alanine is one of several so-called nonessential amino acids for birds and mammals; i.e., they can synthesize it from pyruvic acid (formed in the breakdown of carbohydrates) and do not require dietary sources. Beta-alanine is not found in proteins but occurs naturally in two peptides, carnosine and anserine, found in mammalian muscle. It is an important constituent of the vitamin pantothenic acid.

ālāpa (Sanskrit: "conversation"), in the art music of India and Pakistan, improvised melody structured to reveal a raga and occurring principally in the introductory section of a performance. There the *ālāpa* is performed without rhythmic accompaniment and is free and rhapsodic in character. With only a drone (sustained-tone) accompaniment, the performer of the *ālāpa* gradually introduces the essential notes and melodic turns of the raga to be performed. Only when the soloist is satisfied that he has set forth the full range of melodic possibilities of the raga and has established its unique mood and personality will he proceed, without interruption, to the metrically organized section of the piece. If a drummer is present, as is usual in formal concert, his first beats serve as a signal to the listener that the *ālāpa* is concluded.

Alapayevsk, also spelled ALAPAEVSK, city, Yekaterinburg *oblast* (province), west-central Russia, on the Neyva River. It is one of the oldest centres of the iron and steel industry in the Urals (an ironworks was established there in 1704). It also has machine-tool, timbering, and metalworking industries. Pop. (1991 est.) 50,300.

Alarcón (y Mendoza), Juan Ruiz de (dramatist): see Ruiz de Alarcón (y Mendoza), Juan.

Alarcón y Ariza, Pedro Antonio de (b. March 10, 1833, Guadix, Spain—d. July 10, 1891, Valdemoro), writer remembered for his novel *El sombrero de tres picos* (1874; *The Three-Cornered Hat*).
